23	3	General	General	<p>Instead of damming up the creek as proposed by the SUPER Project, I wholeheartedly support you in your efforts to tighten the MS4 Permit so that the 6 cities upstream and Laguna Beach downstream are forced to significantly reduce their toxic run-off. I believe that as a result of this we do not need the SUPER Project (or any other Army Corps of Engrs flood control for that matter) which will destroy our wilderness park in Aliso Canyon. Besides the destruction of our wilderness park at the very most the SUPER Project will only clean the bacteria at the outflow of the creek not in the wilderness park and the chemical effluents will remain as a nasty soup flowing into the ocean.</p> <p>Furthermore, based on our research, we have found that the clean up area proposed for the end of the creek will be the first item to be cut from the project. If that should happen, the SUPER Project will have done nothing but destroy our wilderness park and leave the water quality as an unresolved major issue. I have grandchildren that I would like to see be assured of swimming, skim boarding and surfing in clean ocean water not the toxic mess that exists today because of the Upstream Cities and my own city's inability to support the MS4 Permit. Laguna Beach should be working with the 6 Upstream Cities to bring them on board, not acting as just another deterrent to a much needed strengthening of the MS4 Permit.</p> <p>We need the 6 Upstream Cities to take responsibility one by one to contain and drastically reduce their urban run-off and by tightening the MS4 Permit will demand that they do so.</p>	<p>Comment noted. The SUPER project will be subject to the MS4 permit where applicable. The SUPER project will require a Clean Water Act Section 401 water quality certification from the Regional Board. The Regional Board plans on a closer review of the SUPER project through the 401 certification process.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
24	4	General	General	<p>Last February, the Copermittees took from your closing remarks a commitment that your staff would look at consistency with existing and draft MS4 permits, including those from the Regional Water Quality Control Boards (RWQCBs) for the Santa Ana and Los Angeles regions. At the same time, USEPA also expressed an interest in seeing greater permitting consistency between RWQCBs. More recently, the final report of the Little Hoover Commission identified the lack of consistency between RWQCBs as a critical area of concern with respect to the ability of the State to deliver on its water quality protection mandates. It is also a key issue for the Orange County Stormwater Program which is subject to the jurisdiction of two RWQCBs.</p> <p>Nonetheless, and in spite of precious assurances and concerns, the March 13, 2009 Tentative Order is fundamentally different from the current draft MS4 permit for North Orange County (Tentative Order R8-2009-0030) in many key programmatic areas. While your staff has acknowledged that they will likely incorporate the North Orange County permit's land development provisions, they are reluctant to eliminate other areas of inconsistency. This disinclination erodes the credibility of the regulatory framework for stormwater in California and serves to confound the ability of local government and the regulated community to effectively address a key environmental mandate at a time of unprecedented fiscal constraint. It is therefore necessary for us to continue to seek revisions to the Tentative Order supportive of a cohesive and cogent alignment of the North and South County permits on the basis that consistency is important to the credibility of our respective efforts to manage urban runoff and is vital to sustaining the obvious cost effectiveness of a single and coordinated Countywide program in Orange County.</p>	<p>It is important to note that consistency between permits does not imply that permits be identical. The San Diego Regional Board's draft Tentative Order for MS4 discharges in Southern Orange County does meet a level of consistency to allow those few cities and the County of Orange who are in both Regions to develop a comprehensive program that is protective of the unique water quality standards in Southern Orange County. In addition, nothing in the draft Tentative Order is in conflict or contradicts the municipal permit recently adopted by the Santa Ana Regional Board. Requirements for low impact development, and the definition of a priority development project are particularly consistent if not identical to the requirements in the Riverside Regional Board's recently adopted MS4 permit for North Orange County.</p> <p>The San Diego Regional Board staff met several times in 2008 to seek consistency with staff from the Los Angeles Regional Board, Riverside Regional Board, State Board and the USEPA. Consistency, unfortunately, was not much of an issue for the other Regional Boards due to a lack of comments or requests to be consistent from their stakeholders. Consistency among all MS4 Permits in Southern California is beyond the San Diego Regional Board's authority due to the semi-autonomous Regional Board system established by State law.</p> <p>Nevertheless, we are sensitive to the Copermittee's concerns of consistency and have sought to write the draft Tentative Order to protect Water Quality and allow the County and those affected Cities to develop a single program. First and foremost, the draft Tentative Order is consistent with the Clean Water Act, Code of Federal Regulations and USEPA guidance. These federal regulations are the driving force behind the requirement for the MS4 permit and this reissuance. To reach consistency with the federal regulations, several changes are in the draft Tentative Order, namely, the removal of the term "urban runoff," prohibition of over-irrigation discharges, and the numeric effluent limitations for dry weather non-storm water discharges. In addition, the draft Tentative Order must comply with the anti-backsliding requirements found in 40 CFR 122.44(l): "[W]hen a permit is renewed or reissued, interim effluent limitations, standards or conditions must be at least as stringent as the final effluent limitations, standards, or conditions in the previous permit."</p> <p>The draft Tentative Order has to be consistent with the San Diego Regional Board's Basin Plan. The Basin Plan defines the unique water quality objectives and beneficial uses in Southern California that the draft Tentative Order is seeking to protect and restore. South Orange County is unique from North Orange County in several aspects. Besides the obvious differences of land use, population density, cultural makeup and geology, several receiving waters in Southern Orange County have been identified as having Warm and Cold habitat</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

beneficial uses. Receiving waters in Northern Orange County have not been identified as having Warm and Cold habitat beneficial uses.

The Regional Board also has to be concerned about consistency with other MS4 permits issued by the San Diego Regional Board. The Regional Board has three separate MS4 permits to write and enforce. To have a fair and consistent enforcement policy implemented by the Regional Board, the MS4 permits issued by the Regional Board need to be consistent. The difficulty for Regional Board staff to understand, review reports and adequately enforce inconsistent MS4 permits puts an unnecessary strain on the Regional Board's limited resources.

The County of Orange's criteria for consistency cannot be a hindrance to improvements in the science and regulation of water quality. Some might argue that to be truly consistent would be a return to the regulations and water quality observed in 1990 when the first NPDES permit was issued for MS4 discharges. This progressive increase in water quality science and knowledge is supported in USEPA guidance. For example, in its "Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits" (61 FR 43761), USEPA states, "In cases where adequate information exists to develop more specific conditions or limitations to meet water quality standards, these conditions or limitations are to be incorporated into storm water permits, as necessary and appropriate."

Even with these constraints on consistency, the draft Tentative Order is consistent with the Santa Ana Regional Board's North Orange County MS4 permit, especially in regard to the requirements for Low Impact Development at Priority Development Projects. While being consistent, this draft Tentative Order is also implementing the USEPA's policy on watershed permitting. At this point in time, adopting an identical permit to that in a separate watershed could be construed to be in violation of USEPA's stated policy on implementing NPDES permitting activities on a watershed basis.

The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
25	4	MAL	D.	<p>The Permittees' concerns with the imposition of Municipal Action levels (MALs) and Numeric Effluent Limits (NELs) have been presented to your staff. The Permittees' fundamental concern is that the method of application is clearly inconsistent with the definitive guidance in this area, specifically the State Water Board's Blue Ribbon panel report on the feasibility of numeric effluent limits. In June 2006, this panel concluded that it is not feasible at this time to set numeric effluent criteria for municipal BMPs and in particular urban discharges. In 2009, this conclusion continues to be the published position of USEPA on this issue. Clearly, both the RWQCBs and the Permittees have a keen interest in being able to demonstrate and report the effectiveness of their stormwater protection and management efforts. However, this effort by your staff to include MALs as the basis for compliance with the MEP standard in the permit is inappropriate on both technical and legal grounds. Likewise, the water quality based NELs established for non-stormwater discharges are legally and regulatorily unsupported. Nonetheless, we recognize the value of action levels and will continue to seek provisions that support the better application of published guidance on program effectiveness assessment including the development and application of benchmarks. Indeed, the Permittees commend the Dry Weather Reconnaissance Program to you as the model application of water quality benchmarks in a manner entirely consistent with the recommendations of the BlueRibbon Panel.</p>	<p>The Regional Board has reviewed and taken into consideration the findings from the Blue Ribbon report: The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities, dated June 14, 2006. The report, written specifically for discharge of storm water, finds it infeasible to establish numeric effluent limitations and recommends utilizing action levels based upon a nationwide and/or localized dataset. The Tentative Order has included action levels, or Municipal Action Levels (MALs), which are not numeric effluent limitations. Language in the updated errata has been changed and a MAL exceedance no longer creates a presumption that MEP is not being met. Thus, MALs are not representative of the MEP standard, but shall be used by Copermittees to determine priorities for BMP implementation (see response to Comment 33 for further discussion).</p> <p>In regards to the non-storm water numeric effluent limits (NELs), the Blue Ribbon report was specifically written to address discharges of storm water. Non-storm water discharges are not addressed by the report. While the dry weather reconnaissance program has established benchmarks and successfully detected, investigated and eliminated illicit discharges, the discharges of non-storm water from the MS4 are causing or have the reasonable potential to cause excursions above applicable water quality standards. Thus, in order to protect the Beneficial Uses of the waters of the State, numeric effluent limits for these non-storm water discharges have been proposed. Inclusion of numeric effluent limits is consistent with other adopted Orders for non-storm water discharges (see response to Comment 39 for further discussion).</p>

26	4	General	General	<p>At the inception of the Stormwater Program, the County of Orange, as Principal Permittee, and the Permittees developed a Drainage Area Management Plan (DAMP) to serve as the principal policy and programmatic guidance document for the Program. Since 1993, the DAMP has been modified through an adaptive management process to reflect the needs of the Permittees, ensure Permittee accountability, and deliver positive water quality and environmental outcomes. The DAMP now provides definitive guidance to each Permittee in the development of its Local Implementation Plan (LIP) which specifically describes how the Program will be implemented on a city/jurisdiction basis. It also includes Watershed Action Plans (WAPs) for each of the six South Orange County watersheds targeting pathogen indicator bacteria. Concurrently, the annual progress report has been developed into a systematic assessment of program effectiveness at jurisdictional, watershed and countywide levels of resolution, using program effectiveness assessment guidance from the California Stormwater Quality Association (CASQA) and a comprehensive environmental quality dataset. Nevertheless, the Tentative Order seeks to impose additional planning requirements including jurisdictional workplans, a business plan and additional planning efforts that might be triggered by exceedances of a water quality action level. The Permittees believe that strategically adjusting the existing planning processes, rather than simply creating additional planning requirements, should be the basis of the Tentative Order's programmatic requirements. Such an approach also offers the additional potential benefit of identifying opportunities to reduce rather than increase the administrative burden of the Program for both the RWQCB and for the Permittees.</p>	<p>While the DAMP may play an important role in aiding the Copermittees in their development of effective local programs, its development is not required in the Tentative Order. It generally serves as a collection of model program components from which the Copermittees have chosen to base their own individual programs. The DAMP and Report of Waste Discharge (ROWD) submitted to the Regional Board in August 2006 constitute the application for reissuance of the municipal storm water permit. The Regional Board is not obligated to accept the proposed program as the equivalent of the NPDES requirements. Instead, the Regional Board has the responsibility of requiring measures that are reasonable and necessary to protect water quality objectives in the Permit area. While the Copermittees may elect to incorporate elements of the DAMP into their local programs, certain requirements in the Tentative Order must be specific enough to ensure that the local programs will reduce discharges of storm water pollutants from municipal separate storm sewer systems (MS4s) to the maximum extent practicable (MEP) and effectively prohibit non-storm water discharges (unless exempted or covered by a separate permit). The DAMP is not an enforceable document by the Regional Board. When Copermittees choose to follow the DAMP, ultimately the individual Copermittee has a responsibility to comply with the draft Tentative Order whether or not the DAMP guides them in compliance. Therefore, the draft Tentative Order allows each individual Copermittee the flexibility to tailor their programs to their individual needs through the Local Implementation Plan and jurisdictional work plans.</p> <p>Please note that the requirements for a business plan have been removed from the Tentative Order.</p>
27	4	SUSMP	F.1	<p>With land development projects, the installation and subsequent maintenance of treatment controls certainly needs to be verified. However, self certification is already a verification mechanism being used by Permittees and it and other third party verification mechanisms should not be precluded by the Tentative Order in exclusive favor of [Cop]ermittee inspection. The current opportunity to strategically re-consider the use of inspection resources should be used to target and focus these activities rather than simply expand their scope. Furthermore, given the current state of the economy, the [Cop]ermittees, like all municipalities, are facing shrinking budgets. Consequently the RWQCB should give great weight to the best use of limited resources in achieving water quality objectives.</p>	<p>The requirements to track and annually inspect high priority post-construction BMPs is in response to findings from the 2005 audits and from USEPA guidance. The 2005 audits found that the Copermittees were not adequately tracking post-construction BMPs. The final audit report recommended that each city should develop a system to verify implementation and track post-construction BMPs to ensure adequate maintenance. The draft Tentative Order does not preclude the Copermittees from using self certification or other equally effective approaches for low or medium priority post construction BMPs. Inspections are required for high priority BMPs due to their threat to water quality. Inspections are more reliable than self-certifications in verifying compliance. Inspections can also be a means of checking on the accuracy of self-certifications. The requirements in the draft Tentative Order are consistent with the requirements in the adopted San Diego County MS4 permit, Order No. R9-2007-0001.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
28	4	Overirrigation	B.	<p>The prescribed prohibition on irrigation runoff also needs to be very carefully considered. Project Pollution Prevention, the public education and outreach initiative of the Program, is already targeting overwatering as a residential practice of concern. Moreover, the effectiveness of the overall public education effort has been validated by public opinion surveys that show incremental and statistically significant increases in public awareness of stormwater issues, as well as positive changes in protective behaviors. In light of this progress, implementation of the prohibition would risk eroding general public support for a Program that is successfully fostering a stewardship ethic in residential environments. There is also concern that the provision would force the expenditure of scarce resources on an issue that is already being addressed by water districts dealing with water conservation imperatives.</p>	<p>The Regional Board disagrees that removing the exemption for irrigation-related discharges from the non-storm water prohibition will erode the public from fostering and stewarding their residential environments. Several citizens at recent public meetings have voiced their support for this action.</p> <p>Furthermore, the removal of the exemption is required by federal law. Section 402(p)(3)(B)(ii), permit requirements for municipal discharges, states that municipal storm water NPDES permits: "shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers." The Federal Register (55, page 48037) and 40 CFR 122.26(d)(iv)(B) clarifies that certain components and categories of discharges are not required to be prohibited. The Code of Federal Regulations requires the discharger have: "...a program, including inspections, to implement through ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program shall address all types of illicit discharges, however, the following category of non-storm water discharges or flows shall only be addressed where such discharges are identified by the municipality as sources of pollutants to the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated groundwater infiltration (as defined at 40 CFR 35.2005(20) to separate storm sewers, uncontaminated pumped groundwater..." As such, the identification of any of these categories as a source of pollutants requires them to be addressed as illicit discharges, which are not authorized under the CWA, and are required to be "effectively prohibited" via ordinance, order or similar means. Therefore, the prohibition on irrigation runoff is required by the federal regulations since the Copermittees have identified irrigation runoff as a source and conveyance of pollutants (as identified in the Supplemental Fact Sheet).</p> <p>It is encouraging to hear that the County believes their overall public education effort is showing improvements in public awareness and changes in protective behavior. Therefore, the overirrigation prohibition will dovetail into their already effective public education programs. As public agencies, the Copermittees must be aware and address their public concerns and the Copermittees are expected to use appropriate discretion through their education and enforcement mechanisms to alleviate those public concerns. As long as the Copermittees have a program in place to effectively prohibit over-irrigation runoff from entering the MS4, they are likely to be in compliance with this Tentative Order. Coordination with the water districts is an acceptable and preferred method of compliance.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
29	4	Existing Development	F.3.	<p>The last area of prescribed new regulatory oversight is mobile businesses. The Permittees have already produced educational materials for these businesses, cooperatively developed wash water disposal options with Orange County's sewerage agencies, and coordinated on enforcement. The further required regulation of these businesses is a potentially resource intensive undertaking that currently appears to lack a strong technical rationale.</p>	<p>Mobile businesses have been identified as sources of pollutants in storm water runoff. The current MS4 Permit lists mobile businesses as one category for which BMPs must be developed. Separation of BMP implementation for Mobile Businesses in the Tentative Order is not a significant change from the existing Order. It is appropriate to segregate mobile businesses from fixed location businesses in the reissued Permit, because of the unique difficulties associated with regulating mobile businesses. The language in the Tentative Order is intended to provide broad flexibility to the Copermittees to account for the individual make-up of each municipality and for the difficulties with identifying and communicating with mobile business operators.</p> <p>Understandably, identifying mobile businesses within each jurisdiction and enforcing storm water regulations on those mobile businesses is a challenge. The draft Order's requirement for Mobile Businesses provides flexibility in dealing with these difficulties by allowing the Copermittees to coordinate and share mobile business inventories. The mobile business section includes the option for the Copermittees to share mobile business inventories, BMP requirements, enforcement action information, and education methodologies. Sharing this type of information would save resources.</p>
30	4	LID	F.1	<p>More recently the County provided the Santa Ana RWQCB with a more detailed conception of a framework for land development. It predicates permit compliance on management of the 85th percentile storm volume. presumes the application of LID BMPs based upon a prioritized consideration of infiltration, capture and re-use, evapotranspiration, and bio-retention/biofiltration, and requires treatment of residual runoff volumes for which the application of LID BMPs has been determined to be infeasible at site, sub-regional and regional scales. The framework also integrates options for water quality credits and provides for alternate compliance approaches including participation in a watershed project and contributions to an "in-lieu~ fund.</p> <p>It also explicitly recognizes bio-retention/bio-filtration BMPs as LID BMPs and the continued and entirely legitimate contribution of effective structural BMPs such as constructed wetlands and detention ponds to the practice of stormwater quality management.</p> <p>The [Cop]ermittees believe that it is imperative that there be a uniform countywide development standard for water quality protection. Consequently, the framework language that is currently being supported by both the North Orange County Permittees and staff of the Santa Ana Regional Board should be the starting point for discussion with respect to the subject Tentative Order.</p>	<p>The draft Tentative Order and errata sheet has updated LID language that is consistent with the recently adopted Riverside Regional Board (Region 8) MS4 permit for North Orange County. The updated language has provisions for the inclusion of LID biofiltration while protecting water quality. The LID language also provides an individual city the freedom and flexibility to implement development standards independent of the County that are more protective of water quality and more suited for the unique conditions found in their city.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
31	4	General	General	<p>In advance of preparing the Report of Waste Discharge (ROWD) the Permittees undertook a detailed program assessment drawing upon prior annual report findings, a comprehensive environmental quality database, audit findings, facilitated workshops, and the CASQA Program Effectiveness Guidance. This assessment provided a strong technical basis for the further improvements to the Orange County Stormwater Program recommended in the ROWD, these improvements have been subsequently validated in later annual progress reports. These informational resources and, in particular, the environmental quality database, have been compiled at great expense and provide unique and site specific information on the state of Orange County's surface waters and the performance of the Orange County Stormwater Program. To the extent that the Tentative Order prescribes requirements supplemental to the ROWD recommendations they need to be explicitly supported by a strong technical justification that is developed from the information that has been compiled over the last 18 years by the [Cop]ermittees. New requirements also need to be consistent with the federal stormwater regulations and within the scope of the Clean Water Act.</p>	<p>The Regional Board appreciates and respects the expertise of the Copermittees in implementing local programs. The commenter, however, incorrectly restricts the Regional Board to using information compiled only by the Copermittees in the last 18 years. In addition, to the data provided by the Copermittees, the fact sheet cites technical information from federal guidance, State plans and policies, and independent studies. The draft Tentative Order is consistent with the federal stormwater regulations and within the scope of the Clean Water Act. Several changes to the draft Tentative Order were made to be consistent with the federal regulations including the removal of the term "urban runoff," inclusion of non-stormwater dry weather numeric effluent limits, and the prohibition on over irrigation water.</p>
32	4	MAL	D.	<p>Contrary To Established Federal Law, the Tentative Order Would Require Permittees to Meet Numeric Effluent Limits for Discharges from the MS4</p> <p>A. Basing Permit Compliance on Municipal Action Levels is Inconsistent with Federal and State Guidance and Not Required by the Clean Water Act.</p> <p>The March 13, 2009 draft of the Tentative Order imposes on Permittees for the first time the concept of "Municipal Action Levels" or "MALs." Beginning in the fourth year after adoption of the permit, discharges from the MS4 that exceed the MALs (which are numeric concentration levels for designated pollutants) would give rise to a presumption that the Permittee was not complying with the MEP standard. In other words, the Permittee would be presumed to be in violation of the permit. The County objects to this significant new requirement for several reasons.</p>	<p>MAL language has been changed and new language is located in the Updates to the Tentative Order. Language has been changed so the exceedance of a MAL does not give rise to the presumption that the Copermittee is not complying with the MEP standard. Please see full response to Comment 33.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
33	4	MAL	D	<p>1. As Proposed, the Municipal Action Levels for Discharges from the MS4 Could Be Considered Numeric Effluent Limits Not Required by Federal Law</p> <p>First, to the extent the MALs are considered numeric effluent limitations, they are not required by the Clean Water Act. The Clean Water Act defines "effluent limitation" as "any restriction established by a State or [the U.S. EPA] on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from point sources..." CWA § 502; 33 U.S.C. § 1362(11). The proposed MALs meet this definition. Because an exceedance of a MAL may result in a permit violation, the MALs represent a restriction on concentrations of designated constituents discharged from the MS4. Because they are expressed numerically rather than through narrative, they would be considered numeric effluent limitations.</p>	<p>The MAL language has been updated to reflect that an excursion above a MAL does not create a presumption that MEP is not being met. Instead, a MAL exceedance is to be used by the Copermittee as an indication that the MS4 storm water discharge point is a definitive "bad actor," and the result from the monitoring needs to be considered as part of the iterative process for reducing pollutants in storm water to the MEP. A MAL is not a restriction on a quantity, rate or concentration, but is a level at which actions that further reduce pollutants from that discharge point need to be evaluated in order to reduce storm water pollutants to the MEP. Thus, MALs are not effluent limitations as defined by the CWC or CWA. This is further discussed in the updated Supplemental Fact Sheet.</p> <p>The approach of using "action levels" is consistent with recommendations made by USEPA in their Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, dated August 26, 1996: "Under the Clean Water Act(CWA) and NPDES regulations, permitting authorities may employ a variety of conditions and limitations in storm water permits, including best management practices, performance objectives, narrative conditions, monitoring triggers, action levels (e.g., monitoring benchmarks, toxicity reduction evaluation action levels), etc., as the necessary water-quality based limitations, where numeric water quality based effluent limitations are determined to be unnecessary or infeasible". As such, these action levels are not considered numeric water quality-based effluent limits.</p> <p>It should be noted that a purpose of monitoring, required under this and previous Orders, is to aid in the evaluation of implemented programs and BMPs in reducing pollutants in storm water discharges to the MEP. The tentative Monitoring and Reporting Program states:</p> <p>A. This Receiving Waters and Urban Runoff Monitoring and Reporting Program is intended to meet the following goals:</p> <ol style="list-style-type: none"> 2.Measure and improve the effectiveness of the Permittees' urban runoff management programs; 3.Assess the chemical, physical, and biological impacts to receiving waters resulting from runoff discharges; 4.Characterize runoff discharges; 5.Identify sources of specific pollutants; 6.Prioritize drainage and sub-drainage areas that need management actions; 9.Provide information to implement required BMP improvements <p>The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
34	4	MAL	D	<p>The Clean Water Act does not require that MS4 permits include numeric effluent limitations. Instead, MS4 permits “shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods...” CWA § 402(p)(3)(B)(iii); 33 U.S.C. § 1342(p)(3)(B)(iii). In other words, discharges from the MS4 must meet the so-called “MEP” standard. Unlike other technology-based standards, the MEP standard is not defined in the Clean Water Act or in federal regulations. It is intended to be flexible, to allow the development of site-specific permit conditions based on the best professional judgment of the permit writer. See, e.g., 55 Fed. Reg. 47989, 48038 (Nov. 16, 1990); 64 Fed. Reg. 68721, 68754 (Dec. 8, 1999); U.S. EPA Region IX, Storm Water Phase I MS4 Permitting: Writing More Effective, Measurable Permits (February 2003).</p>	Please see response to comment 33.
35	4	MAL	D	<p>The Clean Water Act also provides that MS4 permits include “other provisions as [U.S. EPA] or the State determines appropriate for the control of [] pollutants” discharged from the MS4. CWA § 402(p)(3)(B)(iii); 33 U.S.C. § 1342(p)(3)(B)(iii). Case law has interpreted this language to allow, but not require, U.S. EPA or a State to impose requirements in MS4 permits that go beyond the MEP standard, such as numeric effluent limits. See, e.g., <i>Defenders of Wildlife v. Browner</i>, 191 F.3d 1159, 1166-67 (9th Cir. 1999); <i>Building Industry Association of San Diego County v. State Water Resources Control Board</i>, 124 Cal.App.4th 866, 885-86 (2005). In other words, the MEP standard is the statutory floor for MS4 permits. MS4 permits must require that discharges from the MS4 meet the MEP standard. The Clean Water Act allows, but does not require, MS4 permits to include requirements more stringent than the MEP standard. Therefore, to the extent the MALs are considered numeric effluent limitations, more stringent than what is required by the MEP standard, they are not required by the Clean Water Act.</p>	<p>Please see response to comment 33.</p> <p>The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.</p>
36	4	MAL	D	<p>2. Defining MEP in Terms of the MALs is Inconsistent with Established State and Federal Guidance.</p> <p>To the extent the MALs are defining MEP rather than imposing requirements that go beyond MEP, they also are inappropriate. As proposed, the Tentative Order provides that if a discharge exceeds a MAL, it will be presumed that the Permittee has not met the MEP standard. In other words, at a minimum, the MAL for a given pollutant represents MEP. This is inconsistent with federal and state guidance on the MEP standard.</p>	Please see response to comment 33.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
37	4	MAL	D	<p>As discussed above, the MEP standard is not defined by the Clean Water Act or by U.S. EPA. After its initial experience with the MEP standard as implemented through the Phase I MS4 permits, U.S. EPA provided additional guidance as to the standard in the preamble to its Phase II regulations for small MS4s: EPA has intentionally not provided a precise definition of MEP to allow maximum flexibility in MS4 permitting. MS4s need the flexibility to optimize reductions in storm water pollutants on a location-by-location basis. EPA envisions that this evaluative process will consider such factors as conditions of receiving waters, specific local concerns, and other aspects included in a comprehensive watershed plan. Other factors may include MS4 size, climate, implementation schedules, current ability to finance the program, beneficial uses of receiving water, hydrology, geology, and capacity to perform operation and maintenance. The pollutant reductions that represent MEP may be different for each small MS4, given the unique local hydrologic and geologic concerns that may exist and the differing possible pollutant control strategies. . . . EPA envisions application of the MEP standard as an iterative process. MEP should continually adapt to current conditions and BMP effectiveness and should strive to attain water quality standards. Successive iterations of the mix of BMPs and measurable goals will be driven by the objective of assuring maintenance of water quality standards. . . . 64 Fed. Reg. at p. 68754.</p>	<p>Please see response to comment 33.</p> <p>Furthermore, proposed changes to the Tentative Order include a requirement to update MALs to include end-of-pipe storm water monitoring data, thus creating a more localized dataset, which is the approach preferred by the 206 Blue Ribbon report. It is expected that utilizing local data will create MALs that more closely reflect the MEP standard for Copermittees, which may result in MALs that are higher and/or lower based upon local conditions.</p>
38	4	MAL	D	<p>Similarly, the State Water Board has not defined the MEP standard. However, it too has provided guidance that emphasizes the flexible nature of the standard: If, from [a] list of BMPs, a permittee chooses only a few of the least expensive methods, it is likely that MEP has not been met.</p> <p>On the other hand, if a permittee employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit to be derived, it would have met the standard. MEP requires permittees to choose effective BMPs, and to reject applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive. State Water Board Order WQ 2000-11 at p. 20. In light of this state and federal guidance, it is inappropriate for the Tentative Order to attempt to define MEP for a given pollutant with a numeric concentration, i.e., a MAL. For the above reasons, the County requests that Section D be removed from the next draft of the Tentative Order.</p>	<p>Please see response to comment 33.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
39	4	NEL	E	<p>B. The Proposed Numeric Effluent Limits For Discharges of Non-Stormwater From The MS4 Are Not Supported By Federal Law.</p> <p>1. The Clean Water Act Requires That MS4 Permits Include Requirements To “Effectively Prohibit” Discharges Of Non-Storm Water Into The MS4 And Controls To Reduce The Discharge Of Pollutants From The MS4 To The Maximum Extent Practicable; The Act Does Not Require That Non Stormwater Discharges From The MS4 Meet Numeric Effluent Limitations.</p> <p>The Tentative Order would explicitly impose numeric effluent limits (NELs) on discharges from MS4s. Section C incorporates NELs for non-stormwater dry weather discharges into receiving waters. The Tentative Order provides no legal authority for imposing this new and significant requirement. The Supplemental Fact Sheet simply states that because Permittees’ past efforts at controlling pollutants in non-stormwater discharges have been ineffective, NELs on those pollutants are necessary. To the extent there is legal authority for imposing NELs on nonstormwater discharges from the MS4, it is not found in the Clean Water Act.</p>	<p>The Clean Water Act (CWA) employs the strategy of prohibiting the discharge of any pollutant from a point source unless the discharger of the pollutant(s) obtains a NPDES permit pursuant to Section 402 of the Clean Water Act. The discharge of storm water and non-storm water from an MS4 system is considered a discharge from a point source.</p> <p>In 1987 the CWA was amended to include provisions that specifically concerned NPDES permitting requirements for storm sewer discharges from the MS4. Section 402(p), for Municipal and Industrial Stormwater Discharges, regulates the discharge of storm water from a point source (e.g. the municipal separate storm sewers). Storm water means storm water runoff, snowmelt runoff, and surface runoff and drainage (related to precipitation events, see 40 CFR 122.26(b)(13) and 55 Fed Reg 47995-96).</p> <p>Section 402(p)(3)(B), permit requirements for municipal discharges, states that municipal storm water NPDES permits:</p> <p>“(j) may be issued on a system- or jurisdiction-wide basis;</p> <p>(ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and</p> <p>(iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.”</p> <p>Thus, non-storm water discharges into, through and thus from the MS4 are not covered under 402(p)(3)(B)(iii), as they are required to be effectively prohibited, not reduced to the maximum extent practicable. This is, in effect, a narrative prohibition of discharge. The Federal Register (Vol. 55, No. 222, page 47995) provides further clarification regarding non-storm water discharges, defined as “Illicit Discharges”:</p> <p>“Today’s rule defines the term “illicit discharge” to describe any discharge through a municipal separate storm sewer system that is not composed entirely of storm water and that is not covered by an NPDES permit. Such illicit discharges are not authorized under the Clean Water Act. Section 402(p)(3)(B) requires that permits for discharges from municipal separate storm sewers require the municipality to “effectively prohibit” non-storm water discharges from the municipal separate storm sewer...Ultimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit.”</p> <p>The Federal Register (47995-47996) goes on to state that:</p> <p>“Congress did not intend that the term storm water be used to describe any discharge that has a de minimis amount of pollutants, not did it intend for section 402(p) to be used to provide a</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

moratorium from permitting other non-storm water discharges.”

Those wishing to continue non-storm water discharges into (and thus through and from) the MS4 are required to obtain coverage under a separate NPDES permit, pursuant to section 402, not 402(p). The federal regulations (40 CFR 122.26(d)(vi)(2)(B)) require that the municipal separate storm sewer discharger: “Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer.”

However, the Federal Register (55, page 48037) and 40 CFR 122.26(d)(iv)(B) clarifies that certain components and categories of discharges are not required to be prohibited. The Code of Federal Regulations requires the discharger have: “. . .a program, including inspections, to implement through ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program shall address all types of illicit discharges, however, the following category of non-storm water discharges or flows shall only be addressed where such discharges are identified by the municipality as sources of pollutants to the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated groundwater infiltration (as defined at 40 CFR 35.2005(20) to separate storm sewers, uncontaminated pumped groundwater, . . .” As such, the identification of any of these categories as a source of pollutants requires them to be addressed as illicit discharges, which are not authorized under the CWA, and are required to be “effectively prohibited” via ordinance, order or similar means.

Separate permits for discharges to the municipal storm sewer system can be obtained. The Federal Register (55, page 48037) states that: “Permits for such discharges must meet applicable technology-based and water quality-based requirements of Sections 402 and 301 of the CWA. If the permit for a non-storm water discharge to a municipal separate storm sewer contains water quality-based limitations, then such limitations should generally be based on meeting applicable water quality standards at the boundary of the State established mixing zone (for States with mixing zones) located in the receiving waters of the United States.” The Regional Board and State Board have issued multiple permits for non-storm water discharges into MS4 systems, including R9-2008-0002 (extracted groundwater), R9-2002-0020 (hydrostatic discharge) and 2006-008 DWQ (utility vaults), pursuant to section 402 of the CWA. These discharges are required to meet limitations upon discharge into the MS4 system.

The Federal Register (55, page 48037) provides additional clarification on how non-storm water discharges from the MS4 are to be regulated: “Conveyances which continue to accept other “non-storm water” discharges (e.g. discharges without an NPDES permit) with the exceptions

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

noted above (exempted discharges that are not a source of pollutants) do not meet the definition of municipal separate storm sewer and are not subject to 402(p)(B) of the CWA unless such discharges are issued separate NPDES permits. Instead, conveyances which continue to accept non-storm water discharges which have not been issued separate NPDES permits are subject to sections 301 and 402 of the CWA.”

As such, non-storm water discharges that occur are not subject to the MEP standard under 402(p), as 402(p) is for storm water discharges. Any non-storm water discharges from the MS4 that occur are:

- i) illicit discharges;
- ii) exempted categories that are not a source of pollution; and/or
- iii) discharges subject to a separate NPDES permit under section 402 of the CWA.

Owners and operators of the MS4 (dischargers) cannot passively receive discharges from third parties (Federal Register 68766) and thus are responsible for the discharge of non-storm water from their MS4, and the discharge of non-storm water from the MS4 that is a source of pollutants is considered an illicit discharge, which is not authorized under the CWA. Such discharges are required to be prohibited or subject to a NPDES permit under section 402 of the CWA. They are not to be reduced to the maximum extent practicable under 402(p)(B)(iii).

For the last 19 years, Southern Orange County NPDES permits for discharges of runoff (non-storm water and storm water) have required Copermittees (dischargers) to prohibit non-storm water discharges into (thus through and from) their MS4 systems, implement a program to prevent illicit discharges, and monitor to identify illicit discharges and exempted discharges that are a source of pollution. These measures are considered Best Management Practices (BMPs), are required under 402(p), and are considered by USEPA to be an interim approach to permitting non-storm water discharges from the MS4 in accordance with section 402 of the CWA.

For NPDES permits under 402 of the CWA, the Code of Federal Regulations (122.44(k)) clarify that a discharger may utilize BMPs to control or abate the discharge of pollutants when:

- “(1) Authorized under section 304(e) of the CWA for the control of toxic pollutants and hazardous substances from ancillary industrial activities;
- (2) Authorized under section 402(p) of the CWA for the control of storm water discharges;
- (3) Numeric limits are infeasible; or
- (4) The practices are reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of the CWA.”

As BMPs have been utilized by the discharges for the past 19 years, the Regional Board has evaluated (in accordance with 40 CFR 122.44(d)(1)) past and existing controls (BMPs), non-storm water effluent monitoring results, the sensitivity of the species in receiving waters (e.g. endangered species), and the potential for

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
					effluent dilution, and has determined that BMPs are not sufficient to protect water quality standards as non-storm water discharges from the MS4 continue to cause, have the reasonable potential to cause, or contribute to excursions above applicable water quality criteria. Thus, numeric effluent limitations have been established in accordance with federal regulations under 40 CFR 122.44 to control the discharge of pollutants to protect water quality standards (see the updated Supplemental Fact Sheet for further information).
40	4	NEL	E	The Clean Water Act very clearly defines the discharge requirements for permits for discharges from municipal storm sewers (i.e., MS4s permits). Such permits may be issued on a system or jurisdiction-wide basis, must include a requirement to effectively prohibit non-stormwater discharges into the storm sewer, and must require controls to reduce the discharge of pollutants from the storm sewer to the maximum extent practicable. CWA § 402(p)(3)(B); 33 U.S.C. § 1342(p)(3)(B). It is the discharge of pollutants from the MS4, regardless of whether they are in stormwater or non-stormwater, which must be reduced to the maximum extent practicable. Section 402(p) of the Clean Water Act does not distinguish between wet weather and dry weather discharges. Thus the Clean Water Act does not require or provide authority for imposing NELs on the discharge of non-stormwater from MS4s.	Please see response to comment 39. As detailed in the response to comment no. 39, CWA § 402(p) pertains to 'storm water.' The very title of the section is "Municipal and Industrial Stormwater."
41	4	NEL	E	2. The Federal Stormwater Regulations Implement the Clean Water Act's "Effective Prohibition" Requirement. Nor do the federal stormwater regulations impose separate requirements on discharges of nonstormwater from the MS4. Instead, tracking the Clean Water Act language, the federal regulations and preamble impose specific requirements as to how Permittees are to address non-stormwater discharges into the MS4 (i.e., "effectively prohibited"). The regulations use the term "illicit discharge," which means any discharge to the MS4 that is not composed entirely of stormwater, except discharges pursuant to a separate NPDES permit and discharges resulting from fire fighting activities. 40 C.F.R. § 122.26(b)(2). Permittees must have a program to prevent illicit discharges into the MS4. 40 C.F.R. § 122.26(d)(2)(iv)(B)(1). The regulations also require Permittees to address "improper disposal" into the MS4 of used oil and toxic materials through educational activities on the proper management and disposal of these materials. 40 C.F.R. § 122.26(d)(2)(iv)(B)(6).	Section 402(p) of the Clean Water Act is specifically for municipal and industrial storm water discharges (see response to Comment 39). Section 402(p) does include a requirement that permits include a limitation on non-storm water discharges into the MS4 (zero discharge), unless those discharges into the MS4 are covered under a separate NPDES permit under Section 402 of the Clean Water Act, or are exempted and not a source of pollutants (40 CFR 122.26(d)). As discussed in the updated Supplemental Fact Sheet, non-storm water discharges from the MS4 are likely to contain pollutants that cause or threaten to cause an exceedance of the water quality standards, as outlined in the Regional Board's Water Quality Control Plan for the San Diego Basin. As such, to prevent the discharge of non-storm water from causing or contributing to a condition of pollution in the receiving waters, appropriate limitations have been included that ensure the effective prohibition of non-storm water discharges into the MS4 and identify any exempted discharges that are a source of pollution and need to be addressed as illicit discharges through prohibition.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
42	4	NEL	E	<p>U.S. EPA (and presumably Congress) was very aware of the problem that discharges of nonstormwater into the MS4 could create. However, rather than imposing on MS4 owners and operators (e.g., Permittees) numeric limits on the discharge of non-stormwater from the MS4, the federal scheme requires that the owners/operators of such non-stormwater discharges obtain NPDES permits to discharge into the MS4. Permits for such discharges must meet applicable technology-based and water-quality based requirements of the Clean Water Act. By comparison, as part of the MEP standard applicable to discharges of all pollutants from the MS4 (regardless of whether in stormwater or non-stormwater), the owner/operator of the MS4 must develop a program to prevent illicit discharges into the MS4.</p>	<p>The Regional Board acknowledges that USEPA (and presumably US Congress) was indeed aware of the problem that non-storm water discharges into the MS4 could create. The Regional Board contends that the federal regulations under 40 CFR 122.26(d) are clear, and any discharge of non-storm water that is a source of pollutants is required to be addressed as an illicit discharge. Such discharges are not subject to MEP. Please see response to Comment 39 and the Supplemental Fact Sheet for further discussion.</p>
43	4	NEL	E	<p>The Supplemental Fact Sheet suggests that 40 C.F.R. § 122.44(k) somehow requires the imposition in MS4 permits of NELs for the discharge of non-stormwater from the MS4. That is not correct. As discussed above, the only standard applicable to discharges from an MS4 is the Clean Water Act-mandated MEP standard. Section 122.44(k) simply provides that BMPs are to be included in NPDES permits generally when authorized under Clean Water Act section 402(p) or when NELs are infeasible. It says nothing about requiring NELs in MS4 permits.</p>	<p>The supplemental fact sheet has been clarified to explain that Copermittees are using Best Management Practices to attain the requirement of effective prohibition (zero discharge) for non-storm water illicit discharges into, through and from the MS4 system. Discharges of non-storm water from the MS4 are not subject to the MEP standard under 402(p), which is specifically for discharges of storm water from the MS4 (see response to Comment 39 and Supplemental Fact Sheet). Instead, discharges of non-storm water to waters of the United States are regulated under Section 402 of the Clean Water Act. Thus, federal regulations under 40 CFR 122.44(k) are applicable to non-storm water discharges.</p> <p>The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates. Please see comments #155 and 165.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
44	4	NEL	E	<p>3. Non-Stormwater Discharges Into The MS4 May Be Controlled By Separate NPDES Permits For The Discharger Of The Non-Stormwater.</p> <p>To the extent discharges of non-stormwater into the MS4 are permitted under separate NPDES permits, the Permittees likely have no control over the pollutants, or pollutant concentrations, discharged from the MS4. Depending on the terms of the non-stormwater NPDES permits, the discharge from the MS4 may or may not meet the proposed effluent limits in Section C of the Tentative Order. Permittees cannot be held strictly responsible for meeting numeric limits when they have no control over such discharges.</p> <p>For the above reasons, the County requests that Section C be removed from the next draft of the Tentative Order.</p>	<p>As owners and operators of the MS4 system, the Copermittees are required to prohibit non-storm water discharges, can prohibit exempted discharges and can prohibit discharges subject to a separate NPDES permit from entering their MS4 system. Copermittees have control over such discharges into their MS4 and cannot passively receive discharges from third parties (Federal Register 68766). Non-storm water point source discharges, including those into MS4s, are subject to Section 402 of the Clean Water Act. For example, Order R9-2008-0002, for discharges of groundwater into surface waters, requires water-quality based effluent limitations be met for discharges entering surface waters, including via the MS4 system, and requires the groundwater discharger to obtain permission from the owner and operator of the MS4 prior to discharge into, and thus from, the MS4 system. This Order (R9-2008-0002) applies to multiple non-storm water discharges that are currently exempted at 40 CFR 122.26(d).</p> <p>Discharges that are subject to a separate NPDES permit are required to discharge into the MS4 as if that MS4 is a surface water with associated water quality standards. Thus, the Copermittees resulting non-storm water discharge, from allowing the non-storm water discharge under a separate NPDES permit to enter the MS4, should result in a MS4 discharge at a level which will not cause excursions above effluent limitations in the Tentative Order. Those limitations are based upon the same water quality standards under CWA 402. The requirements of Section C.1 of the Tentative Order recognize that other, permitted sources could be discharging into the MS4. That is why the section is written to provide for an investigation of the source of the discharge to occur after an exceedances of an NEL is found. Please see response to Comment 39 and the Supplemental Fact Sheet for further discussion.</p>
45	4	Retrofitting	F.3	<p>T.O. Section F.3.d. As drafted, Permittees could meet the new retrofitting requirements of Section F.3.d and still be in violation of the Order if, among other things, they didn't also solve chronic flooding problems.</p>	<p>Comment noted, the language has been changed to "address chronic flooding problems". Although considered a goal of the retrofitting requirement, the draft Tentative Order does not set an enforceable timeframe to achieve this goal in Section F.3.d.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
46	4	Retrofitting	F.3.	<p>Aside from the breadth of the new requirements, the County objects to the retrofit provision to the extent it would be impracticable and incredibly onerous (if possible at all) to implement and is not required by the Clean Water Act. To the extent such a provision is appropriate in an MS4 permit, it must be clear that Permittees may have no means of compelling private property owners to retrofit their existing developments. Proposed section F.3.d.(3), which says that Permittees "must" require select developments to implement retrofitting activities, and section F.3.d.(4), which talks about "requiring retrofitting on existing development," should be revised accordingly. And since Permittees cannot force owners to retrofit their developments, it makes little sense to require Permittees to identify existing developments that are sources of pollutants and then evaluate and rank them to prioritize retrofitting as sections F.3.d(1) and (2) would do. Without legal support for the retrofitting requirement and unless the requirement is substantially revised to reflect that it would be largely a voluntary program, the County requests that Section F.3.d be removed from the next draft of the Tentative Order.</p>	<p>The requirement to retrofit is consistent with the federal regulations and the Clean Water Act. The Clean Water Act in section 402(p)(3)(B)(ii-iii) states "Permits for discharges from municipal storm sewers shall require controls to reduce the discharge of pollutants [in storm water] to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." Retrofitting existing development is an appropriate management practice and control technique that includes design and engineering methods.</p> <p>Since this provision seeks to reduce impacts from storm flows, the permit language has been modified to reflect the maximum extent practicable standard. The Regional Board realizes that Copermittees cannot force owners to retrofit their developments, hence the inclusion of section F.3.d.(4). By identifying these sites, the Copermittees are prepared to reach out to the landowners and prioritize their program for education, demonstration projects, public and private partnerships, and subsidized retrofitting projects. Also by identifying these privately held areas for retrofitting, the Copermittees are prepared in the event that the landowner decides to retrofit, or to reach out to the new landowner in the event that the property changes ownership.</p> <p>The key word in Section F.3.d.3 is the word "select." The Copermittees must only consider a retrofit project in that years work plan after conducting the evaluation and rankings of Section F.3.d.4. If a retrofit project ranks as one of the top work plan priorities in the process identified in Sections G.3 and J.4 the Copermittees must implement the selected retrofit project. Section F.3.d.3 is revised to reflect this intent.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
47	4	Urban Runoff	General	<p>Without explanation, the Tentative Order universally deletes the word "urban" from everywhere it formerly modified the word "runoff" (and sometimes the term "Stormwater"). Thus Jurisdictional Urban Runoff Management Plans (JURMPs) are now simply Jurisdictional Runoff Management Plans (JRMPs). The Standard Urban Storm Water Mitigation Plan or SUSMP is now just the Standard Stormwater Mitigation Plan or SSMP. Staff has indicated that this universal change was intended to clarify that Permittees are responsible not just for urban runoff that is discharged from their MS4s, but all runoff.</p> <p>Even if "urban runoff" is not defined in the Clean Water Act or federal stormwater regulations, it is clear that it is urban runoff that is the problem the federal regulations seek to address. Stormwater runoff from natural, undeveloped land generally does not create water quality problems.</p> <p>Regulation of stormwater has always focused on urban runoff. After the 1972 amendments to the Federal Water Pollution Control Act (aka the Clean Water Act) began regulating point source discharges of industrial process wastewater and municipal sewage, "it became evident that more diffuse sources (occurring over a wide area) of water pollution, such as agricultural and urban runoff were also major causes of water quality problems." 55 Fed. Reg. at p. 47991. Because agricultural stormwater discharges are statutorily exempt from the NPDES program, the focus turned to urban runoff. Id. "[I]t is the intent of EPA that [stormwater] management plans and other components of the programs focus on the urbanized and developing areas of the county." Id. at p. 48041.</p>	<p>The supplemental fact sheet explains the rationale behind the removal of the term "urban runoff." Among other reasons, this is consistent with federal regulations (40 CFR 122.26). The Copermittees are responsible for all discharges from their MS4 whether from an urban, suburban, or semi-rural land use. By owning and operating the MS4 system, the Copermittee is responsible for the discharge from the MS4 and cannot passively receive discharges from third parties (Federal Register 68766). We agree that storm water runoff from natural, undeveloped land generally does not create water quality problems. The draft Tentative Order does regulate discharges from the Copermittee's MS4 system, as such, the Copermittee's cannot simply blame the nature of their discharge on upstream contributions outside of their control; again, the Copermittees cannot passively receive discharges from third parties. The Copermittees are required to address storm water discharges from third parties to the MEP.</p> <p>The term "urban runoff" was well known to the authors of the Clean Water Act and the federal storm water regulations as evidenced in the discussion of the final rule for the phase 1 regulations (Federal Register Vol. 55, No. 222, November 16, 1990) and the discussion of the final rule for the phase 2 regulations (Fed. Reg. Vol. 63, No. 235, December 8, 1999). Yet, the regulatory authors deliberately chose not to use the term "urban runoff" in the codified Phase 1 regulations (40 CFR 122.26).</p> <p>The term "urban" has been legally defined by the US Census Bureau as an area with a population density of at least 1,000 people per square mile (55 FR 42592, October 22, 1990). The phase 2 regulations for MS4 discharges use this definition of "urban" in determining permittees in urbanized areas. Contrary to phase 2, the phase 1 MS4 discharge regulations require NPDES permits for all MS4 discharges in the defined regulatory areas, including Orange County. The discussion in the federal register makes clear that the intent is to regulate all MS4 discharges and not just MS4 discharges from urban areas.</p> <p>Although, the Commenter quoted the federal register as saying "[I]t is the intent of EPA that [storm water] management plans and other components of the programs focus on the urbanized and developing areas of the county." The full text of the Federal Register states, "While permits issued for these municipal systems will cover municipal systems discharges in unincorporated portions of the county, it is the intent of EPA that management plans and other components of the programs focus on the urbanized and developing areas of the county." (Fed. Reg. Vol. 55, No. 222, November 16, 1990, 48041) Although the Tentative Order does cover all MS4 discharges, including discharges not in an urban area, the Regional Board expects the Copermittees to focus on the urbanized and developing areas within their</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
					<p>jurisdiction. This focus will be a natural outgrowth of their program, because the urbanized areas will have more population and development that will require more education, BMPs, and complaint response.</p> <p>The federal register goes on in several places clarifying that the intent of the regulations is to cover all MS4 discharges within the permitted area. "[The regulations] will result in discharges from separate storm sewer systems serving State highways and other highways through storm sewers ... in unincorporated portions of specified counties being included as part of the large or medium municipal separate storm sewer systems, since all municipal separate storm sewers within the boundaries of these political entities are included." (55 FR. 48041) and "The definition [of MS4] provides that all systems within a geographical area including highways and flood controls will be covered, thereby avoiding fragmented and ill-coordinated programs." (ibid 48043)</p> <p>The removal of the term "urban runoff" is consistent with the code of federal regulations regarding storm water. In addition, removing the term "urban runoff" is consistent with the Los Angeles Regional Board's recently adopted MS4 permit for Ventura County and consistent with the State Board's MS4 permit for the California Department of Transportation.</p> <p>Furthermore, this change is supported by the USEPA (please see Comment No. 306).</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
48	4	Urban Runoff	General	<p>This emphasis on urban runoff is reflected in the foreword to the 1982 Final Report of EPA's Nationwide Urban Runoff Program (NURP):</p> <p>The possible deleterious water quality effects of nonpoint sources in general, and urban runoff in particular, were recognized by the Water Pollution Control Act Amendments of 1972. Because of uncertainties about the true significance of urban runoff as a contributor to receiving water quality problems, Congress made treatment of separate stormwater discharges ineligible for Federal funding when it enacted the Clean Water Act in 1977. To obtain information that would help resolve these uncertainties, the Agency established the Nationwide Urban Runoff Program (NURP) in 1978. This five year program was designed to examine such issues as:</p> <ul style="list-style-type: none"> • The quality characteristics of urban runoff, and similarities or differences at different urban locations; • The extent to which urban runoff is a significant contributor to water quality problems across the nation; and • The performance characteristics and the overall effectiveness and utility of management practices for the control of pollutant loads from urban runoff. <p>NURP Report at p. iii. According to the NURP Report, as early as 1964 the federal government had become concerned about identified pollutants in urban runoff and concluded that there may be significant water quality problems associated with stormwater runoff. NURP Report at p. 2-1.</p>	Please see further discussion on comment 47.
49	4	Urban Runoff	F.3	<p>The focus on urban runoff also is reflected in U.S. EPA's website where, on its NPDES Stormwater FAQ page, U.S. EPA states that the "NPDES stormwater permit regulations, promulgated by EPA, cover the following classes of stormwater discharges on a nationwide basis:</p> <ul style="list-style-type: none"> • Operators of MS4s located in "urbanized areas" as delineated by the Bureau of the Census, • Industrial facilities in any of the 11 categories that discharge to an MS4 or to waters of the United States; all categories of industrial activity (except construction) may certify to a condition of "no exposure" if their industrial materials and operations are not exposed to stormwater, <p>thus eliminating the need to obtain stormwater permit coverage,</p> <ul style="list-style-type: none"> • Operators of construction activity that disturbs 1 or more acres of land; construction sites less than 1 acre are covered if part of a larger plan of development. See U.S. EPA's web page at http://cfpub.epa.gov/npdes/faqs.cfm?program_id=6#302 (emphasis added). 	<p>The USEPA website mentioning "urbanized areas" is referencing the text of the Phase 2 MS4 regulatory language in CFR Section 122.32: "As an operator of a small MS4, am I regulated under the NPDES storm water program? (a) ... you are regulated if you operate a small MS4, ... , and (1) Your small MS4 is located in an urbanized area ..."</p> <p>The draft Tentative Order is a phase 1 permit therefore the referenced language does not apply to the draft Tentative Order. Instead, the phase 1 regulations require permits for all MS4 discharges within the designated area of Orange County." Please see response to Comment No. 47.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
50	4	Urban Runoff	F.3	<p>Finally, the urban runoff focus also is reflected in the San Diego Board's own Basin Plan which discusses the problem of stormwater runoff in terms of urbanization and cites to the NURP report. See Basin Plan at pp. 4-78 & 79. Because the focus of stormwater regulation is urban runoff and because the Tentative Order provides no compelling reason to remove the term "urban" from the permit (e.g., improved water quality), the County requests that the term be restored in the next draft of the Tentative Order.</p>	<p>The term "urban runoff" in the Basin Plan is used in a general sense as previously defined in MS4 permits, as being all flows in a storm water conveyance system and consists of the following components: (1) storm water (wet weather flows) and (2) non-storm water illicit discharges (dry weather flows). In this definition of the term, it is not used to limit or distinguish between urban and non-urban MS4 systems; but rather only as a collective term regarding the discharge from such MS4 systems whether they be in a urban or non-urban area. The term is not used in a strict regulatory capacity, as it would convey if used in the draft Tentative Order or the Code of Federal Regulations. Please see response to Comment No. 47 for more discussion.</p>
51	4	FETD	F.3.	<p>The previous drafts of the Tentative Order proposed to regulate so-called FETDs – Facilities that Extract, Treat and Discharge to waters of the U.S. The current draft of the Tentative Order mentions these so-called FETDs but does not regulate them.² To the extent such facilities discharge non-stormwater to the MS4, the County believes it is appropriate to regulate them as a category of non-stormwater discharges in Section B. of the Order. Under Section B, to the extent the discharge from a FETD is not a significant source of pollutants to waters of the U.S., Permittees would not be required to effectively prohibit the discharge.</p> <p>The following language, from the Santa Ana Regional Board's current draft North County MS4 permit, could be added as Section B.5 of the Tentative Order:</p> <p>5. Permittees shall effectively prohibit discharges from FETDs to the MS4 unless the following conditions are met:</p> <ol style="list-style-type: none"> The discharge must not contain pollutants added by the treatment process or in greater concentration than in the influent; The discharge must not cause or contribute to downstream erosion; The discharge must be in compliance with Section 404 of the Clean Water Act; and Permittees conduct monitoring of the FETD discharge in accordance with the Monitoring and Reporting Program in Attachment E. <p>The County requests the above language be included in the next draft of the Tentative Order.</p>	<p>The Regional Board disagrees with the comment, which states that FETDs are not a source of pollutants and thus should be included as an exempted non-storm water discharge under Section B of the Order. Section B of the Order requires that Copermitees prohibit discharges into the MS4, unless the discharge is specifically exempted (and not a source of pollutants) or subject to a separate NPDES permit. FETDs extract from waters of the U.S., treat the extracted water and then return the treated water to waters of the U.S. The activities from FETDs do not involve discharges into the MS4 system and thus are not subject to exempted categories. FETDs are further discussed in the updated Supplemental Fact Sheet.</p> <p>The requirements suggested by the County are almost exactly the same as those contained in the previous version of this permit (no. R9-2008-0001). It was those very same provisions that the County argued were 'prohibitive' at the Feb 2008 meeting. Further, in written comments submitted on Jan 24, 2008, the County states that "...these requirements are not supported by law and will impose unnecessary burdens..." and that "...there is no basis for regulating FETDs under the federal NPDES permit program..." The Counties Jan 08 letter again requested that "... the FETD requirements be deleted." In partial response to these types of comments, the Regional Board Executive Officer informed the Board that FETDs be removed from the tentative Order and regulated either individually or in a separate general permit specific to FETDs.</p> <p>Discharges from FETDs must meet water quality standards, including numeric water objectives for applicable beneficial uses in the receiving waters. The Regional Board has consistently stated that regulating these discharging facilities as BMPs is an interim measure and that eventually a non-MS4 NPDES permit will be needed. Any entity that withdraws water from a stream has total responsibility for the water's quality upon discharge to receiving waters. If a FETD operator wants to discharge to a stream, that water, like any other water, needs to be treated to a quality that supports all the stream's beneficial uses and will not cause the Basin Plan objectives for surface waters to be exceeded.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
52	4	Overirrigation	B	<p>Finding C.14 of the Tentative Order says that the Permittees have identified landscape irrigation, irrigation water, and lawn water as sources of pollutants to waters of the U.S. These three categories are exempt non-stormwater discharges under the current permit. Section B.2 of the Tentative Order removes these three categories from the list of exempt non-stormwater discharge categories. Removing the three categories would be inconsistent with the federal stormwater regulations.</p> <p>The federal stormwater regulations include a list of categories of "exempt" non-stormwater discharges or flows. 40 C.F.R. § 122.26(d)(2)(iv)(B)(1). Permittees' illicit discharge and illegal disposal program must address these discharges or flows when they have been identified by Permittees as sources of pollutants to waters of the U.S. Id. The preamble to the federal regulations make clear that the illicit discharge program is meant to implement the Clean Water Act's mandate that stormwater permits include a requirement to effectively prohibit nonstormwater discharges to the MS4. 55 Fed. Reg. at pp. 48037 and 48055.</p> <p>The preamble also makes clear that Permittees' illicit discharge program need not prevent discharges of the "exempt" categories into the MS4 "unless such discharges are specifically identified on a case-by-case basis as needing to be addressed." 55 Fed. Reg. at 47995. In other words, individual discharges within exempt categories must be addressed when the particular discharge is a source of pollutants to waters of the U.S. The federal regulations do not allow for removing entire categories of exempt non-stormwater discharges. U.S. EPA confirmed this case-by-case approach in its Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems (November 1992) ("Part 2 Guidance Manual") where it states: If an applicant knows . . . that landscape irrigation water from a particular site flows through and picks up pesticides or excess nutrients from fertilizer applications, there may be a reasonable potential for a storm water discharge to result in a water quality impact. In such an event, the applicant should contact the NPDES permitting authority to request that the authority order the discharger to the MS4 to obtain a separate NPDES permit (or in this case, the discharge could be controlled through the storm water management program of the MS4.)</p> <p>Part 2 Guidance Manual at p. 6-33 (emphasis added). Accordingly, the County requests that the landscape irrigation, irrigation water, and lawn water non-stormwater categories be restored in the next draft of the Tentative Order.</p>	<p>The Regional Board disagrees with the comment that: "The federal regulations do not allow for removing entire categories of exempt non-stormwater discharges."</p> <p>The Federal Register (as referenced in the above comment), in discussion of exempted categories of non-storm discharges states: "in general, municipalities will not be held responsible for prohibiting some specific components of discharges or flows listed below through their municipal separate storm sewer system, even though such components may be considered non-storm water discharges, unless such discharges are specifically identified on a case-by-case basis as needing to be addressed." (55 Fed Reg 47995). The Regional Board maintains that 40 CFR 122.26(d)(2)(iv)(B)(1) and the Federal Register are clear in discussion of "components" and "categories" of non-storm water discharges, and that the exempted components and categories of non-storm water discharges are required to be addressed through prohibition on a case-by-case basis, not on a discharger by discharger basis.</p> <p>The Federal Register further clarifies that once a category of exempted non-storm water discharges has been identified and prohibited, "operators of such non-storm water discharges need to obtain NPDES permits for these discharges under the present framework of the CWA..." as "such illicit discharges are not authorized under the CWA" (55 Fed Reg 47995, see response to Comment 39). This is consistent with existing NPDES permits applicable to categories of discharges.</p> <p>Furthermore, in addition to the regulations under 40 CFR 122.26(d), the Federal Register (55 Fed Reg 48037) clearly states that "the Director may include permit conditions that either require municipalities to prohibit or otherwise control any of these types of discharges where appropriate."</p> <p>The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates. Please see comments #155 and 165.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
53	4	Finding	Finding	<p>“Runoff from an MS4” is inaccurate and likely confusing. It would be more accurate to describe runoff into an MS4 and a discharge from the MS4. The permit should track the language of the Clean Water Act, which requires that MS4 permits include requirements to effectively prohibit non-stormwater discharges into the MS4 and to control the discharge of pollutants from the MS4 to the maximum extent practicable.</p>	<p>The Regional Board feels the use of runoff is not inaccurate, as the tentative Order defines runoff as: "All flows in a storm water conveyance system and consists of the following components: (1) storm water (wet weather flows) and (2) non-storm water illicit discharges (dry weather flows)."</p> <p>The Tentative Order does track the Clean Water Act, as Section B requires the effective prohibition of "non-storm water discharges."</p> <p>Please see response to Comment No. 39 regarding storm water and non-storm water discharges from the MS4.</p>
54	4	Finding	Finding	<p>This finding implies that discharges from the MS4 must strictly comply with water quality standards. That is not correct. The Clean Water Act requires that discharges meet the MEP standard. See, e.g., <i>Defenders of Wildlife v. Browner</i>, supra, 191 F.3d at pp. 1166-67.</p>	<p>On the issue of water quality standards, USEPA, the State Board, and the Regional Board have consistently maintained that MS4s must indeed comply with water quality standards. Those water quality standards may be met with numeric effluent limits or by narrative effluent limits. USEPA guidance on the matter, in fact requires that MS4 discharges comply with water quality standards. In a letter to State Board dated January 21, 1998, the USEPA clarified that "EPA's NPDES permitting regulations include 40 CFR 122.44(d), which implements CWA Section 301(b)(1)(C). Section 122.44(d)(1)(i) provides that "[L]imitations must control all pollutants or pollutant parameters...which the Director determines are or may be discharged at a level which will cause, have the reasonable potential to cause or contribute to an excursion above any State Water Quality standard..." This requirement clearly applies to all excursions above WQS."</p> <p>Please see response to Comment No. 39 regarding non-storm water discharges. While implementation of the iterative BMP process is a means to achieve compliance with water quality objectives for storm water discharges, it does not shield the discharger from enforcement actions for continued non-compliance with water quality standards.</p> <p>The commenter is correct in reading that the Clean Water Act does not explicitly require discharges to meet the MEP standard. The decision in <i>Defenders of Wildlife v. Browner</i>, however, find that the Clean Water Act gives the administrator "the discretion to determine what pollution controls are appropriate. Under that discretionary provision, the EPA has the authority to determine that ensuring strict compliance with state water-quality standards is necessary to control pollutants."</p> <p>The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
55	4	Finding	Findings	The inaccurate language of this finding, imposing different standards on wet weather and dry weather discharges, continues throughout the permit. The Clean Water Act does not require Permittees to reduce the discharge of pollutants from stormwater to the MEP. Rather, the requirement is to reduce the discharge of pollutants from the MS4 to the MEP (regardless of whether the discharge is of wet weather or dry weather flows). Similarly, the federal requirement is to eliminate illicit discharges into the MS4 (which if accomplished would largely eliminate dry weather flows from the MS4), not to eliminate pollutants in dry weather flows.	Please see response to Comment 39.
56	4	Finding	Finding	Under the Clean Water Act, discharges from the MS4 are required to meet the MEP standard. To the extent the permit, when read with the Basin Plan, requires discharges to meet receiving water limitations, it must be a state law requirement. This finding should be clarified accordingly.	Please see response to Comment 39 for clarification regarding applicability of MEP to non-storm water discharges. Finding E.13 from the March 2009 Tentative Order has been removed, as it is redundant with Finding C.2, which states: "Municipal storm water and non-storm water discharges are likely to contain pollutants that cause or threaten to cause a violation of the water quality standards, as outlined in the Regional Board's Water Quality Control Plan for the San Diego Basin (Basin Plan). Storm water and non-storm water discharges are subject to the conditions and requirements established in the San Diego Basin Plan for point source discharges. These water quality standards must be complied with at all times, irrespective of the source and manner of discharge."
57	4	prohibition	A.	Finding A.3 says the permit is consistent with the State Board's precedential Order 99-05. However, the language in section A.3.b of the Order (which requires Permittees to continue the iterative process unless directed otherwise by the Executive Officer) is not consistent with Order 99-05 (which says Permittees do not have to repeat the process unless directed otherwise by the E.O.). Accordingly, Section A.3.b should be revised consistent with State Board Order 99- 05.	The Tentative Order has been modified to clarify that through adoption of this Tentative Order, the Executive Officer issues a standing order that the Copermittees must repeat the process until directed otherwise. The language has been modified to conform with the rest of the permit.
58	4	ASBS	A	The Ocean Plan prohibition of discharges to ASBS is controversial. Moreover, it is a state law, not federal requirement. Unless the Board can justify it in a MS4 permit, it should be deleted.	The Regional Board has removed ASBS/SWQPA language from the tentative Order. Please note ASBS/SWQPAs, like all water bodies, remain subject to receiving water limitations and discharge prohibitions under the Tentative Order.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
59	4	TMDL	I	<p>The Clean Water Act does not require that an MS4 permit include numeric limits derived from waste load allocations (WLAs) in adopted TMDLs. To the extent the Tentative Order will implement such WLAs, compliance should be through the accepted iterative process for complying with water quality standards.</p>	<p>This Order addresses TMDLs through Water Quality Based Effluent Limits (WQBELs) that must be consistent with the assumptions and requirements of the WLA [40 CFR 122.44(d)(1)(vii)(B)]. Federal guidance states that when adequate information exists storm water permits are to incorporate numeric water quality based effluent limitations (USEPA, Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 FR 43761, August 26, 1996). In most cases, the numeric target(s) of a TMDL are a component of the WQBELs.</p> <p>When the numeric target is based on one or more numeric WQOs, the numeric WQOs and underlying assumptions and requirements will be used in the WQBELs as numeric effluent limitations by the end of the TMDL compliance schedule, unless additional information is required. When the numeric target interprets one or more narrative WQOs, the numeric target may assess the efficacy and progress of the BMPs in meeting the WLAs and restoring the Beneficial Uses by the end of the TMDL compliance schedule. In either case, the dischargers will have to monitor and implement BMPs using an iterative process to meet the MS4 WLA, restore impaired beneficial uses, and comply with Water Quality Standards.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
60	4	General	General	<p>The Response to Comments issued by the Regional Board dated July 6, 2007, contends that the Drainage Area Management Plan (DAMP) is an unnecessary document and “serves as a collection of model program components from which the Permittees have chosen to base their own program components.” The County takes exception to this view of the DAMP. The DAMP and Local Implementation Plans (LIPs) are fundamental and necessary elements of the MS4 program since they serve as the primary policy and guidance documents for the program and describe the methods and procedures that will be implemented to reduce the discharge of pollutants to the maximum extent practicable and achieve compliance with the MS4 permit performance standards. Indeed, the CWA regulations speak directly to the necessity and importance of the stormwater management plan in the permitting process. The management program “shall include a comprehensive planning process.....to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate.....Proposed management program shall describe priorities for implementing controls.” 40 CFR 122.16(d)(2)(iv). The necessary detail and prioritization of management efforts must remain at the local level and be described within the DAMP and not in the permit. The significance of the DAMP should therefore be recognized rather than dismissed.</p>	<p>The Regional Board stands by the previous response to comments document and continues to hold the view that the DAMP is a document not required by the Permit. Although it may have some role in guiding the Copermittees in their development of their Local Implementation Plan, the DAMP itself is not an enforceable component of the permit. The Regional Board's legal authority is with issuing requirements to the discharger; for this permit, it is the Copermittee. If the DAMP erroneously leads a Copermittee into a violation of the Tentative Order's requirements, the Regional Board would issue enforcement measures to that individual Copermittee and not to the County. While the individual Copermittees may elect to incorporate certain elements of the DAMP into their local programs, certain requirements in the Tentative Order must be specific enough to ensure that the local programs will reduce discharges of storm water pollutants to the maximum extent practicable (MEP) and effectively prohibit non-storm water discharges (unless exempted or covered by a separate permit).</p> <p>We agree that Local Implementation Plans are fundamental and necessary elements of the MS4 program since they serve as the primary policy and guidance documents for the program and describe the methods and procedures that will be implemented to reduce pollutants in storm water discharges to the maximum extent practicable and to prohibit non-storm water discharges.</p> <p>The commenter misinterprets the Clean Water Act regulations. Where the CWA regulations speak to the necessity and importance of the storm water management plan, the regulations do so in regards to the Jurisdictional Runoff Management Plan and not to the DAMP. We disagree with the commenter's importance placed on the DAMP rather than the JRMPs. Each Copermittee's JRMP allows the individual Copermittee to form and implement their own storm water program as they need to for their unique City. The JRMP allows the Copermittee the freedom to improve water quality without needing to adhere to an overarching mandated document that is not required by the Permit and may not reflect the individual Copermittee's unique interests and priorities.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
61	4	General	General	<p>It is noted that the current draft of the Tentative Order comprises 91 pages compared to the 54 pages of the 2008 Tentative Order. The expanding document connotes an increasingly top down approach that potentially reduces the ability of the Permittees to adaptively manage their programs to meet the MEP standard. This approach seems contrary to the discussion of MEP in the Fact Sheet, which stresses the dynamic aspect of the MEP standard and concludes with the statement that The Order provides a minimum framework to guide the Permittees in meeting the MEP standard.</p> <p>The increasingly prescriptive and detailed permits provisions erode the flexibility and local responsibility of Permittees for continued development and improvement of the MS4 program based upon their extensive and collective experience in managing the program. This shift runs counter to the purpose and intent of the federal stormwater management program as set forth in the federal CWA regulations and USEPA guidance. Notwithstanding these statements, the County supports the need to establish performance standards or metrics within the DAMP that will be used to support our program and direct limited resources effectively.</p>	<p>The commenter provides misleading and inaccurate information mis-characterizes the Tentative Order. The 2008 Tentative Order had 81 pages of text not the 54 pages as claimed by the commenter. Also, the draft Tentative Order is in underline strikeout format which inherently lengthens the document.</p> <p>To base the number of pages as defining the MEP standard is a gross over simplification. Regardless of the number of pages, the draft Tentative Order does provide the minimum framework in meeting the MEP standard. As the body of knowledge in storm water permitting and science progresses, MS4 permits naturally become longer and more complex. The preamble of the Federal NPDES storm water regulations places discretion for permit requirements with the permit writer when it states:</p> <p>"The purpose of the two-part application process is to develop information in a reasonable time frame that would build successful decisions with regard to developing permit conditions" (55 FR 48044) and "Proposed management programs will [...] be evaluated in the development of permit conditions" (55 FR 48052).</p> <p>This discretion is further reinforced in the Federal Register by USEPA in its "Interim Permitting Approach for Water quality-Based Effluent Limitations in Storm Water Permit" (61 FR 43761), which states:</p> <p>"In cases where adequate information exists to develop more specific conditions or limitations to meet water quality standards, these conditions or limitations are to be incorporated into storm water permits, as necessary and appropriate."</p> <p>More recent guidance from the USEPA Environmental Appeals Board also supports permit writer discretion, stating:</p> <p>"Congress therefore created the 'maximum extent practicable' ('MEP') standard [...] in an effort to allow permit writers the flexibility necessary to tailor permits to the site specific nature of the MS4 discharges [...] Included in that flexibility was the capacity to direct permit requirements at the sources of pollution in the MS4 rather than solely at the end of pipe." (NPDES Appeal No. 00-18).</p> <p>The Regional Board finds it disconcerting that the commenter characterizes the evolution of the regulatory process as being an "increasingly top down approach." The very nature of the NPDES permitting process (e.g. 5 year reissuance, BAT requirements, TBELS, etc.) requires that NPDES permits be updated over time to reflect updated standards, including those relating to the MEP process for storm water discharges.</p> <p>This draft Tentative Order is the first MS4 permit in Southern Orange County to include numeric effluent limitations for dry weather non-storm water discharges and municipal action levels for wet weather discharges. Following an effectiveness evaluation after the next permit cycle, the use of water-quality based</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
					<p>performance criteria could possibly reduce the level of prescriptiveness needed in other permit areas. In addition, as Total Maximum Daily Loads are developed and implemented in the MS4 permits, the level of prescriptiveness will increase. More prescriptive requirements provide more clarity to the discharger on actions and standards needed to meet compliance.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
62	4	General	General	<p>The Tentative Order persists in the inappropriate reference to data that exceed Water Quality Objectives (WQOs) as violations. In several instances the language in the Tentative Order has been changed from the prior Order (R9-2002-0001) to replace the term “exceedance” with the term “violation”. For example, “exceedances of water quality objectives” has been replaced with “violations of water quality objectives” (emphasis added). In some cases, the change is inappropriate.</p> <p>The Tentative Order should use the term “exceedance” where it refers to a comparison of data with criteria such as water quality objectives that are relevant to evaluation of the data. The Tentative Order should use the term “violation” when it is referring to a failure to comply with a prohibition or other requirement of the Tentative Order. Careful use of these terms is important, because an “exceedance” does not equate with a “violation.” For example, while it may be useful to compare water quality monitoring data to receiving water quality objectives and use identified “exceedances” to target potential problems areas and pollutants, it is inappropriate to make this same comparison and determine that there is a “violation”. Indeed, the use of the term “violation” to refer to any exceedance detected would, in effect, be using the water quality objectives or other relevant reference criteria as de-facto numeric effluent limitations. The County again requests modification of the Tentative Order language to use the word “exceedance” instead of “violation” when referring to the comparison of water quality monitoring data to reference criteria. The locations in the permit where these changes should be made are:</p> <ul style="list-style-type: none"> • Page 5, Finding C.9. • Page 6, Finding D.1.b. • Page 10, Finding D.3.d. • Page 12, Finding E.1. • Page 17, A.3. <p>The term “violation” in this section is inconsistent with SWRCB Order WQ 99-05 and needs to be modified to “exceedance“. The iterative language in the receiving water limitations speaks to exceedances of water quality standards, not violations. Urban runoff data cannot in itself indicate a violation of water quality standard. A water quality standard consists of two elements: the beneficial use that we’re trying to protect and the water quality objective established to protect that use. The exceedance of a water quality objective does not necessarily result in a violation of a water quality standard. Runoff data can be described as exceeding water quality objectives, but the assessment of whether or not water quality standards are violated is based upon samples and data from the receiving water and impacts or lack of impacts on beneficial uses. The County further notes that similar MS4 permits draw distinctions between assessing urban runoff monitoring results and describing the receiving water. These permits include the</p>	<p>This comment is one that is continuous with previous objections to the use of the term “violation” in Revised Tentative Orders R9-2008-001 and R9-2007-002, when referring to instances when water quality objectives are exceeded. The commenter prefers the term “exceedance,” as has been used in previous Regional Board documents. This comment was addressed via written response for the 2007 and 2008 tentative Orders.</p> <p>The word “violation” is appropriately used in the referenced Findings as a violation is an exceedance of applicable Basin Plan water quality objectives (and other applicable criteria), and such violations have persistently been documented with sufficient, reliable data for a number of storm water and non-storm water related pollutants in water bodies in Orange County. The comment incorrectly implies that the Findings, which reference violations of water quality objectives, are tantamount to enacting numeric effluent limits (see response to Comment 33 and 39 regarding numeric effluent limits).</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
				<p>areawide permits issued by: the San Diego Regional Board to the MS4s draining the watersheds of San Diego County (Order No. R9-2007-0001, NPDES No. CAS0108758, January 24, 2007); and Riverside County (Order No. R9-2004-0001, NPDES No. CAS0108766, July 14, 2004); and those issued by the Santa Ana Regional Board to the MS4s draining the watersheds of San Bernardino County (Order No. R8-2002-0012, NPDES No. CAS618036, April 26, 2002); Riverside (Order No. R8-2002-0011 NPDES NO. CAS 618033, October 25, 2002); and Orange County (Order No. R8-2002-0010 NPDES No. CAS618030, January 18, 2002), and the May 1, 2009 Draft Tentative Order R8-2009-0030 NPDES No. CAS618030). In these permits the monitoring data is described as, or actions are predicated upon, exceedances of water quality standards while prohibitions regarding receiving water tend to use the terminology 'shall not cause or contribute to a violation of water quality standards'. Although the latter is not universal and many permits use the language 'shall not cause or contribute to an exceedance of water quality standards'.</p>	
63	4	Finding	Finding	<p>Finding C.2 seems to be establishing the fact that MS4s are responsible for all sources of pollutant and manner of discharges (see last sentence). The County would submit that municipalities are limited in their ability to control all sources of pollutants (e.g. air pollutants being transported to the receiving waters from the MS4). We recommend that the last sentence be deleted.</p>	<p>Finding C.2 has been modified to clarify that discharges from the MS4 must comply with water quality standards, no matter the source or manner of that discharge. Please see response to Comment 39 regarding non-storm water discharges and response to Comment 54 regarding storm water discharges.</p>
64	4	Monitoring	Findings	<p>Finding C.9. states, in part, that the water quality monitoring data collected to date indicates that there are violations of Basin Plan objectives for a number of pollutants and that the data indicates that runoff discharges are the leading cause of impairment. While the receiving water quality may exceed Basin Plan objectives for constituents identified by the municipalities as pollutants of concern, there is inadequate data to make such a definitive statement that the runoff discharges are the leading cause of impairment in Orange County. This statement does not take into account the other sources within the watershed or the uncertainty within many of the studies that have been conducted. Accordingly, the last sentence of that paragraph should be modified to read, "In sum, the above findings indicate that urban runoff discharges may be causing or contributing to water quality impairments, and warrant special attention."</p>	<p>Finding C.9 (below) does state that runoff discharges are the leading cause of impairment. This is based upon monitoring data submitted to date, as well as sources of impairment identified in 303(d) listings. The commenter does not provide adequate evidence of other discharges, permitted or otherwise, to support the assertion. Furthermore, water quality data does show that discharges of effluent from the MS4 exceed applicable water quality criteria.</p> <p>Finding C.9: The Copermittees' water quality monitoring data submitted to date documents persistent violations of Basin Plan water quality objectives for various runoff related pollutants (fecal coliform bacteria, total suspended solids, turbidity, metals, etc.) at various watershed monitoring stations. Persistent toxicity has also been observed at some watershed monitoring stations. In addition, bioassessment data indicates that the majority of urbanized receiving waters have Poor to Very Poor Index of Biotic Integrity ratings. In sum, the above findings indicate that runoff discharges are causing or contributing to water quality impairments, and are a leading cause of such impairments in Orange County.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
65	4	General	Finding	<p>Finding D.1.c. states that the Tentative Order “contains new or modified requirements that are necessary to improve the Permittees’ efforts to reduce the discharge of pollutants to the MEP and achieve water quality standards”. The Finding further states some of these new or modified requirements “address program deficiencies that have been noted in audits, report reviews, and other Regional Board compliance assessment activities.” In fact, in many cases the new or modified requirements do not have adequate findings of fact and technical justification.</p> <p>In many instances the Fact Sheet not only provides little or no justification of the need for the new requirement, it also does not identify the “program deficiency” that warrants the modification. In many cases the Fact Sheet also does not consider the thorough program analysis that the Permittees conducted as a part of their preparation of the ROWD and the deficiencies and program modifications that Permittees themselves identified as necessary for the program. The Permit Provisions comments in the next section of these comments identify many of the areas where new or modified provisions of the Tentative Order lack factual or technical support in the Fact Sheet.</p>	<p>The Tentative Order's fact sheet and supplemental fact sheet provides all the necessary information regarding program deficiencies and technical justification. The comment is vague and without the necessary detail describing the specific Tentative Order's sections that the commenter believes needs more justification. Where the commenter has sought more information through other sections of their comment letter, the Regional Board has responded accordingly.</p>
66	4	SUSMP	Finding	<p>Finding D.2.b. seems to be making the case that treatment control BMPs are ineffective and should not be used. This Finding overstates or incorrectly states the constraints of treatment control BMPs. It is fair to say that without a performance standard for treatment control BMPs then treatment control BMPs suffer from the constraints noted. However, treatment control BMPs can be effective in removing pollutants for a wide range of storms and, when combined with source control BMPs, provide a comprehensive pollutant reduction strategy. This finding should be significantly modified to support the statement that “using a combination of onsite source control and site design BMPs augmented with treatment control BMPs... is important.”</p>	<p>The Finding simply points out the difference between on-site source control / site design BMPs and end-of-pipe BMPs. The finding describes the importance of on-site source control and site design BMPs by pointing out potential detriments to end-of-pipe BMPs. While end-of-pipe BMPs are effective at reducing pollutants, they nevertheless have some drawbacks and are not preferable to on-site source control and site design BMPs.</p>
67	4	Existing Development	Finding	<p>Finding D.2.e. states that the one-acre threshold for heavy industrial sites is appropriate “since it is consistent with the requirements in the Phase II NPDES stormwater regulations that apply to small municipalities”. The Phase II stormwater regulations do not apply to the Phase I communities. 40 CFR 122.32. The reference to Phase II NPDES regulations and, as discussed below, the corresponding change in the permit provisions should be deleted.</p>	<p>The language in Finding D.2.e does not imply that Phase II storm water regulations apply to Phase I municipalities. The language simply states that smaller municipalities are required to apply the one-acre threshold, thus requiring the same of a larger (Phase I) municipality is reasonable and appropriate. Furthermore, the threshold has been lowered to 10,000 square feet in consistency with other phase 1 MS4 permits throughout California.</p>

68	4	Hydromod	Finding	<p>Finding D.2.g. identifies that increased volume, frequency, and discharge duration of storm runoff from developed areas has the potential to greatly accelerate downstream erosion, impair stream habitat in natural drainages, and negatively impact beneficial uses. However, it does not acknowledge that hardened or stabilized channels will likely not be susceptible to hydromodification impacts. It is recommended that the Finding be modified as follows:</p> <p>The increased volume, velocity, frequency and discharge duration of storm water runoff from developed areas has the potential to accelerate downstream erosion in natural drainages and unimproved channels, impair stream habitat in natural drainages, and negatively impact beneficial uses. Development and urbanization increase pollutant loads in stormwater and volume of stormwater runoff. Impervious surfaces can neither absorb water nor remove pollutants and thus lose the purification and infiltration provided by naturally vegetated soil. Some channels that are either engineered and maintained, or hardened may not be susceptible to the impacts of hydromodification.</p>	<p>The Regional Board will include the final language suggested by the commenter. In addition, the following sentence will also be added as the last sentence of the paragraph: “Nevertheless, it is important to include hydromodification measures upstream of hardened channels in the event that the hardened channels are restored to their natural state, thereby restoring the chemical, physical, and biological integrity and Beneficial Uses of local creeks.”</p> <p>The Regional Board disagrees with the commenter’s suggestion to modify the text to address natural drainages as “unimproved channels.” This implies that hardened channels are “improved” over natural drainages. In terms of water quality and Beneficial Uses of surface waters, such an interpretation is highly inaccurate. According to the Copermittees’ 2006-2007 monitoring data, urban streams have low Index of Biotic Integrity (IBI) scores. In the absence of water chemistry and toxicity impacts, these low scores were attributed to poor physical habitat conditions, i.e. concrete lining and channelization. Therefore, it is contradictory to refer to such concrete-lined channels as “improved” over natural drainages. The goal of hydromodification requirements are to prevent or further prevent hydromodification impacts on downstream watercourses and eventually restore natural flow regimes. The restoration of natural flow regimes is a major component necessary to protect and restore the physical, chemical and biological integrity of receiving waters, which is a major objective of the Clean Water Act.</p>

69	4	SUSMP	Finding	<p>Finding E.7. states that, "[u]rban runoff treatment and/or mitigation must occur prior to the discharge of urban runoff into a receiving water." We believe that Finding E.7. is based on a misinterpretation of CWA regulations and misconstrues USEPA guidance on stormwater treatment BMPs. This concern is discussed in detail in Attachment A (Pages 1-7). We wish to comment here on the implications it has for watershed restoration activities.</p> <p>Prohibiting treatment and mitigation in receiving waters severely limits the potential locations for installation of treatment control BMPs and will adversely affect many watershed restoration projects. For example, this Finding may have unintended adverse effects for the Aliso Creek Water Quality SUPER Project.</p> <p>The Aliso Creek Water Quality SUPER Project proposes a multi-objective approach to Aliso Creek watershed development and enhancement, accommodating channel stabilization, flood hazard reduction, economic uses, aesthetic and recreational opportunities, water quality improvements, and habitat concerns. The project is aimed at water supply efficiency and system reliability through reclamation, along with benefits for flood control and overall watershed management and protection. The ecosystem restoration and stabilization component of the project will include:</p> <ul style="list-style-type: none"> • Construction of a series of low grade control structures and reestablishment of aquatic habitat connectivity; • Shaving of slide slopes to reduce vertical banks; and • Invasive species removal and riparian revegetation and restoration of floodplain moisture. <p>The Permittees are concerned that some of these activities may be deemed "urban runoff treatment and/or mitigation" in a receiving water and, thus, may not be allowed, compromising the project objectives. In addition, this Finding seems to conflict with Existing Development Component Section 3.a.(4) Page 51 of the Tentative Order, which requires the Permittees to evaluate their flood control devices and identify the feasibility of retrofitting the devices to provide for more water quality benefits.</p> <p>Given the lack of any proper legal or factual basis for these limitations as well as the adverse impacts on watershed restoration efforts, the Finding should be deleted from the Tentative Order.</p>	<p>This comment was addressed in the 2007 response to comments on a previous version of this draft permit and stated: "The intent of the Finding, and related requirements, is to prevent the conversion of waters of the U.S. and State into waste treatment facilities consistent with Federal guidance. It in no way prevents restoration of natural hydrological, biochemical, and habitat functions. Similarly, providing treatment of urban runoff after it has been discharged from the MS4 to waters of the U.S. does not relieve the Copermittees of their responsibility to implement source control, pollution prevention, and treatment BMPs before the water is discharged from the MS4. If diverted water is treated, then discharged back to waters of the U.S., it is likely to need an individual NPDES Permit. Diversion to the sanitary sewer for treatment is allowable, provided the effluent from the sewage treatment facility can meet its NPDES requirements. This Finding is supported by federal regulation 40 CFR 131.10(a) and USEPA guidance. 40 CFR 131.10(a) is very clear "In no case shall a State adopt waste transport or waste assimilation as a designated use for any waters of the United States.""</p> <p>Where a CWA section 404 permit has been issued by the U.S. Army Corps of Engineers for the conversion of a water body into a non-jurisdictional water, then the placement of a treatment BMP in that area would be consistent with the Tentative Order. However, the placement of fill and other material into the water body may be subject to waste discharge requirements from the Regional Board. Generally, the Copermittees cannot assume that such conversion would be allowed. The Tentative Order requirements for priority projects (Section D.1.d.4) acknowledge that some conversion is likely to be permitted. However, the Copermittees must recognize that limiting such conversions can be a practical site design BMP.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
70	4	FETD	Finding	<p>This finding identifies that the Order does not regulate the discharge of Facilities that Extract, Treat and Discharge (FETDs) to waters of the U.S. It also indicates the intention of the Regional Board to require individual NPDES Permits for each of these types of facilities. Such an approach to the regulation of these facilities is deemed highly problematic to the Permittees for the same reasons that were presented in early 2008, principally that separate permits would likely preclude the use of facilities currently necessary for protecting public health at Orange County's beaches. The Permittees were working on potential FETD language with previous Permit staff during the first draft Permit adoption process prior to postponement by the Board. That language is significantly similar to the draft language found in the Region 8 draft. It is provided below and commended to you for incorporation into the Order. "Discharges from facilities that extract, treat and discharge water diverted from waters of the U.S: These discharges shall meet the following conditions: (1) The discharges to waters of the US must not contain pollutants added by the treatment process or pollutants in greater concentration or load than the influent; (2) the discharge must not cause or contribute to a condition of erosion; (3) The extraction and treatment must be in compliance with Section 404 of the Clean Water Act; and (4) Conduct Monitoring in accordance with Monitoring and Reporting Program attached to this Order."</p>	<p>The intent of Finding E.9 is to clarify that the Order is specifically for discharges from the MS4 system. FETDs are facilities that would be extracting from waters of the U.S. It is important to note that non-storm water discharges from the MS4 should not need any treatment to protect public health, as non-storm water discharges into, through and from the MS4 that are a source of pollutants are considered illicit discharges, are not authorized under the Clean Water Act and are to be prohibited (see response to Comment 39).</p> <p>Also, please see response to Comment 51.</p>
71	4	TMDL	Finding	<p>This new finding identifies that MS4 WLAs from adopted TMDLs are incorporated into the Tentative Order, and additionally early TMDL requirements may be included in the Tentative Order. The County has significant concerns about the use of either Clean Up and Abatement Orders (CAOs) (as indicated in the Tentative Order) or Cease and Desist Orders (CDOs) (as indicated in the supplemental Tentative Fact Sheet) as the means by which to incorporate forthcoming TMDL WLAs into the MS4 permit. CAOs and CDOs are types of enforcement actions used to compel compliance, typically of an uncooperative discharger. These tools were neither envisioned by the State Water Board in its TMDL and impaired water policy documents or by USEPA in its recent draft handbook TMDLs to Stormwater Permits4.</p>	<p>All references to CDOs and CAOs, in regards to TMDL implementation, have been removed from the Tentative Order. This does not, however, preclude the Regional Board from future consideration of the use of these authorities to address TMDLs.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
72	4	TMDL	Finding	<p>Further, this finding indicates that it is the intention of the Regional Board to incorporate MS4 WLAs as end-of-the-pipe numeric Water Quality Based Effluent Limitations for adopted TMDLs. US EPA's 2002 guidance memorandum⁵ on establishing stormwater permit requirements to implement WLAs stated that EPA expected that most WQBELs for NPDES-regulated municipal ... will be in the form of BMPs and that numeric limits will be used only in rare instances [emphasis added]. This reference was specifically cited in the Beaches and Creeks TMDL Technical Report and reflects the intent of the Regional Board staff and the understanding of the Stakeholder Advisory Group as to how the TMDL would be incorporated into the NPDES permit. This approach to incorporating WLAs into stormwater permits is maintained in the draft handbook TMDLs to Stormwater Permit, in which Chapter 6 identifies method of coordinating TMDLs and stormwater permits. Six options are put forward as methods for permit writers to incorporate TMDLs in a stormwater permit, the last of which is to consider numeric effluent limitations. Furthermore the County would also note that as required by 40 C.F.R. § 122.44(d)(1)(vii)(B), the Permit must be "consistent with the assumptions and requirements of available WLAs". The Regional Board should seriously consider and not foreclose the palette of options available to implement water quality controls for impaired waters in stormwater permits.</p> <p>The Regional Board should follow the guidance in the 2002 Memorandum and the Draft Handbook and the intent of the Regional Board TMDL staff and express the WLAs in the Tentative Order as being implemented through the BMPs. This is especially true in California where an implementation plan is required for TMDLs and which in turn may be incorporated into the Permit consistent with EPA guidance.</p>	<p>The 2002 USEPA guidance does not preclude the establishment of WLAs as end-of-pipe numeric Water Quality Based Effluent Limits (WQBELs). The 02 guidance also directs the reader to the "Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, 61 FR 43761, Aug 26, 1996," which states that when adequate information exists storm water permits are to incorporate numeric water quality based effluent limitations.</p> <p>The Implementation Plan in the December 17, 2007 Technical Report for the "Bacteria Impaired Waters TMDL Project I for Beaches and Creeks," specifically states that WQBEL WLAs may be expressed as numeric effluent limitations using a different metric [e.g., derived from the Numeric Targets or from the Basin Plan Water Quality Objectives] or as BMP development, implementation, and revision requirements. It is expected that an iterative BMP Program will be a component of the WQBELs, but at the end of the TMDL compliance schedule the numeric targets and/or numeric WQOs may serve as numeric effluent limitations, unless additional information is required.</p> <p>This Order does not "...foreclose the palette of options..." available because it requires a BMP Program (up to the Copermitees to develop and implement) that will meet the Numeric Targets within the time period allowed to meet the required WLA reductions. This approach is consistent with the Draft USEPA Technical Document "TMDLs to Stormwater Permits Handbook." Furthermore, it is consistent with USEPA comments received on this Order (no. 305) that "We [USEPA] are also pleased by the apparent intent of the Regional Board as indicated in Finding E.12 and Section I of the draft permit to express permit effluent limits, when necessary to ensure consistency with applicable WLAs, as numeric effluent limits. Numeric limits provide greater assurance of consistency with WLAs than the alternative of BMPs which are sometimes used, given the uncertainty in the performance of many of the BMPs commonly used for stormwater pollution control."</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
73	4	General	Finding	<p>The intention of this new Finding is not clear and appears to be redundant with the receiving water limitations language in Section A, Prohibitions and Receiving Water Limitations. Finding E.13 states that the Permittees discharge from the MS4 is required to meet receiving water limitations [emphasis added]. This requirement is already stated more effectively and within the context of the Receiving Water Limitations language - the Permittees evaluate the discharges and the receiving waters to determine if the discharges cause or contribute to an exceedance of water quality standards and follow the outlined process in cases where the discharge is determined to be causing or contributing to a WQS exceedance in the receiving water. It is recommended that this Finding be deleted.</p>	<p>Finding E.13 from the March 2009 Tentative Order has been removed as it is redundant with Finding C.2.</p>
74	4	General	A	<p>In section A.3.b., the Regional Board has modified the standard state-wide receiving water limitations language to require the Permittees to repeat the assessment process for exceedances of the same water quality standard. This modification is inconsistent with State Water Board WQ Order 99-05. In the previous permit, and in permits throughout the state, including the permit recently issued by the Regional Board to MS4 dischargers to the watersheds draining San Diego County, this provision of the RWL language is set up such that the process is only repeated once unless otherwise directed. The original language recognizes the length of time it can take for new BMP programs to be developed, deployed, and fully implemented before a change in water quality may be observed and avoids pointless reassessments of the same pollutant.</p> <p>Even in cases where there has been a significant reduction of the source of a pollutant, it typically takes several years for monitoring programs to see the change in the receiving water. In cases where the pollutant is persistent in the environment, it can take decades to detect changes in water quality or indicator monitoring.</p> <p>It is recommended that the Regional Board reinstate the original language from WQ Order 99-05 (see below) regarding iterations of the assessment process for exceedances of the same water quality standard.</p> <p>So long as the Copermittee has complied with the procedures set forth above and is implementing the revised Jurisdictional Urban Runoff Management Program, the Copermittee does not have to repeat the same procedure or continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Board to do so.</p>	<p>The Permit language in section A.3.b has been amended. Please see comment #57.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
75	4	Overirrigation	B	<p>The Regional Board has modified the list of conditionally exempt non-stormwater discharges so that it no longer includes landscape irrigation, irrigation water, and lawn watering. The Findings explain that these discharges have been identified by the Permittees as a source of pollutants (Finding C.14, Page 6). We would contend that a prohibition on these discharges is potentially problematic from the perspective of fostering and sustaining public support for the Program and that the approach should be focused more on public education and water conservation.</p> <p>The Orange County DAMP contains a variety of BMPs and efforts to reduce pollutants in discharges associated landscape irrigation. These practices include public outreach on the use of landscape chemicals (fertilizers and pesticides) and overwatering, implementation of integrated pest management (IPM) practices within municipal programs, and water conservation measures that mandate the use of efficient irrigation systems, as well as other programs that general control pollutant sources which reduce the pollutants that might be conveyed into the MS4s by excess irrigation flows. The use of BMPs to reduce pollutants associated with runoff is a preferable and more practical approach.</p> <p>Additionally, as noted in the Supplemental Fact Sheet, Permittees have sought grant funding to assist with the implementation of programs to reduce irrigation-related urban runoff. Grant programs frequently prohibit the award of grants to meet requirements of NPDES permits requirements. The inclusion of the prohibition could limit the types of grants the Permittees might otherwise be eligible for to help address this discharge.</p>	<p>Please see comment # 28. The Copermittees are expected to use appropriate discretion in implementing their education and enforcement programs to address public concerns and to effectively prohibit this non-storm water discharge. This action in no way should deter the County from continuing their outreach and retrofit efforts.</p> <p>The Copermittees are encouraged to continue seeking grant funding for projects and are encouraged to help define and craft any future bills heard by the legislature that could restrict the uses of grant funds from State propositions.</p>
76	4	Overirrigation	B	<p>Finally, a prohibition of irrigation-related runoff may be in conflict with other permits that allow such discharges including the industrial general permit and the construction general permit. In particular, the construction permit authorizes such discharges if they are necessary for the completion of construction (and are identified in the SWPPP with appropriate BMPs). The final phase of construction includes the installation and establishment of landscaping (also known as vegetative stabilization). The establishment of new plantings to ensure long-term survival typically requires higher than normal levels of irrigation to ensure good root growth and vegetative cover prior to the onset of the rainy season to reduce erosion and sediment transport from the project site. The complete prohibition of irrigation related runoff may impede the ability of the Permittees to establish erosion resistant vegetative covering.</p>	<p>The prohibition is against irrigation runoff and not against irrigation application. Construction sites can adjust their irrigation schedules appropriately to eliminate runoff while maintaining plant growth. Further, the locations and types of landscaping can be adjusted to require much less water. Prior to erosion-preventative vegetative covering being established, a construction site is expected to implement temporary erosion controls. The draft Tentative Order is consistent with the Statewide General Construction Permit in this regard. The Construction permit states "discharges of non-storm water are authorized only where they do not cause or contribute to a violation of any water quality standard." The Copermittees in South Orange County have identified over irrigation as causing or contributing to a violation of a water quality standard; therefore overirrigation discharges from construction sites must no longer be authorized.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
77	4	NEL	C	<p>The Tentative Order makes the case (see Finding C.14) that non-stormwater discharges are not subject to the maximum extent practicable standard and therefore subject to water quality based effluent limits (see Table 3). The County disagrees with this assessment for a number of technical and legal reasons which are discussed in the following paragraphs and in Attachment A respectively.</p> <p>The Regional Board in Finding C.14 incorrectly interpreted CWA section 402(p)(3)(B)(ii). In Finding C.14 the Board staff concludes that non-stormwater discharges are to be effectively prohibited unless specifically exempted. Furthermore the finding goes on to include a contradictory statement that "exempted discharges as a source of pollutants are required to be addressed through prohibition". On the one hand non-stormwater discharges are prohibited unless exempted but exempted discharges with pollutants are prohibited. The question that begs to be asked is why exempt a non-stormwater discharge that is a source of pollutants from the prohibition is[in] the first place.</p> <p>CWA section 402(p) (3) (B) (ii) reads as follows: (B) Municipal Discharge – Permits for discharges from municipal storm sewers – (ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewer; The provision does not provide any reference to exemptions. Rather the section may be read that a permit shall "effectively prohibit non-stormwater discharges" but may exempt certain discharges that are not significant sources of pollutants from the prohibition. The section does not require a full prohibition but rather an effective prohibition. The operative word is "effective". The more precise and correct finding should note that non-stormwater discharges are effectively prohibited (per 402 (p) (3) (B) (ii)). However discharges that are not significant sources of pollutants are exempted from the prohibition.</p>	<p>The section referenced in Finding C.14 reads as follows: "Non-storm water (dry weather) discharge is not considered a storm water (wet weather) discharge and therefore is not subject to regulation to the Maximum Extent Practicable (MEP) from CWA 402(p)(3)(B)(iii), which is explicitly for "Municipal and Industrial Stormwater Discharges (emphasis added)". Non-storm water discharges, per CWA 402(p)(3)(B)(ii) are to be effectively prohibited unless specifically exempted. Exempted discharges identified as a source of pollutants are required to be addressed through prohibition."</p> <p>Section 402(p)(3)(B)(ii) of the Clean Water Act clearly requires the "effective prohibition" of non-storm water discharges into the MS4. This is further clarified by the Federal Register which states that "Congress did not intend that the term storm water be used to describe any discharge that has a de minimis amount of pollutants, nor did it intend for section 402(p) to be used to provide a moratorium from permitting other non-storm water discharges" (55 Fed. Reg. 47995-96). Instead, non-storm water discharges into, through and from the MS4 are Illicit Discharges not authorized under the Clean Water Act, except for specific discharges identified under 40 CFR 122.26(d)(iv)(B) that are not thought to be a source of pollution and are therefore exempted from prohibition. These specific discharges into the MS4 are exempted unless identified as a source of pollutants, in which case they are subsequently required to be addressed by the Copermittee as illicit discharges, per language and requirements in 40 CFR 122.26(d). Nonetheless, Finding C.14 has been updated to prevent any confusion of language.</p> <p>The Federal Register does clarify that certain non-storm water discharges were expected to not pose environmental problems in every case, and goes further to provide that "the Director may include permit conditions that either require municipalities to prohibit or otherwise control any of these types of discharges where appropriate" (55 Federal Register 48037). Thus Finding C.14 is not contradictory, and the Director is further authorized to take action regarding exempted non-storm water discharges, even if said discharges are not identified as a source of pollutants by the municipality. The updated Supplemental Fact Sheet provides further clarification regarding NELs.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
78	4	NEL	C	<p>The County would submit that the technology based standard for non-stormwater discharges is "effectively prohibit" just as "maximum extent practicable" is the technology based standard for stormwater discharges.</p> <p>Furthermore, the County would submit that this technology based limit is in fact protective of water quality and compliance with water quality standards. The County has an extensive dry weather monitoring program to identify problematic discharges, including illegal discharges, which support the protection of water quality standards. It is unclear to the County how the Board has determined that these efforts are in fact inadequate to necessitate the development of water quality based effluent limits.</p> <p>Furthermore the TMDL program as noted in Finding E.11 and E.12 provide the appropriate regulatory vehicle to address stormwater and non-stormwater discharges that are causing and contributing to an exceedance of a water quality standard.</p>	<p>The Regional Board does not agree with the County of Orange's submission that the narrative prohibition of non-storm water discharges under Section 402 of the CWA is a technology based standard, as technology based limitations are to be promulgated by USEPA in accordance with Section 301 of the CWA. The Regional Board contends that the Clean Water Act's "effectively prohibit" narrative requirement for non-storm water discharges into the MS4 should result in a net numeric discharge from the MS4 of zero. Under a scenario of zero discharge, the discharge would be protective of water quality criteria as there would simply be no discharge into and thus from the MS4 system. However, as 40 CFR 122.26(d) and 55 Federal Register 222 explain, certain categories of non-storm water discharges are conditionally exempt from the discharge prohibition unless found to be a source of pollutants, which would then require their discharge into the MS4 to be effectively prohibited. Additionally, other non-storm water NPDES permits (utility vaults, dewatering, etc) may allow discharge into the MS4 if done in compliance with the limitations present within those permits and after garnering authorization from the owner and operator of the MS4.</p> <p>The updated errata and supplemental fact sheet clarify why water-quality based effluent limitations are required for non-storm water discharges from the MS4.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
79	4	NEL	C	<p>Should the Regional Board choose a numeric metric to define the technology based narrative limit of “effectively prohibit” then the development of technology based numeric effluent limits must be consistent with Federal and State regulations and policy. The County would submit that the proposed NELs in Table 3 are not. USEPA has provided significant guidance⁶ for the development of technology based effluent limits (TBELs) for industrial dischargers in order to comply with best practicable control technology currently available (BPT) and best available technology economically achievable (BAT) standards. Consistent with this guidance TBELs are based on demonstrated performance of a reasonable level of treatment that is within the economic means of the discharger. (Page 49-50, NPDES Permit Writers’ Manual). This guidance provides insight into how one may develop TBELs for municipal dischargers. For industrial dischargers, the development of TBELs should consider the following parameters:</p> <ul style="list-style-type: none"> • Data collection – Sufficient technical and economic data must be available and should be obtained from various sources with respect to trends, environmental impacts, BMPs, and economics. • Discharger and site profile – Discharger specific information should be obtained through surveys, site visits, etc. to develop a profile. The profile should include: <ul style="list-style-type: none"> o General description/definition and NAICS and/or SIC codes o Industry practices and trends o Manufacturing processes used o General facility information (age of equipment and facilities involved) o Discharge characteristics o Based on the data gaps identified as a part of the existing data collection efforts, additional field sampling and statistical analyses may be necessary o Local climatological data. • Technology Assessment – The technology assessment should determine the depth and breadth of effectiveness data for various industry related source and treatment BMPs and identify the quantity and quality of data available to describe the performance of all currently used and innovative practices, the ability of each to effectively control impacts due to runoff and the design criteria or standards currently used to size each practice to ensure effective control of runoff. For each source and treatment BMP, the assessment should include: <ul style="list-style-type: none"> o General Description of the BMP o Applicability o Design and installation criteria o Design and/or site considerations and/or variations o Effectiveness o Limitations o Maintenance o Cost • Regulatory Options – Once the Data Collection, Industry Profile and Technology Assessment has been completed, the State 	<p>Please see response to Comment No. 78. The Supplemental Fact Sheet clarifies why water-quality based effluent limitations are required for non-storm water discharges from the MS4. To date, USEPA has not promulgated national effluent limitations guidelines for non-storm water discharges from the MS4. Furthermore, the Regional Board will not be developing TBELs for non-storm water discharges from the MS4 based upon Best Professional Judgement (BPJ).</p> <p>Furthermore, the commenter incorrectly interprets the NPDES permit writers manual (page 49-50) as stating, "TBELs are based on demonstrated performance of a reasonable level of treatment that is within the economic means of the discharger." The full correct passage is as follows: "For industrial sources, the national ELGs are developed based on the demonstrated performance of a reasonable level of treatment that is within the economic means of specific categories of industrial facilities. Where national ELGs have not been developed, the same performance-based approach is applied to a specific industrial facility based on the permit writers BPJ". The updated Supplemental Fact Sheet provides discussion regarding the evaluation of TBELs when establishing numeric limitations for non-storm water discharges.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
				<p>should identify the regulatory options that are available. This effort should identify industry impacts, which pollutants to address as well as other non-water quality related impacts (such as energy requirements).</p> <ul style="list-style-type: none"> • Economic analysis7 - Once the regulatory options are identified (see above), the State should evaluate the costs and environmental benefits and determine the appropriate option based on factors such as: <ul style="list-style-type: none"> o Total Costs o Monetized and non-monetized environmental benefits o Ease of implementation o Industry financial impacts o Industry acceptance 	
80	4	NEL	C	<p>As demonstrated above, the development of TBELs for industrial dischargers must be comprehensive and consider many factors. A similar approach for municipal dischargers is appropriate. The County was unable to confirm whether the State completed such an analysis as it appears the State defaulted to Basin Plan water quality objectives to establish a technology based standard. In essence the Tentative Order has stipulated water quality based limits as equivalent to the technology based limits.</p>	<p>Please see response to comment 79. The Regional Board has not stipulated water quality-based limitations as equivalent to TBELs. Please see the updated Supplemental Fact Sheet for further discussion (discussion of Section C of the Order).</p>
81	4	NEL	C	<p>Notwithstanding the argument that water quality based effluent limits are inappropriate and not justified, the Board, if it determines that technology based limits are insufficient to meet water quality standards, is obligated to stipulate additional requirements consistent with 40 CFR 122.44. In this context the Regional Board must determine whether the discharge has a "reasonable potential" to cause or contribute to an excursion of the applicable water quality standard. (40 CFR 122.44 (d)(1)(i-iii)). If determined to cause or contribute then effluent limits (either narrative or numeric) must be developed for the discharge. The County was unable to determine whether such an analysis was completed and the subsequent basis for Table 3 of the Revised Tentative Order. Furthermore, if numeric effluent limits are developed then they must be consistent with 40 CFR 122.45. Again we were unable to verify this consistency as Table 3 is not consistent with 40 CFR 122.45 (c). In fact there is conflicting information in Table 3 and Finding E. 11. In Table 3 the Board has established numeric effluent limits for a list of some 28 constituent/hydrologic area combinations. This table would imply that the Board has determined reasonable potential for each of these constituents. However, in Finding E.11 the Board acknowledges that only four pollutants have been shown to have reasonable potential.</p>	<p>The Supplemental Fact Sheet contains the reasonable potential analysis for non-storm water discharges from the MS4 (discussion of Section C in the Supplemental Fact Sheet), including metals as referenced by the commenter in regards to 40 CFR 122.45(c).</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
82	4	NEL	C	<p>Of primary importance to the County is that the Regional Water Board adopt a permit that is reasonable, feasible and protects water quality. At this time, the Permittees are exposed to significant risk to comply with the numeric effluent limits for dry weather discharges. We have completed a comparison of existing dry weather discharges with the selected NELs noted in Table 3. The results of that comparison are shown below:</p> <p>Constituent Hydrologic Unit Percentage of time NELs</p> <p>Total Dissolved Solids* Group 1 74.5 Total Dissolved Solids* Group 2 97.1 Total Phosphorus@ Group 1 and 2 93.0 Nitrate + Nitrite Group 1 and 2 93.8 Fecal coliform Group 1 and 2 90.0 Nickel (dissolved) Group 1 and 2 0.3 Copper (dissolved) Group 1 and 2 9.5 Cadmium (dissolved) Group 1 and 2 18.1</p> <p>*A factor of 0.6 was multiplied by the specific conductance measurements to estimate TDS @Proposed NEL was compared to measurements of reactive orthophosphate as P</p> <p>As a result, the County/Permittees will face enforcement action for not complying with all the NELs. Where there is exceedance, the Permittees will be faced with liability under several different enforcement regimes. First, the NELs, as proposed in the Revised Tentative Order, would clearly constitute numeric effluent limitations. Violation of effluent limitations in an NPDES permit subjects the Permittees to mandatory minimum penalties (MMPs). (See Water Code §§ 13385 and 13385.1). In addition, non-compliance with the NELs may subject the Permittees to additional enforcement actions imposed by the Regional Water Board and through third party actions under the citizen suit provisions of the CWA. Although the Tentative Order (see 4/29/09 Tentative Updates) attempts to clarify that compliance with Non-Stormwater Dry Weather Numeric Effluent Limits Section C is met by one of three follow-up actions, the structure of the Tentative Order negates such a compliance option and stipulates a hard and fast numeric effluent limit and the resulting exposure to MMPs.</p>	<p>The Regional Board acknowledges that excursions above non-storm water numeric effluent limits may subject the Permittees to multiple enforcement mechanisms, including mandatory minimum penalties (MMPs). MMPs are subject to the requirements under CWC 13385.1 including, but not limited to, the definitions for a serious violation, the number of violations within a given sampling time frame, and the provisions under subdivision (j). Furthermore, the requirements of Section C.1 of the Tentative Order recognize that other, permitted sources could be discharging into the MS4. That is why the section is written to provide for an investigation of the source of the discharge to occur after an exceedance of an NEL is found.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
83	4	NEL	C	As a final point the County would submit that the use of numeric limits for non-stormwater discharges is premature at best. The TMDL program provides the safety net for ensuring that our water bodies are protected in the most reasonable and effective manner. The direct translation of water quality objectives into numeric effluent limits bypasses the TMDL process. It is likely that some of our non-stormwater discharges will exceed the NEL but have no effect on the receiving water quality or beneficial uses. But under the proposed Order the Permittees would be obligated to expend considerable resources without a reciprocal water quality benefit. This is poor public policy and use of public funds.	Irregardless of the TMDL process, discharges of waste from point sources to waters of the United States are required to apply for and obtain permit coverage under a NPDES permit. A 303(d) listing and subsequent TMDL development does not provide an exemption from NPDES permitting requirements, and the TMDL process may, in fact, result in discharge requirements which are more stringent than the non-storm water numeric effluent limits proposed under the Tentative Order because TMDLs often incorporate a Margin of Safety. In addition, the argument that non-storm water numeric limits should not be included due to the likelihood that some discharges may not have an effect on receiving water quality or Beneficial Uses is inconsistent with NPDES permitting requirements, specifically in regards to Section 301 of the CWA and 40 CFR 122.44. Finally, the Regional Board maintains that ensuring compliance with water quality criteria to protect the receiving waters and Beneficial Uses in accordance with the Clean Water Act is neither poor public policy nor poor use of public funds.
84	4	NEL	C	In summary, the establishment of NELs for non-stormwater discharges is fundamentally flawed from a technical and legal perspective. If the NELs are proposed are [as] technology based effluent limits then they must be developed pursuant to USEPA guidance (USEPA NPDES Permit Writers' Manual). If, on the other hand, they are proposed as water quality based numeric limits then their derivation must also follow Federal and state regulations (40 CFR 122.44). The County was unable to determine whether either of these efforts took place. Furthermore, the technical feasibility of complying with these numeric limits is questionable especially since our drinking water supply would not be able to comply with the limits.	Please see response to comment 81. Furthermore, aquatic life criteria may, in some cases, be more restrictive than drinking water criteria due to the sensitivity of aquatic life in the receiving waters (e.g. 40 CFR 131).
85	4	MAL	D	The County has considerable concerns regarding the development and application of MALs. Overall, we contend that the MALs are not technically sound, and more importantly, are not legal in the manner proposed in the Draft Tentative Order. Our legal discussion is provided in Attachment A, County of Orange Legal Comments. The Tentative Order (with updates) attempts to walk a fine line of using MALs to identify the adequacy/inadequacy of the program (see Finding D.h.1, page 8) without calling them numeric effluent limits. However, we would submit that the current configuration of MALs in the Tentative Order may be considered effluent limitations under state law (See Water Code § 13385.1 where effluent limitation means "a numerically expressed narrative restriction.") and exceedances of the MALs after Year 3 may subject the Permittees to mandatory minimum penalties. Our comments here highlight and summarize the relevant points to MALs.	Please see response to Comment 33.

86	4	MAL	D	<p>A) Establishment of TBELs must reflect EPA Guidance</p> <p>The Tentative Order (see 4/29/09 Tentative Updates at page 4) contains a combination of purported technology based MALs and water quality based MALs. To the extent that municipal action levels are used to define the technology based standard of maximum extent practicable (MEP) they should be consistent with EPA guidance⁸, and federal law and regulations. As noted previously in the discussion regarding non-stormwater, USEPA has provided significant guidance for the development of technology based effluent limits (TBELs) for industrial dischargers in order to comply with best practicable control technology currently available (BPT) and best available technology economically achievable (BAT) standards. Consistent with this guidance, TBELs are based on demonstrated performance of a reasonable level of treatment that is within the economic means of the discharger (Page 49-50, NPDES Permit Writers' Manual). This guidance provides insight into how one may develop TBELs for municipal dischargers. For industrial dischargers, the development of TBELs should consider the following parameters:</p> <ul style="list-style-type: none"> • Data collection – Sufficient technical and economic data must be available and should be obtained from various sources with respect to trends, environmental impacts, BMPs, and economics. • Discharger and site profile – Discharger specific information should be obtained through surveys, site visits, etc. to develop a profile. The profile should include: <ul style="list-style-type: none"> o General description/definition and NAICS and/or SIC codes o Industry practices and trends o Manufacturing processes used o General facility information (age of equipment and facilities involved) o Discharge characteristics o Based on the data gaps identified as a part of the existing data collection efforts, additional field sampling and statistical analyses may be necessary o Local climatological data. • Technology Assessment - The technology assessment should determine the depth and breadth of effectiveness data for various industry related source and treatment BMPs and identify the quantity and quality of data available to describe the performance of all currently used and innovative practices, the ability of each to effectively control impacts due to runoff and the design criteria or standards currently used to size each practice to ensure effective control of runoff. For each source and treatment BMP, the assessment should include: <ul style="list-style-type: none"> o General Description of the BMP o Applicability o Design and installation criteria o Design and/or site considerations and/or variations 	Please see response to Comment 33.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

- o Effectiveness
- o Limitations
- o Maintenance
- o Cost
- Regulatory Options - Once the Data Collection, Industry Profile and Technology Assessment has been completed, the State should identify the regulatory options that are available. This effort should identify industry impacts, which pollutants to address as well as other non-water quality related impacts (such as energy requirements).
- Economic analysis⁹ - Once the regulatory options are identified (see above), the State should evaluate the costs and environmental benefits and determine the appropriate option based on factors such as:
 - o Total Costs
 - o Monetized and non-monetized environmental benefits
 - o Ease of implementation
 - o Industry financial impacts
 - o Industry acceptance

As demonstrated above, the development of TBELs for industrial dischargers must be comprehensive and consider many factors. A similar approach for municipal stormwater dischargers is appropriate. The County was unable to confirm whether the State completed such an analysis as it appears the State defaulted to a regional dataset to arbitrarily establish a technology based standard.

87 4 MAL D

Furthermore, to the extent that the Tentative Order establishes water quality based numeric effluent limits (WQBELs), the WQBELs must be established consistent with Federal and State regulations and policy. The Board, if it determines that technology based limits are insufficient to meet water quality standards, is obligated to stipulate additional requirements consistent with 40 CFR 122.44. In this context the Regional Board must determine whether the discharge has a “reasonable potential” to cause or contribute to an excursion of the applicable water quality standard. (40 CFR 122.44 (d)(1)(i-iii)). If determined to cause or contribute, then effluent limits (either narrative or numeric) must be developed for the discharge. The County was unable to determine whether such an analysis was completed and the subsequent basis for Table 4 of the Revised Tentative Order. Furthermore, if numeric effluent limits are developed then they must be consistent with 40 CFR 122.45. The Board basically stipulated that end of pipe discharges must comply with water quality objectives for pH, TDS and mercury regardless of whether the MS4 discharges were causing or contributing to a water quality standard exceedance.

Please see response to Comment 33.

Furthermore, the values for pH, TDS and Mercury expressed as action levels. The levels are based upon Phase I arid west regional data, of which the calculated action levels would be set below applicable water quality criteria for those constituents (pH, TDS and Mercury). Since it is expected that the iterative process will result in a storm water effluent discharge which meets all applicable water quality criteria and thus protects the Beneficial Uses of the receiving waters, these action levels were raised to their respective water quality criteria. As they are action levels, they are not restrictions on the storm water discharge.

88	4	MAL	D	<p>B) The MALs Contained in the Tentative Order Are Not Supported by SWRCB Blue Ribbon Panel Findings and Recommendations. The County submits that the specific MALs contained in the Tentative Order are not technically supportable or valid. The technical validity of establishing numeric limits for outfalls was posed to a State Water Resources Board Control Board (State Water Board) convened group of experts referred to as the Blue Ribbon Panel (BRP). The results and conclusions of the BRP are highlighted in a June 2006 Blue Ribbon Panel Report¹⁰. The BRP Report unequivocally states the position that numeric limits for municipal stormwater discharges are not possible at this time. However, the Panel did agree that "action levels" may be used to identify "bad actor" catchments. Specifically, the BRP Report states: It is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban discharges ... For catchments not treated by a structural or treatment BMP, setting a numeric effluent limit is basically not possible. However, the approach of setting an 'upset' value, which is clearly above the normal observed variability, may be an interim approach which would allow "bad actor" catchments to receive additional attention. For the purposes of this document, we are calling this "upset" value an Action Level because the water quality discharge from such locations are enough of a concern that most all could agree that some action should be taken ... (BRP Report at p. 8, emphasis added.) The Tentative Order attempts to disguise these numeric effluent limits by defining them as Action Levels. However, the intent and application of these numeric limits are consistent with numeric effluent limits (See Water Code §13385.1 where effluent limitation means "a numerically expressed narrative restriction.") and not action levels.</p>	Please see response to Comment 33.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
89	4	MAL	D	<p>Action levels come into play when the stormwater is clearly above the normal observed variability. To develop an appropriate action level, the State's Blue Ribbon Panel suggested various options, which included: (1) consensus based approach; (2) ranked percentile distribution; and, (3) statistically based population parameters. The Tentative Order claims to use a statistical approach that used the central tendency of the dataset and accounting for data variability (Tentative Order, at p. 8). In its actual calculation, it appears that the Tentative Order took the median value of a regional data set and multiplied it by the coefficient of variation. There is no basis for this approach in establishing action levels. This calculation actually reflects the variability of the data (measured as the standard deviation) and does not account for central tendency of the dataset.¹¹ The Tentative Order's approach is not consistent with the State's Blue Ribbon Panel suggestion for a statistically relevant calculation.</p>	<p>The Regional Board contends that the statistical approach taken to develop MALs is one recommended by the Blue Ribbon report, which allows for flexibility when taking a statistically based population approach. The report states:</p> <p>"The statistically based population approach would once again rely on the average distribution of measured water quality values developed from many water quality samples taken for many events at many locations. In this case, however, the Action Level would be defined by the central tendency and variance estimates from the population data. For example, the Action Level could be set as two standard deviations above the mean, i.e. if measured concentrations are consistently higher than two standard deviations above the mean, an Action Level would be triggered. Other population based measures of central tendency could be used (i.e. geomean, median, etc.) or estimates of variance (i.e. prediction intervals, etc.). Regardless of which population based estimators are used (or percentile from above), the idea would be to identify the [statistically derived] point at which managers feel concentrations are significantly beyond the norm."</p> <p>The Regional Board used a measure of central tendency (the median) and of variation (the coefficient of variation) to develop MALs on a pollutant by pollutant basis. The commenter states that there is no basis for this approach, and that the calculation does not account for the central tendency of the dataset. The Regional Board does not agree with the commenter.</p> <p>In addition, in meeting with the Copermittees regarding the tentative Order, the Regional Board has made it clear that selection of the median and coefficient of variation was done to be consistent with the statistical approach taken by the Los Angeles Regional Board. Furthermore, Regional Board staff had made it clear to the Copermittees that this approach was one of many recommended by the Blue Ribbon panel, and that Regional Board staff were/are open to discussing alternative statistical approaches when developing MALs. The commenter disputes the approach, but do offer an alternative of using a 90th percentile approach for a localized dataset (see Comment 96). While it is unclear if the Copermittees would accept a 90th percentile approach utilizing the USEPA Rain Zone 6 data, the Regional Board remains open to further discussion regarding alternative statistical approaches.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
90	4	MAL	D	<p>In addition, the Tentative Order's use of USEPA Rainfall zone 6 database (4/29/09 Fact Sheet Changes at p. 11) is not appropriate to generate the MALs if a sufficient local data base is available. The State's Blue Ribbon Panel noted that there is greater opportunity to use various data sets for establishing the MALs. Three options proposed in the Report, in order or preference, are:</p> <ul style="list-style-type: none"> • Local urban stormwater monitoring data (the Panel even notes the existence of such data sets from Los Angeles County, Orange County and other California MS4 programs) • Combine municipal permit monitoring datasets if there is a lack of data for specific constituents in any one location • National database <p>In this case, the Tentative Order selects the second preferred option to generate the MALs even though there are local stormwater data sets available. In fact, in California and specifically in Orange County, the MS4s have comprehensive data sets. While the Climate zone 6 database is much preferred over the use of the national dataset, the County would submit that our monitoring dataset is sufficiently robust to generate MALs.</p>	<p>The Regional Board acknowledges that local data sets are the preferred option for developing MALs. For this reason, the data set for MALs was changed to reflect USEPA Rainfall Zone 6, which includes MS4 effluent data from Orange, San Diego, Los Angeles and Ventura County. While the County of Orange has a large monitoring data set, Regional Board staff have concluded that there is a lack of effluent monitoring from major outfalls that are representative of conditions throughout the Region. Furthermore, staff do not feel it is appropriate to utilize storm water receiving water data to develop MALs, as the resultant MALs may not be representative of storm water effluent and result in MALs that may be higher or lower than storm water effluent for the region.</p> <p>Since the Regional Board acknowledges the importance of localized data, the Tentative Order updates includes the following language: "Section D.5 (new section) The MALs will be reviewed and updated at the end of every permit cycle. The data collected pursuant to D.2 above can be used to create MALs based upon local data. It is the goal of the MALs, through the iterative and MEP process, to have outfall storm water discharges meet all applicable water quality objectives."</p>
91	4	MAL	D	<p>Furthermore, the derivation and use of action levels as envisioned by the State's Blue Ribbon Panel reflects an approach to identify the "bad actors." (Report at page 8) The use of MALs in the Tentative Order establishes a numeric end point for assessing MEP. The Tentative Order does introduce the iterative process to address exceedances of MALs and subject to the action or lack of action by the MS4s to address these exceedances, the discharger may be viewed to be out of compliance with the MEP standard. Such a permit strategy is unique but it does not diminish the fact that a numeric value is being used to define MEP. Notwithstanding this statement, the Tentative Order notes the absence of MAL exceedances does not give rise to a presumption that the discharger in compliance with the MEP criteria. Thus it's fair to say regardless of the outcome of the MAL comparison the Board will ultimately decide whether the dischargers are complying with MEP. This somewhat convoluted logic poses difficulties for all parties and makes the interpretation of the Tentative Order even more difficult. With that in mind, the County submits that consistent with the Blue Ribbon Panel recommendations, MALs should be used as assessment tools to identify "bad actors" and not as compliance metrics.</p>	<p>Please see previous response to comment no. 33 regarding MALs and the MEP standard.</p> <p>Also, language in the updated errata has been modified to clarify that meeting a MAL does not exempt the Copermittees from the implementation of other required storm water programs. The Regional Board will look at multiple lines of evidence, including reaction to MAL exceedances, in assessing the Copermittees compliance with the MEP standard to reduce pollutants in storm water discharges from the MS4.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response												
92	4	MAL	D	<p>C) MALs Are More Restrictive than the Basin Plan and Establish New Water Quality Objectives for a Water Body</p> <p>Instead of identifying “bad actors,” the MALs as calculated in the Tentative Order may actually establish new water quality objectives for a waterbody or, at the very least, may establish action levels that are more restrictive than applicable water quality objectives for the waterbodies in question. For example, the Tentative Order proposes a MAL for total nickel of 26.34 ug/L that must be compiled with 80% of the time based on a running average. A comparison of the nickel MAL with the Basin Plan water quality objective is shown below in Table 3.</p> <p>Table 3 - Comparison of MALs v. Basin Plan Water Quality Objective for Nickel</p> <p>Constituent Units Municipal Action Levels</p> <p>Basin Plan3 Nickel ug/L 26.34 469</p> <ol style="list-style-type: none"> 1. Measured as total 2. Table 4, as modified in 4/29/09 Tentative Updates. 3. From California Toxic Rule and assuming acute criterion and 100 mg/L as CaCO3 hardness and default conversion factors. <p>A review of the table demonstrates that the MAL is considerably more restrictive than the water quality objectives (in the case of nickel, the MAL is nearly 18 times more restrictive than the water quality objective). Thus it is very possible that the County would be held responsible for significantly reducing its lead and nickel concentrations even though the water body receiving the discharge is in compliance with the water quality standard. To demonstrate this point, water quality data were compiled for mass emission stations located on various creeks in Orange County. This compilation is shown in Table 4. A review of the table shows that the creeks are out of compliance with the MAL even though they are in general in compliance with the Basin Plan objective for these same waters.</p> <p>Table 4. Comparison of Orange County Waterbodies with Nickel MAL and Water Quality Objectives</p> <table border="1"> <thead> <tr> <th>Waterbody</th> <th>Percentage of time1 > MAL of 26.34 ug/L</th> <th>Percentage of samples1 > CTR water quality objective of 469 ug/L</th> </tr> </thead> <tbody> <tr> <td>Aliso Creek</td> <td>58.5 0</td> <td></td> </tr> <tr> <td>Prima Deshecha</td> <td>100.0 2.1</td> <td></td> </tr> <tr> <td>Segunda Deshecha</td> <td>93.4 0</td> <td></td> </tr> </tbody> </table>	Waterbody	Percentage of time1 > MAL of 26.34 ug/L	Percentage of samples1 > CTR water quality objective of 469 ug/L	Aliso Creek	58.5 0		Prima Deshecha	100.0 2.1		Segunda Deshecha	93.4 0		<p>Regional Board staff, prior to submission of this comment by the County of Orange, updated MAL language to include a clause that provides a sliding scale for those priority pollutant MALs which have California Toxic Rule values dependent on the hardness of the receiving water. This was presented to the Copermittees in proposed updated erratta documents submitted to the Copermittees on April 29th and May 5th, 2009.</p>
Waterbody	Percentage of time1 > MAL of 26.34 ug/L	Percentage of samples1 > CTR water quality objective of 469 ug/L															
Aliso Creek	58.5 0																
Prima Deshecha	100.0 2.1																
Segunda Deshecha	93.4 0																

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
93	4	MAL	D	<p>Table 5. Characteristics of Ventura County Land Use -Specific Outfalls for Nickel Industrial Outfall Residential Outfall</p> <p>Number of samples 26 26</p> <p>Mean, ug/L 28.9 17.6</p> <p>Range <5 - 120 <1 - 53</p> <p>% of time above MAL 42 22</p> <p>Assuming runoff in Orange County is similar to runoff in Ventura County we would submit that the application of MALs to Orange County will create a situation where our receiving waters will be in compliance with the Basin Plan but that discharges from our outfalls will not be in compliance with the MALs. Furthermore, because the water body (see Table 4) is significantly in compliance with the applicable water quality objective, discharges from residential storm drain outfalls are clearly not causing or contributing to an exceedance of a water quality standard. Thus, the MS4 discharges and the waterbody do not exceed or impact the Basin Plan water quality standards, but due to the application of the MAL, the Permittees without corrective action to lower the discharge level, would be out of compliance with the Tentative Order and would potentially be subject to mandatory minimum penalties for failing to comply with an effluent limits. Unnecessary and significant costs will therefore accrue to the Permittees from the obligation to address discharges that present regulatory rather than environmental concerns.</p>	<p>Please see previous response to comment no. 33 regarding MALs and the MEP standard. MALs are not effluent limitations and will not result in MMPs. Furthermore, MALs are not set below applicable water quality objectives. Please see responses to comment nos. 87 and 92.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
94	4	MAL	D	<p>D. Compliance with MALs will prove to be problematic</p> <p>The Tentative Order (as modified in the 4/29/09 Tentative Updates) provides clarification regarding the follow-up action required should the outfalls exceed the MALs. The Tentative Order requires each Permittee to affirmatively augment and implement all necessary stormwater controls and measures to reduce the discharge of the associated class of pollutants(s) in the affected watershed to the MEP. The definition of MEP (at Attachment C, page C-7) provides a broad definition that primarily focusing on source control BMPs and treatment control BMPs only if source control BMPs prove ineffective¹². Given the current lack of knowledge regarding the effectiveness of source control BMPs and the liability of non compliance with numeric effluent limits (and resulting mandatory minimum fines) the Permittees would be well served to implement treatment control BMPs. As a result, the Tentative Order is structured to effectively require Permittees to retrofit all outfalls with treatment control BMPs. However, the language in the Tentative Order creates an illusion that the Permittees can comply with the MALs through a traditional stormwater management program. If it is the Regional Water Board's intent to structure compliance through the implementation of treatment control BMPs (see Provision 3.d Retrofitting Existing Development at pg. 65), then the Tentative Order must clearly state that all outfalls are to be retrofitted with treatment control BMPs. Obviously, the costs and ramifications on Permittees for such a requirement are huge and in some cases may not be possible without displacing existing development.</p>	<p>As modified, the Tentative Order updates language does not, as the comment states, effectively require Permittees to retrofit all outfalls with treatment control BMPs. The language requires:</p> <p>"each Copermittee to affirmatively augment and implement all necessary storm water controls and measures to reduce the discharge of the associated class of pollutants(s) in the affected watershed to the MEP. The Copermittee shall utilize the exceedance information as a high priority consideration when adjusting and executing annual work plans, as required by this Permit. Failure to appropriately consider and react to MAL exceedances in an iterative manner creates a presumption that the Copermittee(s) have not complied to the MEP."</p> <p>Thus, Copermittees are required to evaluate exceedances and react in an iterative manner. It is expected that the Copermittees will take the presence of exceedances as a priority when making decisions on what actions should be taken in the short and long term as part of the iterative process. The Regional Board contends that MALs are not restrictions, but an additional identification and evaluation tool for Copermittees to utilize as part of the iterative process to reduce pollutants in storm water discharges to the MEP.</p>
95	4	MAL	D	<p>Furthermore, it is unclear to the County that even after retrofitting all of our outfalls that we would comply with the MAL numeric effluent limits. As a case in point, the County reviewed options for lowering the nickel concentrations to the MAL level and were unable to verify that the BMPs purported to be practicable in the national ASCE database could in fact reduce nickel to levels required for compliance. Basically, the ASCE BMP database has no supporting documentation demonstrating the effectiveness of treatment control BMPs to reduce nickel. Similarly, the database did not contain performance data for mercury removal; thus, it's unclear what options are available to the MS4 should the discharge exceed the MAL for mercury.</p>	<p>Please see response to Comment No. 94. An exceedance does not necessarily mean an outfall requires immediate retrofitting. The exceedance of the MAL is expected to be used to evaluate all programs, including implementation of addition BMPs. It is expected that the Copermittee, during evaluation of MAL data, may set priorities based upon the available BMP options at the time. The Regional Board does not expect that MALs will require Copermittees to go above and beyond the MEP standard for storm water.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
96	4	MAL	D	<p>E. County’s Alternative Approach for Use of MALs</p> <p>The Tentative Order’s use of MALs to define MEP is ill conceived as it is inconsistent with state and federal policies, is technically flawed, results in requirements more stringent than federal law, and creates limits that are more restrictive than adopted water quality objectives contained in the Basin Plan. While the County disagrees with the use of MALs to define MEP as a numeric value to determine compliance, we understand the Regional Water Board is looking for a new mechanism to ensure Orange County’s stormwater program is effective and protective of water quality. Thus, instead of using MALs as proposed in the Tentative Order, we propose an alternative method consistent with the approach proposed by the State Water Resources Control Board’s “Blue Ribbon Panel of Experts,” as expressed in the June 2006 Blue Ribbon Panel Report (“BRP Report”). This approach would meet the Regional Water Board’s desire to include performance measures in a municipal stormwater program for Orange County. To achieve these goals, we support an approach that “would set “an ‘upset’ value, which is clearly above the normal observed variability, which would allow bad actor catchments to receive additional attention” through creation of an upset value (see BRP Report at p. 8.). The BRP Report termed upset value as “...an Action Level because the water quality discharge from such locations are enough of a concern that most all could agree that some action should be taken...” (Id.) The strikeout/underline language in Attachment B presents the Permittee’s proposal for how MALs should be developed and used to achieve the purpose set forth in the BRP Report. The Permittees’ proposal is to use locally relevant data to create MALs as a tool which, together with additional investigation and attention, will ensure that water quality is improved in the subject subwatershed. Such a proposal would also include the deletion of any references of MALs</p> <p>to support the determination of MEP. To develop MALs for this purpose, the Permittees propose to use the 90th percentile of local, countywide data to develop MALs. Any sub-watershed that exceeds the 90th percentile would be above the normal observed variability and in need of additional attention. In addition, we propose to develop MALs only for those pollutants where there is water quality impairment (based on the section 303(d) list), or have been identified as pollutants of concern and that are present in significant quantities in MS4 discharges. The Permittees’ approach would avoid using public resources unwisely and inefficiently and focus on pollutants that are causing water quality concerns.</p>	<p>Please see response to Comment Nos. 33 and 90.</p> <p>In addition, while the Regional Board appreciates the alternative suggestion regarding MALs, Regional Board staff contend that MALs as presented in the Tentative Order updates are sufficient given the available storm water effluent data. As previously discussed, the Phase I effluent monitoring data, including localized data, is for pollutants that are expected to be present in storm water runoff from the MS4. Furthermore, the Regional Board encourages the Copermittees to incorporate sampling for constituents above and beyond what is proposed in the Tentative Order, particularly for additional pollutants of concern to the Copermittees and/or any 303(d) listed constituents. Additional sampling for such constituents can be used in developing localized MALs, as described in Comment 90, and by Copermittees to determine if additional priorities for other pollutants, including 303(d) listed impairments, are needed.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
97	4	MAL	D	<p>Where a sub-watershed exceeds a MAL due to the MS4 discharge, the Permittees propose that the responsible Permittee be required to submit an "MAL Action Plan" to the Regional Water Board's Executive Officer. The plan would need to include an assessment of the sources responsible for the abnormal pollutant levels, the existing BMPs that address those sources, an assessment of additional BMPs and actions that could be implemented, and, based on such analyses, the additional BMPs and/or actions the responsible Permittee proposes to implement to achieve the MAL to the MEP. The Executive Officer, in approving the plan, would have the opportunity to identify additional BMPs or actions the Regional Water Board believes necessary to address the constituent of concern. In summary, Permittees propose that MALs be used to identify poor performing catchments or sub-watersheds for pollutants of concern to implement further practical controls. Where MALs are exceeded, the Permittees, in conjunction and with approval by the Regional Water Board's Executive Officer would be required to implement additional actions deemed necessary to address the high concentration. Thus, MALs are used to elevate municipal responsibility in a manner that is reasonable and practical while improving water quality.</p>	<p>Please see response to Comments 33, 90 and 96.</p> <p>The Tentative Order has been changed to include language very similar to what is proposed by the comment. The Regional Board, however, feels that every MAL exceedance would not warrant submission of an individual "MAL Action Plan." It is expected that Copermittees will evaluate MAL exceedances in a comprehensive scenario on a watershed and pollutant basis when setting BMP priorities. This is already a requirement of all monitoring programs conducted under the Order. Thus, the Regional Board contends that "MAL Action Plans" should be incorporated into the overall work plans (Sections G.3 and J.4) for Copermittees and used as a tool for setting priorities and implementing BMPs within the MEP process.</p>
98	4	Legal	E	<p>LEGAL AUTHORITY</p> <ul style="list-style-type: none"> • Effectiveness of BMPs (Section E.1.j, Page 24) <p>The Tentative Order includes a new provision that requires the Permittees to demonstrate that they have the legal authority to require documentation on the effectiveness of BMPs. This provision is redundant with other requirements in the permit in that it ignores the fact that the New Development/Significant Redevelopment section of the DAMP (Section 7.0) establishes a process for the selection, design, and long-term maintenance of permanent BMPs for new development and significant redevelopment projects and requires developers to select BMPs that have been demonstrated as effective for their project category. In addition, it ignores the fact that the Permittees have already established legal authority for their development standards so that project proponents have to incorporate and implement the required BMPs. This provision should be deleted from the Order.</p>	<p>This section has been added to the Order to ensure that BMPs implemented by third parties are effective. Since the Copermittees cannot passively receive and discharge pollutants from third parties, the Copermittees must ensure discharges of storm water pollutants to the MS4 are reduced to the MEP. In order to achieve this, the Copermittees must be able to ensure that effective BMPs are being implemented by requiring the third parties to document BMP effectiveness. Regarding the Copermittees' ability to require documentation and reporting from third parties, USEPA states "municipalities should provide documentation of their authority to enter, sample, inspect, review, and copy records, etc., as well as demonstrate their authority to require regular reports."</p>

100	4	SUSMP	F.1.	<p>• Infiltration and Groundwater Protection (Section F.1.c.(6), Page 26)</p> <p>The Regional Board Response to Comments dated July 6, 2007 regarding this section makes reference to the Order No. R9-2002-0001 Fact Sheet and recommendations provided by the U.S. EPA Risk Reduction Engineering Laboratory related to restrictions on infiltration of stormwater. The Order No. R9-2002-0001 Fact Sheet references the document U.S. Environmental Protection Agency. 1994. Potential Groundwater Contamination from Intentional and Nonintentional Stormwater Infiltration. EPA 600 SR- 94 051. This document that is referenced as guidance for infiltration of stormwater is more than 15 years old and does not provide an adequate technical basis for many of the requirements related to infiltration of stormwater. A closer review of this document will show that the study evaluated the impact of industrial stormwater discharges into local groundwater. However, the site soil conditions had a poorly defined soil structure and included gravel. Thus stormwater from the industrial site was discharged in an almost direct conduit to the groundwater. The County would submit that the Tentative Order should require the Permittees to develop criteria for the use of infiltration BMPs that consider land use, runoff quality, groundwater depth, site soil conditions and other information relevant to groundwater protection. The Regional Board Response to Comments dated July 6, 2007 also identifies that language contained in the Tentative Order also allows the Permittees to develop alternative criteria to replace the suggested restrictions. As currently drafted the restrictions are more than “suggestions” and are actually more restrictive than requirements for onsite septic systems currently being considered by the State Water Board. If the restrictions are “suggested” then they should not be required as provision but should be identified as suggested or removed from the permit. If the intent is to allow the Permittees to develop criteria for infiltration of stormwater than the provision should be that the Permittees should develop the criteria and the “suggested” criteria should be deleted from the permit.</p> <p>Since the Fact Sheet, and the Regional Board Response to Comments dated July 6, 2007 does not provide adequate technical basis for the requirements and the Regional Board Response to Comments dated July 6, 2007 identifies the requirements as “suggested”, Section F.1.c.(6) should be deleted from the Tentative Order.</p> <p>Jurisdictional Runoff Management Program (JRMP) Section F.1.c.(6)(g) restricts the use of infiltration treatment control BMPs in areas of industrial or light industrial activity and areas subject to high vehicular traffic. High vehicular traffic is defined as 25,000 or greater average daily traffic on main roadway or 15,000 or more average daily traffic on any intersecting roadway. There is no specific technical basis for this restriction or the definition of “high vehicular traffic” included within the Fact</p>	<p>The Tentative Order continues to give the Copermitees the needed flexibility to develop criteria for infiltration treatment devices. The criteria set forth in the Permit are the minimum requirements for infiltration if the Copermitees choose not to develop separate criteria. The language will remain in the Permit as we have no knowledge of an individual Copermitee implementing separate infiltration criteria. Any separate infiltration criteria developed by the Copermitees, must be submitted as part of their updated SSMP for public review and comment. The restriction on areas with high vehicular traffic is included on the recommendation of the USEPA guidance that the commenter cited.</p> <p>The requirement in Section F.1.c.6.(g) restricting infiltration in certain areas has been modified to be allow infiltration, provided the runoff is treated or filtered to remove pollutants prior to entering the infiltration device. This change is in light of the findings of the Los Angeles and San Gabriel Rivers Watershed Council's Water Augmentation Study Phase II Final Report. The study found that "Filtration methods employed at industrial sites seemed to be effective at removing certain pollutants prior to entering the infiltration system, which may make infiltration more feasible at these more polluted sites." This provision is in keeping with the goal of maximizing infiltration opportunities to benefit surface water quality and maximize local sources of water supply.</p>

101	4	SUSMP	F.1	<p data-bbox="708 176 1117 575">Sheet and the reference to the EPA Guidance in the Regional Board Response to Comments dated July 6, 2007 does not provide an adequate technical basis. As such, prescriptive requirements should not be included in the Tentative Order unless there is a strong technical basis. Although SWRCB Order WQ 2000-11 provides guidance on some of the restrictions on the use of infiltration treatment control BMPs contained in the Tentative Order, there is no mention of restrictions related to areas subject to high vehicular traffic. Moreover, we are not aware of any demonstrated relationship between traffic counts and frequency of materials deposited on the street.</p> <p data-bbox="708 596 1117 890">• Native/Low Water Landscaping (Section F.1.c.(7), Page 27) This new provision identifies that landscaping with native or low water species where feasible shall be preferred in areas that drain to the MS4 or waters of the U.S. It is unclear to the County as to the nexus between the use of native plants and runoff water quality. For what purpose does this provision have to protect water quality and beneficial uses? This provision would appear to be outside the jurisdiction of the Regional Board.</p>	<p data-bbox="1146 596 1560 919">This provision is not an Order requirement, and is simply a suggestion to use native species where feasible. Invasive plant species can degrade the Beneficial Uses of the waters of the State, and the Regional Board is encouraged by the actions taken to date by Copermittees to prevent many non-native species from being introduced to waters of the U.S. and State, especially via the MS4 system. Furthermore, native/low water landscaping is likely to require fewer fertilizers that could be mobilized to jurisdictional waters and cause nutrient-related water quality impacts.</p>

102	4	SUSMP	F.1	<p>• Standard Stormwater Mitigation Plans (SSMPs) (Section F.1.d, Page 27-28) Section F.1.d. requires each Permittee to implement an updated local SSMP within twelve months of adoption of the Order. The schedule for the update of the SSMP is overly aggressive and does not allow the time necessary for the Permittees to incorporate changes and implement an updated SSMP. This provision adds language that requires the inclusion of the hydromodification requirements in provision F.1.h in an updated local SSMP within one year of the adoption of the Order. The requirements in provision F.1.h include the development of watershed specific HMPs within two years of adoption of the Order. The timeframe to update the local SSMPs in Provision F.1.d should be consistent with the time frame identified to develop the watershed specific HMPs in provision F.1.h. It is recommended that the Provision be modified as follows:</p> <p>Each Copermittee must implement an updated local SSMP, upon completion of the watershed specific HMP(s) in their jurisdiction, which meets the requirements of section F. 1. d. of this Order and (1) reduces Priority Development Project discharges of storm water pollutants from MS4 to the MEP, (2) prevents Priority Development Project runoff discharges from the MS4 from causing or contributing to a violation of water quality standards, (3) manages increases in runoff discharge rates and durations from Priority Development Projects that are likely to cause increased erosion of stream beds and banks, silt pollution generation, or other impacts to beneficial uses and stream habitat due to increased erosive force and (4) implements the hydromodification requirements in section F.1.h.</p>	<p>The Tentative Order has been revised to allow up to two years to develop the updated SSMP in conjunction with the hydromodification management plan.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
103	4	SUSMP	F.1	<ul style="list-style-type: none"> • Priority Development Project Categories (Section F.1.d.(2), Page 29) <p>The Regional Board Response to Comments dated July 6, 2007 regarding this section does not provide any technical basis for requiring that a new Development project feature requires the entire project footprint being subject to SSMP requirements. The Response to Comments only mentions that the provision is “a particularly important requirement since municipalities have greater latitude during development to require pollution prevention than they have with existing development”, however pollution prevention is not required from land uses that are not Priority Development Project Categories and so the Response to Comments fails to address this potential situation and does not provide any technical basis for the provision. Furthermore, this requirement, Provision F.1.d.(2), appears in direct conflict with Provision F.1.d.(1)(b) which defines the area subject to SUSMP requirements. Given that provision F.1.d.(1)(b) is consistent with Board Order WQ 2000-11, provision F.1.d.(2) should be deleted. Since the previous comments on this issue were not addressed in the Regional Board’s Response to Comments, the comments are being resubmitted.</p>	<p>Although a priority development project is defined throughout the permit, the entire project footprint is subject to SSMP requirements. This is reasonable and protective of water quality because specific priority development projects have amenities that may generate pollutants. This common sense approach that the SSMP requirements apply to the entire project footprint is recognized in the County of Orange's Local Implementation Plan that is contrary to their comment. Table A-7.VI-2, Anticipated and Potential Pollutants Generated by Land Use Type, in the County's LIP describes parking lots as potentially generating nutrients, pesticides, sediments and oxygen demanding substances if landscaping exists onsite. If the SSMP applied to only the criteria triggering a priority development project, the County's table would not list those substances as being generated from a parking lot. For example, although a housing subdivision of 10 or more dwelling units defines one type of priority development project, the entire project would be subject to SSMP requirements. The SSMP would need to treat runoff from the yards, streets, and driveways as well as runoff from the houses.</p> <p>The commenter misreads provision F.1.d.(1)(b). The requirement is not in conflict but is demonstrating the difference associated with redevelopment and new development categories. It is appropriate to have a different requirement for redevelopment due to expected site constraints encountered with redevelopment.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
104	4	SUSMP	F.1	<p>Section F.1.d.(2) defines Priority Development Project Categories. In an introduction to the listed categories, this section states that, where a new development project feature, such as a parking lot, falls into a Priority Development Project Category, the entire project footprint is subject to SUSMP requirements. As currently written this provision would require a new development that has a 5,000 square foot parking lot feature and 100,000 square feet of other land uses that are not Priority Development Project Categories, to provide treatment for the entire project (105,000 square feet). This requirement would unduly burden the landowner in this case with the cost of treating runoff from 105,000 square feet when only 5,000 square feet should be subject to SUSMP requirements and treatment controls.</p> <p>The need to treat runoff from a greatly increased land area will require an increase in the size of treatment controls, which will increase the volume of water treated without a likely commensurate increase in pollutant removal. This requirement will unnecessarily increase the cost of treatment control BMPs without commensurate pollutant removal benefits and likely discourage re-development.</p> <p>The Fact Sheet fails to provide any information showing that development land uses that are not in the Priority Development Project Category contribute pollutants to the MS4 and are a threat to water quality. The Fact Sheet (page 78) states that this provision “is included in the Order because existing development inspections by Orange County municipalities show that facilities included in the Priority Development Project Categories routinely pose threats to water quality. This permit requirement will improve water quality and program efficiency by preventing future problems associated with partially treated runoff from redevelopment sites. This explanation does not demonstrate any connection between development land uses that are not in the Priority Development Project Category and the observed “threats to water quality.” In addition, although the explanation focuses on the water quality benefits for redevelopment projects, the Section is for “new development” projects”. Since the Fact Sheet does not provide any technical information showing that land uses that are not Priority Development Project Categories are a significant source of pollutants and a threat to water quality, the introductory paragraph of Section F.1.d.(2) subjecting the entire project footprint to SUSMP requirements should be removed from the permit.</p>	<p>See response to Comment No.103. In addition, the commenter appears to be confusing the difference between the project footprint and the lot size. Project footprint is that area that is being developed. Within a property owner's lot, there may be natural undisturbed areas in addition to the project footprint. Clearly, runoff from the natural, left undisturbed areas need not be treated.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
105	4	SUSMP	F.1.	<p>• Commercial Developments (Section F.1.d.(2)(b), Page 29) Section F.1.d.(2)(b) lowers the threshold criterion for commercial developments required to comply with SUSMP requirements from 100,000 square feet (2.3 acres) to one acre. The Fact Sheet states that this provision has been modified to be consistent with US EPA Phase II Guidance. However, EPA Phase II guidance is not relevant to a Phase I permit.</p> <p>The Fact Sheet also states that this Provision is based on Permittee findings that smaller commercial facilities pose high threats to water quality. This is not the case. The Permittees indicated that commercial facilities of 100,000 square feet or less receive a score of 3 out 5 (a medium threat) in Table 9-8 in the 2007 DAMP. Since the Fact Sheet does not provide any technical basis for lowering the threshold criterion for commercial developments required to comply with SUSMP requirements from 100,000 (2.3 acres) square feet to one acre, the category should be described as, "Commercial developments greater than 100,000 square feet."</p>	<p>The Tentative Order has been changed to make the definition of a priority development project consistent with the recently adopted Region 8 MS4 permit for North Orange County. The modified requirement defines any commercial development greater than 10,000 square feet to be a priority development project requiring a SSMP. This criteria was redefined to adequately address potential pollutant sources, which may exist at properties that undergo development for commercial uses.</p>
106	4	SUSMP	F.1	<p>• Industrial Developments (Section F.1.d.(2)(c), Page 29) Section D.1.d.(2)(c) requires industrial developments of greater than one acre to comply with SUSMP requirements. The Fact Sheet states that this provision has been modified to be consistent with US EPA Phase II Guidance. Again, EPA Phase II guidance is not relevant to a Phase I permit. In addition, the Fact Sheet does not provide a technical basis for adding industrial sites to the Priority Development Project Categories and consequently Section D.1.d.(2)(c) should be deleted from the permit.</p>	<p>The Tentative Order has been changed to make the definition of a priority development project consistent with the recently adopted Region 8 MS4 permit for North Orange County. The modified requirement defines any industrial development greater than 10,000 square feet to be a priority development project requiring a SSMP. This criteria was redefined to adequately address potential pollutant sources, which may exist at properties that undergo development for industrial uses.</p>

107	4	SUSMP	F.1	<ul style="list-style-type: none"> • Retail Gasoline Outlets (Section F.1.d.(2)(j), Page 30) <p>Section F.1.d.(2)(j) includes as a Priority Development Project Category Retail Gasoline Outlets (RGOs) that meet the criteria of 5,000 square feet or more or have a projected Average Daily Traffic (ADT) of 100 or more vehicles per day. SWRCB Order WQ 2000- 11 provides guidance on whether RGOs are subject to SSMP requirements. The State Board states in this Order that “In considering this issue, we conclude that construction of RGOs is already heavily regulated and that owners may be limited in their ability to construct infiltration facilities. Moreover, in light of the small size of many RGOs and the proximity to underground tanks, treatment may not always be feasible, or safe.”</p> <p>Although the State Board does not prohibit subjecting RGOs to SSMP requirements, the State Board provides a number of reasons for not doing so, including that fact that RGOs are already heavily regulated. It should also be noted that the DAMP already prescribe a suite of BMPs specific to RGOs. Subjecting RGOs to SSMP requirements imposes duplicity where it is not needed. Section F.1.d.(2)(j) should be removed from the permit.</p>	<p>The inclusion of Retail Gasoline Outlets was discussed at length in the Fact Sheet. Please see the discussion in the fact sheet for Finding D.2.d. on page 52, and Section D.1.d.(2)(j) on page 86. This section has not been changed or modified.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
108	4	LID	F.1.	<p>• LID Site Design BMP Requirements (Section F.1.d.(4), Page 30-33) This provision identifies that each Permittee must require LID stormwater practices or make a finding of infeasibility for each Priority Development Project (PDP) for inclusion of LID. This provision effectively requires each PDP to perform an analysis of the applicability of LID BMPs for a given project and either incorporate LID BMPs into the project or provide documentation that supports a finding that LID BMPs cannot be incorporated, which presents a significant change in the way development projects are planned and designed and presents an additional burden on developers and municipal plan checkers.</p> <p>The Tentative Updates and Errata document released on May 5th changes this language by specifying that each Permittee must require a project to include LID stormwater practices or, alternatively, participate in the LID substitution program described in Section F.1.d.(8). The analysis of the feasibility of LID BMPs is most appropriate to be included under this provision as the LID Site Design Substitution Program, as discussed later, is confusing and an unnecessary provision.</p> <p>It is recommended that Section F.1.d.(4)(a)(i) not be changed per the Tentative Updates and Errata document release on May 5th and remain as worded in the March 13th Tentative Order as follows: Each Copermittee must require LID storm water practices or make a finding of infeasibility for each Priority Development Project.</p>	<p>The Tentative Order has been modified to address the commenter's concern. The finding of infeasibility is subject to the criteria outlined in the LID substitution program.</p>
109	4	LID	F.1	<p>Section F.1.d.(4)(a)(iii) requires each PDP to perform an assessment of the potential for collection of stormwater for beneficial use on-site or off-site prior to discharging from the MS4. The language "discharging from the MS4" is confusing and the meaning should be defined or the language should be changed to "discharging to the MS4". There is no language in the Tentative Order that identifies how extensive the analysis should be and there is no supporting language in the Fact Sheet as to why this analysis should be done. The requirement to perform this assessment for off-site use, which is not defined, puts an undue burden on developers to identify potential uses beyond the area and control of the PDP. This provision likely goes beyond the authority of the Regional Boards per Water Code § 13360, which prohibits the Regional Board from specifying the manner of compliance with its regulations. It is recommended that Section (a)(iii) of this provision be modified as follows: The review of each Priority Development Project shall consider potential collection of storm water for beneficial use on-site prior to discharging to the MS4.</p>	<p>The Tentative Order has been changed in response to this comment. The phrase, "on site or off site prior to discharging from the MS4" has been removed.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
110	4	LID	F.1	<p>Section F.1.d.(4)(a)(vi) requires that within 365 days of adoption of the Order that each Permittee review its local codes and ordinances and identify barriers therein to implementation of LID stormwater practices. One year, however is not adequate time for each Permittee to identify barriers to LID in its local codes and ordinances as similar projects to identify barriers to LID have taken multiple years. A minimum of two (2) years should be provided for the Permittees to identify these barriers which would allow a thorough understanding of the types of barriers present in local codes and ordinances, and the time to create ordinances that are compatible and support the other stormwater program elements.</p> <p>It is recommended that Section F.1.d.(4)(a)(vi) be modified as follows: Within 365 days two (2) years after adoption of this Order, each Copermittee must review its local codes and ordinances and identify barriers therein to implementation of LID storm water practices. Following the identification of these barriers to LID implementation, where feasible the Copermittee must take appropriate actions to remove barriers directly under Copermittee control by the end of the permit cycle.</p>	<p>The Tentative Order has been changed to allow the Copermittee's up to two years to review their local ordinances as part of the updated SSMP. Although the Copermittee has two years to identify the local ordinances, the Copermittee has up to five years, the next permit cycle, to create and amend their ordinances to be compatible and support LID, i.e. remove barriers.</p>
111	4	LID	F.1.	<p>Section F.1.d.(4)(b)(i) requires PDPs to maintain or restore natural storage reservoirs and drainage corridors in drainage networks in preference to pipes, culverts, and engineered ditches. The intent of the provision appears to be to assist in maintaining the pre-development hydrology, however this provision specifies how a PDP is to maintain the pre-development hydrology which may go beyond the limitations in Water Code § 13360.</p> <p>It is recommended that Section F.1.d.(4)(b)(i) be modified as follows: Consider maintaining or restoring natural storage reservoirs and drainage corridors (including depressions, areas of permeable soils, swales, and ephemeral and intermittent streams) in drainage networks in preference to pipes, culverts, and engineered ditches.</p>	<p>After meeting with the Copermittees, the Tentative Order has been modified to remove the term "in drainage networks in preference to pipes, culverts, and engineered ditches."</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
112	4	LID	F.1.	<p>Section F.1.d.(4)(b)(ii) of this provision requires draining a portion of the impervious area to pervious areas before discharge to the MS4, specifying that the amount of runoff shall correspond to the total capacity of the pervious areas. Section (b)(iii) of this provision identifies that pervious or landscaped areas should be properly designed and constructed to effectively receive and infiltrate or treat runoff. The effect of these provisions requires that all landscaped and pervious areas are sized and designed as stormwater treatment devices, such as bioretention or vegetated swales. Using landscaped and pervious areas as stormwater treatment devices is not always feasible and is dependant on site specific constraints.</p> <p>It is recommended that Section F.1.d.(4)(b)(ii) and Section F.1.d.(4)(b)(iii) of this provision be modified as follows: Section F.1.d.(4)(b)(ii) - Projects with landscaped or other pervious areas shall, where feasible, drain a portion of impervious areas (rooftops, parking lots, sidewalks, walkways, patios, etc) into pervious areas prior to discharge to the MS4. The amount of runoff from impervious areas that is to drain to pervious areas shall correspond with the total capacity of the project's pervious areas to infiltrate or treat runoff, taking into consideration the pervious areas' soil conditions, slope, and other pertinent factors.</p> <p>Section F.1.d.(4)(b)(iii) - Projects with landscaped or other pervious areas shall, where feasible, properly design and construct the pervious areas to effectively receive and infiltrate or treat runoff from impervious areas, prior to discharge to the MS4. Soil compaction for these areas shall be minimized. The amount of the impervious areas that are to drain to pervious areas must be based upon the total size, soil conditions, slope, and other pertinent factors.</p>	The Tentative Order has been updated to incorporate the commenter's suggestion.

113	4	LID	F.1.	<p data-bbox="708 184 1117 831">• LID Site Design BMPs Sizing and Design (Section F.1.d.(4)(c), Page 33) The Tentative Updates and Errata document released on May 5th (page 7) contains a new section which requires that LID structural site design BMPs to be sized and designed to ensure capture of the 85th percentile storm event for all flows from the development in accordance with Section F.1.d.(6)(a)(i) and Section F.1.h. The objective of Low Impact Development is for a development site to maintain pre-development site hydrology by implementing site-design techniques that function similar to natural processes. LID BMPs should therefore not be designed to capture the 85th percentile storm event but rather to capture the difference in volume between the 85th percentile storm event for the pre-development condition and the 85th percentile storm event for the post-development condition (delta volume). By sizing and designing LID BMPs to the delta volume this will help to ensure that the pre-development hydrology is maintained which is the objective of the Low Impact Development stormwater approach.</p> <p data-bbox="708 858 1117 1182">This new section also requires that any volume over and above the design capture volume, that is not captured by the LID BMPs shall be treated using conventional treatment control BMPs in accordance with Section F.1.d.(6). This language appears to require treatment beyond the 85th percentile storm event which unnecessary as most pollutants are removed through treatment or capture of the 85th percentile storm event, it is likely infeasible in many locations, and it would but an unnecessary burden on PDPs without much added pollutant removal benefit.</p> <p data-bbox="708 1209 1117 1507">It is recommended that the Provision be modified as follows: LID structural site design BMPs shall be sized and designed to ensure capture of the difference between 85th percentile storm event (“design capture volume”)for the predevelopment condition and the 85th percentile storm event (“design capture volume”)for the post-development condition for all flows from the development or redevelopment project in accordance with Section F.1.d.(6)(a)i. and Section F.1.h below.</p>	<p data-bbox="1146 184 1560 508">The Tentative Order's language regarding Low Impact Development requirements has been modified to be consistent with the Region 8's recently adopted MS4 permit for North Orange County. The language still requires onsite retention through infiltration, evapotranspiration or rainwater harvesting. In addition, the Permit allows properly designed biofiltration BMPs to be used as allowed by the Region 8 permit. Retention on site and/or biofiltration is required of all flows resulting from storm up to and including the 24-hour 85th-percentile storm event.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
114	4	LID	F.1.	<p>Alternatively the term “capture” as used in the Tentative Updates and Errata document released on May 5th should be defined as capturing water for treatment using LID BMPs and should not be defined as retention of the 85th percentile storm event. Retention of the 85th percentile storm event is an artificial metric that does not meet the objective of Low Impact Development which is to maintain pre-development site hydrology. If retention is used as the definition of capture there will be many development site locations where this will be infeasible due to site constraints. Capture should be defined as treatment of the 85th percentile storm event which is likely feasible at almost all development site locations. The benefits of LID are realized with the definition of capture as treatment, as retention will still occur on sites where it is feasible through infiltration and evapotranspiration, and on sites where retention is not feasible, vegetated LID BMPs will still provide treatment and volume reduction will occur through some infiltration and evapotranspiration.</p> <p>Alternatively it is recommended that the Provision be modified as follows:</p> <p>LID structural site design BMPs shall be sized and designed to ensure capture treatment of the 85th percentile storm event (“design capture volume”) for all flows from the development or redevelopment project in accordance with Section F.1.d.(6)(a)i. and Section F.1.h below.</p>	<p>The Tentative Order's language regarding Low Impact Development requirements has been modified to be consistent with the Region 8's recently adopted MS4 permit for North Orange County. The language still requires onsite retention through infiltration, evapotranspiration or rainwater harvesting. In addition, the Permit allows properly designed biofiltration BMPs to be used as allowed by the Region 8 permit.</p>

115	4	SUSMP	F.1.	<p>• Treatment Control BMP Requirements (Section F.1.d.(6)(f) and (g), Page 34) The Regional Board Response to Comments dated July 6, 2007 regarding this section does not provide any technical basis for these provisions and it does not adequately address the comments provided stating that “the concerns are addressed within the Tentative Order”. Since the previous comments on this issue were not adequately addressed in the Regional Board’s Response to Comments, the comments are being resubmitted.</p> <p>Section F.1.d.(6)(f) require treatment control BMPs be implemented prior to discharging into waters of the U.S. and provision F.1.d.(6)(g) requires that treatment controls not be constructed within waters of the U.S. or waters of the State. These provisions of the Tentative Order greatly limit the use of regional BMP and watershed-based approaches. The provisions demand a lot-by-lot approach in implementing BMPs that is analogous to the site-by-site septic tank approach that has been discredited as an effective strategy for sewage treatment in urban areas. Similarly, the Permittees submit that such an approach is also ineffective for stormwater and will lead to a diversion of limited resources to managing thousands of site-by-site treatment controls, which are managed by parties that have limited or no experience, instead of hundreds of regional controls, that are managed by parties and governmental agencies that have expertise in BMP management.</p> <p>The Tentative Order encourages a renewed focus on the ‘watershed approach’ but the proposed restriction on regional BMPs is antithetical to a watershed approach. The USEPA in its National Management Measures Guidance to Control Nonpoint Source Pollution from Urban Areas, Management Measure 5: New Development Runoff Treatment dated November 2005 (page 5-38) states that “regional ponds are an important component of a runoff management program.” and that the costs and benefits of regional, or off-site, practices compared to on-site practices should be considered as part of a comprehensive management program. The EPA guidance acknowledges that a regional approach can effectively be used for BMPs.</p> <p>In addition, the Fact Sheet does not provide any technical justification for these provisions. Since neither the Findings nor the Fact Sheet provide any technical basis for precluding regional BMPs and EPA guidance recommends the use of regional BMPS, these provisions should be deleted from the permit.</p>	<p>This issue was addressed in the 2007 fact sheet and response to comments. Please see the response to Comment No. 69.</p>

116	4	LID	F.1.	<ul style="list-style-type: none"> • LID Site Design BMP Substitution Program (Section F.1.d.(8)(d), Page 36) <p>In the March 13th Tentative Order the provision has been modified to require that for PDPs participating in the Substitution Program that all LID site design BMPs meet the requirements in Section F.1.d.(4). As LID BMPs are now required in every PDP the Substitution Program essentially becomes a moot provision since if it is feasible to incorporate LID BMPs a PDP would most likely not need to include treatment control BMPs. The May 5th Tentative Updates and Errata document modifies this provision to include a feasibility analysis for PDPs where LID BMPs are not feasible. This new language effectively changes the meaning of Provision F.1.d.(8) from a LID Site Design BMP Substitution Program to a Treatment Control BMP Substitution Program as the Tentative Order requires LID site design BMPs unless they are demonstrated to be infeasible, which then Treatment BMPs appear to be able to be substituted. It is recommended that the Provision be deleted and that the LID feasibility provisions under Section F.1.d.(8)(d) from the May 5th Tentative Updates and Errata document be moved under Section F.1.d.4.(a)(i).</p>	<p>The commenter is correct that it is the intent of this section that LID BMPs are required unless demonstrated to be infeasible, which then Treatment BMPs are able to be substituted and mitigation implemented. The language in the Tentative Order has been modified to clarify that intent.</p>
117	4	SUSMP	F.1.	<ul style="list-style-type: none"> • Treatment Control BMP Maintenance Tracking (Section F.1.f, Page 38) <p>The Regional Board Response to Comments dated July 6, 2007 regarding this section identifies that the provision has been modified to “allow the Permittees more latitude with verifying treatment control BMP operations through self-certification, third party inspection and/or verification by the Copermittee,” however the self-certification program is required to comply with the same very prescriptive provisions. The Provision should be amended to properly allow the Permittees to develop a self-certification inspection program that will meet the intent of the provision without having pre-determined requirements which undermine the benefits of a self-certification inspection program.</p> <p>It is recommended that the Provision be modified as follows: (c) Verify implementation, operation, and maintenance of treatment BMPs by inspection, through the development of a self-certification BMP inspection program within 12 months of the adoption of this Order.</p>	<p>Please see the response to Comment #27. Copermittee inspections are preferable to self certification programs for high priority projects. The requirements in the Tentative Order are on the verification program as a whole including inspections and self certifications. The requirements define when it is appropriate to use the self certification program.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
118	4	Hydromod	F.1.	<ul style="list-style-type: none"> Requirements for Hydromodification and Downstream Erosion (Section F.1.h, Page 39) Section F.1.h. discusses the hydromodification requirements for Priority Development Projects. The hydromodification provisions are of concern to the Permittees for several reasons. As a general matter, the hydromodification provisions may actually discourage smart growth and sustainable development and encourage urban sprawl. High density urban development generally does not have the space to allocate to onsite hydromodification controls. However, urban development has other water quality benefits such as incorporating subterranean parking garages, retail and office workspace, and residential space into a single impervious footprint. As a result, these types of developments have a much smaller impervious footprint than suburban developments that accommodate the same features. This Provision should be amended to include an exception for urban development based on impervious footprint. 	<p>The Regional Board agrees that urban development is preferable to urban sprawl for the reasons stated by the commenter. Nevertheless, the Regional Board disagrees that the hydromodification requirements should include an exception for urban development. New urban development must provide opportunities to incorporate LID design features and green spaces that can infiltrate runoff from smaller, frequent storms. In order to incorporate the necessary design features to capture runoff from larger storms per the hydromodification requirements, land developers have the option to use regional treatment controls where space is limited. Section F.1.h of the Tentative Order has been modified to include the use of regional treatment controls as an option to meet the hydromodification requirements.</p>
119	4	Hydromod	F.1.	<p>Section F.1.h.(3) (Page 40) requires each Permittee to implement, or require implementation of, a suite of management measures within each Priority Development Project to protect downstream beneficial uses and prevent adverse physical changes to downstream stream channels. This section should not apply to watersheds or watershed plans that already include sufficient hydromodification measures. For example, the County of Orange and major landowners, such as Rancho Mission Viejo have put in place a comprehensive watershed land use/open space strategy for the San Juan Creek Watershed/Western San Mateo Watershed which includes water quality/quantity management as an integral component. The Tentative Order should be amended to provide an exception to this section for those watersheds where a watershed plan that contains sufficient hydromodification measures has been developed.</p>	<p>The Regional Board disagrees that the hydromodification measures stated in section F.1.h should not apply to certain watersheds. Although certain watersheds may have an existing watershed land use/open space strategy, there is no assurance that this strategy would maintain the same level of protection from hydromodification that the measures in section F.1.h provide. Additionally, the hydromodification measures call for a collective strategy to be developed by all the Copermitees to ensure a consistent, effective, region-wide approach. Allowing exceptions because of alternative management plans does not accomplish a consistent approach.</p>
120	4	Hydromod	F.1.	<p>This section should also recognize that the common hydromodification management measures for complying with the hydromodification requirements don't necessarily apply directly to flood control projects.</p>	<p>Part of the tasks in developing an HMP by the copermitees is defining a range of flows for which hydromodification management measures must be applied. Flows outside of that range (including flows that may cause flooding) need not be controlled.</p>
121	4	Hydromod	F.1.	<p>Section F.1.h.3.(b) (Page 40) requires that management measures must be based on a sequenced consideration of site design measures, on-site management controls, and then in-stream controls. The provision does not include an option to address hydromodification on a regional or watershed basis. This provision should be amended to include an option to address hydromodification on a regional or watershed basis.</p>	<p>Section F.1.h of the tentative order has been modified to include a provision for regional controls. Regional controls shall be an option after site design measures and on-site controls have been considered.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
122	4	Hydromod	F.1.	<p>Section F.1.h.(3)(b)(i) (Page 40) requires that site design measures for hydromodification must be implemented on all Priority Development Projects. It is neither necessary nor prudent to require hydromodification controls on all priority projects. Some priority projects may be too small to have hydromodification effects and some may discharge into engineered channels, which makes these measures unnecessary. The receiving channel must always be part of the assessment of whether hydromodification controls will be required. This Provision should be amended to include language that the controls are required unless a waiver per paragraph (c) of this section is granted.</p>	<p>The Regional Board recognizes that some priority development projects may be too small to have hydromodification effects; for that reason, the Copermittees must define a range of flow rates for which hydromodification management measures must be implemented. If a project is estimated to generate flows outside of this range, then the flows need not be controlled. Additionally, for smaller projects, it is likely that the hydromodification management measures will be met through the use of LID features, which are required per section F.1.d (4).</p> <p>Although some projects may discharge into engineered channels, the hydromodification management measures must still be implemented to ensure bank stability if the engineered channel is ever returned to its natural, pre-armored state. Therefore the assessment of the receiving channel will be included in the HMP, and in cases where the receiving channel has been hardened, the assessment shall be done for a comparable soft-bottomed channel, as described in section F.h.(1)(b). Alternatively, if the Copermittees determine that it is infeasible to perform the assessment on a hardened channel as though it were a soft-bottomed, then the Copermittees may use the hardened channel as the channel standard. However, the Copermittees must also conduct a feasibility study to explore the removal of concrete in the channel as a means towards stream restoration. The study must include an analysis of the maximum flows that could be tolerated by a stable soft-bottomed creek bed and bank, and an analysis of the flow reductions required per sub-watershed to achieve a stable soft-bottomed creek bed and bank.</p> <p>Because the hydromodification controls will be required upstream of hardened channels, or a feasibility study for restoring the creek will be required, the Regional Board will not modify the language regarding waivers per the commenter's suggestion.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
123	4	Hydromod	F.1.	<ul style="list-style-type: none"> Hydromodification & Engineered Channels (Section F.1.h.3.(c)(ii), Page 41) Provision F.1.h.3.(c)(ii) has been deleted, which removes the waiver of hydromodification requirements for those PDPs that discharges to concrete-lined or significantly hardened channels downstream to their outfall in bays or the ocean. The waiver for PDPs that discharge to concrete-lined or significantly hardened channels should be included as hydromodification requirements are not appropriate for channels that are designed to accept increased flows from upstream development as the potential for erosion is minimal or not present. The fact sheet does not provide any discussion under this provision of why the waiver was removed and the discussion under Finding D.2.g does not adequately address hydromodification requirements related to concrete lined or significantly hardened channels. It is recommended that the Provision providing conditional waivers for hydromodification requirements for concrete-lined or significantly hardened channels be added back into the Tentative Order. 	The fact sheet has been modified to include a discussion regarding the removal of the waiver of hydromodification requirements for Priority Development Projects which discharge to concrete-lined channels.
124	4	Hydromod	F.1.	<ul style="list-style-type: none"> Hydromodification Management Plans (Section F.1.h.(4) & (5), Page 41-43) Provisions F.1.h.(4) & (5) have been modified to require the development of watershed specific Hydromodification Management Plans that include specific criteria for minimizing and mitigating hydrologic modification at all development and redevelopment projects within two years of adoption of the Order. The timeframe for development of HMPs for each watershed is too short to ensure an optimized program. Interim criteria assures that there will not be unregulated construction in the interim. A minimum of three years, which was the length of time to develop criteria identified in the previous Tentative Order, should be allowed for their development. It is recommended that the Provisions be modified as follows: Section F.1.h.(4) - Each Copermittee must revise its SSMP/WQMP to implement a watershed specific Hydromodification Management Plan (HMP) to include specific criteria for minimizing and mitigating hydrologic modification at all development and redevelopment projects, unless hydromodification requirements have already been developed for a watershed which can be integrated into the SSMP/WQMP. Section F.1.h.(5) (a) - Within 3 years of adoption of the Order, the Permittees shall submit to the Regional Board a draft HMP that has been reviewed by the public, including the analysis that identifies the appropriate limiting range of flow rates. 	<p>The Regional Board will not modify the language in the Tentative Order to allow for the use of an alternate hydromodification management plan that may not have as rigorous of requirements for the reasons discussed in the response to comment No. 119.</p> <p>Given that a Hydromodification Management Plan (HMP) is nearing completion in the San Diego area, it is not appropriate to delay the development of an HMP in the Orange County area by adding another year. The Regional Board fully expects the Orange County copermittees to utilize the findings from the San Diego copermittees in developing a local HMP.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
125	4	Hydromod	F.1.	<ul style="list-style-type: none"> Interim Hydromodification & Effective Impervious Area (Section F.1.h.(6)(i), Page 43) <p>Section F.1.h.(6)(i) has been modified to require, as an interim measure that each PDP, not just projects disturbing 20 acres or more, disconnect impervious areas by reducing the percentage of Effective Impervious Area to less than five percent of total project area. EIA is not an adequate metric for hydromodification as there is a lack of a technical consensus on a performance standard relating the disconnection of impervious area and either water quality or hydromodification. This performance standard will ultimately be a very land intensive requirement which may promote sprawl and not conserve natural areas. The 5% EIA number was originally identified in the context of watershed imperviousness and not for a specific development site. The fact sheet identifies that the 5% EIA number was added in direct response to comments from the USEPA on Tentative Order R9-2008-001, however USEPA, in several statements made by Dr. Cindy Lin at the November 14, 2008 CASQA General Meeting, suggested that the 5% EIA metric should only be considered as an example and that USEPA is open to consideration of other metrics for LID. It is unclear whether the language in the Tentative Updates and Errata document released on May 5th replaces and removes the 5% EIA metric from the Tentative Order or if the language is in addition to the 5% EIA metric. In addition the new language from the Tentative Updates and Errata document released on May 5th should be based on the 85th percentile storm event runoff volume. It is recommended that the current language of the Draft North Orange County permit be substituted.</p>	<p>The language regarding the interim hydromodification and EIA has been removed from section F.1.h.(6)(i). The requirements involving EIA are discussed under the LID requirements (section F.1.d.(4)). Please response to Comment No. 4 for discussion on the revised LID metric.</p>
126	4	Construction	F.2	<p>Construction Component</p> <ul style="list-style-type: none"> Permit Fees <p>Since the previous comments on this issue were not addressed in the Regional Board's two Response to Comments documents, the comments are being resubmitted. Although not directly addressed within the Tentative Order, the Permittees take issue with the requirement that they must pay a significant fee for the municipal stormwater permit, which covers their construction responsibilities and are also required to pay an additional fee when they submit an NOI to obtain coverage under the Statewide Construction General Permit. Since there is some discretion in how the Regional Water Board addresses these fees, the Permittees request that their municipal stormwater fees cover all municipal activities including construction and that they not be held liable for additional fees when submitting NOIs.</p>	<p>Each person for whom waste discharge requirements have been prescribed pursuant to section 13263 of the Water Code shall submit, to the State Board, an annual fee in accordance with the schedules prescribed in California Code of Regulations Title 23, Division 3, Chapter 9, Waste Discharge Reports and Requirements Article 1, Fees Section 2200, Annual Fee Schedules. The fee shall be submitted for EACH waste discharge requirement order issued to that person. The Regional Board does not have the discretion to combine, reduce, or waive fees for waste discharge requirements. The Regional Board is required by the California Code of Regulations to collect fees for each order issued to an entity wanting to discharge waste to waters of the State of California.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
127	4	Construction	F.2.	<p>• BMP Implementation (Section F.2.d, Page 46-47) The previous comments on this issue made by the Permittees were not addressed in the Regional Board's two Response to Comments documents, and are therefore resubmitted.</p> <p>Section F.2.d.(1)(a)(ii) requires the development and implementation of a site-specific stormwater management plan. To make the language consistent with the changes made to Section F.2.c.2 (Page 46), the County suggests the following change: (ii) Development and implementation of a site-specific stormwater management plan erosion and sediment control plan (or equivalent BMP plan);</p>	<p>Comment noted. In order to be consistent the permit language on Page 46 will strike the requirement of an erosion and sediment control plan and replace it with a runoff management plan. The new language will read as follows:</p> <p>Provision F.2.c.2 - "Prior to permit issuance, the project proponent's runoff management plan (or equivalent construction BMP plan) must be required to comply, and reviewed to verify compliance, with the local grading ordinance, other applicable local ordinances, and this Order.</p> <p>Provision F.2.d.(1)(a) – Management Measures Provision F.2.d.(1)(a)(ii) - "Development and implementation of a runoff management plan;"</p> <p>To provide further clarity, runoff is defined in Appendix B of the Order.</p>
128	4	Construction	F.2.	<p>• Construction Reporting of Non-compliant Sites (Section F.2.g.(2), Page 50) This new provision requires that each Permittee must annually notify the Regional Board of all construction sites with potential violations prior to the commencement of the wet season. This reporting requirement should be limited to the sites meeting the criteria specified in F.2.e.1 that are required to be inspected in August and September of each year.</p> <p>The County recommends the following modifications. Each Copermittee shall annual notify the Regional Board, prior to the commencement of the wet season, of all construction sites inspected in accordance with F.2.e.4 that meet the criteria specified in F.2.e.1, with potential violations. ..."</p>	<p>The Tentative Order has been updated and "potential" replaced with the word "suspected." The intent of the requirement is to allow the Regional Board to evaluate and prioritize inspections of construction sites, and is not intended to be used to determine Copermittee compliance with the Order. While suspect sites can include those under F.2.e.1, and the Regional Board does not discount their importance, the Regional Board expects suspect sites will include the following:</p> <ol style="list-style-type: none"> 1) Sites where the Copermittees have issued enforcement, but a follow-up inspection has not occurred. 2) Sites that have not been inspected. 3) Sites that have received 3rd party complaints. 4) Sites that Copermittees have otherwise identified as warranting further inspection. <p>The required information can be included with the JRMP Annual Report.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
129	4	Existing Development	F.3.	<p>Municipal</p> <ul style="list-style-type: none"> Flood Control Structures (Section F.3.a.(4)(c), Page 53) <p>Section F.3.a.(4)(c) requires the Permittees to evaluate existing flood control devices to identify those that are causing or contributing to a condition of pollution, identify measures to reduce or eliminate the structure's effect on pollution, and evaluate the feasibility of retrofitting the structure. This provision is problematic for several reasons as described below. The federal regulations [40 CFR, Part 122.26(d)(2)(vi)(A)(4)] focus on evaluating flood control devices and determining if retrofitting the device is feasible. The regulations state: (4) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from stormwater is feasible. The language should be modified so that it is aligned with the current stormwater permit, recognizes the work that has been completed, is consistent with the intent of the federal regulations, and is consistent with the justification within the Fact Sheet.</p> <p>The proposed language modification is as follows:</p> <p>(4). BMP Implementation for Flood Control Structures (c) Each Permittee who owns or operates flood control devices/facilities must continue to evaluate its existing flood control devices/facilities, identify devices causing or contributing to a condition of pollution, identify measures to reduce or eliminate the structure's effect on pollution, as needed and identify opportunities and the feasibility of configuring and/or reconfiguring channel segments/structural devices to function as pollution control devices to protect beneficial uses. The inventory and updated evaluation must be completed by July 1, 2008/10 and submitted to the Regional Board with the Fall 2008/10 annual report.</p>	<p>The Regional Board appreciates the fact that many structural flood control devices are owned and operated by the Orange County Flood Control District, which is also a Copermittee. Each Copermittee, however, must meet the requirements of the Tentative Order for its structural flood control devices. The Regional Board expects that the Flood Control District and other Copermittees will communicate with each other regarding structures owned by the District that serve other municipalities.</p> <p>This comment was addressed at length in the Response to Comments Documents Nos. 1 and 2, and the Fact Sheet. No changes have been made to the Order in response to this comment.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
130	4	Existing Development	F.3.	<p>• Infiltration from Sanitary Sewer to MS4 (Section F.3.a.(7), Page 54) Although the first portion of the Tentative Order provision (7)(a) is consistent with the current permit (Order No. R9-2002-0001), the Permittees submit that the provisions regarding sanitary sewer maintenance are more applicable to sanitary sewer agencies, not stormwater agencies. It is inappropriate to include sanitary sewer maintenance requirements in a stormwater permit even where the two systems may be operated by the Permittee. Where similar maintenance requirements are included in the wastewater treatment plant or collection system permit¹³, these provisions are an unnecessary duplication of other regulatory programs. On a similar issue, the State Board stayed a provision in the existing permit finding that “the regulation of sanitary sewer overflows by municipal storm water entities, while other public entities are already charged with that responsibility in separate NPDES permits, may result in significant confusion and unnecessary control activities.” [emphasis added] (WQ 2002-0014 at p.8). Therefore we submit that part (a) of the provision (7) should be deleted from the Tentative Order. While the Permittees agree that stormwater agencies must also address aspects of sanitary sewer incursions into the MS4s, the provisions in (7)(b) are aspects of other portions of the stormwater program and should be moved to those sections of the Tentative Order.</p> <p>The proposed changes include:</p> <ul style="list-style-type: none"> i. Adequate plan checking for construction and new development – incorporate in the Construction and New Development programs ii. Incident response training for municipal employees that identify sanitary sewer spills – incorporate in the Illegal Discharges/Illicit Connections (ID/IC) program. iii. Code enforcement inspections – delete, this is covered by other programs iv. MS4 maintenance and inspections – incorporate in the Municipal program, provision D.3.a(6). v. Interagency coordination with sewer agencies – incorporate in the ID/IC program vi. Proper education of municipal staff and contractors conducting field operations on the MS4 or municipal sanitary sewer (if applicable) – incorporate in the Municipal program 	<p>Section F.3.a.7 identifies requirements regarding infiltration of sewage into the MS4 and preventive maintenance of the MS4. The requirements in the Tentative Order are specific to maintenance of the storm drain system and other tasks typically performed by the Copermittee and not the sanitary sewer agency, except in circumstances where the Copermittee operates its own sanitary sewer system. The requirements that apply to agencies which also operate sanitary sewers are clearly identified. Other requirements are reasonable functions of MS4 operators. This section has not been revised. See Also July 6, 2007 Response to Comments Document. No.44</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
131	4	Existing Development	F.3.	<p data-bbox="711 184 1117 632">Commercial/Industrial • Commercial Sites/Sources (Section F.3.b.(1)(a)(i), Page 57) The Tentative Order added four new categories of commercial sites/sources: food markets, building material retailers and storage, animal facilities, and power washing services. The Fact Sheet notes that these facilities were added because these activities were identified as potentially significant sources of pollutants in annual reports. While we agree that sites/sources that are identified by the Permittees as contributing a significant pollutant load to the MS4 should be incorporated into the inventory, we disagree with adding them to the list in the Tentative Order unless universally identified, by all the Permittees as a significant source.</p> <p data-bbox="711 659 1117 806">The determinations of significance need to be made at a local level and incorporated into the local JURMP. As noted in the Regional Board's first response to comments document in discussing the balance of flexibility and enforceable criteria:</p> <p data-bbox="711 833 1117 932">"... the Tentative Order sets numeric criteria regarding commercial inspections, but relies on each Copermittee to select inspection targets based on its local knowledge."</p> <p data-bbox="711 959 1117 1127">It is important that these determinations be made at a local level and if identified as a common problem, then apply the requirement applied countywide, otherwise the Board staff may inadvertently be diverting resources from high priority issues to lower priority issues in some areas.</p> <p data-bbox="711 1155 1117 1306">The new categories should be deleted from the Tentative Order and, instead, recognize that those sites/sources have been locally determined to contribute a significant pollutant load to the MS4 be should be incorporated into the local JURMP(s).</p>	<p data-bbox="1146 184 1568 659">The new categories of pollutant generating activities and areas were identified in the annual MS4 program reports and quarterly Aliso Creek watershed reports. It is appropriate to include these new categories within the Tentative Order. Watersheds generally do not follow jurisdictional boundaries. Pollutant generating businesses and activities identified by some Copermittees were not jurisdictionally specific. The requirement in the Tentative Order applying to all Copermittees would prevent a "Tragedy of the Commons" whereby a less stringent requirement in a neighboring jurisdiction encourages the business to move operations to the jurisdiction with the less stringent requirement. The business is more than likely not to change practices or BMPs to reduce pollutant loads in the new jurisdiction with the less stringent requirement.</p> <p data-bbox="1146 686 1568 905">Although, the Copermittee must identify the additional pollutant generating businesses, the Tentative Order provides great flexibility in determining what businesses the Copermittee must inspect. The addition of the categories is consistent with the requirements in the MS4 permit for San Diego County and the MS4 permit for North Orange County recently adopted by Region 8.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
132	4	Existing Development	F.3	<p>• Mobile Businesses (Section F.3.b(3)(a), Page 59) The Tentative Order adds a new requirement to develop and implement a program to address discharges from mobile businesses. The program must include the identification of BMPs for the mobile business, development of an enforcement strategy, a notification effort, the development of an outreach and education program, and inspection as needed.</p> <p>In our previous comment letter we noted the difficulties associated with initiating this program, concerns which were mirrored in the Fact Sheet. For the reasons previously noted and acknowledged by the Regional Board, we request that the requirement for this program be changed to the development of a pilot program for the mobile business category. The pilot program would allow the Permittees to work together on a regional basis to develop an appropriate framework for addressing mobile business and determine whether the program is effective prior to expending a significant amount of resources on multiple categories of mobile businesses.</p>	<p>This comment was addressed in the July 2007 response to comments. The requirement for the inclusion of mobile business is not a significant change from the existing Order because several categories of mobile businesses are required to implement BMPs. The separate requirement only specifies the unique circumstances of mobile businesses; therefore the section has been segregated from the fixed location businesses. Conducting a pilot program would be unnecessary, because nothing in the Tentative Order prohibits the Copermittees from working together on a watershed basis to address mobile businesses. In addition, since the existing Order already requires BMP implementation at some of the identified mobile businesses; any lessening of that requirement would be considered backsliding and not compliant with anti-backsliding regulations within CFR 122.44(l).</p>
133	4	Existing Development	F.3.	<p>• Inspection of Industrial and Commercial Sites/Sources (Section F.3.b(4)(b), Page 60) This new provision requires that each Permittee must annually notify the Regional Board of all commercial and industrial sites/sources with potential violations prior to the commencement of the wet season. Similar to the new requirement for inspecting and reporting non-compliant construction sites, this requirement is ambiguous and subject to potential misinterpretation because Permittees do not inspect all commercial and industrial sites/sources each year.</p> <p>This reporting requirement should be revised so that it does not imply an expansion of the inspection frequency or change in inspection timing than that identified in the subsequent findings and JURMPs.</p> <p>"Each Permittee shall annual notify the Regional Board, prior to the commencement of the wet season, of all the Industrial Sites and Industrial Facilities subject to the General Industrial Permit or other individual NPDES permit with potential violations that were inspected within the preceding 6 months."</p>	<p>The Tentative Order has been modified to clarify the provision. Please see response to Comment 178 and 257.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
134	4	Existing Development	F.3.	<p>• Food Facility Inspections (Section F.3.b.(4)(d), Page 61)</p> <p>The Permittees appreciate the elimination of the proposed expanded requirement to address maintenance of greasy roof vents. As noted in our April 2007 comments, the existing Food Facility Inspection program, which focuses on the major water-quality related issues associated with restaurants including disposal methods for food wastes, fats, oils and greases, wash water, dumpster management and floor mat cleaning has be shown to be effective.</p> <p>The Permittees submit that the additional expanded requirement, (c)(iv) identification of outdoor sewer and MS4 connections, either be deleted from the Tentative Order or the subject of further technical justification of its need for this successful program element.</p>	<p>Provision F.3.b.(4)(d) requires a Copermittee to conduct inspections at food facilities for compliance with its water quality ordinances. Sub-provisions (i) through (v) identify 5 areas an inspector should review during their inspection. Sub-provision (iv) specifically calls to attention a review of any outdoor sewer and MS4 connections. Review of surrounding outdoor sewer and MS4 connections is reasonable to evaluate how the facility's drainage is connected and if any illegal connections are present. No changes were made to this section.</p>
135	4	Existing Development	F.3.	<p>• Third Party Inspections (Section F.3.b(4)(e), Page 61) The previous comment on this issue was not addressed in the Regional Board's two Response to Comments documents, and is therefore resubmitted. The Tentative Order includes new, prescriptive requirements for third party inspections that provide a significant amount of detail as to how the inspection program must be managed. However, the Findings and the Fact Sheet do not address the need for these expanded requirements or provide any rationale as to how these new requirements would make the third-party inspection program more effective. In fact, this level of detail should be determined locally and should be included as a part of the program within the model DAMP and local JURMPs. After the inclusion of the industrial and commercial inspection programs in the third term permit, the Permittees determined that they could leverage their resources by utilizing and expanding upon existing inspection programs to assist them in complying with the permit instead of creating duplicative inspection programs. The ability to utilize third-party inspections as an effective part of the program, has allowed the Permittees to maximize their resources. An example of a third party inspection program that has been developed and implemented is the use of the Orange County Health Care Agency (OCHCA) inspectors to assist the Permittees in inspecting 10,000 restaurants countywide on an annual basis.</p> <p>The Permittees have developed this program in conjunction with OCHCA so that it is only an incremental burden on their limited resources, effective, and allows for clear communication between the inspectors and the Permittees. Since the Permittees have already developed an effective framework for a third-party inspection program, provisions (i)(a) through (i)(d) are unnecessary and should be deleted from the Tentative Order.</p>	<p>The Regional Board recognizes the utilization of third party inspectors for verifying compliance may aid the Copermittees in their program effectiveness. Thus, the Tentative Order allows for the use of third party inspections while reiterating that Copermittees are responsible for quality assurance and quality control for those inspections. The requirements are intended to retain flexibility while incorporating necessary inspection elements to ensure compliance with other permit requirements and conditions (e.g. illicit and illegal discharges). Furthermore, requirements are meant to encourage cooperative enforcement between the Copermittees and the Regional Board.</p>

136	4	Retrofitting	F.3.	<p>• Retrofit Existing Development (Section F.3.d, Pages 65-66)</p> <p>This new provision requires that each Permittee must implement a retrofitting program for existing developments (i.e. municipal, industrial, commercial, residential). These new requirements present a significant change and present a substantial burden to the municipal stormwater program.</p> <p>Currently, new development requirements are imposed as conditions of approval for new projects and projects that are voluntarily undergoing redevelopment. A thorough legal review is required to determine whether municipalities have the authority to compel land development requirements absent a voluntary land development application and if such authorities can be developed given other legal constraints.</p> <p>The Permittees do not concur with the statement of the Regional Board in the supplemental fact sheet that "Retrofitting existing development is practicable for a municipality..." The Permittees request that the Regional Board provide a technical justification for this statement. A systematic evaluation of the technical and legal opportunities and constraints of a requirement to require retrofitting, especially of private landowners, is necessary to determine whether or not such a requirement is practicable. The evaluation must precede the permit provision to mandate MS4s require retrofitting of existing development.</p> <p>These provisions of the permit represents an entire new approach to existing development that places an unknown significant burden on the Permittees and ultimately to property owners in the south Orange County area. The Permittees therefore request that this unprecedented requirement be eliminated from the permit.</p>	<p>The updated supplemental fact sheet provides several examples of municipalities across the nation that have found retrofitting existing development to be practicable. The requirements in the Tentative Order have been written in a manner to address the municipalities constraints in requiring retrofitting projects on privately held land. In addition, this permit section only requires the Copermittees to look for and identify potential retrofitting opportunities and to implement those that are a high priority based upon their evaluations and rankings.</p> <p>The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.</p> <p>Also, please see response to comment no. 46.</p>

137	4	Monitoring	F.4.	<p>ID/IC Program</p> <ul style="list-style-type: none"> Investigation/Inspection and Follow Up (Section D.4.e(2)(b) and (c), Page 68-69) <p>The County appreciates the acknowledgement of the concern in the Regional Board's first Response to Comments document regarding the intent of the permit language. However the language of the Tentative Order was not altered to match the Regional Board's stated intent that the investigation must be initiated within the specified timeframe. The requirements in the Tentative Order are that the Permittees must conduct the investigation within the specified time frame. The following language changes are requested within the Tentative Order to better meet the intent of this requirement as stated by the Regional Board.</p> <p>(b) Field screen data: Within two business days of receiving dry weather field screening results that exceed action levels, the Permittees must either initiate an investigation to identify the source of the discharge or document the rationale for why the discharge does not pose a threat to water quality and does not need further investigation.</p> <p>(c) Analytical data: Within two business days of receiving analytical laboratory results the exceed action levels, the Permittees must either initiate an investigation to identify the source of the discharge or document the rationale for why the discharge does not pose a threat to water quality and does not need further investigation.</p>	<p>The Regional Board agrees that the requested change is reasonable. The Tentative Order updates have been changed to include the modified language.</p>

138	4	WURMP	G	<p>Watershed Urban Runoff Management Program (Section G, Page 70)</p> <p>The Tentative Order includes increasingly prescriptive requirements for the Watershed Urban Runoff Management Program (WURMP). The Fact Sheet states that the increased prescriptiveness for the WURMP provision was necessary because enforceability of the permit has been a critical aspect. The Fact Sheet further states that: "For example, the watershed requirements of Order No. R9-2002-01 were some of the Order's most flexible requirements. This lack of specificity in the watershed requirements resulted in inefficient watershed compliance efforts. This situation reflects a common outcome of flexible permit language. Such language can be unclear and unenforceable, and it can lead to implementation of inadequate programs¹⁴."</p> <p>Not only do the Permittees take strong exception to this statement, but the Fact Sheet is inconsistent with the Findings, which simply state that the WURMPs need to focus on the high priority water quality issues. In addition, the Fact Sheet does not acknowledge any of the notable Permittee successes including 1) the development of a South Orange County Integrated Regional Watershed Management Plan (IRWMP), which resulted in a \$25 million IRWMP competitive grant award, (2) the 303(d) de-listing efforts that are ongoing and have been submitted for consideration; and 3) the efforts of the County of Orange and major landowners, such as Rancho Mission Viejo to put in place a comprehensive watershed land use/open space strategy for the San Juan Creek Watershed/Western San Mateo Watershed through the approved Southern Subregion Habitat Conservation Plan (HCP) and Special Area Management Plan (SAMP) both of which include water quality/quantity management as an integral component.</p> <p>The Permittees submit that the increased prescriptiveness of the Tentative Order is unwarranted and antithetical to a watershed management approach, which should be founded on a stakeholder driven process. Successful watershed-based programs follow a stakeholder driven process and are developed from the "bottom-up" not from the "top-down". The Permittees must be given latitude in how the watershed-based programs are developed and implemented, especially since many of the pollutants of concern (Cu, Zn, pesticides, pathogen indicators, etc.) and issues are the same within and among watersheds. The language must be modified to provide the flexibility that is necessary within a watershed management program (similar to the language in Order No. R9-2002-0001) and, instead, focus on the major objectives for the program. Some language changes that would assist the Board in making these changes are provided below.</p>	<p>The full excerpt from the Fact Sheet is as follows: "The challenge in drafting the Order is to provide the flexibility described above while ensuring that the Order is still enforceable. To achieve this, the Tentative Order frequently prescribes minimum measurable outcomes, while providing the Copermittees with flexibility in the approaches they use to meet those outcomes. Enforceability has been found to be a critical aspect of the Order. For example, the watershed requirements of Order No. R9-2002-01 were some of the Order's most flexible requirements. This lack of specificity in the watershed requirements resulted in inefficient watershed compliance efforts. This situation reflects a common outcome of flexible permit language. Such language can be unclear and unenforceable, and it can lead to implementation of inadequate programs.</p> <p>To avoid these types of situations, a balance between flexibility and enforceability has been crafted into the Order. Minimum measurable outcomes are utilized to ensure the Order is enforceable, while the Copermittees are provided flexibility in deciding how they will implement their programs to meet the minimum measurable outcomes."</p> <p>The Regional Board does not state, as the commenter suggests, that all programs are deficient. Instead, the flexibility in the previous Order did not require minimum outcomes from WRMP activities that the Regional Board felt were needed. The Finding in the Tentative Order states: "This Order contains new or modified requirements that are necessary to improve Copermittees' efforts to reduce the discharge of pollutants in storm water runoff to the MEP and achieve water quality standards. Some of the new or modified requirements, such as the expanded Watershed Runoff Management Program section, are designed to specifically address high priority water quality problems. Other new or modified requirements address program deficiencies that have been noted during audits, report reviews, and other Regional Board compliance assessment activities."</p> <p>It is unclear to the Regional Board why the Copermittees should not address high priority water quality problems, which the Copermittees are required to do as part of the iterative process. The Regional Board is not dictating what each Copermittee's high priority water quality problem is, and as such there is flexibility within the WRMP requirements. Furthermore, the language provides the Copermittees with flexibility in the development and implementation of BMPs.</p> <p>The WRMP section of the Order has been restructured to retain this flexibility but provide guidance and enforceable outcomes. Provision G has been streamlined requiring only one Watershed Work Plan that covers the 5 year permit cycle and annual watershed review meetings. Annual watershed review meetings</p>

139	4	WURMP	G	<p>• Lead Watershed Permittee (Section G.1.a, Page 71)</p> <p>The Tentative Order has designated which entity within the watershed should be the default lead Permittee and what those responsibilities entail. The Permittees contend that this level of detail is inappropriate for a permit provision and should, instead, be a collaborative decision that is made among the various watershed stakeholders based on locally determined criteria and needs.</p> <p>The Permittees propose that the language be modified as follows: a. Lead Watershed Permittee Identification Watershed Permittees may must identify the Lead Watershed Permittee for their WMA. In the event that a Lead Watershed Permittee is not selected and identified by the Watershed Permittees, by default the Permittee identified in Table 3 as the Lead Watershed Permittee for that WMA must be responsible for implementing the requirements of the Lead Watershed Permittee in that WMA. The Lead Watershed Permittees must will serve as liaisons between the Permittees and Regional Board, where appropriate.</p>	<p>are required to be appropriately noticed and open to the public. It is expected that the Copermittees will consider these meetings to be an important stakeholder process for evaluating what the public considers high priority water quality problem(s), as well as provide for an evaluation and update of the overall BMP strategy and implementation to address the high priority water quality problems. The Regional Board expects that this will contribute to what the commenter wants in a "bottom-up" stakeholder process.</p> <p>The requested modification to the Tentative Order has been made.</p>
140	4	WURMP	G	<p>• BMP Implementation and Assessment (Section G.1.e, Page 74)</p> <p>The Tentative Order requires an arbitrary minimum number of watershed activities to occur in each year. The Fact Sheet states that the Permittees have completed the assessments, prioritization, and collaboration and now need to implement the activities identified. While the Permittees agree that there are activities that will be undertaken in conformance with the WURMP, the Tentative Order should not presuppose that the Permittees will not follow through with implementation of the WUMRPs now they have been developed. Since this requirement is unfounded, onerous, arbitrary, and dictates a top-down approach for managing the watersheds, the language should be modified to incorporate the flexibility necessary for the stakeholders to identify the BMPs to be implemented and the details of that implementation. The Tentative Order language should be modified to remove the prescriptive detail and incorporate more flexible language that will ensure that the WURMPs contain performance standards, timeframes for implementation, responsible parties and methods for measuring the effectiveness of their programs.</p>	<p>Provision G has been modified to provide the Copermittees sufficient flexibility to identify their watershed's highest priority water quality problem(s), develop a watershed BMP implementation strategy to abate the identified highest priority water quality problem(s), model and monitor improvements in receiving water quality, determine their schedule for development and implementation of the Watershed Work plan, and report on WRMP updates annually during a meeting (as opposed to lengthy yearly written reporting submittals). This modification provides the flexibility requested and promotes efficient use resources.</p>

141	4	Economic	H	<p>Fiscal Analysis (Section H, Page 78) Section F of the Tentative Order requires the Permittees to secure the resources necessary to implement the permit, conduct a fiscal analysis of the stormwater program, and develop a long term funding strategy and business plan. While the Permittees agree with Board staff that there is an identified need to prepare a fiscal reporting strategy to better define the expenditure and budget line items and to reduce the variability in the reported program costs and have committed to do such in the ROWD, the Permittees take exception to the requirement to develop a long-term funding strategy and business plan. The concerns for these new requirements are discussed in further detail below.</p>	<p>This comment was addressed in the 2007 response to comments. This section has been expanded in order to develop more useful and meaningful fiscal reporting. However, the Business Plan requirement has been removed from the Tentative Order.</p>
142	4	Economic	H	<p>• Long Term Funding Strategy and Business Plan (Section H.3, Page 78) The Tentative Order requires that each Permittee submit a funding business plan that identifies the long-term strategy for program funding decisions. The Fact Sheet states that this requirement is based on the need to improve the long-term viability of the program and is based on the 2006 Guidance for Municipal Stormwater Funding from the National Association of Flood and Stormwater Management Agencies (NAFSMA). The Fact Sheet further indicates that, without a clear plan, that the Board has uncertainty regarding the implementation of the program.</p> <p>The Permittees have a demonstrated history of compliance and leadership in developing, implementing and adequately funding the stormwater program. Regardless of the source of funds, a historical review of the expenditures to date provide undisputable evidence that the Permittees are dedicated to the program, plan their budgets accordingly, and have adequately funded the program for the past 16 years. In our previous comments we provided a historical review of the shared and individual costs of program implementation that demonstrates the commitment of the Permittees to funding the program. It is an unnecessary diversion of the Permittees resources to invest in the development of a new tool for a program component that has been successfully met for 16 years.</p> <p>The Regional Board staff relies on the 2006 NAFSMA Guidance for Municipal Stormwater Funding to justify this new requirement. We note that this national guidance document was developed to provide a resource to local governments as they address stormwater program financing challenges and primarily focuses on the considerations and requirements for developing a service/user/utility fee. While the guidance document states that the most “successful” programs have developed a business plan, such guidance is not a one size fits all approach, and in light of the history of the Orange County Program it is not warranted and should be removed from the permit.</p>	<p>Please see response to Comment 141.</p> <p>In addition, this comment is a repeat of comments received and responded to in 2007; please see http://www.waterboards.ca.gov/sandiego/water_issues/programs/stormwater/oc_stormwater.shtml for previous responses to comments.</p>

143	4	TMDL	I	<ul style="list-style-type: none"> • TMDLs (Section I, Page 79) <p>This new provision supports Finding E.12 and identifies that adopted TMDL WLAs will be incorporated as numeric effluent limits for specific pollutants and watersheds. As noted previously in these comments (see comments on Finding E12), the County has significant reservations about the use of either Clean Up and Abatement Orders (as indicated in the TO) or Cease and Desist Orders (as indicated in the supplemental Tentative Fact Sheet) as the means by which to incorporate forthcoming TMDL WLAs into the MS4 permit. The Permittees request an explanation as to why the Regional Water Board plans to use these two types of enforcement tools to specify TMDL requirements.</p>	<p>All references to CDOs and CAOs, in regards to TMDL implementation, have been removed from the Tentative Order. This does not, however, preclude the Regional Board from future consideration of the use of these authorities to address TMDLs.</p>
144	4	TMDL	I	<p>Also as noted previously, the Permittees are concerned that it appears the Regional Board plans to incorporate WLAs as numeric effluent limits in the stormwater permit without consideration of other options or as to how the TMDL may be written, which might include:</p> <ul style="list-style-type: none"> • Requiring implementation of specific BMPs in the permit; • Providing a recommended menu of potential BMPs in the TMDL, implementation plan, or the permit for sources to evaluate and select; • Referencing BMP performance standards in the TMDL, implementation plan, or the permit; • Recommending the selection of BMPs and developing benchmark values or performance measures; and • Requiring the review of existing BMPs and selecting additional BMPs to achieve progress. <p>The USEPA draft handbook TMDLs to Stormwater Permit lists the above options and notes that: "There are no guidelines for determining which approach is most appropriate to use. It is likely that a variety of factors, including type of source, type of permit, and availability of resources, will influence which approach makes the most sense." It does not appear that the Regional Board has consider the variety of factors in determining that numeric effluent limitations are most appropriate method of incorporating the WLAs for all pollutants in all watersheds into the MS4 stormwater permit.</p>	<p>Please see response to comment no. 72.</p> <p>Further, the "TMDL Implementation Plan" contained in Attachment A to Resolution R9-2008-0027 specifically states that meeting Waste Load Allocations of the TMDL will result in full attainment of Water Quality Standards. And, by the end of the compliance period, applicable Water Qulaity Objectives will be met in the receiving waters.</p>

145	4	General	J	<p>Program Effectiveness Assessment (Section J, Page 79)</p> <p>The previous comments on this issue made by the Permittees were not addressed in the Regional Board's two Response to Comments documents, and are therefore resubmitted. Section J. of the Tentative Order requires the Permittees to assess the effectiveness of their JURMP, identify necessary program modifications, and report that information to the Regional Water Board on annual basis. Section J.1.a. identifies specific water quality-based objectives for 303(d) listed water bodies, environmentally sensitive areas (ESAs), and the major program components.</p> <p>Although the concept and intent of the provision is understood and supported by the Permittees, the specificity and inclusion of the required water quality-based objectives and focus on the 303(d) listed water bodies and ESAs is misplaced and has not been developed within the context of the California Stormwater Quality Association (CASQA) Guidance, the existing Orange County program effectiveness assessment framework and metrics, or the recommendations within the ROWD (Section 1.2.2). In addition, the Tentative Order also requires that each Permittee conduct their own assessments including integrated assessments, which are more effective on a regional scale and over a longer timeframe. As written, this section of the Tentative Order does not provide flexibility for the Permittees to develop objectives and an overall strategy for the effectiveness assessment and will result in resources being expended without achieving the intended goal.</p> <p>Since the Permittees have already developed and implemented a program effectiveness assessment framework and programmatic and environmental performance metrics and have committed to developing metric definitions and guidance to improve the efficacy of the assessments in the ROWD, the provision should be modified to allow the Permittees to functionally update their long-term effectiveness assessment approach. The updated approach would build on the existing framework that has been utilized within the County for the past four years as well as the CASQA Municipal Stormwater Program Effectiveness Assessment Guidance Document, May 2007, and would assess the jurisdictional, countywide, and watershed-based elements of the stormwater program. The long-term strategy would include the purpose, objectives, and methods for the assessments and achieve the Regional Water Board staff objectives.</p> <p>The proposed language, which is provided below, would replace J.1. and J.2. of the Tentative Order and is based on the current permit requirements.</p> <p>The proposed language is: a. As part of its individual JURMP, each</p>	<p>This comment was raised in 2007 and responded to at that time (comment #56, page 70 of Response to Comments on Tentative Order No. R9-2007-0002, July 6, 2007). The comment does not raise any new arguments on the subject.</p> <p>The Regional Board disagrees with the commenter who suggested that the Tentative Order not require each Copermittee to conduct annual effectiveness assessments. The commenter based its recommendation on the grounds that assessments are more appropriately conducted on a regional basis, rather than jurisdictional basis. The Regional Board considers annual assessments of individual programs crucial to the implementation of effective programs. For instance, without such assessments, the Copermittees would be challenged to properly implement the iterative process of the Receiving Waters Limitation language. Annual assessments should be based on an evaluation of the findings of the individual program's components and water quality data. A regional assessment can help provide some context for the total effort or proportional effort of various components, but it cannot substitute for an assessment of the actual effectiveness of the jurisdictional program.</p> <p>In regards to the CASQA guidance and the recommendations within the ROWD, the Regional Board is not obligated to write the Tentative Order to be identical with such documents. The CASQA document is more suited as guidance for the Copermittees in complying with MS4 permits rather than guidance for the Regional Board in writing MS4 permits. The Regional Board considers that information as part of the body of knowledge in crafting the requirement. We disagree that effectiveness assessments are better suited on a regional level rather than on a jurisdictional level. Assessments conducted on a regional level are inflexible to the needs and concerns of the individual Copermittee, but rather reflect the priorities and mandates of the regional authority who conducts the assessment. The individual Copermittee is responsible for the discharge from their MS4 and for compliance with the MS4 permit, not the regional authority. The permit requires watershed based assessment through the WRMP program (Section G), which is more appropriate than a regional assessment.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

Permittee shall update their long-term strategy for assessing the effectiveness of its individual Jurisdictional URMP based on lessons learned from the existing program framework and available guidance. The long-term assessment strategy shall identify the purpose, objectives, methods and specific direct and indirect measurements that each Permittee will use to track the long-term progress of its individual Jurisdictional URMP towards achieving improvements in receiving water quality. Methods used for assessing effectiveness shall include the following or their equivalent: surveys, pollutant loading estimations, and receiving water quality monitoring. The long-term strategy shall also discuss the role of monitoring data in substantiating or refining the assessment.

b. As part of its individual Jurisdictional URMP Annual Report, each Permittee shall include an assessment of the effectiveness of its Jurisdictional URMP using the direct and indirect assessment measurements and methods developed in its long-term assessment strategy. The updated long-term strategy shall be submitted within 365 days after adoption of the permit.

c. Long-term strategy for assessing the effectiveness of the Watershed URMP. As part of the WURMPs, the watershed Permittees shall update their long-term strategy for assessing the effectiveness of the WURMPs based on lessons learned from the existing program framework and available guidance. The long-term assessment strategy shall identify the purpose, objectives, methods and specific direct and indirect performance measurements that will track the long-term progress of Watershed URMP towards achieving improvements in receiving water quality impacted by urban runoff discharges. Methods used for assessing effectiveness shall include the following or their equivalent: surveys, pollutant loading estimations, and receiving water quality monitoring. The longterm strategy shall also discuss the role of monitoring data in substantiating or refining the assessment. The updated long-term strategy shall be submitted within 365 days after adoption of the permit.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
146	4	General	K	<p>Reporting (Section K, Pages 83-85, and Section G, Page76)</p> <p>The previous comments on this issue made by the Permittees were not addressed in the Regional Board's two Response to Comments documents, and are therefore resubmitted. Section H of the Tentative Order requires the Permittees to submit the following reports:</p> <ul style="list-style-type: none"> • Individual and Unified JURMP annual reports - September 30 of each year (July 1 – June 30) • Individual and Unified WURMP annual reports - January 31 of each year (July 1 – June 30) <p>Although the Permittees understand that the Tentative Order included these changes to allow for a longer time period between the two sets of submittals, the Permittees would receive more benefit from keeping the two timelines for the submittals aligned. As such, the language should be revised so that the JURMPs and WURMPs are submitted January 31 of each year. This will allow the Permittees to assess their stormwater program and water quality monitoring program and conduct an integrated assessment to identify water quality improvements.</p> <p>Section G.4. requires that the Permittees submit the Aliso Creek WURMP annual report by March 1 of each year for the period January – December of the previous year. Since the Watershed Action Plan Annual Report for the Aliso Creek Watershed has historically been submitted in November of each year and has been based on the fiscal year like the other WURMP reports, it is unclear why Board staff are requiring this change. As such, the Aliso Creek WURMP submittal is now inconsistent with the other WURMP submittals both in the date for submittal and the time period for which the report covers.</p> <p>The submittal date for the Aliso Creek WURMP annual report should be modified to be aligned with the other WURMP submittals. The proposed language modification is as follows:</p> <p>4. Aliso Creek Watershed RMP Provisions b. Each Copermittee must provide annual reports by March 1 January 31 of each year beginning in 20089 for the preceding annual period of January July 1 through December June 30...</p>	<p>In addition to allowing the Coermittees more time to prepare each set of the submittals, the staggered submittal schedule allows the Regional Board more time to review the annual reports. Also, separating the WRMP and JRMP annual reports provides separate attention to the watershed program so that the watershed priorities do not become confused, lost and diminished in light of the jurisdictional reports. Section K. Reporting of the Tentative Order has been revised to allow the Copermittees to propose an alternate reporting criteria and schedule as part of their updated JRMP.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
147	5	NEL	C	<p>The Draft Permit’s misapplication, or in some cases lack of application, of the Maximum Extent Practicable (“MEP”) standard remains a primary overarching defect with the Permit. The Draft Permit contains numerous provisions that simply ignore the MEP standard that governs municipal storm water discharges under the Clean Water Act (“CWA”). In effect, the Draft Permit attempts to treat municipal dischargers in the same manner as industrial dischargers by applying strict numeric effluent limits to all dry weather discharges (through the use of specific numeric effluent limits) and wet weather discharges (through the use of what are referred to as Municipal Action Levels or “MALs”). ...</p> <p>In sum, these terms: (i) replace the MEP standard with numeric effluent limits for all dry weather discharges (Section C.2, Section C.14), (ii) apply MALs as numeric limits for wet weather discharges (Section D), These provisions are contrary to the CWA and California law.</p>	Please see response to Comments 33, 39 and 79.
148	5	TMDL	I	<p>The Draft Permit’s misapplication, or in some cases lack of application, of the Maximum Extent Practicable (“MEP”) standard remains a primary overarching defect with the Permit. The Draft Permit contains numerous provisions that simply ignore the MEP standard that governs municipal storm water discharges under the Clean Water Act (“CWA”). ... The Draft Permit likewise seeks to require strict compliance with all waste load allocations from adopted Total Maximum Daily Loads (“TMDLs”). ... (iii) directly incorporate waste load allocations from adopted TMDLs as strict discharge prohibitions (Section I, p. 79), and (iv) enforces TMDLs through the use of Cease and Desist orders. These provisions are contrary to the CWA and California law.</p>	<p>All references to CDOs and CAOs, in regards to TMDL implementation, have been removed from the Tentative Order. This does not, however, preclude the Regional Board from future consideration of the use of these authorities to address TMDLs.</p> <p>Please see response to comment no. 59.</p> <p>The Regional Board (San Diego) does not agree that these provisions, which have been removed for the most part, are contrary to the CWA or California Law. It is not clear what aspects of the CWA and of CA Law the City is invoking and/or calling into question.</p>
149	5	Urban Runoff	General	<p>Notably, the Draft Permit’s universal deletion of “urban” from the phrase “urban runoff” also appears to reflect a policy shift to completely remove the MEP standard from the Permit. But this attempt to effectively revise the CWA is directly contrary to U.S. EPA’s regulations under the CWA, which define storm water as including urban runoff: “Storm water means storm water runoff, snow melt runoff, and surface runoff and drainage.” (40 CFR 122.26(b)(13).) Because “storm water,” by definition, specifically includes not only “storm water runoff” and “snow melt runoff” but also “surface runoff and drainage,” the plain language of the regulation demonstrates that EPA expressly intended for “urban” runoff to be included in the definition of storm water.</p>	<p>The commenter misinterprets the definition of storm water in the Code of Federal Regulations. In no way does “surface runoff and drainage” connote “urban runoff” nor restrict that surface runoff only comes from urbanized areas. The plain language of the definition in the Code of Federal Regulations does not include the term “urban runoff,” a term that was well known to the USEPA. The Final Rule to the Code of Federal Regulations expressly declares that MS4 permits apply to all MS4 discharges in the designated areas and is not limited to those MS4 discharges in urban areas, but also includes MS4 discharges in suburban and semi-rural areas where the Copermittees own and operate a MS4. Please see the response to Comment No. 47 for more information.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
150	5	NEL	C	Likewise, the Draft Permit's effort to remove "dry-weather" discharges from regulation as "storm water" is directly contrary to law and should be deleted. The CWA simply does not treat dry weather discharges as a separate category of non-storm water discharge. In short, the Draft Permit's attempt to distinguish between wet weather runoff, versus other urban runoff, and the desired enhanced regulation of municipal dischargers which follows in the Draft Permit from this ill-conceived distinction, is contrary to law.	Please see response to Comments 39 and 79.
151	5	Legal	General	When viewed collectively, the Draft Permit's terms operate to eliminate the application of the MEP standard to municipal discharges and to replace the MEP standard with strict numeric limits. Time and again, however, courts, U.S. EPA, and the State Board have recognized that storm water discharges are different than traditional point source discharges, and storm water must be analyzed and treated as such under the CWA. For example, in <i>Building Industry Association of San Diego County v. State Water Resources Control Board</i> (2004) 124 Cal. App. 4th 866, 874 the court found that "Congress amended the Clean Water Act to add provisions that specifically concerned NPDES permit requirements for Storm Sewer discharges. [Citations] In these amendments, enacted as part of the Water Quality Act of 1987, Congress distinguished between industrial and municipal storm water discharges. . . . With respect to municipal storm water discharges, Congress clarified that the EPA has the authority to fashion NPDES permit requirements to meet water quality standards without specific numeric effluent limits and instead to impose controls to reduce the discharge of pollutants to the maximum extent practicable." (Id. citing 33 USC § 1342 (p)(3)(B)(iii) & <i>Defenders of Wildlife v. Brown</i> (9th Cir. 1999) 191 F.3d 1159, 1163.)	<p>Please see response to Comments 33 and 39.</p> <p>The Regional Board agrees regarding the differing treatment of municipal and industrial storm water discharges under 402(p) of the CWA, hence the amendments to section 402 in 1987. However, the Regional Board maintains that the regulations under 402(p) and USEPA are clear regarding the applicability and use of numeric limits for municipal stormwater discharges, though none are proposed under this Tentative Order. The Federal Register states that NPDES permits for municipal storm water discharges must require controls to reduce the discharge of pollutants to the MEP and where necessary water quality based controls (55 Fed Reg 47994, 47995). This is further supported by USEPA in their Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, dated August 26, 1996. The document states: "The interim permitting approach uses best management practices in first-round storm water permits, and expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards. In cases where adequate information exists to develop more specific conditions of limitations to meet water quality standards, these conditions or limitations are to be incorporated into storm water permits, as necessary and appropriate. This interim permitting approach is not intended to affect those storm water permits that already include appropriately derived numeric water quality-based effluent limitations. Since the policy only applies to water quality-based effluent limitations, it is not intended to affect technology-based limitations, such as those based on effluent guidelines or the permit writer's best professional judgement, that are incorporated into storm water permits".</p> <p>In addition, as noted in <i>Building Industry Association of San Diego County et al. v. State Water Resources Control Board, et al.</i> ((2004) 124 Cal.App.4th 866, 142-143), the Ninth Circuit in <i>Defenders of Wildlife v. Browner</i> [(9th Cir. 1999) 191 F.3d 1159] rejected arguments "that 'the EPA may not, under the [Clean Water Act], require strict compliance with state water-quality standards, through numerical limits or otherwise.'" (<i>Defenders of Wildlife v. Browner, supra</i>, 191 F.3d at p. 1166).</p>

152	5	NEL	General	<p>EPA also has expressly acknowledged that storm water discharges must be treated differently than industrial discharges, and that urban runoff need not meet numeric limits or implement costly end-of-pipe controls. For example, when adopting the California Toxics Rule ("CTR"), EPA made the following comments in its Preamble and/or in its Responses to Comments on CTR:</p> <p>Thus, under the CWA, EPA's promulgation of water quality criteria or standards establishes standards that the State, in turn, implements through the NPDES permit process. The State has considerable discretion in deciding how to meet the water quality standards and in developing discharge limits as needed to meet the standards. In circumstances where there is more than one discharger to a water body that is subject to water quality standards or a criteria, a State also [has] discretion in deciding on the appropriate limits for the different dischargers. While the State's implementation of federally-promulgated water quality criteria or standards may result indirectly in new or revised discharge limits for small entities, the criteria or standards themselves do not apply to any discharger, including small entities. (65 Fed. Reg. 31682, 31708-09 [Ex. 3].)</p> <p>In EPA's Responses to certain Ventura County Comments on CTR, EPA stated that: If you look across the country, across the U.S., there are many, many states that have standards on the books, water quality standards that are far more stringent than the numbers we're promulgating or proposing to promulgate in Southern California. If you look at their standards, you won't see any black boxes on the end of those storm water discharges. Nobody builds treatment for storm water treatment in this country. They've been implementing standards for 15 years, California is no different. (See Ex. 3 hereto, EPA Response to CTR H-002-017.) In EPA's Response to Comments from Los Angeles County, EPA stated: EPA did not ascribe benefits or costs of controlling storm water discharges in the proposed or final Economic Analysis. EPA believes that many storm water dischargers can avoid violation of water quality standards through the application of best management practices that are already required by the current storm water permits. The commenter claims that even with the application of current BMPs, its storm water dischargers would still violate water quality standards due to the CTR criteria. The commenter appears to assume that storm water discharge would be subject to numeric water quality based effluent limits, which would be equivalent to the criteria values and applied as effluent limits never to be exceeded or calculated in the same manner that effluent limits are calculated for other point sources, such as POTWs. The comment then appears to assume that such WQBELs would then require the construction of very costly end-of-pipe controls. EPA contends that neither scenario is valid with regard to developing WQBELs for storm water discharges or</p>	<p>Please see response to Comments 33, 39 and 79.</p> <p>The Regional Board disagrees with the commenters statement that EPA "has expressly acknowledged that storm water discharges must be treated differently than industrial discharges, and that urban runoff need not meet numeric limits or implement costly end-of-pipe controls". Please see response to comment 151. In comments received on this Tentative Order, USEPA states: "We believe that the use of numeric effluent limits for non-stormwater discharges would be a significant step in the right direction and we support the proposed limits. // As noted in the fact sheet, additional information has become available to the Board about the discharges over the years, and we agree that the numeric effluent limits are now appropriate." Please see comment no. 307.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

establishing compliance with WQBELs.... EPA will continue to advocate the use of BMPs, as discussed in the CTR preamble. EPA will continue to work with the State to implement storm water permits that comply with water quality standards with an emphasis on pollution, prevention, and best management practices rather than costly end-of-pipe controls. (Ex. 3, EPA Response to CTR-001-007.) In EPA's Response to Comments of Sacramento County, it admitted that: EPA believes the applicability of water quality standards to storm water discharges is outside the scope of the rule. (Ex. 3, EPA Response to CTR-040- 014b.) In EPA's Response to the Fresno County Metropolitan Flood Control District's Comments, it acknowledged as follows: EPA believes that implementation of the criteria [CTR] as applied to wet weather will not require the construction of end-of- pipe facilities. (Ex. 3, EPA Response to CTR-031-005b.) In other EPA responses to various comments, it again confirmed that stormwater is to be treated differently than traditional point source discharges: As further described in the responses to CTR-021-008, CTR-013- 003 and CTR-040-004, EPA believes that the final CTR will not significantly affect the current storm water program being implemented by the State, which includes the requirement to develop best management practices to control pollutants in storm water discharges. As such, EPA believes that inclusion of end-of- pipe treatment costs for storm water are inappropriate. (Ex. 3, EPA Response to CTR-035-044c.) EPA's Comments in CTR to the California Storm Water Task Force included the following: EPA disagrees with the cost estimates provided by the commenter as EPA does not believe that storage and treatment of storm water would be required to ensure compliance with the CTR. (Ex. 3, EPA Response to CTR H-001-001b.) EPA believes that the CTR language allows for the practice of applying maximum extent practicable (MEP) to MS4 permits, along with best management practices (BMPs) as effluent limits to meet water quality standards where infeasible or insufficient information exists to develop WQBELs. (Ex. 3, EPA Responses to CTR-040-004.) Importantly, when adopting the rule EPA specifically determined that CTR was not to have a direct effect on NPDES sources not typically subject to numeric water quality based effluent limits or urban runoff, and that "compliance with water quality standards through the use of best management practices (BMPs) is appropriate." (65 Fed. Reg. 31703 [Ex. 3].)

153	5	TMDL	I	<p>Moreover, in a November 22, 2002 EPA Guidance Memorandum on Establishing TMDLs (EPA Guidance Memo, Ex. 4), EPA explained that for NPDES-regulated municipal storm water discharges, any water quality based effluent limit for such discharges should be “in the form of BMPs, and that numeric limits will be used only in rare instances.” (EPA Guidance Memo, Ex. 4, p. 6.) EPA recommended that “for NPDES-regulated municipal . . . discharges effluent limits should be expressed as best management practices (BMPs) or other similar requirements, rather than as numeric effluent limits.” (Id. at p. 4.) EPA went on to expressly recognize in this Guidance Memo the general difficulties in regulating Stormwater discharges, where it stated that: EPA’s policy recognizes that because storm water discharges are due to storm events that are highly variable in frequency and duration and are not easily characterized, only in rare cases will it be feasible or appropriate to establish numeric limits for municipal and small construction storm water discharges. The variability in the system and minimal data generally available make it difficult to determine with precision or certainty actual and projected loadings for individual dischargers or groups of dischargers. Therefore, EPA believes that in these situations, permit limits typically can be expressed as BMPs, and that numeric limits will be used only in rare instances. (EPA Guidance Memo, Ex. 4, p. 4.)</p>	Please see responses to comments Nos. 59, 72 and 144.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
154	5	MEP	General	<p>In addition, the policy of the State of California provides that strict numeric limits are not an appropriate means by which to implement the MEP standard. The State’s policy to apply the MEP standard through iterative BMP implementation and not through strict numeric discharge limitations is reflected in prior orders and other documentation from the State Board. (See, e.g., Order No. 91-04, p. 14 [“There are no numeric objectives or numeric effluent limits required at this time, either in the Basin Plan or any statewide plan that apply to storm water discharges.” p. 14] [Ex. 5]; Order No. 96-13, p. 6 [“federal laws does not require the [San Francisco Reg. Bd] to dictate the specific controls.”] [Ex. 6]; Order 98-01, p. 12 [“Stormwater permits must achieve compliance with water quality standards, but they may do so by requiring implementation of BMPs in lieu of numeric water quality-based effluent limitations.”] [Ex. 7]; Order No. 2001- 15, p. 8 [“While we continue to address water quality standards in municipal storm water permits, we also continue to believe that the iterative approach, which focuses on timely improvements of BMPs, is appropriate.”] [Ex. 8, emph. added]; State Board Order No. 2006-12, p. 17 [“Federal regulations do not require numeric effluent limitations for discharges of stormwater”] [Ex. 9]; Stormwater Quality Panel Recommendations to The California State Water Resources Control Board – The Feasibility of Numeric Effluent Limits Applicable to Discharges of Stormwater Associated with Municipal, Industrial and Construction Activities, June 19, 2006, p. 8 [“It is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban dischargers.”] 1 [Ex. 10]; and an April 18, 2008 letter from the State Board’s Chief Counsel to the Commission on State Mandates, p. 6 [“Most NPDES Permits are largely comprised of numeric limitations for pollutants. . . . Stormwater permits, on the other hand, usually require dischargers to implement BMPs”] [Ex.11].) In light of this state and federal authority, any attempt to impose strict compliance with numeric limits at this time--through numeric effluent limits for dry weather dischargers, MALs for wet weather, or waste load allocation from TMDLs--is wholly unsupportable and contrary to law.</p>	<p>Please see response to Comment Nos. 33(MALs), 39(NELs), 79(NELs) and 151(legal).</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
155	5	unfunded mandate	General	<p>The Permit's use of more stringent compliance measures than is required by federal law (see <i>Defenders of Wildlife v. Brown</i> (9th Cir. 1999) 191 F.3d, 1159, 1166) triggers an obligation to comply with a series of requirements imposed under State law. As was the case with the prior proposed permit, because the Draft Permit imposes various requirements that go beyond federal law requirements (e.g., compliance with MALs for wet weather runoff, numeric effluent limits for dry weather runoff, strict compliance with TMDL waste load allocations, the complete prohibition of irrigation waters entering the MS4, LID requirements, retrofit requirements and other terms discussed in prior comments), the Regional Board must comply with the Porter- Cologne Act. Specifically, the Board must consider all of the factors and considerations delineated in California Water Code Sections 13000 and 13241 before adopting the Draft Permit. (See <i>City of Burbank v. State Water Resources Control Board</i> (2005) 35 Cal.4th 613, 627.)</p>	<p>The requirements of the Tentative Order do not exceed federal law. The Tentative Order contains requirements more explicit (i.e. detailed) than the federal NPDES storm water regulations, for the purpose of achieving compliance with the CWA provision that MS4 permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable" (CWA section 402(p)(3)(B)(iii)). As such, the Tentative Order's (space removal) requirements are necessary to comply with federal law, rather than exceed it. Therefore, the Regional Board need not consider the factors listed in Water Code section 13241 in adopting the Tentative Order. (<i>City of Burbank v. State Water Resources Control Board</i> (2005) 35 Cal.4th 613.) To the extent that information about cost is submitted, the Regional Board will nonetheless consider it. To the extent that information about cost is submitted, the Regional Board will nonetheless consider it. The Fact Sheet for Finding E.6 discusses this matter in further detail. Nothing presented in this comment changes the Fact Sheet discussion.</p>
					<p>The Regional Board's Tentative Order provides more detail to implement performance standards in the CWA or NPDES regulations. NPDES regulations specify terms and conditions that must, at a minimum, be included in NPDES requirements; they do not limit states or U.S EPA from including other provisions that may be necessary to ensure that municipalities with MS4 reduce storm water pollutants to the MEP. In fact, the Clean Water Act requires the Regional Board to "require ... other provisions as the Administrator or the State determine appropriate for the control of such pollutants." (CWA Section 402(p)(3)(B)(iii)) The burden to determine the appropriateness of the required provisions lies with the State rather than the Copermittee, because a discharger cannot self regulate their discharge.</p>
					<p>No portion of the proposed MS4 requirements exceed the level of "governmental service" (i.e., performance) necessary to reduce pollutants in storm water to the MEP as mandated by Section 402(p)(3)(B)(iii) of the CWA [33 U.S.C. Section 1342(p)(3)(B)(iii)]. While, technically, all NPDES requirements issued by the Regional Boards "fall under the legal authority of the state" because they are promulgated in waste discharge requirements issued pursuant to Sections 13260 and 13263 of the Water Code, requirements issued for discharges of pollutants from point sources to waters of the United States, including requirements for discharges of storm water in MS4s, implement the provisions of the federal CWA and the federal NPDES regulations, as contemplated by Chapter 5.5 of the Porter-Cologne Water Quality Control Act (Section 13370, et seq.). Therefore, nothing in the proposed order renewing NPDES requirements for discharges in Orange County MS4 exceeds the scope of regulation necessary to implement NPDES regulations for MS4.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
156	5	NEL	C	To be sure, the above-referenced statutory, regulatory, and case authority all clearly confirm not only that municipal dischargers are to be treated differently than other NPDES dischargers, but also that numeric limits should not and cannot be applied to municipal dischargers at this time. "It is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban dischargers." (Numeric Limits Panel Report, [Ex.9 p. 8].) Given that Congress specifically provided a different standard for municipal dischargers-- the MEP standard, and in light of the demonstrated infeasibility of complying with numeric limits at this time (Ex. 9), the Draft Permit's terms that seek to force strict compliance with numeric effluent limits impose impossible requirements. These requirements therefore are unenforceable. (See <i>Hughey v. JMS Development Corp.</i> (11th Cir. 1996) 78 F.3d 1523, 1529- 30.)	Please see response to Comment nos. 25, 33, 39, 79 and 151.
157	5	TMDL	I	A prime example of this impossibility is found in the Draft Permit terms which provide that TMDL waste load allocations incorporated into the Permit will be enforced through "Cease and Desist" orders issued under Water Code section 13331. That law states: "Upon the failure of any person or persons to comply with any cease and desist order issued by a regional board or the state board, the Attorney General, upon request of the board, shall petition the superior court for the issuance of a preliminary or permanent injunction, or both, as may be appropriate, restraining such person or persons from continuing the discharge in violation of the cease and desist order." (Water Code § 13331(a).) These cease and desist provisions plainly presume that the alleged violator has control over the discharge and has the ability to cease "continuing the discharge." But there is no evidence it is possible for municipal dischargers to strictly comply with numeric limits. In fact, the primary purpose of the Numeric Limits Panel Report was to evaluate this very issue, and the Report concluded that it was "infeasible" to do so at this time. In other words, the Report concluded that it is not "possible" for municipal dischargers to achieve compliance with numeric limits.	All references to CDOs and CAOs, in regards to TMDL implementation, have been removed from the Tentative Order. This does not, however, preclude the Regional Board from future consideration of the use of these authorities to address TMDLs. In regards to numeric limits, please see response to Comments 25, 33 and 39.
158	5	NEL	C	Finally, it is well settled that the CWA does not require that municipal dischargers strictly comply with numeric limits. Any attempt by the Regional Board to compel compliance with strict numeric limits plainly requires a consideration of all of the factors and considerations set forth under Water Code Sections 13241 and 13000 before imposition of any such numeric effluent limits (whether through MALs or waste local allocation from TMDLs). But there is no evidence at this time (whether in the record, Fact Sheet, or in any other analysis made public by Regional Board Staff to date), that these mandatory factors and considerations were analyzed.	Please see response to Comments 33, 39, 79, 81, 151 and 155.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
159	5	Overirrigation	B	<p>As was the case with the prior version, the Draft Permit improperly renders municipalities responsible for the discharging activities of third parties that are beyond Dana Point's control. Indeed, read literally, the Permit requires that Dana Point prohibit all non-point source "Landscape irrigation," "Irrigation water," and "lawn water," from entering any storm sewer system. But meeting such a requirement is not just impracticable, it is impossible. (See Hughey, 78 F.3d at 1529-30.)</p> <p>For example, to prohibit all "irrigation" and "lawn" waters from "entering" the MS4, Dana Point would have to adopt and enforce an ordinance that prevents any overwatering from entering the storm sewer, and it essentially would have to require a large percentage of its residents to remove grass from yard landscaping. Such a requirement is not found in the CWA, and as such again triggers the need to comply with Water Code Sections 13000 and 13241.</p> <p>Moreover, if any non-point source irrigation water or other runoff enters the City's storm drain system, the City would be subject to penalties and citizen suits (and attorney's fees) under the CWA, regardless of whether the irrigation waters are the cause of an exceedance of receiving water limitations. It appears that to comply with these measures, Dana Point would need to hire staff to act as full time policing agents of irrigation water runoff.</p>	<p>Please see response to Comments 39, 42 and 44.</p> <p>The commenter misapplies the decision in <i>Hughey v. JMS development</i>, 78 F.3d. The commenter's interpretation of a prohibition of non-stormwater discharges into the MS4 may seem absurd (impossible) on the surface; but their proposed implementation of the prohibition is speculative and is not the expectation of the Tentative Order or the federal regulations. The history of Copermittees prohibiting non-stormwater discharges does not support the commenter's contention. The previous MS4 permit for South Orange County and all other MS4 permits in Southern California prohibit the discharge of non-stormwater to the MS4 with certain case-by-case exceptions. Other examples of prohibited non-stormwater discharges other than overirrigation include powerwashing, commercial car washing and chlorinated swimming pool discharges. Copermittee's programs to comply with the previous Permit's prohibition of non-stormwater discharges did not result in an absurd (impossible) requirement. Clearly, the Regional Board has not expected the Copermittee's to do the impossible in the past, and the Regional Board does not expect the Copermittee's to do the impossible in the future. A reasonable approach to address the prohibition on overirrigation would be through the Copermittee's existing programs to prohibit non-stormwater discharges, e.g. prohibition ordinances, education of the public, response to complaints, progressive enforcement as needed, and to work in concert with the water providers.</p> <p>In addition, the Regional Board expects that the removal of irrigation water (lawn water, residential landscape water, etc.) will require Permittees to incorporate such non-storm water discharges into their current IC/ID programs for detecting and eliminating illicit discharges. The Regional Board does not anticipate that the Copermittee would have to require property owners to remove grass or yard landscaping. As current and past versions of the Order include and have included requirements prohibiting the discharge of non-storm water into the MS4 (see updated Supplemental Fact Sheet), any non-storm water discharge into the MS4 which currently occurs, that is not exempt or subject to a separate NPDES permit, is in violation of the discharge prohibition contained in the Order. Thus, requiring the prohibition of an additional non-storm water discharge is not subjecting the Copermittee to any enforcement mechanisms not already present in the current Order.</p> <p>The prohibition of over irrigation runoff is practicable. The Copermittees already have demonstrated the ability to adopt ordinances prohibiting other non-storm water discharges such as commercial car washing, power washing and chlorinated swimming pool discharges. The Copermittees have developed a program of education, complaint response, and progressive enforcement to address non-storm water discharges. The prohibition of over irrigation</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

					<p>would be easily implemented through their existing programs that address non-storm water discharges. The Regional Board realizes that the effectiveness of such measures dealing with over irrigation runoff will not be realized over night.</p> <p>The claim that the City will need to require its residents to remove grass from yard landscaping is a "slippery slope" logical fallacy. The prohibition of over irrigation in the MS4 permit certainly does not require the removal of grass; nor does the Regional Board expect a City to go to such extreme measures. The Copermittees will have to exercise due care and discretion in addressing the prohibition on over irrigation to assuage public concerns. A reasonable approach to address the prohibition on over irrigation would be to educate the public, respond to complaints, conduct progressive enforcement as needed, and work in concert with the water providers.</p>
160	5	NEL	C	<p>As noted in prior comments and by the County's concurrent comments, the CWA requires only that city's work to "effectively" prohibit non-storm water discharges and illegal discharges/illicit connections to storm drain systems. (See 40 C.F.R. 122.26 (d)(2)(iv)(B)(1). Under EPA's regulations implementing the CWA, municipalities comply with this requirement by enacting and reasonably enforcing ordinances to prohibit discharges of non-storm water containing pollutants to storm drains. (Id.) The Draft Permit, however, goes much further than federal law requires. It essentially holds municipalities strictly liable for third party discharges and non-point source dry-weather runoff into storm drain systems by making any exceedance of numeric limits--found in the MALs and water quality based effluent limitations incorporated into the Draft Permit--actionable as a violation. Such provisions are contrary to law, and therefore should not be included in the Permit. Moreover, because these terms are not required anywhere under federal law, the Draft Permit is contrary to State law because the Board has failed to comply with Water Code Sections 13000 and 13241 before imposing such provisions.</p>	<p>Please see response to Comments 39, 43, 79, 81, 82, 155 and 165.</p> <p>In addition, past Orders and the Tentative Order prohibit non-storm water discharges into the MS4 and require that Copermittees prohibit non-storm water discharges into the MS4 via ordinances, orders or similar means (see response to Comments 39, 42, 44). As such, any non-storm water discharges into the MS4 that are not exempted or subject to a NPDES permit would be in violation of the current and tentative Order.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
161	5	Legal	F.1	<p>The Permit’s LID and retrofitting provisions (e.g. Section D.3.d, F.3.d) are contrary to law. These retrofitting provisions are beyond the power of the Board to require. For example, there is no existing legislative mandate that requires mandatory structural changes be made to existing developments to limit runoff. But the retrofitting requirements plainly command that cities evaluate candidates for retrofitting. Taken to its logical conclusion, such a provision violates the separation of power clause under the California Constitution. (Cal. Const. Art. 4, § 1; Knudsen Creamery Co. of California v. Brock (1951) 37 Cal.2d 485, 492.) The executive branch of government is charged with enforcing laws, but it cannot adopt laws itself. (Id.) The executive branch also cannot adopt regulations that conflict with local agencies’ powers under the State Constitution. The detailed legal enforcement provisions of the Draft Permit, including the provisions requiring enforcement of specific obligations in relation to particular property owners, such as HOAs (section D.3.c.(5)(b)), unduly restrict the inherent legislative power of cities.</p>	<p>The requirement for the Copermittees to implement a retrofitting program is authorized by law under the Clean Water Act 402(p)(3)(B)(ii-iii), California Water Code section 13377 and Federal NPDES regulations 40 CFR 122.26(d)(2)(iv). Permits for discharges from municipal storm sewers shall require controls to reduce the discharge of storm water pollutants to the maximum extent practicable. The requirements for retrofitting are consistent with the maximum extent practicable standard as written. Retrofitting has been conducted throughout the country in diverse communities and watersheds. The requirements for retrofitting as written do not conflict with any local agencies’ powers or authorities. Section F.3.d.(4) was specifically written to be within those local agencies’ powers.</p>
162	5	Retrofitting	F.3	<p>In addition to compromising the separation of powers doctrine, the retrofitting provisions of the permit act as an underground regulation of the private property owners who are the true subjects of the regulatory command for retrofitting. A regulation enacted without adherence to the Administrative Procedure Act’s (“APA”) notice and hearing requirements is void. (Tidewater Marine Western, Inc. v. Bradshaw (1996) 14 Cal.4th 557, 573-576) “The APA was designed in part to prevent the use by administrative agencies of ‘underground’ regulations [citation], and it is the courts, not administrative agencies, which enforce that prohibition.” (California Advocates for Nursing Home Reform v. Bonta (2003) 106 Cal. App.4th 498, 506.) In Tidewater Marine, 14 Cal.4th at 569 the California Supreme Court recognized that: “One purpose of the APA is to ensure that those persons or entities whom a regulation will affect have a voice in its creation [citation], as well as notice of the law’s requirements so that they can conform their conduct accordingly.” Here, the Draft Permit is directly affecting private property owners subject to the “retrofitting” assessment, but there has been no effort to comply with the APA.</p>	<p>The Tentative Order does not place any requirements on private landowners. Rather, Section F.3.d.(4) requires the copermittees to cooperate with private landowners in encouraging retrofitting projects, similar to other retrofitting projects throughout the country such as in Kansas City, KS and Montgomery County Maryland. The actual decision to retrofit on privately held land would be at the discretion of the private landowner. Also, please see response to comment no. 46.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
163	5	Legal	F.3	<p>Moreover, as discussed in regard to various provisions in the prior Draft Permits, the retrofitting provisions are contrary to the California Environmental Quality Act (“CEQA,” Public Resources Code § 21000 et seq.) because they change the environmental review process applicable to projects involving retrofitting, and they completely remove the discretion of local governmental entities that expressly provided by law. (See Ex. 2, Dana Point’s January 21, 2008 Comments, pages 12-14.)</p>	<p>The Regional Board does not propose to impose requirements that exceed federal law in the CWA and NPDES regulations but may impose requirements necessary to meet the minimum federal MEP standard. Therefore, the Regional Board does not have to comply with CEQA requirements because the Tentative Order’s requirements do not exceed the level of regulation necessary to implement the MEP performance standards for stormwater discharges. The requirements are not intended to circumvent or alter CEQA as applied to local agencies in carrying out their authorities.</p> <p>The Tentative Order contains requirements more explicit than the federal NPDES storm water regulations, for the purpose of achieving compliance with the CWA provision that MS4 permits “shall require controls to reduce the discharge of [storm water] pollutants to the maximum extent practicable” (CWA section 402(p)(3)(B)(iii)). As such, the Tentative Order’s requirements are necessary to comply with federal law by meeting the minimum federal MEP standard, rather than exceed it. This matter is further discussed in the Fact Sheet discussion for Finding E.6.</p> <p>The Regional Board is not precluded from issuing MS4 requirements that “go beyond” NPDES regulations, either, as in this case by providing more detail to implement performance standards in the CWA or NPDES regulations: NPDES regulations specify terms and conditions that must, at a minimum, be included in NPDES requirements; they do not limit states or U.S EPA from including other provisions that may be necessary to ensure that municipalities with MS4s reduce stormwater pollutants to the MEP. No portion of the proposed MS4 requirements exceed the level of “governmental service” (i.e., performance) necessary to reduce stormwater pollutants to the MEP as mandated by Section 402(p)(3)(B)(iii) of the CWA [33 U.S.C. Section 1342(p)(3)(B)(iii)]. While, technically, all NPDES requirements issued by the Regional Boards “fall under the legal authority of the state” because they are promulgated in waste discharge requirements issued pursuant to Sections 13260 and 13263 of the Water Code, requirements issued for discharges of pollutants from point sources to waters of the United States, including requirements for discharges of storm water in MS4s, implement the provisions of the federal CWA and the federal NPDES regulations, as contemplated by Chapter 5.5 of the Porter-Cologne Water Quality Control Act (Section 13370, et seq.). Therefore, nothing in the proposed order renewing NPDES requirements for discharges in Orange County MS4 exceeds the scope of regulation necessary to implement NPDES regulations for MS4.</p>

164	5	Legal	F.1.	<p>In addition, the Draft Permit’s LID and retrofitting provisions raise significant constitutional issues by forcing property owners to incur costs of mandated physical changes to the configuration of their property. As such, implementation of the retrofitting provisions plainly implicates the taking provision of the U.S. Constitution and California Constitution, which require that public entities provide just monetary compensation to property owners for private property that is altered to further a public use. The due process clauses of the state and federal Constitutions guarantee property owners “due process of law” when the state “deprive[s] [them] of . . . property.” (Cal. Const., art. I, §§ 7, 15; U.S. Const., 14th Amend., § 1.) And the takings clauses of the state and federal Constitutions guarantee property owners “just compensation” when their property is “taken for public use.” (Cal. Const., art. I, § 19; U.S. Const., 5th Amend; see also, e.g., <i>Kavanau v. Santa Monica Rent Control Bd.</i> (1997) 16 Cal. 4th 761, 774.)</p>	<p>In no way does the Tentative Order force property owners to incur costs of mandated physical changes to the configuration. The retrofitting program as written in the Tentative Order is voluntary for the private property owner and requires the Copermittees to develop a program encouraging retrofitting for those private property owners. The commenter has misinterpreted the draft language in the Tentative Order.</p> <p>The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
165	5	Legal	F.1.	<p>Finally, the LID and retrofitting requirements unlawfully impose on cities unfunded mandates. Any NPDES requirements that are not dictated by federal law must be funded by the state. And because these provisions are not required by federal law, they violate Article XIII B, Section 6 of the California Constitution. (County of Los Angeles v. Commission on State Mandates (2007) 150 Cal.App.4th 898, 915-916.) Despite prior comments on this point, the revised Draft Permit and related materials do not address the unfunded mandates that are being imposed on the Permittees. Contrary to contentions made by the Regional Board on this issue that such unfunded mandates are appropriate where they are being imposed pursuant to a federal program, it is only where the federal program mandates a particular requirement upon the state agency that the exception to Article XIII B, Section 6 for federal mandates applies. Where the federal program provides discretion to the State agency to impose a local program, any mandate imposed upon the local municipality through the exercise of that discretion is considered an unfunded mandate and, as such, is prohibited by the California Constitution. (See Hayes v. Commission on State Mandates (1992) 11 Cal. App.4th 1564, 1570.) It is only when the State has no "true choice" in implementing a federal mandate that the prohibition under the California Constitution can be avoided. (See id. at 1593.)</p> <p>As noted in its prior comments, the Regional Board's imposition of compliance obligations that exceed the CWA, and which are thereby not required by federal law, must be accompanied by state funding to be valid. Accordingly, Draft Permit requirements such as the retrofitting of any public property (e.g., storm drains) clearly must be accompanied by state funding to be valid.</p>	<p>The LID and retrofitting requirements are not unlawful and are not unfunded mandates. The requirements are authorized by the Clean Water Act section 402(p)(3)(B)(iii) and necessary to reduce pollutants to the MEP as mandated by federal law. The contention that NPDES permits and their requirements are unfunded state mandates has been repeatedly heard and denied by the State Water Board. (See Order Nos. WQ 90-3 and WQ 91-08). Indeed, the unfunded state mandate argument was recently heard by the State Water Board when it considered the appeal of the Los Angeles Regional Board standard urban stormwater mitigation plan (SUSMP) requirements. The Los Angeles Regional Board SUSMP requirements are municipal storm water permit requirements for new development that are similar or identical to many of the requirements of the Tentative Order. The unfunded state mandate argument was summarily rejected by the State Water Board in that instance (Order WQ 2000-11). The Board notes that in 2007, the Court of Appeal in County of Los Angeles v. Commission on State Mandates ((2007) 150 Cal.App.4th 898) invalidated a Government Code statute that had exempted Regional Water Board orders from constitutional state mandates subvention requirements. To the extent that basis was relied upon previously by the State or Regional Water Boards to assert that provisions were not unfunded state mandates, such a basis is no longer available; however where, as here, provisions are necessary to meet the federal MEP standard and expand upon existing programs, they do not constitute unfunded state mandates. In addition, because local agencies can pay for compliance with permit provisions by reallocating costs or levying service charges, fees or assessments to pay for implementation, the provisions do not constitute unfunded state mandates requiring subvention.</p> <p>The California Constitution addresses reimbursement for additional "services" mandated by the State upon local agencies, not regulatory requirements imposed upon all Permittees, including cities and counties. The intent of the constitutional section was not to require reimbursement for expenses incurred by local agencies complying with laws that apply to all state residents and entities. (See City of Sacramento v. State of California, 50 Cal. 3d. 51 (1990) citing County of Los Angeles v. State of California, 43 Cal. 3d. 46).</p> <p>A central purpose of the principle of state subvention is to prevent the state from shifting the cost of government from itself to local agencies. (Hayes v. Commission on State Mandates, 11 Cal. App. 4th 1564, 1581 (1992)). In this instance, no such shifting of the cost of government has occurred. The responsibility and cost of complying with the CWA and Phase I NPDES municipal storm water regulations lies squarely with the local agencies which own and operate MS4s, not with the State. The State cannot shift responsibilities and costs to local agencies when</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

the responsibilities and costs lie with the local agencies in the first place.

The commenter attempts to assert that any use of discretion on the part of the Regional Board in implementing a federal program reflects "a matter of true choice," and is therefore a state mandate. This is a misrepresentation of the case law. In *Hayes v. Commission on State Mandates*, above, the Court only contemplates whether participation itself in a federal program is "a matter of true choice" in order to determine if an unfunded state mandate has occurred. It does not contemplate whether any use of discretion on the part of a regulatory agency in implementing the necessary details of a federal program constitutes an unfunded state mandate.

Therefore, the case does not support the commenters' claims. Any discretion exercised by the Regional Board in implementing federal law in the

Tentative Order is in accordance with federal law and guidance. For example, use of permit writer discretion and the inclusion of more detailed requirements in the Tentative Order is consistent with USEPA guidance. The preamble to the Phase I NPDES storm water regulations states "this rule sets out permit application requirements that are sufficiently flexible to allow the development of site-specific permit conditions" (FR 48038). In addition, in its review of a City of Irving Texas NPDES municipal storm water permit, the USEPA Environmental Appeals Board stated that Congress "created the 'maximum extent practicable' ('MEP') standard and the requirement to 'effectively prohibit non-storm water discharges' into the MS4 in an effort to allow permit writers the flexibility necessary to tailor permits to the site-specific nature of MS4 discharges" (2001). The Tentative Order, to be issued to implement a federal program, does not become an unfunded state mandate simply because the

Regional Board appropriately exercised its discretion in defining the particulars.

The Regional Board's implementation of a federal program according to federal law and guidance does not constitute an unfunded state mandate. The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates.

Please see the fact sheet, response to comment #5 in the July 2007 response to comments and response to comment #155 for more information.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
166	5	TMDL	Findings	T.O., page 2, #2, the last statement, "These water quality standards must be complied with at all times, irrespective of the source and manner of discharge." This is in conflict with the intent expressed by Regional Water Quality control Board (RWQCB) Staff during numerous workshops, the Amendment to the Water Quality Control Plan for the San Diego Basin (9) to incorporate implementation provisions for indicator bacteria water quality objectives to account for loading from natural, uncontrollable sources within the context of a Total Maximum Daily Load, Resolution, R9-2008-0028, as well as subsequently updates in Sections C.1., C.3., D.4., etc. as identified in the T.U. The City feels that the intent of the paragraph is preserved with the removal of this sentence. Please remove said sentence.	Regional Board Resolution No. R9-2008-0028, "A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) to Incorporate Implementation Provisions for Indicator Bacteria Water Quality Objectives to Account for Loading from Natural Uncontrollable Sources Within the Context of a Total Maximum Daily Loads," has essentially revised the Water Quality Standards for bacteria in water bodies that are addressed by TMDLs. The Water Quality Standards for bacteria, within the context of a TDML, allows for exceedances of the bacteria WQOs, as long as the exceedances are due to natural and background (non-anthropogenic) sources using a "reference system and antidegradation approach" or a "natural sources exclusion approach." To date, a TMDL containing either approach has not been fully approved in Southern Orange County. The Bacterial Indicators TMDL for Baby Beach has the option of developing a "natural sources exclusion approach." Once developed, the TMDL must be amended prior to any changes to the MS4 Permit to be consistent with the assumptions and requirements of the TMDL Waste Load Allocations. The requested deletion is not made.
167	5	LID	Finding	T.O., page 6 #13, The City disagrees with the statement "... The risks typically associated with properly managed infiltration of runoff (especially from residential land use areas are not significant." Please provide scientific data supporting this statement, appropriate for the soil and geologic conditions found in south Orange County, including an economic evaluation or delete this statement. From experience, the City has found that many of the "management techniques" identified to address the existing clay soils and risks and liabilities associated with landslides have made infiltration for certain projects economically infeasible with a high level of risk of which the City cannot pursue nor approve.	The key phrase is "properly managed." We agree that when not properly managed infiltration of runoff can carry significant risks. The Regional Board expects all Copermittees to properly manage the infiltration of runoff to minimize risks. Please see the USEPA's fact sheets on infiltration basins, infiltration trenches, grass swales, and porous pavement. http://cfpub1.epa.gov/npdes/stormwater/menuofbmps/index.cfm?action=min_measure&min_measure_id=5
168	5	Existing Development	Finding	T.O. page 7, #d. As this T.O. is significantly different than the current permit, we request a longer time to effectively and efficiently update our programs. There are some significant issues that will affect our constituencies in significant ways and the development process must allow time for outreach to garner support. We suggest that you allow 18-24 months in lieu of proposed 12, acknowledging the historical successes of south Orange County copermittees working together, garnering stakeholder support and producing quality products.	One year from the date of adoption of the Order is a sufficient amount of time to update the jurisdictional programs to address the areas of the Order that have changed. The Copermittees are more than familiar with storm water regulations, as are its stakeholders. A change to extend the time to implement requirements is not made at this time.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
169	5	Existing Development	Finding	<p>T.O., page 9 e. Industrial sites are regulated under a State issued Industrial General Permit.</p> <p>Why are requirements addressed here rather than under the industrial permit, resulting in redundancy and confusion? We feel any requirement relating to the regulated industrial sites should be omitted from this Permit and be addressed in the Industrial Permit. We understand that the Industrial Permit is due for renewal and this would be an appropriate time for RWQCB to suggest requirements to be included in the new Order.</p>	<p>This Finding is under the Development Planning section of the Findings. The finding is for the development and re-development of industrial sites, which is under the purview of the Tentative Order. The finding clarifies that the development of industrial sites classified as priority development projects require the implementation of LID to meet the MEP standard. Furthermore, USEPA, in requiring separate storm water permits for industrial dischargers and MS4 owners and operators expected the permits to act in a dual complimentary manner (55 Fed Reg 48000-01). Thus, the Copermittees retain responsibility for industrial development and inspections, which is expected to work in concert with the requirements under the industrial permit when the facility discharges storm water to the MS4. As such, the finding will remain in the Tentative Order.</p>

170	5	FETD	Finding	<p>T.O. page 14 & S.F.S. page 18– FETDs. We continue to disagree with the Discussion of Finding E.9. We feel that it is appropriate to regulate FETDs within the MS4 Permit, as these facilities are installed and operated to meet the requirements of the Permit and are part of the MS4 system.</p> <p>In addition to our previous concerns regarding FETDs provided in Exhibits 1 and 2 of Attachment A, we offer the following comments in regards to the current FETD language provided in this draft:</p> <p>We encourage consistency and encourage you to consider the language that was proposed in the recent Region 8 draft which captures the intent of the first reiteration of FETD language which we saw in the first draft of this Permit back in 2007. We will also note that the copermittees were working on potential FETD language with previous Permit staff during the first draft Permit process, prior to postponement by the Board, which is significantly similar to the draft language found in the Region 8 draft, and therefore we support it. The draft language in Region 8’s Order is provided below for consideration:</p> <p>“Discharges from facilities that extract, treat and discharge water diverted from waters of the U.S: These discharges shall meet the following conditions: (1) The discharges to waters of the US must not contain pollutants added by the treatment process or pollutants in greater concentration or load than the influent; (2) the discharge must not cause or contribute to a condition of erosion; (3) The extraction and treatment must be in compliance with Section 404 of the Clean Water Act; and (4) Conduct Monitoring in accordance with Monitoring and Reporting Program attached to this Order.” Please note we suggest the one minor modification to the language in the Region 8 draft, which is underlined. Please also note that the existing 401 Certification and Grant Agreement for our existing Salt Creek Ozone Treatment Facility are also attached for reference in Exhibit B-2 & B-3, respectively.</p>	Please see response to Comments 51 and 70.
171	5	TMDL	Finding	<p>T.O. Page 15, #11 -303(d) list – We suggest that you clarify which water bodies are impacted by the listed pollutants, as we are aware that not all waterbodies in south Orange County are impaired by each of the pollutants listed.</p>	A table has been added to the Findings of the Tentative Order containing the 303(d) listed water bodies for Southern Orange County.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
172	5	TMDL	Finding	T.O. Page 15, #12 The City believes and agrees with statements made by certain RWQCB staff and State Water Resource Control Board (SWRCB) staff during workshops that the language regarding TMLD and WLAs may be premature and should be omitted from the Permit at this time since there are no TMDLs that are approved by the State, Office of Administrative Law and/or EPA to date. The City also deems it necessary for TMDL staff and Permit staff to work together to incorporate the TMDLs into the permit at the appropriate time to retain the intent and implementation strategies that were developed through the several year TMDL development process. Prior to incorporating TMDLs into the Permit, we suggest that the permit writers work with TMDL staff and also refer to the strategically developed implementation plan(s) that were developed as part of the TMDL.	Regional Board staff from the TMDL and Surface Water Units have had several meetings to discuss the incorporation of TMDLs into storm water permits. This dialogue will continue as final approval of Resolution No. R9-2008-0027, "A Resolution to Adopt an Amendment to the Water Quality Control Plan for the San Diego Basin (9) to Incorporate Total Maximum Daily Load for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay" nears. The State Board is scheduled to hear and approve the item on 16 June 2009.
173	5	ASBS	A	T.O. page 18, #5 & page 20 #5 – "As ASBS's or SWQPA's are already regulated separately by the State Board, page 18 #5 and Page 20 #5 are redundant and should be deleted from the MS4 Permit."	The Regional Board has removed ASBS/SWQPA language from the tentative Order. Please note ASBS/SWQPAs, like all water bodies, remain subject to receiving water limitations and discharge prohibitions under the Tentative Order.
174	5	Overirrigation	B	<p>T.O. page 19, #2– The removal of landscape irrigation, irrigation water and lawn watering for the list of exempted discharges is problematic and we are concerned that the tentative prohibition will diminish public support of the Permit and the City's water quality protection program. Our residents and businesses will not accept that, without proof, potable water running over grass is a pollutant worthy of illegal declaration.</p> <p>Regarding urban runoff from over-irrigation, please note that copermittees and water districts are working aggressively and cooperatively to address this issue. Please see the attached excerpts from South Coast Water District Water Conservation Ordinance (No. 206) that has already been adopted (Exhibit B-1), covering the majority of Dana Point and parts of Laguna Beach and San Clemente. As we have discussed with your staff, all water districts have or will be adopting similar ordinances. Also, significant water rate increases (34% plus proposed for SCWD, effective July 1, upon approval) and allocations are on the way. Please reconsider whether this comprehensive water conservation approach, along with the new AB1881 requirements that will address new developments, will suffice to address the concern of urban runoff from over-irrigation for this Permit cycle, in lieu of the elimination of the exemption.</p> <p>We all want to reduce runoff carrying pollutants in dry weather and we feel that our proposed approach will receive greater public acceptance and commensurate results without stimulating blow back and rejection by a significant segment of the public, which could result in stalling or setting us back in our efforts to progress in improvements in water quality.</p>	Please see response to comments Nos. 28, 39, 42, 44, 52, and 159. The Copermittees program of education and cooperation with the water districts would likely meet the requirements of the Permit in addition to the Copermittees modifying their existing programs that address non-stormwater to also address overirrigation discharges. The Copermittees are expected to use the proper discretion in conducting education, complaint response, and progressive enforcement to alleviate public concerns. The programs and rate increases by the water district are in response to the current water shortage and are likely to be ceased once the water shortage has been addressed. The water quality impacts from overirrigation discharges will exist in drought years and in surplus years; therefore the Copermittees need to implement a program to address overirrigation. It is our expectation that removal of the exemption to improve water quality will work in concert with conservation efforts aimed at source control.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
175	5	SUSMP		Page 38f.c. – given the options for verification in (c), the word “inspection” in (iii), (iv), (v), (vi), (vii) (viii), and (ix) should be changed to “verification” for consistency, please.	The word inspection was deliberately chosen to be used in section F.1.f.(2)(c). Inspections provide greater assurance that post construction BMPs are properly maintained, operated and implemented. The inspections are limited to high priority BMPs, but a Copermittee may choose to inspect all the BMPs rather than just the high priority BMPs. Self certifications, surveys or other effective means are reserved for those BMPs that are not a high priority.
176	5	Construction	F.2.	T.O. Page 47, (b) iii – The requirement for slope stabilization on all active slopes during rain events regardless of season does not appear to be consistent with the proposed General Construction Permit; nor is practical in many situations. We suggest that the language in the proposed General Construction Permit be reviewed so that this language can be revised to allow flexibility in implementation of erosion and sedimentation control while keeping with the intent of keeping sediment and pollutants on site.	The statewide general construction permit has not yet been adopted and is likely to be further amended; therefore it is not appropriate to attempt consistency with a permit that has not been adopted. We encourage the commenter to bring their concern to the State Board, so that the General Construction Permit may be amended to be consistent with the Tentative Order. The Regional Board's experience is that it is practicable to implement temporary soil stabilization BMPs prior to rain events and this requirement also keeps with the intent of preventing erosion and sediment transport.
177	5	Construction	F.2.	T.O. Page 50 g.1 Please clarify what the RWQCB intends to do with the information provided in the proposed reporting of construction sites with stop work order or high enforcement due to stormwater violations. This information is already reported annually in the annual report. Unless the RWQCB intends to effectively use this instantaneous information, this requirement is an additional administrative task without perceived commensurate benefit. Historically, we know that Dana Point and other south Orange County Permittees have been very proactive in coordinating with RWQCB regarding the regulation of construction sites when needed, including setting up pre-rainy season inspections with RWQCB staff and contractors at high priority sites and also requesting assistance or guidance when challenging issues arise.	The requirement regarding notification of stop work orders or high enforcement is required to provide the Regional Board with additional information in order to evaluate and prioritize construction site inspections. The Regional Board acknowledges that many Copermittees have been historically proactive in regulatory coordination, and the submittal of this information further provides for complimentary enforcement.
178	5	Construction	F.2.	T.O. Page 50 g.2. The requirement to annually notify the Regional Board of all construction sites with “potential” violations is questioned. Virtually every site could fit into this “potential” category at some point, and basically we would be sending the entire construction site inventory. The term “potential” is too hard to define and will lead to widely varying compliance of copermittees. Please remove this requirement.	Please see response to Comment 128.
179	5	Monitoring	F.4	14. T.O. Page 67 & 68, b. The last sentence conflicts with the previous sentences which indicates that GIS is “highly recommended”. If GIS is not used, the layers cannot be submitted. We suggest the modification: “The GIS layers of the MS4 map or a hard copy of map, if GIS is not used, must be submitted with the updated Jurisdictional.....”.	The Tentative Order language has been updated to reflect that GIS is required, not recommended.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
180	5	Monitoring	F.4.	T.O. Page 70, (2), As the water districts serving the City of Dana Point (South Coast Water District, Moulton Niguel Water District and San Juan Capistrano Utilities) are charged with the responsibility of regulating sanitary sewer overflows and serve as the primary spill prevention and response coordination authority, we request that the Regional Board remove this provision so as to reduce duplicity of effort, confusion and the implementation of unnecessary control activities, when an effective program is already in place and regulated.	<p>The Regional Board recognizes that sewage spill containment and cleanup may be the responsibility of agencies not under the Copermittees control or responsibility. It should be noted this comment was previously received and language was relaxed in the 2007 Tentative Order. Language under (2), for sewage spills, was changed to read "management measures and procedures" to reflect the concern that is raised by this comment. It is unclear to the Regional Board why the language should now be removed.</p> <p>The response to the original comment is still applicable and reads: "The Tentative Order includes sewage and non-sewage spills in the requirement for spill prevention and response. Federal regulations clearly define sewage as an illicit discharge that must be addressed by municipalities (see Phase II Final Rule, p.68758). Sewage is an illicit discharge to the MS4 that threatens public health. As such, the Copermittees must implement measures to prevent sewage from entering the MS4 system and must respond to illicit discharges that have entered the system. This section has been revised to clarify that management measures and procedures must be implemented to prevent, respond to, and cleanup spills.</p> <p>When the State Water Board stayed the sewage provision from Regional Board Order No. R9-2002-01, it found that the costs of the requirement did not constitute harm, but agreed that harm could ensue from potential response delay and confusion (Order WQO 2002-0014). Subsequently, the Copermittees and the local sewer agencies have developed mature relationships regarding sewage spill response. As a result, the concerns expressed by the State Water Board are no longer warranted. For instance, the Copermittees have developed and implemented procedures for spill response and sewage spill response. The Model Sewage Spill Response Procedure is outlined in the Copermittees' Proposed 2007 Drainage Area Management Plan (DAMP). According to the 2007 DAMP, regardless of where the spill originates, if the spill has entered or may enter the storm drain system, the Copermittees respond to assist with the cleanup and remediation of the area.</p> <p>Section D.3.a.7 of the Tentative Order includes requirements for measures that must be taken to prevent sewage spills. Examples of measures being implemented by Copermittees include inspections of fats, oils, and grease management at restaurants. Other preventative measures can be implemented during routine planning efforts for new development and redevelopment projects. Similarly, building permit inspections should be used to verify the integrity of the sanitary and storm sewer infrastructure and ensure that cross-connections between the two are avoided.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
181	5	WURMP	G	<p>T.O. Page 70 (1) and page 71 b. The City believes that it would be prudent to update Watershed Runoff Management Plans (WRMPs) concurrently with TMDL bacteria load reduction plans (BLRP) or comprehensive load reduction plans (CLRP), as they will most likely be one comprehensive document. This makes sense as the watershed management areas are consistent with TMDL waterbodies. As we have WRMPs in place and are implementing them, we suggest revising the timeframe for updates to be concurrent with the development of the BLRP/CLRPs to maximize efficiency. Please also coordinate this effort with your fellow TMDL staff, as we as copermittees have already drafted a outline of these plans.</p> <p>The same comments apply to the watershed map. It is prudent that we create a map that can be used for watershed and TMDL planning and implementation and we request that you allow flexibility in the timeframe for development of the map so that the copermitties can effectively and efficiently prepare a map that will meet TMDL planning requirements.</p>	<p>The WRMP section of the Order has been restructured. Section G has been streamlined to allow Copermittee's to report their WRMP updates annually. The Order does not specify when during that year a Copermittee has to submit a report, therefore the Copermittee is able to coordinate reporting WRMP updates with BLRP or CLRP submittals. This change gives the Copermitted flexibility and encourages efficient use of resources.</p>
182	5	WURMP	G	<p>T.O., page 74, (e) (2) RWQCB staff and copermittees agreed to delete the word "each" from this section.</p>	<p>The WRMP section of the Order has been restructured. The term "each" has been removed from this section.</p>
183	5	General	K	<p>T.O., page 85, #3 Annual Reports – During conversations and workshop with RWQCB staff, both RWQCB staff and copermittees agreed that it makes sense to add some language providing flexibility and allowing copermittees to propose an alternative report format and/or annual submittal dates for review and approval by RWQCB. We support language to this effect and look forward to seeing it in a subsequent draft or errata.</p>	<p>Section K. Reporting of the Tentative Order has been revised to allow the Copermittees to propose an alternate reporting criteria and schedule as part of their updated JRMP.</p>
184	5	TMDL	Supplemental Fact Sheet	<p>S.F.S. Page 19 – No TMDLs have been approved by State Board, Office of Administrative Law and/or EPA and therefore this Finding and other references to WLA or TMDLs should be omitted.</p>	<p>All references to CDOs and CAOs, in regards to TMDL implementation, have been removed from the Tentative Order and Fact Sheet. This does not, however, preclude the Regional Board from future consideration of the use of these authorities to address TMDLs.</p> <p>Two TMDLs for Bacterial Indicators are likely to be approved in the next five years. Title 40 CFR 122.44(d)(1)(vii)(B) requires MS4 Permits to be consistent with the Waste Load Allocation (WLA) assumptions and requirements. Therefore, the discussion on incorporation of WLAs should already have begun. On June 16, 2009, the State Water Resources Control Board approved Resolution R9-2008-0027 amending the Basin Plan to incorporate Total Maximum Daily Loads (TMDLs) for indicator bacteria for Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay. Final approvals by the Office of Administrative Law and the USEPA are expected to be garnered prior to adoption consideration of this re-issuance of the MS4 Permit for So. Orange County.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
185	6	LID	F.1	<p>We are disappointed with the Tentative Order. It is inconsistent with state and federal law in absolute terms and does not adequately respond to comments from both EPA and NRDC or reflect the direction of the Board at the conclusion of the last hearing. With respect to low impact development (“LID”), it continues to pursue highly flawed approaches that are vague and ambiguous and fail to implement the federal maximum extent practicable standard. Indeed, the flaws in the LID approach are even more apparent in contrast to the recent adoption by the Los Angeles Regional Water Quality Control Board of LID provisions which require onsite retention of the 85th percentile design storm. The requirements imposed by the Los Angeles Regional Board also require offsite mitigation when onsite compliance is not feasible. Notably, NRDC, other environmental groups, and all of the permittees in Ventura County supported these provisions. During the South Orange County permit workshop held on May 6, staff provided some indication that further modifications of the permit would be forthcoming to make it both clearer and consistent with the federal MEP standard. We strongly encourage this direction.1</p>	<p>The Tentative Order has been modified in the errata sheet to clarify requirements that LID BMPs require onsite retention and/or biofiltration of the 85th percentile design storm and offsite mitigation when onsite compliance is not technically feasible.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
186	6	LID	F.1	<p>The Tentative Order lacks a clear performance standard—tied to onsite retention of stormwater—that requires robust implementation of LID techniques;</p> <p>The Tentative Order’s Development Planning Component remains legally inadequate and is not based on the evidence in the record before the Regional Board. As currently written, the Tentative Order does not require any specific level of LID implementation and would, as explained below, essentially allow the Copermittees to regulate themselves and to grant wholesale waivers of otherwise universally applicable SUSMP sizing criteria. There is no stated analysis that supports the staff’s proposals or provides even a general assessment of the water quality impact of the proposed approach. Furthermore, the Tentative Order’s Development Planning Component fails to address the known water quality problems that staff articulate in the Fact Sheet (See, e.g., Revised Fact Sheet for Tentative Order 2008-001, at 26) and falls well below many other stormwater permits and regulatory documents around the country. In all of these respects, staff have failed to adequately respond to the issues raised when the last draft of the Permit was rejected by the Regional Board, and the revisions in the current draft do not address the fundamental weaknesses of the Tentative Order.</p> <p>While we appreciate the fact that the Tentative Order does require some undefined level of LID implementation unless the Copermittee makes a finding of infeasibility, the Tentative Order remains legally insufficient due to the lack of a numeric performance requirement for LID, the availability of all-encompassing waivers from treatment standards, the improper placement of and failure to define the Tentative Order’s 5% “effective impervious area” (“EIA”) limitation, and the ill-conceived nature of other provisions. These problems with the Development Planning Component, elaborated below, need to be remedied before the Tentative Order will meet the Clean Water Act’s MEP standard for pollutant reduction.</p>	<p>The 5 percent EIA requirement has been removed in favor of requirements that LID BMPs require onsite retention and/or biofiltration of the 85th percentile design storm and offsite mitigation when onsite compliance is not technically feasible.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
187	6	SUSMP	F.1	<p>The Tentative Order contains unlawfully vague and general new development and redevelopment provisions;</p> <p>As noted in our January 24, 2008, letter, which we incorporate by reference herein, the previous draft of the Tentative Order was rife with vague and unenforceable provisions.¹³ Some of these provisions have been improved in the new draft, but many remain unacceptable. This is particularly problematic where the Tentative Order fails to establish the necessary numeric performance standards which would ensure that the most effective, pollution-reducing BMPs— i.e., LID practices—are implemented to the maximum extent practicable.</p> <p>These flaws are all the more apparent because they stand in contrast to recently adopted LID requirements for Ventura County, adopted on May 7, 2009, by the Los Angeles Regional Water Quality Control Board. The new Ventura County MS4 permit requires that 95% of the volume from the 85th percentile storm be retained onsite through infiltration, harvesting and reuse, or evapotranspiration. If full onsite management of the design storm volume is technically infeasible, the retention obligation may be reduced, but offsite mitigation with equivalent results must be performed (or funds must be contributed to a public mitigation fund in an amount sufficient to offset the project’s onsite non-compliance). Notably, this requirement resulted from a collaboration and agreement between NRDC, Heal the Bay, and all of the Ventura County permittees. This is the type of performance standard that is lacking in the Tentative Order.</p> <p>The Tentative Order’s LID provisions are still a collection of largely hortatory provisions with no specific measurable outcome. Unfortunately, even the vast majority of the revisions to the Development Planning Component fall into this category, requiring only “assessments” of LID practices or applying LID requirements only “where applicable and feasible.” Narrative and subjective terms are, thus, still prominent, e.g.: “The following LID BMPs ... shall be implemented ... where applicable and feasible,” (Tentative Order ¶ F.1.c.(2)), “Buffer zones for natural water bodies, where feasible,” (Tentative Order ¶ F.1.c.(3)), “Where feasible, landscaping with native or low water species shall be preferred,” (Tentative Order ¶ F.1.c.(7)), “The review ... must include an assessment of techniques to infiltrate, filter, store, evaporate, or detain runoff,” (Tentative Order ¶ F.1.d.(4)(a)(iv)), “[W]here feasible the Copermittee must take appropriate actions,” (Tentative Order ¶ F.1.d.(4)(a)(vi)), “[D]rain a portion of impervious areas,” (Tentative Order ¶ F.1.d.(4)(b)(ii)), etc. Such vague provisions would not enable the Regional Board or the Copermittees to measure the outcomes of, or to enforce, the Tentative Order’s requirements since implementation could vary enormously.</p>	<p>The Tentative Order has been modified in the errata sheet to with more specific requirements that LID BMPs require onsite retention and/or biofiltration of the 85th percentile design storm and offsite mitigation when onsite compliance is not technically feasible. In addition to the design storm criteria, the Tentative Order includes other specific performance measures, wet weather municipal action levels and dry weather non-storm water numeric effluent limits.</p>

188	6	SUSMP	F.1.	<p>The control measures included in the Development Planning Component do not meet the “maximum extent practicable” (“MEP”) standard of the Clean Water Act, especially given other stormwater control measures being implemented in California and around the U.S.;</p> <p>Section 402(p) of the Clean Water Act establishes the MEP standard as a requirement for pollution reduction in stormwater permits. (33 U.S.C. § 1342(p)(3)(B)(iii).) Regional Board staff have failed to implement this standard effectively, and currently the Permit does little more than pay lip service to superior stormwater management practices commonly implemented around the country. Nonetheless, “the phrase ‘to the maximum extent practicable’ does not permit unbridled discretion. It imposes a clear duty on the agency to fulfill the statutory command to the extent that it is feasible or possible.” (Defenders of Wildlife v. Babbitt (D.D.C. 2001) 130 F.Supp.2d 121, 131 (internal citations omitted); Friends of Boundary Waters Wilderness v. Thomas (8th Cir. 1995) 53 F.3d 881, 885 (“feasible” means “physically possible”).)</p> <p>Similarly, in South Orange County, an onsite retention standard based on the effective impervious area of a site would be a technologically feasible approach that would reduce stormwater discharges and pollution far more than the non-specific measures contained in the Tentative Order.²⁰ We have even called to the Regional Board’s attention an EPA study which found that LID practices are frequently less costly than conventional stormwater BMPs.²¹ Regional Board staff have offered no justification for ignoring our and EPA’s comments regarding the need for a specific, enforceable, numeric performance standard and no evidence that meeting our proposed onsite retention standard of 3% EIA would be infeasible, assuming that—as we have suggested—the Tentative Order includes an appropriate infeasibility provision tied to a technically equivalent alternative compliance requirement. Indeed, the Tentative Order’s inclusion of a 5% EIA limitation (albeit inadequately defined) for hydromodification purposes strongly implies that Regional Board staff, too, believe that this standard could be feasibly implemented in South Orange County.</p> <p>Other Phase I MS4 permits within California (beyond the abovementioned Ventura County MS4 permit), despite their problems, are also heading in this direction. The North Orange County draft permit, for instance, establishes a hierarchy of options (from onsite to regional systems) that each require onsite retention—or biofiltration through LID—of the 85th percentile design storm volume.²⁹ With such precedents in California and in other parts of the country, the Tentative Order’s failure to adopt a numeric performance standard beyond the barebones SUSMP hydraulic sizing criteria is particularly remarkable. The decision to</p>	<p>The Tentative Order has been modified in the errata sheet to clarify requirements that LID BMPs require onsite retention and/or biofiltration of the 85th percentile design storm and offsite mitigation when onsite compliance is not technically feasible. This is consistent with the recently adopted Region 8 MS4 permit for North Orange County.</p>

189	6	General	General	<p>waive these bare-bones criteria without even requiring offsite mitigation, as discussed below, evidences an even more flagrant disregard for the MEP standard.</p> <p>The control measures in the Tentative Order do not constitute “best management practices,” as required by law;</p> <p>As detailed in our January 24th Letter, the provisions of the Tentative Order, which remain largely unchanged from previous drafts, are insufficient to constitute “best management practices” (“BMPs”), as required by the Clean Water Act. To reiterate our comments briefly, the Tentative Order, at most, sets forth ideas around which a proposed management program and articulated BMPs could be developed, which is required in the application for an MS4 permit. (See 40 C.F.R. § 122.26.) Missing are the actual BMPs and accompanying performance standards that must be described in the Tentative Order. The closest the Tentative Order comes to identifying actual BMPs is the list of general LID design practices in Section F.1.d.(4)(b). (Tentative Order ¶ F.1.d.(4)(b).) However, these design measures need not be hydraulically sized to treat any particular amount of stormwater. This is tantamount to no requirement at all and does not satisfy EPA’s counsel that, among other components, BMPs must be attached to measurable goals that include “a quantifiable target to measure progress toward achieving the activity or BMP.” As the examples from EPA’s guidance document—included in our January 24th Letter—highlight, merely outlining a general technique with no quantifiable requirement for implementation does not satisfy the Clean Water Act’s mandates.</p> <p>The State Water Board has also voiced its support for establishing numeric requirements that apply to stormwater BMPs, stating that, “[t]he addition of measurable standards for designing the BMPs provides additional guidance to developers and establishes a clear target for the development of the BMPs.”³¹ Despite pointing out the necessity of such targets to the Regional Board in our last comment letter, the Tentative Order’s site design requirements still fail to include more than a requirement for some undetermined amount of LID implementation.</p> <p>As a result, the provisions of the Tentative Order fail to satisfy EPA regulations and guidance and are invalid under the Clean Water Act.</p>	<p>The Tentative Order has been modified in the errata sheet to clarify requirements that LID BMPs require onsite retention and/or LID biofiltration of the 85th percentile design storm and offsite mitigation when onsite compliance is not technically feasible. The design storm is a quantifiable target to measure progress toward achieving the activity or BMP. In addition, the Tentative Order includes other performance criteria including wet weather municipal action levels and dry weather non-storm water numeric effluent limitations.</p>

190	6	SUSMP	F.1	<p>The Tentative Order would allow unlawful waivers from hydraulic sizing criteria and does not adequately require mitigation for non-complying projects;</p> <p>The Tentative Order’s waiver section sets forth a skeletal process for allowing projects not to comply with the Permit’s already lacking requirements whenever Copermittees deem compliance “infeasible,” yet this section would not require any equivalent performance through offsite mitigation or maximize the implementation of stormwater management practices, as required by the MEP standard. Indeed, there are no criteria established by the Tentative Order to determine what constitutes “infeasibility” that would allow for waivers, and there is no evidence in the record to demonstrate that any sites are incapable of meeting the barebones SUSMP sizing criteria. We suggest instead the establishment of an onsite retention standard, such as 3% EIA, with the option for onsite treatment paired with offsite mitigation in situations of technical infeasibility. This type of standard has been adopted in wide-ranging locations around the US, including last week in Ventura County, as mentioned above, and we have submitted expert reports analyzing its feasibility in various locations around California. The waiver section provides the perfect opportunity to adopt far more robust and appropriate requirements regarding offsite mitigation when onsite compliance is infeasible, but despite facts in the record to support such requirements, the Tentative Order has created a blanket waiver of the state-law-backstop hydraulic sizing criteria without even addressing why this is necessary.</p> <p>The Tentative Order’s Waiver Provisions Contravene Federal and State Law and Are Ill-Conceived.</p> <p>Through the waiver provision, Priority Development Projects can receive a waiver from “the requirement of implementing treatment BMPs with numeric sizing criteria if infeasibility can be established.” (Tentative Order ¶ F.1.d.(7).) Projects receiving waivers must consider all available treatment BMPs;33 however, because the Tentative Order does not define infeasibility, the determination of what is infeasible is left entirely to the Copermittees, which amounts to impermissible self-regulation, as discussed in this letter and in our previous comment letter. In other words, the Tentative Order, as written, could allow qualifying projects to install treatment systems that are incapable of handling more than one milliliter of rainfall, yet this would constitute compliance with the Tentative Order. No offsite mitigation would be required because the waiver provision leaves it to the discretion of the Copermittees to “collectively or individually develop a program [for] a storm water mitigation fund.” (Tentative Order ¶ F.1.d.(7)(b).) This is an unlawful result. Federal</p>	<p>The Tentative Order has been modified in the errata sheet to clarify requirements that LID BMPs require onsite retention and/or biofiltration of the 85th percentile design storm and offsite mitigation when onsite compliance is not technically feasible. The Tentative Order includes criteria to define technical infeasibility consistent with Region 8’s recently adopted MS4 permit for North Orange County.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

law and state law require that all Priority Development Projects, some of which would be exempted from hydraulic sizing criteria by the Tentative Order, meet certain minimum standards. Federal regulations mandate that MS4 permits impose requirements to reduce the discharge of stormwater pollution from new development and redevelopment projects. (40 C.F.R. § 122.26.) The State Water Board—through the Bellflower decision—has gone further and established the SUSMP hydraulic sizing criteria as a compliance floor for all Priority Development Projects.³⁴ A permit cannot meet the MEP standard if it does not impose these criteria to reduce stormwater pollution, yet these criteria are exactly what the Tentative Order waives entirely for projects that meet the Copermittees’ own definition of “infeasibility.” This is unlawful. Certainly, what constitutes MEP now is not a lesser standard than what constituted MEP nearly a decade ago.

The Requirements for Priority Development Projects that Receive Waivers Are Unlawfully Lax.

For projects that receive waivers of hydraulic sizing criteria, the Tentative Order would apparently require no stormwater management at all except perhaps whichever BMPs the Copermittee has—at its own discretion—found to be feasible. (Tentative Order ¶ F.1.d.(7).) As mentioned above, there is no obligation to undertake offsite mitigation because the requirement to contribute funds for offsite mitigation remains at the discretion of the Copermittees; moreover, the offsite mitigation funding option is tied to avoided cost and thus bears no relationship to water quality results. (Tentative Order ¶ F.1.d.(7)(b).) This runs counter to the several nationwide examples cited above, where offsite mitigation is required in proportion to the extent of onsite non-compliance. It also runs counter to U.S. EPA’s recent advice on other MS4 permits in California: “We ... recognize that there may be situations where achievement of specified volumetric criteria for management of stormwater via LID design elements may be infeasible due to physical site constraints. The permit should include a clearly defined, enforceable process for requiring off-site mitigation for projects where use of LID design elements is infeasible.” “[T]he permit could require the retention of stormwater at an offsite location corresponding to 1.5 times the volume which cannot be practically managed via LID.”

Without remedying these very substantial deficiencies in the waiver provisions, the Tentative Order would unlawfully allow many Priority Development Projects to do far less than is required to meet the MEP standard. As mentioned elsewhere in this letter, these deficiencies also hamstring the Tentative Order’s ability to move South Orange County toward compliance with water quality standards in the area’s many impaired watersheds. We strongly urge the Regional Board to redraft the Permit such that

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

all Priority Development Projects must meet an onsite retention-based, numeric performance standard (e.g., 3% EIA, properly defined) and, where onsite compliance is technically infeasible, provide offsite mitigation that achieves at least equivalent water quality results (e.g., require the contribution of in-lieu funds sufficient to retain 1.5 times the design storm volume not retained onsite).

191	6	SUSMP	General	<p>The Tentative Order precludes meaningful Regional Board and public review of critical aspects of the Permit;</p> <p>As discussed in our previous comment letter, the general lack of guidance and requirements for Regional Board and public review of relevant standards and documents in the Tentative Order's provisions would allow the Copermittees to make essentially all meaningful decisions related to stormwater mitigation by themselves. The particularly important provisions of the Development Planning Component that now fail to require Regional Board and public review include:</p> <ul style="list-style-type: none"> • Updates to Local SSMPs to comply with the Permit (F.1.d.); • Copermittee review of local codes and ordinances to remove barriers to LID implementation (F.1.d.(4)(a)(vi)); • Waivers of numeric sizing criteria (F.1.d.(7)(a)); • Development of programs to require the contribution of funds for offsite mitigation (F.1.d.(7)(b)); • LID Site Design BMP Substitution Programs (F.1.d.(8)); and • Copermittee requirements in SSMPs or WQMPs that establish hydromodification criteria (F.1.h.). 	The Tentative Order has been revised to allow a public review of the the updated SSMP and hydromodification management plan.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
192	6	Hydromod	F.1.	<p>The hydromodification provisions are inadequate to prevent adverse geomorphological changes;</p> <p>The Tentative Order includes three requirements for interim hydromodification control criteria, and project applicants can meet the third requirement through three different means. The first and second of these three means improperly establish the “pre-construction” or “preproject” condition as the baseline for analysis and comparison. (Tentative Order ¶ F.1.h.(6)(a)(iii).) This standard is acceptable only for new development on land that has remained in its natural state until the time of construction, but it is wholly unacceptable for infill and redevelopment projects where the land has already been developed.</p> <p>Because of the prevalence of now-antiquated stormwater management practices that focused on peak flow and not on matching discharge rates and durations, pre-construction or pre-project rates and durations for infill and redevelopment sites will almost always represent measurements that we now want to avoid. Imagine, for example, the redevelopment of a 1950s era surface parking lot: under the Tentative Order’s standard, a developer could comply with the permit by doing essentially nothing to mitigate the effects of hydromodification—after all, a parking lot constructed in the 1950s would shunt all runoff directly to storm drains as rapidly as possible, resulting in the early, high peak flows that are at the root of the hydromodification problem. Nonetheless, under the Tentative Order, this unnatural “pre-construction” or “preproject” hydrograph would be the standard against which the new project would be measured. Instead of requiring projects not to exceed pre-construction or pre-project runoff rates and durations, the Tentative Order should require projects not to exceed pre-development runoff rates and durations. This will ensure that hydromodification criteria result in measurable progress and stream geomorphology benefits, rather than the institutionalization of detrimental, antiquated stormwater management practices. Technical experts and other jurisdictions have supported this type of standard. The Southern California Coastal Water Research Project, for instance, suggests that “attempting to have the post-development condition match pre-development runoff magnitude and duration should be an initial consideration for all circumstances.”³⁸ And Los Angeles County has implemented the following standard: “Mimic undeveloped stormwater and urban runoff rates and volumes in any storm event up to and including the ‘50-year capital design storm event.’”</p> <p>To address the technical inadequacy of the Tentative Order’s hydromodification provisions, the first and second options under the third interim requirement should be changed to reference “pre-development”</p>	<p>The Regional Board agrees that the standard to which post-construction hydrograph matching must occur is the hydrograph resulting from the pre-developed, naturally occurring condition. Therefore, the Tentative Order has been clarified by adding the following sentence:</p> <p>“Where the proposed project is located on an already developed site, the pre-project discharge rate and duration shall be that of the pre-developed, naturally occurring condition.”</p> <p>Additionally, the phrase “pre-project” has been replaced with “pre-development (naturally occurring)” to avoid any confusion with the use of this term. Also, specific criteria have been included in section F.1.h that addresses the last part of the comment.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

conditions as the baseline. (Tentative Order ¶ F.1.h.(6)(a)(iii).) Without this revision, the hydromodification provisions will not meet the MEP standard of the Clean Water Act and will not necessarily ensure the health of aquatic ecosystems and the maintenance of stream geomorphology.

2. The Requirements for Addressing Hydromodification Do Not Establish a Clear Standard for the Copermittees to Meet through their Hydromodification Management Plans.

We remain very concerned about the vagueness of the (non-interim) requirements to address hydromodification, and we incorporate our prior comments here by reference. The revisions to these provisions have failed to establish a clear standard that the Copermittees must implement—the closest the new language comes to establishing such a standard is Section F.1.h.(4)(c), but the Tentative Order does not unequivocally state that maintaining Erosion Potential at 1 is obligatory. The Tentative Order should be rewritten to make this a requirement.

193 6 SUSMP F.1.

The Tentative Order’s applicability criteria for the Development Planning Component must be significantly lowered to meet the MEP standard;

The Tentative Order’s applicability criteria stand out as exceptionally weak compared to other Phase I MS4 permits in California and must be revised accordingly. The current criteria could hardly be construed as meeting the MEP standard since both the San Francisco Bay and North Orange County Phase I MS4 permits under consideration for adoption, for instance, contain more stringent applicability criteria, generally setting thresholds at 5,000 square feet or, at most, 10,000 square feet.⁴⁰ The particularly problematic thresholds in the Tentative Order are: the catchall of one acre or whatever the Copermittees collectively identify as an equivalent threshold, (Tentative Order ¶ F.1.d.(1)(c)), the residential threshold of 10 or more dwelling units, the commercial and industrial development thresholds of one acre, and the lack of any automotive repair shop size threshold at all. (Tentative Order ¶ F.1.d.(2).) The Permit should set the catchall at or below 10,000 square feet, commensurate with other California MS4 permits and with the significant, cumulative impacts that projects under one acre can have, while specific land uses that generate especially high levels of pollution should be subject to lower thresholds.

The Tentative Order’s designation of a Priority Development Project has been modified to be more consistent with Region 8’s recently adopted North Orange County MS4 permit.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
194	6	TMDL	I	<p>The Tentative Order needs to clarify that waste load allocations from adopted TMDLs are enforceable Permit limitations and/or will be included in the Permit;</p> <p>TMDLs establish wasteload allocations (“WLAs”)—or the maximum amount of a pollutant that each point source discharger may release into a particular waterway—that constitute a form of water quality-based effluent limitation. (See 33 U.S.C. 1313(d)(4)(A); 40 C.F.R. § 130.2.) Once a TMDL has been adopted, NPDES permits are required to include WLAs and to contain effluent limitations and conditions consistent with the assumptions and requirements of the TMDL from which they are derived. (40 C.F.R. § 122.44(d)(1)(vii)(B).)</p> <p>The Regional Board has adopted two TMDLs for the Orange County Permittees: for Indicator Bacteria Project I – Beaches and Creeks in the San Diego Region, and for Indicator Bacteria Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay. However, to date, neither has been approved by the State Board, the Office of Administrative Law (“OAL”), or the U.S. EPA. As such, there are no TMDLs currently in effect for Orange County in Region 9.41 However, the Tentative Order and Fact Sheet state that “[w]ater qualitybased effluent limits for storm water discharges have been included within this Order if the TMDL has received all necessary approvals.” (Tentative Order Fact Sheet, at 20-21; see also Tentative Order, at Finding E.12.) The Tentative Order then states that “[a]dopted TMDLs will be addressed as Cleanup and Abatement Orders (CAOs) subject to approval and adoption by the Regional Board in a public process,” (Tentative Order, at Finding E.12), and that the Tentative Order will “incorporate adopted TMDL WLAs as numeric limits on a pollutant by pollutant, watershed by watershed basis. Reduction schedules and monitoring requirements will be inserted into this Order as individual Cleanup and Abatement Orders.” (Tentative Order ¶ I.)</p> <p>We believe that a superior approach would be to include the WLAs identified in the two adopted TMDLs in the Permit at adoption, with a provision that the WLAs—as well as any interim or early TMDL requirements based on compliance schedules contained in the TMDLs⁴²—are to come into effect for the Copermitees upon completion of the approval process by the State Board, the OAL, and the U.S. EPA. Through inclusion of the WLAs at this stage, the Regional Board can ensure that the permit remains consistent with the assumptions and requirements of the TMDL upon its approval, and that the imposition of adopted WLAs and compliance therewith are clearly identified as a stated condition of the permit. Given that the U.S. EPA has stated that MS4 permits should “explicitly state that the wasteload allocations (WLAs) established by . . . TMDLs are intended to be enforceable permit</p>	<p>First, to clarify, the Bacteria Project I TMDL has been withdrawn by the Regional Board and will be revised and heard again later this fall. Approval of the revised Bacteria Project I TMDL by State Board, OAL and USEPA may not occur until late 2010 or early 2011. The details of implementation remain in flux. Therefore, it is pre-mature to include the WLAs of the Bacteria Project I TMDL in this Order.</p> <p>The TMDL for "Indicator Bacteria Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay" is expected to have gained approval from the State Board, Office of Administrative Law and the USEPA prior to adoption consideration of this re-issuance of the MS4 Permit for So. Orange County. The Tentative Order has been updated to clarify that the final Waste Load Allocations (WLAs) for the Indicator Bacteria TMDL for Baby Beach in Dana Point must be met by the end of the TMDL implementation compliance schedule provided in Resolution No. R9-2008-0027, "A Resolution to Adopt an Amendment to the Water Quality Control Plan for the San Diego Basin (9) to Incorporate Total Maximum Daily Load for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay." Furthermore, the Tentative Order has also been revised to require that all discharges to Baby Beach in Dana Point meet the Numeric Targets of the TMDL by the end of the compliance schedule in order to be consistent with the assumptions and requirements of the WLAs.</p>

195	6	Legal	General	<p>The Tentative Order allows the discharge of pollutants from new dischargers and sources;</p> <p>Approval of the Tentative Order will authorize the discharge of pollutants to impaired water bodies from “new sources” or “new dischargers” in violation of the CWA’s implementing regulations. 40 C.F.R. § 122.4(i) explicitly prohibits discharges from these sources, stating that: No permit may be issued:</p> <p>... (i) To a new source or a new discharger, if the discharge from its construction or operation will cause or contribute to the violation of water quality standards. The owner or operator of a new source or new discharger proposing to discharge into a water segment which does not meet applicable water quality standards or is not expected to meet those standards ... and for which the State or interstate agency has performed a pollutants load allocation for the pollutant to be discharged, must demonstrate, before the close of the public comment period, that: (1) There are sufficient remaining pollutant load allocations to allow for the discharge; and</p> <p>(40 C.F.R. § 122.4(i).) Under 40 C.F.R. § 122.2, a “new discharger” is defined as “any building, structure, facility, or installation: (a) From which there is or may be a ‘discharge of pollutants;’ . . . (c) Which is not a ‘new source;’ and (d) Which has never received a finally effective NPDES permit for discharges at that ‘site.’” (40 C.F.R. § 122.2.) A “new source” is defined as “any building, structure, facility, or installation from which there is or may be a ‘discharge of pollutants . . .’” that may be subject to applicable standards of performance under section 306 of the Clean Water Act. (40 C.F.R. § 122.2.) Thus, the Tentative Order may not authorize the development or redevelopment of any building or structure, including, without limitation, a new subdivision, industrial facility, or commercial structure, within the Copermittees’ jurisdiction, if runoff from the new discharge adds any pollutant to discharges from the MS4 that “will cause or contribute to the violation of water quality standards” for a water body impaired for that pollutant. Furthermore, the applicant for the permit must prove the availability of any exception to this provision, as set forth above.</p> <p>In <i>Friends of Pinto Creek v. U.S. E.P.A.</i>, the Ninth Circuit Court of Appeals vacated an NPDES permit issued by the U.S. EPA to a new discharger on the grounds that the Copermittees’ “discharge of dissolved copper into a waterway that is already impaired by an excess of the copper pollutant” would violate the CWA. (9th Cir. 2007) 504 F.3d 1007, 1011.) Citing 40 C.F.R. § 122.4(i), the court stated that “[t]he plain language of the first sentence of the regulation is very clear that no permit may be issued to a new discharger if the discharge will contribute to the violation of water quality standards.” (Id. at 1012.) The</p>	<p>We disagree with the commenter that the Tentative Order will authorize the discharge or pollutants from “new sources” or “new discharger” in violation of the CWA’s implementing regulations. The permit regulates the discharge from the existing MS4. While new development or redevelopment may change the characteristics of the discharge entering the MS4 and hence the receiving water, each new development or redeveloped area does not constitute a new source or discharge. Further, the current MS4 permit addresses pollutant loads through an iterative process. The Tentative Order has requirements for LID at new development and redevelopment priority development projects to meet water quality standards. Through the Tentative Order’s construction, existing development and education components, Copermittees must reduce storm water pollutants to the MEP and meet water quality standards for runoff discharges from new development and redevelopment projects that are not priority development projects.</p> <p>The case primarily relied on in this comment, <i>Friends of Pinto Creek v. USEPA</i>, 504 F.3d 1007, did not involve an MS4 permit. Rather, it involved an individual NPDES permit for an individual discharger discharging directly into a water of the United States. Here, NRDC asks that the Regional Board expand the holding of that case to prohibit discharges into an MS4 system. These are two very different contexts, as the regulatory scheme/NPDES permitting requirements for an MS4 system are distinct from that of an individual discharger discharging directly into federal waters. Thus, to the extent that <i>Friends of Pinto Creek</i> is factually, distinguishable from the current situation, the holding is not applicable to this permit.</p> <p>New buildings developments, and construction projects are not “new discharges” or “new dischargers” unless there is an associated “discharge of pollutants”. 40 CFR 122.2 defines “discharge of a pollutant” as “Any addition of any ‘pollutant’ ... to ‘waters of the United States’ from any ‘point source.’” Addition of pollutants onto surface area which is thereafter mobilized by surface runoff and drainage, or directly into surface runoff and drainage, that is thereafter channeled into a point source that ultimately discharges into waters of the United States is not in and of itself a discharge of pollutants into waters of the United States. In other words, the definition of “new discharge” or “new discharger” was not intended to reach each and every construction project that is up gradient of an MS4 permit. The various construction projects and restraints thereon in the construction and MS4 permits are not regulated directly as NPDES facilities under CWA section 402 subds. (a) and (b), but rather, under subds. (p)(2)(E) and (p)(3) because they may contribute pollutants to storm water that is discharged from a point source to waters of the United States—not because they are themselves point</p>

-------------	-----------	---------	---------	------------------	------------------

court noted that a single exception to this rule exists where a TMDL has been performed, and the “new source can demonstrate that, under the TMDL, the plan is designed to bring the waters into compliance with applicable water quality standards.” (Id.) Thus, where no TMDL has been completed for a specified water body and pollutant, new discharges that add pollutants that will cause or contribute to a violation of water quality standards are prohibited absolutely. Additionally, the court in Friends of Pinto Creek observed that unless a TMDL explicitly provides that existing discharges into the impaired water body are “subject to compliance schedules designed to bring the segment into compliance with applicable water quality standards,” issuance of a permit for new discharge is also prohibited under 40 C.F.R. § 122.4(j). (Id. at 1013.) In effect, a permit for new discharges may not be issued, even when a TMDL for the relevant pollutant exists, unless it firmly establishes that “there are sufficient remaining pollutant load allocations under existing circumstances.” (Id. at 1012.)

source discharges of pollutants to waters of the United States. As such, the Friends of Pinto Creek case is not on point.

For the reasons set forth above, under the holding of Friends of Pinto Creek, the Regional Board is prohibited from approving a permit that allows new sources or dischargers of any pollutant to waterbodies already impaired by that pollutant, unless the Tentative Order demonstrates that an existing TMDL specifically provides sufficient waste load allocations for the discharge.

Even if a TMDL adopted by the Regional Board were to come into effect during the term of the Tentative Order, following the court’s holding in Friends of Pinto Creek, the permit could allow new dischargers or sources of pollutants to be approved only in the event that the applicable TMDL explicitly establishes that (1) existing discharges into the impaired water body are “subject to compliance schedules designed to bring the segment into compliance with applicable water quality standards,” and (2) additional allocations are available for the specified water body. (Friends of Pinto Creek, 504 F.3d at 1013.) Absent an approved TMDL in effect for a specific waterbody and meeting these conditions, there is no authority for the Regional Board to issue the Tentative Order. In order to be lawful, the Tentative Order must establish measures to ensure that stormwater discharges, from existing or future sources, do not cause or contribute to identified impairments, and the Tentative Order has not done so.

We stress that these concerns highlight the need for the Tentative Order to contain both clearly articulated performance standards for LID-based retention of stormwater onsite and strict limitations on the use of alternative compliance measures in order to address water quality problems associated with urban runoff. One critical means of ensuring that runoff from new sources or dischargers will not contribute additional pollutants to an impaired waterbody

is to mandate the proper implementation of LID practices through the imposition of either an EIA standard or an equivalent onsite-retention standard.

196	6	Overirrigation	B	<p>The Tentative Order fails to prohibit all non-stormwater discharges;</p> <p>Federal law requires that MS4 permits “shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers.” (33 U.S.C. § 1342(p)(3)(B)(ii).) However, the Tentative Order and Tentative Order Fact Sheet state that “the federal regulations . . . included a list of specific non-storm water discharges that ‘need not be prohibited.’” (Tentative Order Fact Sheet at 15.) This exception violates the clear language of the CWA and its implementing regulations. Section 402(p)(3)(B)(ii) of the CWA requires that permits for discharge from municipal sewers “effectively prohibit non-stormwater discharges,” 33 U.S.C. § 1342(p)(3)(B)(ii), and does not create any authorization for exemption of such discharges. The Tentative Order states that “[n]on-storm water discharges, per CWA 402(p)(3)(B)(ii) are to be effectively prohibited unless specifically exempted.” (Tentative Order, Finding C.14.) The Tentative Order states that the “following categories of non-storm water discharges are not prohibited unless a Copermittee or the Regional Board identifies the discharge category as a source of pollutants to waters of the U.S. For such a discharge category, the Copermittee must either prohibit the discharge category or develop and implement appropriate control measures to prevent the discharge of pollutants to the MS4 and report to the Regional Board pursuant to Section K.1 and K.3 of this Order.” (Tentative Order ¶ B.1.) However, section 402(p) places a clear, mandatory duty on the Copermittee to prohibit non-stormwater discharges to the MS4 system. The Copermittee, or Regional Board, has no discretion to deviate from this requirement. In ascertaining the meaning of a statute, construction must begin with the text. (Duncan v. Walker (2001) 533 U.S. 167, 172.) “If there is no ambiguity, then we presume the lawmakers meant what they said, and the plain meaning of the language governs.” (Day v. City of Fontana (2001) 25 Cal.4th 268, 272.) There is no ambiguity present in the CWA’s requirement that a permit “effectively prohibit nonstormwater discharges,” and the Tentative Order’s provision of categorical exceptions stands in clear violation of its terms.</p> <p>Neither the CWA, nor its implementing regulations under 40 C.F.R. §122.26(d)(2)(iv)(B)(1) allow exemptions from the prohibition against non-stormwater discharges, as the Fact Sheet implies. (Tentative Order Fact Sheet, at 10.) The regulations set forth the circumstances under which the Copermittee must specifically design a program to prevent certain illicit discharges: “the following category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States.” The cited regulation, providing for an enforcement program to “prevent illicit discharges,” does not support</p>	<p>The Regional Board contends that the exception language in 40 CFR 122.26(d)(iv)(B) and the Federal Register (55 Fed Reg 47995-47996 and 48037) is clear regarding exempted discharges and discharges covered under a separate NPDES permit.</p> <p>Please see response to Comment 199.</p>

-------------	-----------	---------	---------	------------------	------------------

the construction, seemingly implemented by the Tentative Order, that certain specified categories of non-stormwater discharges “are not prohibited unless” they are identified as a source of pollution. (Tentative Order ¶ B.2.) Indeed, the interpretation adopted in the Tentative Order, allowing for categorical exemptions for non-stormwater discharges, is not found in the plain language of the regulation, and the Tentative Order’s provisions would place the regulations in direct conflict with the overlying statute. As written, the entire scheme of the Tentative Order is inconsistent with both the regulations and the statute that they purport to implement.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
197	6	Legal	General	<p>The Permit application does not include an assessment of the likely effectiveness of the control measures imposed.</p> <p>A permit application for discharge from a large- or medium-sized MS4 must contain an assessment of controls, including “[e]stimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program.” (40 C.F.R. § 122.26(d)(2)(v).) Neither the application, the Tentative Order, the Tentative Order Fact Sheet, nor other supporting documents include any required information or other discussion of the amount of pollution that will be reduced through its controls. The approval of the Tentative Order without this information fundamentally violates basic precepts of administrative procedure, not only because required evidence in the record is lacking, but also because the findings and related subfindings in the record are therefore devoid of necessary guideposts as to why and how provisions were included or rejected. The Tentative Order does not provide sufficient evidence to demonstrate that the management practices included in the Tentative Order are adequate to meet relevant requirements and water quality standards.</p> <p>The U.S. EPA has previously released guidance purporting to “allow[] permitting authorities to develop flexible reapplication requirements that are site-specific.” (61 F.R. 41698.) However, nothing in the CWA’s implementing regulations permits such flexibility, and this or other guidance cannot reduce or remove the regulatory requirement that the Tentative Order include estimated reductions in pollutant loadings. It is axiomatic that where agency guidance is inconsistent with an unambiguous statutory scheme or its enabling regulations, the regulations must govern. (See, e.g., <i>Christensen v. Harris County</i> (2000) 529 U.S. 576, 588 (“To defer to the agency’s position would be to permit the agency, under the guise of interpreting a regulation, to create de facto a new regulation”); <i>Davis v. Florida Power & Light Co.</i> (11th Cir. 2000) 205 F.3d 1301, 1307 (rejecting agency policy guidance as inconsistent with its overlying statutory scheme).) In order for the Tentative Order application to meet the requirements of the CWA, the Tentative Order must include an estimate of the pollutant load reduction that it is expected to achieve.</p> <p>Even if the guidance were not in direct conflict with the regulations, the guidance does not in itself specifically exempt permits from including this information. The guidance states that “as a practical matter, most first-time permit application requirements are unnecessary for purposes of second round MS4 permit application;” it does not state that all such information is unconditionally unnecessary. (61 F.R. 41698 (emphasis</p>	<p>The USEPA published an Interpretive Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems (MS4s), (40 CFR Part 122; Federal Register, Volume 61, Number 155). The memorandum explains that MS4 permit applicants and NPDES permit writers have considerable discretion to customize appropriate and streamlined reapplication requirements in subsequent term permits. The memorandum states that “The MS4 permit application requirements at 40 CFR 122.26(d)(1) and (2) apply to the first round permit applications required of large and medium MS4s. The permit application deadline regulations in 40 CFR 122.26(e) (3) & (4) clearly reflect the “one time” nature of the Part I & II application requirements for large and medium MS4s.” The Memorandum rhetorically asks “Are Initial MS4 Permit Application Requirements Applicable To Permit Reapplication?” and definitively answers “No.” Nevertheless, the Report of Waste Discharge submitted by the Copermittees did include an effectiveness assessment of their program. Several program measures do not provide a direct assessment of pollutant load reduction, (e.g. education, fiscal analysis). Some program measures such as street sweeping and trash collection do provide a direct assessment of assumed pollutant load reduction and that information is included in the Report of Waste Discharge. Where the commenter does not agree with the USEPA guidance, the commenter should contact USEPA.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

added).) The omitted pollutant reduction estimates represent a fundamentally different type of information from that required by most of the other provisions of 40 C.F.R. § 122.26(d)(2), such as identifying already identified “major outfalls,” for which repeating the exercise “would be needlessly redundant,” especially “where it has already been provided and has not changed.” (61 F.R. 41698.) Instead, the required pollutant load reduction estimates are self-evidently relevant to crafting and assessing the core requirements of the new permit. Such estimates are an essential means of determining whether or not the permit will ensure that water quality standards will be met and what improvements can be expected; they are not merely an administrative detail that has no effect on the permit’s functionality.

The missing information is further indispensable when, as here, the Tentative Order and the provisions included in it represent a substantial change from the previously adopted Permit. Indeed, the Tentative Order itself notes that “[t]he Order contains new or modified requirements that are necessary to improve Copermitees’ efforts to reduce the discharge of pollutants in runoff to the MEP and achieve water quality standards.” (Tentative Order, Finding D.1.c.) Given changes from the prior Permit, the necessity of basing the Tentative Order on information about its estimated efficacy should be clear. The Tentative Order and application must be revised to include the required estimates.

198	6	LID	F.1.	<p>The Tentative Order fails to set a specific numeric performance standard for the implementation of LID at Priority Development Projects. As a result, provided that a project installs some de minimis LID features, it would comply with the Tentative Order. In effect, LID features would not have to be sized to accommodate any meaningful quantity of stormwater. This is completely contrary to the exhortations of expert agencies and scientists, as described above, or the standard now adopted by the Los Angeles Regional Water Quality Control Board for Ventura County.</p> <p>The specific provisions that fail to establish the necessary, numeric performance standard are the “Low Impact Development Site Design BMP Requirements,” which were revised in the current draft. (Tentative Order ¶ F.1.d.(4)(a).) These provisions merely state that “[e]ach Copermittee must require LID storm water practices or make a finding of infeasibility for each Priority Development Project.” (Tentative Order ¶ F.1.d.(4)(a)(i).) Nowhere in this section, however, or anywhere in the Development Planning Component is there a requirement that establishes a level of implementation for LID practices. Indeed, the closest thing to a numeric performance standard is the section on “Treatment Control BMP Requirements,” which merely mirrors the SUSMP criteria of the State Board’s Bellflower decision.¹⁷ (Tentative Order ¶ F.1.d.(6).) These are not referenced or included as a numeric performance standard in the LID provisions, though, which contain instead the various vague requirements listed above. In terms of requiring onsite retention through LID implementation, the Tentative Order is far from meeting the MEP standard because the Tentative Order merely mandates that “[t]he review of each Priority Development Project must include an assessment of techniques to infiltrate, filter, store, evaporate, or detain runoff close to the source of runoff.” (Tentative Order F.1.d.(4)(a)(iv).) This amounts to no requirement at all for onsite retention.</p> <p>The Tentative Order should state: Copermittees must require that each Priority Development Project retain onsite— through infiltration, evapotranspiration, or harvesting and reuse—the design storm volume listed in Section F.1.d.(6)(a)(i). Onsite retention standards of this form are becoming prevalent across the country, as discussed below, and since their implementation is not only feasible, but will result in better stormwater pollution reduction, the Permit cannot meet the Clean Water Act’s MEP standard without such a performance requirement. As currently written, the Tentative Order’s provisions do no more than encourage the implementation of some, non-hydraulically-sized LID features—just as the last draft of the permit did.</p>	<p>The Tentative Order's requirements regarding the implementation of low impact development practices has been changed to be consistent with Region 8's recently adopted MS4 permit.</p> <p>The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
199	6	NEL	C	<p>In an attempt to “assure non-storm water dry weather discharges from the Orange County MS4 into receiving waters are not causing, threatening to cause or contributing to a condition of pollution or nuisance and to protect designated Beneficial Uses,” (Tentative Order ¶ C.1), the Tentative Order incorporates “Non storm water dry weather TMDLs . . . in this Order as QBELs.” (Tentative Order Fact Sheet, at 21.) Generally speaking, we approve of the Regional Board’s use of numeric limits to assure that water quality standards are met, and of including provisions that Copermittees must monitor progress toward and attain numeric standards for discharges from the MS4 system. While this provision represents a positive step toward preventing illicit discharges of non-stormwater to the MS4 system, the appropriate means of implementing the requirements of section 402(p) is not through the use of “dry weather TMDLs,”⁵⁴ but by effectively prohibiting discharges of non-stormwater altogether. To the extent that the Regional Board will incorporate numeric limitations on pollutants in non-stormwater discharges, Section C must, at a minimum, be revised to assure that the permit does not allow for non-stormwater discharges containing any quantity of pollution to occur, as opposed to only prohibiting those discharges that exceed the numeric limits. The Tentative Order states that Copermittees “shall monitor for and attain the non-storm water dry weather numeric limits” incorporated into the Order as a means of compliance. (Tentative Order ¶ C.5.)</p> <p>Under 40 C.F.R. § 122.26(d)(2)(iv)(B)(1), the Tentative Order must prohibit the discharge of any pollutant in non-stormwater discharges to waters of the United States, not just pollutants that exceed the numeric standards identified in Section C. In order to avoid confusion, the language of Section C must be revised to explicitly state: (1) that compliance with the Tentative Orders’ numeric limitations does not constitute compliance with the CWA’s requirement that nonstormwater discharges be “effectively prohibit[ed],” or (2) that categories of non-stormwater discharge which the Regional Board believes are exempt from this prohibition may not discharge any pollutants, regardless of whether they exceed numeric limitations. Though we question the Regional Board’s authority to exempt any categories of nonstormwater discharge from section 402(p)’s prohibition against discharges to the MS4 system, we note with approval the Tentative Order’s decision to remove landscape irrigation, irrigation water and lawn watering from the list of exempt discharges, effectively prohibiting discharge from these sources. (Tentative Order ¶ B.2.) Lawn irrigation has been identified as a “hot spot” for nutrient contamination in urban watersheds—lawns “contribute greater concentrations of Total N, Total P and dissolved phosphorus than other urban source areas . . . source research suggests that nutrient concentrations in lawn runoff can be as much as four times greater than other</p>	<p>Language in the Tentative Order has been updated to reflect that all non-storm water discharges are prohibited unless specifically exempted and not a source of pollutants to waters of the United States. This language has been modified to clarify that compliance with non-storm water numeric limits does not exempt Copermittees from effectively prohibiting non-storm water discharges that are not exempt or covered under a separate NPDES permit (see response to Comments 11, 41 and 77).</p> <p>The Regional Board does not agree that all non-storm water discharges are required to be effectively prohibited, as under 40 CFR 122.26(d)(iv)(B) certain categories of pollutants are exempt from the effective prohibition requirement and need not be addressed unless identified as a source of pollutants (see also 55 Fed Reg 47995-47996 and 48037). The Regional Board expects any non-compliance with non-storm water numeric effluent limits to result in the following: identification of illicit discharges, exempted categories that need to be addressed, and/or NPDES permit(s) that have discharge into the MS4 that is/are not meeting discharge requirements.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

urban sources such as streets, rooftops or driveways.” 55 Given the strong evidence that these discharges are consistent sources of pollution to the MS4 system and waters of the United States within the Copermittees’ jurisdictions (see Tentative Order Fact Sheet at 5, 8-13, 22), we strongly support the Regional Board’s decision in this regard. In total, the Tentative Order’s approach does not uphold the CWA’s mandate that Copermittees “effectively prohibit non-stormwater discharges into the storm sewers.” (33 U.S.C. § 1342(p)(3)(B)(ii).) Given the evidence that pollution from non-storm discharges constitutes a serious and ongoing problem in receiving waters under the jurisdiction of the Copermittees, we underscore that, as with our comments in Section IV, these concerns emphasize the need for LID-based, onsite stormwater retention requirements, since these approaches will reduce nonstormwater runoff from new development to zero when properly implemented.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
200	7	General	General	<p>During the last public hearing on the Draft Permit, in February, 2008, the SDRWQCB Board directed Board Staff to revise the permit to achieve greater consistency with Phase I MS4 permits throughout the state, and to provide stakeholders and the regulated community with a meaningful opportunity to assist in the development of the revisions. Unfortunately, the Draft Permit was released without cooperative input from the regulated community prior to its release and, more significantly, is entirely inconsistent with other Large MS4 Permits issued throughout the state.</p> <p>Indeed, a brief comparison of the Draft Permit with the North Orange County MS4 Permit that is likely to be adopted by the California Regional Water Quality Control Board, Santa Ana Region ("SARWQCB") on May 22, 2009, reveals that there is a significant disparity between the two permits. The North Orange County MS4 Permit is of particular concern because many of the Copermittees, including the City, are subject to both the North Orange County Permit, and the Draft Permit. Inconsistencies between the two permits create bureaucratic hurdles that cost the City time and valuable resources. Furthermore, the conspicuous disparity between the permits are likely to cause confusion among the public, and discourage public acceptance and participation in clean water efforts.</p> <p>In addition to the consistency issues, the Draft Permit largely conflicts with guidance from the State Water Resources Control Board ("State Board") and the United States Environmental Protection Agency ("EPA"). This deviation from agency guidance, and industry practice is most stark in the Draft Permit's Numeric Effluent Limits ("NEL") and Municipal Action Level ("MAL") requirements. As described more fully below, these aspects of the Draft Permit exceed the standards for municipal discharges set forth in the Clean Water Act and/or completely ignore State Board studies on whether such provisions can be feasibly implemented in MS4 permits. The City's specific comments on the Draft Permit follow.</p>	Please see response to Comments 24, 25, 33 and 39.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
201	7	NEL	C	The Draft Permit attempts to impose a higher compliance standard for dry weather discharges. Pursuant to this heightened standard, the Draft Permit imposes NELs for dry weather discharges from the MS4. The Draft Permit states that this heightened standard is warranted because the Clean Water Act requires MS4 permits to prohibit discharges of non-stormwater, and dry weather flows constituted non-stormwater. The Clean Water Act clearly defines the discharge requirements for MS4 permits. Pursuant to the Clean Water Act, NPDES permits may be issued on a system or jurisdiction-wide basis, and must include a requirement to effectively prohibit nonstormwater discharges into the storm sewer, and must require controls to reduce the discharge of pollutants from the storm sewer to the maximum extent practicable. (33 U.S.C. § 1342(p)(3)(B).) The Clean Water Act does not distinguish between wet weather and dry weather discharges, and thus does not support a heightened standard for discharges of non-stormwater from MS4s.	Please see response to Comment 39.
202	7	NEL	C	Moreover, the NELs in the Draft Permit directly conflict with the findings of the State Water Resources Control Board's ("State Board") Blue-Ribbon Panel Report on the feasibility of numeric effluent limits in MS4 permits. After an exhaustive investigation into the feasibility of numeric effluent limits and action levels, the Blue Ribbon Panel found "[i]t is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban discharges." (Blue Ribbon Panel Report, pp. 8.) Nonetheless, the Draft Permit includes NELs for dry weather flows. When this inconsistency was brought to the attention of Regional Board staff, it was dismissed on the grounds that the Blue Ribbon Panel report applied only to wet weather flows. As stated above, the Clean Water Act makes no such distinction.	Please see response to Comment 25.
203	7	Legal	C	While the SDRWQCB may have the authority to impose restrictions in Waste Discharge Requirements that exceed the requirements of the Clean Water Act, when imposing such restrictions, the SDRWQCB must comply with applicable State laws. (City of Burbank v. State Water Resources Control Board (2005) 35 Cal.4th 613; see also Defenders of Wildlife v. Brown (9th Cir. 1999) 191 FJd, 1159, 1166.) These include but are not limited to the California Environmental Quality Act, and Water Code sections 13241 and 13000. The Draft Permit does not comply with these requirements. Imposing NELs in the Draft permit will result in numerous unintended consequences, including the possibility that the Copermittees will be held liable for mandatory minimum penalties for exceeding the NELs. For that reason, the City requests that the SDRWQCB remove the NEL requirements from the Draft Permit.	NELs do not exceed the requirements of section 402 of the Clean Water Act. Nonetheless, the Board will consider any economic information that is submitted. Please see response to Comments 39, 41, 42, 43, 79, 81, 82, and 155.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
204	7	MAL	D	<p>The Draft Permit includes MALs. Pursuant to the Draft permit, beginning in the fourth year after adoption of the permit, discharges from the MS4 that exceed the MALs create a presumption that the permittee is not complying with the Maximum Extent Practicable ("MEP") standard. In other words, the permittee would be presumed to be in violation of the permit. The decision to include MALs in the Draft Permit ignores guidance from the State Board and the EPA, as well as the MS4 Permits adopted by other Regional Boards. The MALs in the Draft Permit directly conflict with the State Board's Blue-Ribbon Panel Report findings. The MALs recommended by the Blue Ribbon Report were to be used as a management tool to indicate when additional Best Management Practices ("BMPs") are necessary, not a point of compliance. In contrast, the MALs in the Draft Permit are tied to MEP compliance and as a result are effectively NELs. As stated above, the Blue Ribbon Panel found that NELs for municipal BMPs and urban discharges are not feasible. By imposing NELs by a different name, the Draft Permit flatly ignores the Blue Ribbon Report's recommendations.</p>	Please see response to Comment 33.
205	7	MAL	D	<p>Additionally, the Draft Permit's attempt to tie compliance with the MEP standard to non-compliance with MALs is not supported by the Clean Water Act. The MEP standard is designed to allow the Copermitees flexibility to implement effective and feasible BMPs to address stormwater pollution. This interpretation of the MEP standard is supported by the EPA. (See 64 Fed. Reg. 68721,68754 (Dec. 8, 1999) ["EPA has intentionally not provided a precise definition of MEP to allow maximum flexibility in MS4 permitting. MS4s need the flexibility to optimize reductions in stormwater pollutants on a location by- location basis"].) It is also endorsed by the State Board. (State Water Board Order WQ 2000-11 at p. 20 ["MEP requires permittees to choose effective BMPs, and to reject applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive"].)</p>	Please see response to Comment 33.
206	7	MAL	D	<p>Defining MEP compliance with a single MAL standard violates the intent of the Clean Water Act to give the municipal permittees the discretion and flexibility to do use BMPs to prevent and/or treat discharges from their MS4s. This is the approach taken by the other Regional Boards in Southern California when issuing MS4 Permits. Neither the recently adopted Ventura County Large MS4 Permit, nor the North Orange County Large MS4 Permit includes NELs or MALs.1 The Draft permit should reflect the national and statewide guidelines on MALs. For that reason, the SDRWQCB should either revise the Draft Permit to meet the recommendations from the Blue Ribbon Panel, or remove the MALs from the Draft Permit.</p>	<p>Please see response to Comment 33.</p> <p>Please note that regardless of the permit elements included or excluded from other Regional Board's MS4 permits, the San Diego Regional Board may include or exclude permit requirements as it deems necessary by State and federal law. For further, discussion please see response to Comment 24.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

207	7	Urban Runoff	General	<p>The Draft permit has removed the word "urban" from everywhere it formerly modified the word "runoff". This universal change suggests that the Copermittees are responsible not just for urban runoff, but all runoff. Holding the Copermittees to this heightened standard exceeds the jurisdiction and intent of the Clean Water Act.</p> <p>MS4 Permits are NPDES Permits. Pursuant to the Clean Water Act, NPDES permits regulate point source discharges. By definition, agricultural discharges are not point sources, even when they are discharged from a conveyance that would meet the definition of a point source. By removing the term "urban" from the Draft permit, the Draft Permit would hold the Copermittees liable for agricultural and other non-point source discharges that enter and exit their MS4. Because agricultural discharges are not point sources, they are not subject to regulation with NPDES permits. Attempting to include agricultural discharges in the Draft Permit therefore exceeds the Clean Water Act's jurisdiction.</p> <p>The history of the Clean Water Act demonstrates that it was intended to regulate urban runoff rather than agricultural sources and other non-point discharges. Indeed, when issuing the MS4 Permit regulations in 1990, EPA stated, "it is the intent of EPA that [stormwater] management plans and other components of the programs focus on the urbanized and developing areas of the county." (55 Fed. Reg. 47989, 48041 (Nov. 16, 1990).) The urban discharge focus is reflected in the San Diego Region Basin Plan which discusses the problem of stormwater runoff in terms of urbanization and cites to EPA Guidance limiting regulation of stormwater to urban sources. (See San Diego Basin Plan, pp. 4-78, 4-79.) There is simply no support for the Draft permit's attempt to expand the scope of regulation by adding additional sources of regulated discharges.</p> <p>By removing the term "urban" from the Draft Permit, the SDRWQCB has potentially enlarged the scope of regulation to include agricultural discharges, other traditional nonpoint source discharges, and naturally occurring pollutant discharges. As stated above, regulation of these discharges is not within the scope of the Clean Water Act.² The City therefore requests that Draft Permit be revised to make clear that it only pertains to "urban" discharges.</p>	Please see response to Comment No. 47.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
208	7	Retrofitting	F.3.	<p>Section FJ.d of the Draft Permit requires the Copermittees to develop a plan to retrofit existing development within their jurisdiction. Specifically, each permittee must implement a retrofitting program that:</p> <ul style="list-style-type: none"> • Solves chronic flooding problems, • Reduces impacts from hydromodification, • Incorporates Low Impact Development ("LID") principles, • Supports stream restoration, • Systematically reduces downstream channel erosion, • Reduces the discharges of stormwater pollutants from the MS4 to the MEP, and • Prevents discharges from the MS4 from causing or contributing to a violation of water quality standards. <p>These requirements are inconsistent with other recently issued MS4 Permits. More importantly, they are infeasible. While the Copermittees have traditional land use authority to impose requirements on new development as a condition of development, there is no similar authority to require property owners to retrofit existing development. The Draft Permit ignores this lack of authority and goes as far as to require the Copermittees to identify existing developments that are sources of pollutants and then evaluate and rank them to prioritize retrofitting. (Draft Permit, section FJ.d(1)-(2).) Additionally, because the City has limited authority to impose retrofit requirements on existing development within its jurisdiction, the Draft Permit's retrofit provisions will result in an allocation of resources that is not likely to benefit clean water. For example, the City will be required to dedicate significant resources and time to identify and inventory existing sites and then complete evaluations and prioritization of these sites for retrofits. These intensive activities will divert resources, time, and funding away from other vital permit related programs.</p> <p>Because the Copermittees have little authority to implement the Draft permit's existing development retrofit requirements, the City requests that they be removed from the Draft Permit.</p>	Please see response to Comments 46, 136 and 162.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
209	7	Overirrigation	B	<p>The Draft Permit has eliminated irrigation water as an exempt discharge. The federal stormwater regulations include a list of categories of "exempt" non-stormwater discharges or flows. (40 CFR 122.26(d)(2)(iv)(B)(1).) The Copermittees' illicit discharge and illegal disposal program must address these discharges or flows when they have been identified by the Copermittees as sources of pollutants to waters of the U.S. (Id.) Where individual sources of discharge are identified they need to be addressed on an individual basis. This approach is supported by the EPA. (See Part 2 Guidance Manual at p. 6-33.)</p> <p>This is a sound approach to addressing pollutants in irrigation water. While irrigation runoff may act as a conveyance of pollutants in some instances, whether it is a conveyance of pollutants needs to be evaluated on an case by case basis. This is because the tendency of irrigation water to convey pollutants is dependant on the pollutants and the source of those pollutants. Moreover, many of the pollutants that may be conveyed by irrigation overflows are naturally occurring, are regulated by the State under different permits or programs, or are diffuse and uncontrollable by the Permittees. Potable irrigation water itself is not a pollutant. Therefore, it is inappropriate to regulate irrigation runoff as a pollutant.</p>	Please see response to Comment no.s 28, 52, 75, and 174.
210	7	Overirrigation	B	<p>Furthermore, enforcing discharges of potable irrigation water from residential homes presents numerous challenges for the City. Residents without a significant water quality background are unlikely to agree that potable irrigation water is a pollutant. This will discourage public acceptance and participation in the water quality program, a program whose foundation is outreach and public education.</p>	Please see response to Comment #s 28, 52, 75, and 174.
211	7	Overirrigation	B	<p>Lastly, it is also important to recognize that irrigation runoff is a significant water supply issue. The City, the other Copermittees, and water districts throughout the region are working toward limiting excessive irrigation runoff through numerous water conservation programs and ordinances. Therefore, reduction of irrigation runoff will be achieved through other means, and does not need to be regulated in the Draft Permit. Regulation as a water supply issue has the added benefit of public acceptance and participation in conservation programs. This will allow the benefits of fewer irrigation overflow discharges to occur without undennining public support for the City's water quality program. The City therefore requests that the exemption for landscape irrigation be restored.</p>	<p>Please see response to Comment #s 28, 52, 75, and in particular 174.</p> <p>It is our expectation that removal of the exemption to improve water quality will work in concert with conservation efforts aimed at source control. Data discussed recently at the Water Conservation Summit (http://www.waterconservationsummit.com/ReTHINK_Water_-_Maureen_Stapleton.pdf) clearly indicate that voluntary actions are not enough to reach the conservation needed by the water districts. Therefore, it is not accurate to state public acceptance and participation has been sufficiently achieved for water conservation.</p>

212	7	SUSMP	F.1	Draft Permit Section D.I.f. requires Copermittees to maintain a watershed based database to track and inventory approved treatment control BMPs. It additionally requires Copermittees to verify, on an annual basis, that the BMPs are being maintained and operated effectively. Compliance with this section will require a significant commitment from Copermittee staff, and may require the addition of staff. The value of the outlay of funds that compliance with this section will require is questionable in comparison to the overall benefit to stormwater quality. This section should be removed, or the Permit should be revised to allow for inspection and verification on an as needed basis.	This permit provision is necessary due to findings from audits of the Copermittees and recommendations from USEPA. The permit section requires that the Copermittees inspect at least the high priority post-construction BMPs annually and gives latitude to the Copermittee in deciding what post-construction BMPs are a high priority. The Copermittees may employ other less costly measures, such as self certifications, for low and medium priority BMPs. The Copermittees latitude in determining high priority BMPs and the use of measures other than inspections for other priority BMPs gives the Copermittees the flexibility needed to comply with this provision within their existing programs and constraints.
213	7	Hydromod	F.1.	During preparation of the Fourth Draft of the North Orange County Permit, the land development provision of the permit were the subject of a series of stakeholder meetings and subsequent comments by the EPA. These sections of the SARWQCB permit containing the land development provisions were revised and are currently scheduled for consideration of adoption by the SARWQCB on May 22,2009. The City requests that SDRWQCB staff include the same or very similar land development provision within the SDRWQCB Draft Permit to facilitate consistency and feasible implementation between the two regions within Orange County. As state above, this issue is very important to the City as it will be required to implement both programs within its jurisdiction. The North Orange County Permit's development provisions are more flexible than those currently included in the Draft Permit. It was nonetheless accepted by the EPA, the Copermittees, the building industry, and interested environmental groups. Those provisions represent mutually agreeable design standards that should be adopted in the Draft Permit.	<p>The language in section F.1.h describing the hydromodification management requirements have been substantially revised. Nevertheless, the requirements are not identical to the hydromodification management requirements described in Order No. R8-2009-0030.</p> <p>The requirements described in the Tentative Order are more stringent than Order No. R8-2009-0030 because they require that the Copermittees develop a Hydromodification Management Plan (HMP) to identify a range of flow rates and durations that will result in increased potential for erosion, and also implement hydrologic controls measures to mitigate for such flows. Under Order No. R8-2009-0030, the Copermittees must ensure that post-project hydrograph mimics the pre-project hydrograph for a 2 year frequency storm event. Because the range of flows to be controlled under the Tentative Order will likely include larger storms than the 2 year frequency storm event, the Copermittees regulated under the Tentative Order are likely to automatically comply with Order No. R9-2008-0030.</p> <p>Please see response to Comment No. 4 for a discussion of LID requirements that are substantially similar to those required by Region 8.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
214	7	Existing Development	F.3.	<p>Draft Permit Section D.3.a.(5) requires Copermittees to design and implement a street sweeping program based on criteria which includes optimizing the pickup of "toxic automotive byproducts" based on traffic counts. Although the Permit does not specify what pollutants it is trying to capture, one can only assume that this provision is aimed at commonly utilized automotive products such as oil, gasoline, transmission fluid, brake fluid, brake dust and radiator fluids. Because the term is not defined, however, it could be broad enough to include air-deposited byproducts of combustion. Street sweeping, and street sweepers in general, were not designed to be the primary means of collecting these by-products. It is therefore unlikely that street sweeping will be effective at collecting many of them, including any liquids that have soaked into the pavement. Additionally, whether such by-products are deposited on a given street is not necessarily a function of the traffic volume on that street. There does not appear to be a direct correlation between traffic counts and the effectiveness or need for street sweeping. There are other pollutants such as litter, debris, and grass clippings etc. that could be detrimental to stormwater quality that are de-emphasized by the Permit's focus on traffic counts. This section should therefore be revised to both specify the types of pollutants the Copermittees should be seeking to reduce with their street sweeping programs, and to provide the Copermittees with the discretion to utilize street sweeping in a manner that maximizes its effectiveness.</p>	<p>This comment is a repeat comment previously raised by the City of Lake Forest, City of Laguna Hills, City of Aliso Viejo, City of Dana Point and County of Orange in regards to a previous version of the Tentative Order (R9-2007-0002). The section protested by the City of Lake Forest (D.3.a.5 for "toxic automotive byproducts") was removed in the July 06, 2007 Response to Comments. The requirement has not been present in Tentative Orders R9-2008-001 or R9-2009-002. Thus, the requested change was made almost two years ago and further changes are not warranted.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
215	7	Existing Development	F.3	<p>The North Orange County permit, which the City will also be required to implement, no longer includes a mobile business tracking requirement. Instead, the North Orange Permit requires the County, as the principle permittee to develop a program over the next permit term that could be implemented by all of the Copermittees. This approach is preferable to the language in the Draft Permit because it gives the Copermittees the flexibility to develop a program they mutually agree upon.</p> <p>For that reason, the City requests that the SDRWQCB either remove the mobile business provisions from the Draft Permit, or replace them with language similar to that in the North Orange County permit. Draft Permit Section F.3.b.(3) requires the Copermittees to develop and implement a program to reduce the discharge of pollutants from various types of mobile businesses. This section requires Copermittees to develop a listing of mobile businesses, and requires the Copermittees to develop and implement a number of measures to limit the discharge of pollutants from them. As a practical matter, these requirements will be very difficult to enforce for the following reasons:</p> <ol style="list-style-type: none"> 1. What constitutes a mobile business is not well defined; 2. Mobile businesses operate in multiple jurisdictions and cannot be tracked as to time and place; 3. Mobile businesses may operate on private property out of the City's view; and 4. Additional staff time will be required to roam the City looking for mobile businesses. <p>The Fact Sheet that the SDRWQCB has issued in support of the Permit states that the Permit has targeted mobile businesses for special attention because the Copermittees reported that discharges from such businesses have been difficult to control with existing programs. Rather than finding a solution for this problem, the Permit directs Copermittees to implement a number of non-descript solutions that will not necessarily make regulation of mobile businesses any easier. The SDRWQCB should therefore revise this section of the Permit to provide the Copermittees with the discretion to focus on mobile sources when they feel it is necessary, or if they identify mobile businesses as a significant source of stormwater pollution within their jurisdiction.</p>	<p>Please see response to Comment 24, 29 and 256.</p> <p>Due to the nature of mobile businesses, it is unclear why the Copermittees should "focus on mobile sources when they feel it is necessary, or if they identify mobile businesses as a significant source of stormwater pollution within their jurisdiction". Mobile businesses should be focused upon for illicit discharges as part of the IC/ID program at all times, and should implement BMPs to reduce pollutants in storm water to the MEP. It is unclear how the Copermittees would distinguish what constitutes necessity and when a mobile business is a significant source of pollutants.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
216	7	General	H	<p>Draft Permit Section F. requires the Copermittees to conduct an annual fiscal analysis of the capital, operation, and maintenance expenditures necessary to implement the Permit's requirements. This section additionally requires each analysis to "include a qualitative or quantitative description of fiscal benefits realized from implementation of the stormwater protection program." A review of the Fact Sheet indicates that the Permit is requiring the Copermittees to conduct an economic benefits analysis of their respective stormwater programs.</p> <p>This requirement is unnecessarily duplicative. As described in the Report of Waste Discharge, the Copermittees have already committed to develop a fiscal reporting strategy to better define the expenditure and budget line items included in the fiscal report. Furthermore, the SDRWQCB is already required to take the economic benefits and burdens of their actions into account when issuing stormwater permits. (See City of Burbank v. State Water Resources Control Board (2005) 35 Cal.4th 613; and California Water Code § 13263.) Requiring the Copermittees duplicate these requirements is a waste of resources that could be better spent on implementing other Permit provisions.</p> <p>Accordingly, this section should be modified to encourage rather than require the Copermittees conduct such an analysis.</p> <p>This section of the Permit additionally requires each Copermittee submit a business plan that identifies a long term funding strategy for program evolution and funding decisions.</p> <p>The Copermittees do not always have information on the future sources of funding as it is not often readily available. This makes production of such a document difficult. The SDRWQCB does not need to know the funding sources for each Copermittee's stormwater program. Requiring such a report is overreaching in a manner that will unnecessarily cost the Copermittees additional time and resources. This section of the Permit should therefore be modified to encourage rather than require the Copermittees develop a business plan.</p>	<p>Section H has been expanded in order to develop more useful and meaningful fiscal reporting. Please see response to Comment Nos.141 and 142. In regards to the Copermittees assertion that they have proposed a similar program in their Report of Waste Discharge, that document is not a binding or enforceable document. When drafting the Tentative Order, the permit writers consider the information provided in the Report of Waste Discharge by the Copermittees. The ad hoc funding of storm water programs in some jurisdictions may lead to Permit non-compliance. This requirement will improve the long-term viability of storm water programs and thus Permit compliance leading to better protection of water quality standards. The difficulty in providing information on the future sources of funding would only be where that funding has not been identified. Not identifying future funding for the storm water program puts in jeopardy in multi year planning and implementation for projects (structural and non-structural) that are needed to reduce pollutants in storm water discharges to meet water quality standards.</p> <p>Please note that the Business Plan requirement (H.3) has been removed from the Tentative Order.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
217	7	unfunded mandate	General	The Draft Permit includes numerous requirements that exceed the requirements of federal law. While the SDRWQCB has the authority to include such requirements in the Draft Permit, it must comply with the statutory requirements set forth in the California Porter Cologne Water Quality Control Act. (City of Burbank v. State Water Resources Control Bd. (2005) 35 Cal. 4th 613.) This includes making the findings required by Water Code sections 13000, 13241 and 13263. Additionally, as these requirements represent state, rather than federal, mandates, if they are included the final permit, the Copermittees are entitled to reimbursement from the State for the costs associated with implementing them. (California Constitution, Article XIII B, § 6.)	The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.
218	8	ASBS	B	The City of Laguna Beach has reviewed the language pertaining to ASBS in the Tentative Order and suggests removing #5 from page 18 and #5 from page 20. The City is not opposed to using ASBS drainage as criteria for identifying LID retrofit opportunities as seen on page 66 of the Tentative Order. Possible alternative language in place of the deleted text may read: "Dry and we weather discharges into ASBS or SWQPAs are separately regulated by the State Board" The City feels that adding an ASBS discharge prohibition to the permit is not necessary because the ASBS discharge prohibition is covered in much more detail by the (draft)"Special Protections for Selected Storm Water and Nonpoint Source Discharges into Areas of Special Biological Significance" issued by the State Board. Having two branches of the same agency regulating the ASBS is simply an extra burden on City and State personnel with no measurable water quality benefit. Laguna Beach has focused water quality control and storm water BMP efforts in the Heisler Park ASBS over the past several years and has achieved measureable results. The ASBS language in the permit is not necessary to further these efforts. Since the City faces enforcement actions from the State Board for illegal discharges outside the NPDES permit, the City requests the deletions noted above.	The Regional Board has removed ASBS/SWQPA language from the tentative Order. Please note ASBS/SWQPAs, like all water bodies, remain subject to receiving water limitations and discharge prohibitions under the Tentative Order.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
219	9	Existing Development	B	<p>Federal and state laws require that commercial buildings install fire suppression systems the majority of which include standard ceiling sprinklers. These systems are seldom used, resulting in water typically sitting in piping for five years, or until required testing results in its discharge. During that time, harmful pollutants such as chemicals, rust, oils, disease-causing agents, nitrates, minerals and bacteria build up in the standing water and are discharged onto open surfaces and into storm drains. It has been estimated that sprinkler technicians flush about 2.35 gallons of water per square foot through piping during testing. California has roughly 460,000 to 550,000 commercial buildings containing between 6.6 billion to 7.0 billion square feet of space (based on extrapolations from the Energy Information Administration report Overview of Commercial Buildings 2003). At 2.35 gallons per square foot, about 2.9 billion to 3.2 billion gallons of polluted water are discharged from buildings every year. The vast majority of this amount drains into our oceans and waterways while the remainder is left to percolate into the water table, a source of fresh water for many cities.</p> <p>Several California municipalities, in compliance with Federal Clean Water Act and the NPDES, require sprinkler technicians to capture polluted fire sprinkler discharge at the source and to transport it to purification centers. Moreover, there are other emerging developments that are more portable, easier to use and capable of processing water at the source. They include the newly developed portable water cleaning process of Hydro(gen) Innovations Inc. and Abtech Corporation's Smart Sponge called the EcoSmart Filter which is used in draining maintenance.</p> <p>Given that there are newer technologies and easier means for fire sprinkler companies to contain and clean polluted water, it is imperative that the California EPA and Water Quality Boards move to the next step - mandating building owners and managers and fire sprinkler technicians to clean polluted water before discharging it into public storm drain systems. This would also require ensuring that there is oversight and authority to cite and prosecute so that laws are being met and that those involved are acting within the requirements of state law.</p>	<p>To date, no municipalities (Copermittees) have identified discharges or flows from fire fighting as significant sources of pollutants to waters of the United States. Thus, under 40 CFR 122.26(d)(B)(1), such flows are not required to be addressed as illicit discharges. The Federal Register (55 Fed Reg 48037), however, states that:</p> <p>"In the case of fire fighting it is not the intent of these rules to prohibit in any circumstances the protection of life and public or private property through the use of water or other fire retardants that flow into separate storm sewers. However, there may be instances where specified management practices are appropriate where these flows do occur (controlled blazes are one example)."</p> <p>The Regional Board contends that the flushing of building fire suppression systems (e.g. fire sprinklers), constitutes a fire fighting maintenance activity. The Federal Register (55 Fed Reg 48037) allows the Director to "include permit conditions that either require municipalities to prohibit or otherwise control any of these types of discharges where appropriate."</p> <p>The Regional Board has identified that maintenance of building fire suppression systems results in a discharge that contains waste, and as such new language has been added requiring Copermittees to address these maintenance activities as illicit discharges.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
220	10	General	Finding	<p>To support the programmatic approach to water quality and water body protection that has taken place in southern Orange County, the Regional Board should incorporate into the Final Order two new Findings in Section D.4 Watershed Runoff Management as follows:</p> <p>d. The South Orange County municipal storm water permits have, since the first term permit, directed the co-permittees to implement methods of coordinating land use planning at the watershed scale and to address the impacts of development on water resources as early in the planning process as possible. In response to those permit requirements, the County and cities in South Orange County developed processes to review and approve land use plans in a way that implemented these requirements. The County's approval of the Ranch Plan embodies the results of this process, and exemplifies what can be achieved when the co-permittees and the development community embrace the goals and intent of the water quality regulatory program.</p> <p>e. The San Juan Creek Watershed and Western San Mateo Creek Watershed Special Area Management Plan and Southern Subregion Habitat Conservation Plan, both regional watershed-based planning programs, will contribute to the protection of beneficial uses through i) the conservation and management of the Southern Subregion Habitat Reserve and its associated Aquatic Resource Conservation Areas and ii) implementation of the site design, source control, treatment control, and hydromodification control measures contained in the Conceptual Water Quality Management Plan for Priority Development Projects within the SAMP and HCP Study Areas.</p>	<p>It is not appropriate for the Tentative Order to include findings or requirements for a specific development project. Where appropriate, the Tentative Order may be changed to address commonalities in all new development. While Regional Board staff participated in an advisory role for the SAMP process, the Regional Board addresses dredge and fill impacts to waters of the United States that require a federal permit by issuing individual 401 Water Quality Certifications, pursuant to Section 401 of the Clean Water Act. As such, these findings are not included in the Tentative Order.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
221	10	LID	F.1	<p>The proposed development project criteria and requirements contained in Section F.1 (i.e., Sections F.1(c), F.1(d)(4), and F.1(h)(6)) do not provide for Projects that have addressed these requirements through the development and application of basic principles of hydrology and geomorphology at the sub-watershed and watershed scale. For example, the first LID BMP on page 26 of the Revised Tentative Order states "Conserve natural areas, including existing trees, other vegetation and soils". In our case, this LID BMP has been accomplished at the watershed scale resulting in 20,868 acres of RMV lands that will be preserved as open space (including all main stem creeks) and dedicated to a Habitat Reserve over time. Table 1 (attached) takes each Site Design BMP, Buffer Zone and Infiltration and Groundwater Protection requirement from this section and illustrates how this has been achieved at the watershed and sub-watershed scale on RMV. Additionally, an excerpt from the WQMP that summarizes the Watershed Planning Principles and approaches taken by RMV to implement these principles is provided in Attachment 1. Because of the protections to water quality and water bodies achieved through watershedbased projects such as the Ranch Plan, the Regional Board should define Watershed Planning as an alternative and co-equal approach to the project-specific requirements as follows:</p> <p>Suggested Language Insert for the Tentative Order Section F. 1.(c) (p. 27):</p> <p>Suggest inserting the following new item (8) to Section F.1.(c):</p> <p>"Alternative Performance Criteria for Watershed-Based Projects. Where a Project has been prepared using watershed and/or sub-watershed based water quality, hydrologic, and fluvial geomorphologic planning principles that meet the intent of the criteria and requirements of this Order, such standards shall govern review of Projects with respect to Section F.1.of this Order and shall be deemed to satisfy this Order's requirements for LID/site design, buffer zone, infiltration and groundwater protection standards, source control, treatment control, and hydromodification control standards."</p>	We agree with the commenter on the importance of watershed and sub-watershed based planning and development to protect water quality. The Tentative Order's requirements have been changed to allow regional LID treatment approaches.

222	11	General	General	<p>As described in the Little Hoover Commission Report (January 2009), policies developed on a Regional Water Quality Control Board (Regional Board) by Regional Board basis result in ineffective and inefficient stormwater programs. The Little Hoover Commission Report specifically states:</p> <p>The Commission found a critical need for a more unified regulatory agency that has clear priorities and procedures that can be implemented throughout the state. While current statutes give the State Water Resources Control Board ample authority to direct the nine Regional Water Quality Control Boards, in practice the regional boards are too independent, with differing policies and processes on even some of the most important statewide issues. (Page 93)</p> <p>Many of the Findings and Provisions set forth in the Draft South OC MS4 Permit represent significant shifts in policy on issues that are of statewide importance. Several of these are identified herein and as described are inconsistent with the Federal Regulations, State policy as established by the State Water Resources Control Board (State Board), and/or current statewide practices and understanding. Such significant changes in policy related to the administration and implementation of the NPDES Phase I MS4 stormwater permit program should be addressed by the State Board, through the development of a statewide policy and should not be independently implemented by the San Diego Regional Board.</p>	Please see comment #24 regarding consistency on a statewide level.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
223	11	NEL	B	<p>The NPDES Phase I MS4 permits issued in California since 1990 have reflected a clear understanding that Clean Water Act (CWA) section 402(p)(3)(B)(iii), which defines that the "discharge of pollutants" must be reduced to the Maximum Extent Practicable (MEP), also applies to the discharge of pollutants that may exist in non-stormwater. This understanding reflects the reality that, although the discharge from a MS4 may constitute a point source to the receiving water, the sources of the pollutants are often "non-point" in nature. Additionally, unlike industrial wastewater discharges, pollutants that may be in both wet and dry weather runoff are not under the direct control of the MS4 Permittees and cannot practicably be regulated or eliminated as though this were the case. Dry weather non-point source discharges can be described as akin to other property related land use violations - on a long-term basis they can be managed, but never eliminated. The Draft South OC MS4 Permit proposes to re-define the performance standards, and exclude non-stormwater from being subject to the MEP performance standard and require strict prohibition similar to an industrial wastewater discharge. Implementing MS4 permit provisions that deviate from the MEP performance standard should not be made at the discretion of Regional Board staff. If the Regional Board believes that such a shift in policy or standard is necessary, the Regional Board should pursue a statewide policy through the State Board. Not doing so continues to impose inconsistent and ineffective regulations upon the regulated community, an outcome which was criticized in the Little Hoover Commission report. Additionally the strict prohibition of non-stormwater discharges as required in the Draft South OC MS4 Permit is contrary to the Final Phase I Regulations, 55FR222, on Page 48037 which state: EPA is clarifying that section 402(P)(3)(b) of the CWA (which requires permits for municipal separate storm sewers to 'effectively' prohibit non-stormwater discharges) does not require permits for municipalities to prohibit certain discharges or flows of non-stormwater to waters of the United States through municipal separate storm sewer systems in all cases. Accordingly 122.26(d)(2)(iv)(B)(l) states that the proposed management program shall include: "A description of a program including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system. " As clearly stated in the regulations, the 'effective' prohibition of non-stormwater discharges does not require 'strict' prohibition, but rather a management program focused on prohibiting illicit discharges to the MS4 system. Further, the clear intent of the Federal regulations is that only those exempted non-stormwater discharges that are found to be illicit discharges be managed. It was not expected that whole classes of exempted discharges would be prohibited.</p>	Please see response to Comments 39, 43, 44, 52, and 77.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
224	11	Overirrigation	B	<p>The Draft South OC MS4 Permit removes landscape irrigation, irrigation water and lawn watering (collectively, "irrigation runoff") from the list of conditionally-exempted discharges. Regional Board staff has asserted that data submitted by the Orange County MS4 Permittees supports this action. However, the Orange County MS4 Permittees do not draw the same conclusions from their data. In any case, the data leading to the Regional Board's conclusion is specific to Orange County, and as such, incorporation of a similar requirement in Riverside County would be inappropriate and unwarranted. Nevertheless, the Riverside County Permittees have identified the following issues with the approach the Regional Board is taking in the prohibition of irrigation runoff.</p>	<p>This Tentative Order applies to South Orange County. The applicability of removing the exemption for Riverside County is best addressed at the time of reissuance of the permit for their region.</p> <p>Please see response to Comments 28, 52, 75, 77, and 174.</p> <p>Furthermore, the Federal Register (55 Fed Reg 48037) clearly states that "the Director may include permit conditions that either require municipalities to prohibit or otherwise control any of these types of discharges where appropriate."</p>
225	11	Overirrigation	B	<p>At the May 6th public workshop Regional Board staff stated that their "hands were tied" and that the Regional Board is "required" to prohibit discharges of irrigation runoff. On the contrary, when conditionally exempt discharges are determined to be a source of pollutants to receiving waters, there is no requirement that they be outright prohibited. Both the Final Phase I Rule V.55 No. 222, page 48037 and 40CFR 122.26 (d) (2) (iv) (B) (I) clearly state that these "non-stormwater discharges or flows shall be addressed (emphasis added) where such discharges are identified by the municipality (emphasis added) as sources of pollutants to waters of the United States." Finding C.14 in the Draft South Orange County MS4 Permit inappropriately adds onto this language by stating that "Exempted discharges identified as a source of pollutants are required to be addressed through prohibition. The term 'addressed' does not implicate nor require prohibition, but instead, and as described in the above referenced final rule, should consist of a "program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent (the discharge) to the municipal storm sewer." The Federal regulations clearly do not require the prohibition of irrigation runoff and as such (and not withstanding the other comments herein on this matter) the language in Finding C.14 should be removed.</p>	<p>The Regional Board maintains that exempted non-storm water discharges that are identified as a source of pollutants are to be "addressed" via effective prohibition. Please see response to Comments 52 and 77.</p> <p>The reference from 40 CFR 122.26(d)(iv)(B) reads as follows: "A description of a program, including a schedule, to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer. The proposed program shall include: (1) A description of a program, including inspections, to implement and enforce an ordinance, order or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program shall address all types of illicit discharges, however the following categories of non-storm water discharges or flows shall be addressed where such discharges are identified..."</p> <p>The Regional Board maintains that exempted discharges that are identified as a source of pollutants are to be prohibited and subsequently addressed by the Copermitees as illicit discharges.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
226	11	Overirrigation	B	<p>An MS4 Permittee's ability to eliminate irrigation runoff as required in the Draft South OC MS4 Permit is akin to any government's ability to eliminate crime or homelessness. It is something that can be managed, but never eliminated. In the April 3rd Public Workshop, Regional Board staff stated that they intend to use discretion when enforcing this permit provision, and not necessarily enforce it in every instance, pending a determination by Regional Board staff as to whether reasonable controls had been implemented. This statement reveals that even San Diego Regional Board staff does not believe that an outright prohibition of irrigation runoff is reasonable or enforceable. Yet, the Draft South OC MS4 Permit includes findings and provisions that would nevertheless put the MS4 Permittees in unavoidable non-compliance and subject to citizen suits for noncompliance under the Clean Water Act. It is the responsibility of the Regional Board to develop permits that have clear and attainable requirements.</p> <p>A programmatic approach to addressing non-point sources of pollution (instead of prohibition) is especially appropriate in the case of irrigation runoff, where outright prohibition would effectively require the MS4 Permittees to commit significant financial and staffing resources in tracking down and enforcing against every potential source of irrigation runoff including broken sprinklers, overspraying nozzles, inappropriately set residential sprinkler timers, etc. The language in the Draft South OC MS4 Permit should instead be revised to promote control of irrigation runoff through various programs such as public education and cooperative programs with water purveyors, rather than inappropriately prohibiting this discharge. Despite implementation of an extensive and expensive program to attempt to enforce a prohibition on irrigation runoff, it is unlikely that such a program could ever be successful in completely eliminating this discharge, again resulting in unavoidable non-compliance. Additionally, when evaluating the economic considerations of a strict prohibition of irrigation runoff, implementation of such a program would provide little benefit to designated beneficial uses relative to the significant costs that would be required.</p> <p>The Permit writers and the Orange County Permittees should be working together to define appropriate county-specific programs that can be written into the Draft South OC MS4 Permit to address this issue.</p>	<p>Please see response to Comments 39, 42, 43, 44, 159 and 160.</p> <p>To be clear regarding enforcement, the Regional Board's goal is to enforce any alleged violation of the Permit that they identify. The Regional Board, however, has the discretion to choose the level of enforcement befitting the nature and extent of the violation and the limited resources available to respond. Violation of this discharge prohibition would be handled similarly to any other violation of permit provisions. The permit does not dictate to the Copermittees the manner of compliance with the prohibition. The proposed changes simply remove the exemptions against the prohibition. It will be up to the Copermittees to determine the manner of compliance, types of new ordinances needed and programs necessary to comply with the discharge prohibition.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
227	11	Urban Runoff	General	<p>Through Finding C.2 and removal of references to 'urban' runoff, the Draft South OC MS4 Permit makes the Permittees responsible for exceedances of water quality standards irrespective of the source and manner of discharge. While MS4 Permittees have successfully developed and implemented effective programs to control sources of pollution under their jurisdiction, typically there are entities within a watershed over which the Permittees have no authority/ability to regulate, including:</p> <ul style="list-style-type: none"> • Tribal entities • Federal installations • State facilities • Agricultural operations <p>Additionally, some pollutants discharged from natural sources and conserved lands can cause MS4 discharges to exceed water quality standards. Identification and characterization of the sources of these natural loads is often beyond the technical and fiscal resources of the MS4 Permittees.</p> <p>Despite the inability of MS4 Permittees to regulate the quality of discharges from these sources, the California Rule establishes that if any of these lands are upstream of lands under the jurisdiction of the Permittees, the Permittees must accept tributary flows from these areas, and these flows and any pollutants contained therein will inevitably enter the Permittees' MS4. The Draft South OC MS4 Permit stipulates that in the event these flows contribute pollutants that cause or contribute to an exceedance of water quality standards in receiving waters, the Permittees will be held in violation despite the fact that they have no regulatory authority to control these sources.</p> <p>In contrast, State law specifically grants the Regional Board responsibility and authority to directly regulate the discharges from the entities not under the jurisdiction of the MS4 Permittees and has the responsibility to correct water quality standards to accommodate background pollutant concentrations from natural sources. The USEPA has authority to regulate Federal facilities and tribal entities not under the jurisdiction of the Regional Board. It is inappropriate for the Regional Board to attempt to transfer the responsibilities of the Regional Board and the USEPA to MS4 Permittees, and hold them responsible for the actions of dischargers over which they have no jurisdiction.</p>	<p>Please see the response to Comment No. 47. In addition, since the Copermittees own and operate their MS4s, they cannot passively receive discharges from third parties (Federal Register 68766).</p> <p>Having the legal authority to terminate a storm water discharge to the MS4 can be a powerful tool for the Copermittees to effectively control those storm water discharges and to compel implementation of best management practices (BMPs) from various entities. Commenters cite this discussion as requiring Copermittees to terminate or cut-off access by various third parties to their MS4, which could lead to unintended damage from flooding. The Fact Sheet, however, clearly explains that the development and implementation of a comprehensive BMP-based program is appropriate for controlling the contribution of pollutants into the MS4 system. Preventing or terminating access of pollutants to the MS4 is one of the BMPs that must be available for the Copermittees to use at their discretion.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
228	11	Urban Runoff	Finding	<p>The Riverside County Permittees generally support the proposed addition of Section D.4 to the Draft South OC MS4 Permit in the tentative updates dated May 5, 2009, which clarifies that the intent of the permit is not to regulate natural sources and conveyances. However, the subsequent requirement to demonstrate that the likely and expected cause of the exceedance is non-anthropogenic in nature can be difficult and expensive for some constituents (i.e., pH, total dissolved solids, total suspended solids, metals, bacteria, etc.). In order to adequately demonstrate this, MS4 Permittees would be obligated to spend a significant amount of resources for each exceedance, even when the source of the exceedance may be found to be from natural sources or sources that have otherwise not been adequately regulated by the Regional Board or USEPA under existing or needed permits. This difficulty is also reflected in our comments below pertaining to the applicability of Water Quality Based Effluent Limits in stormwater permits.</p>	<p>The referenced finding was removed from the Tentative Order following discussion with the interested stakeholders. Where an MS4 system receives runoff from natural areas, the MS4 system unnaturally converts the discharge from a non-point source to a point source discharge. The MS4 system does not allow for natural infiltration and attenuation of pollutants and could concentrate pollutants at the discharge point to ultimately cause an exceedance of water quality standards. The finding is not found in the MS4 permit adopted for San Diego County.</p>
229	11	NEL	C	<p>The Panel of Experts commissioned by the State Board to determine the appropriateness and applicability of numeric effluent limits to stormwater discharges (hereinafter referred to as the Blue Ribbon Panel), stated in their 2006 Report: "It is not feasible at this time to set enforceable numeric effluent criteria for ... urban discharges". Despite and contrary to the recommendations of this State Board-commissioned report, the Regional Board staff has proposed Water Quality Based Effluent Limits (WQBELs) as both Wet Weather and Dry Weather Compliance metrics in the Draft South OC MS4 Permit. The Riverside County Permittees object to the use of WQBELs as compliance objectives in MS4 permits for the same reasons as presented in that report, and due to the distributed (non-point) and quite often random nature of the source(s) of the pollutants of concern. As stated previously, the Riverside County Permittees have significant concern where the Draft South OC MS4 Permit departs from current State policy. Inasmuch as Regional Board staff has indicated their intent to use the South OC MS4 Permit as a model for the MS4 permit to be issued to Riverside County, the Riverside County Permittees proactively outlined more appropriate approach for Municipal Action Levels in their January 2009 ROWD that warrants consideration in the development of their MS4 permit.</p>	<p>Please see response to Comment 25 and 33.</p>

230	12	Finding	Finding	Change [Finding C.1] to: "may" contain waste	<p>This comment was addressed in the July 2007 response to comments. It says:</p> <p>"The Findings are appropriately supported and have not been revised. Finding C.1 states that "runoff contains waste." This was supported in State Water Board Order WQ 2001-15, which reviewed the previous San Diego County MS4 Permit (Regional Board Order No. R9-2001-01). Discharges from MS4s to receiving waters are considered point source discharges to be regulated by NPDES requirements. Finding C.3 notes that discharges from MS4s may cause or threaten to cause conditions of pollution, contamination, or nuisance. The Fact Sheet relies on national and local water quality studies to support this conclusion.</p> <p>"Clearly, not all storm water discharged from MS4s is waste. Much of it is precipitation. That storm water, however, can pick up waste and pollutants along its path to and through the MS4. The Copermittees must ensure implementation of storm water BMPs to limit the amount of pollution that is discharged with the precipitation from the MS4s. Limited storm water monitoring conducted by the Copermittees demonstrates this, and the Tentative Order includes requirements to conduct storm water monitoring at storm drains to better assess the conditions (Attachment E). Runoff also includes dry-weather discharges. In southern Orange County, dry-weather runoff has been increasingly monitored under the existing MS4 Permit. The data demonstrates significant amounts of pollution that cannot be attributed to nonanthropogenic sources."</p>
231	12	Finding	Finding	Table 2a says "Aliso Creek uses the term "toxicity." Specify what kind of toxicity?	<p>Aliso Creek is 303(d) listed for toxicity. Listings for toxicity are based on the evaluation of data from required MS4 monitoring, SWAMP monitoring and any other applicable data source. The Regional Board evaluates any acute and chronic effects on organisms (e.g. Hyalla azteca) and compares sampling data to LC50 values, controls, etc. to determine toxicity.</p>
232	12	Finding	Finding	Finding says: "Municipal storm water...discharges are likely to contain..." Change to: "may" contain	<p>Please see response to Comment No. 230.</p>
233	12	Finding	Finding	Discharges exempted are still required to be addressed through prohibition if they are identified as a source of pollutants. If specific types of discharges are known to be a source of pollutants and contribute to the degradation of water quality, they should not be exempt. The finding should state that discharges identified as asource of pollutants should be addressed and not include discharges that are known sources of pollutants as exempt.	<p>Finding C.14 has been clarified to prevent confusion.</p>
234	12	Finding	Finding	Non-storm water discharges...are to be effectively prohibited... Prohibiting flow will dry up wetlands; violation of US Army Corps of Engineers permit	<p>The Clean Water Act requires non-storm water discharges to be effectively prohibited (402(p)). It is unclear how the prohibition of non-storm water discharges will violate a US Army Corps of Engineers permit.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
235	12	MAL	Finding	Basing MALs on nationwide MS4 data is not appropriate for this region.	Please see response to Comments Nos. 37 and 90 as the MALs have been updated to reflect regional data.
236	12	WURMP	Finding	This is a very important finding that should be kept within the permit as finalized and should be included in future MS4 permits throughout the region. Change to: "Watershed management of runoff does not require Copermittees to expend resources outside of their jurisdictions".	The proposed change is already in the March 13, 2009 Tentative Order and has been present since the release of Tentative Order R9-2007-002.
237	12	unfunded mandate	Finding	Finding claims that the permit is not an unfunded mandate with one reason listed as "the local agency...[has] the authority to levy service charges, fees, or assessments sufficient to pay with this Order." The finding should acknowledge that under State law, local agencies cannot levy assessments or property related fees without a majority vote of the affected electorate or affected property owner.	The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165. The commenters request to identify the existing State law is superfluous because it only addresses one avenue for the Copermittee to raise funds. The fact sheet demonstrates that numerous activities contribute to the pollutant loading in the municipal separate storm sewer system. Local agencies can levy service charges, fees, or assessments on these activities, independent of real property ownership. (See, e.g., Apartment Ass'n of Los Angeles County, Inc. v. City of Los Angeles (2001) 24 Cal.4th 830, 842 [upholding inspection fees associated with renting property].) The ability of a local agency to defray the cost of a program without raising taxes indicates that a program does not entail a cost subject to subvention. (County of Fresno v. State of California (1991) 53 Cal.3d 482, 487-488.)
238	12	unfunded mandate	Finding	Finding E.6 states one reason why the permit is not an unfunded mandate is that the copermittees have "requested permit coverage... in lieu of numeric restrictions on their discharges." Yet MALs are a condition imposed within this permit and the technical fact sheet in the discussion of finding D.1.h confirms that MALs are a form of numeric limits If MALs remain a requirement, the finding should not be made that this permit does not constitute an unfunded mandate.	This language for the Tentative Order has been changed to reflect that the language applies to numeric limitations for discharges of storm water from the MS4. The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.
239	12	General	General	All references to human health need to be removed This is not a public health permit	Within the San Juan Hydrologic Unit for Southern Orange County where the Copermittees MS4s discharge, all inland surface waters and coastal receiving waters have been designated as having or the potential to have the Contact Water Recreation 1 beneficial use per the San Diego Basin Plan. This beneficial use includes uses of water for recreational activities involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, swimming, wading, water-skiing, skin and SCUBA diving, surfing, white water activities, fishing or use of natural hot springs. To protect this beneficial use, the Tentative Order appropriately references public health.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
240	12	NEL	C	Table 3: MBAS, all metals MBAS AL is lowered. Metals #'s are not correlated to a hardness... how to intepret this?	The Tentative Order updates includes chages to metal criteria according to receiving water hardness per the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California..
241	12	MAL	D	This section is not consistent with D.1.h and the discussion of the finding in the Supplemental Fact Sheet. The fact sheet states "Compliance with MAL levels is considered at least compliant with the Maximum Extent Practicable (MEP) regulation for storm water" and explains why "MALs have been determined to be the appropriate regulatory measurement of achieving the [MEP]." Permit section D.3 should be revised to state "compliance with MAL levels is considered compliant with MEP."	Please see response to Comment 33. It is important to note that MAL monitoring results which do not exceed MALs do not create a presumption that MEP is being met, nor does it exempt Copermittees from implementing other programs and requirements under the Tentative Order.
242	12	unfunded mandate	D	The finding states one reason why the permit is not an unfunded mandate is that the copermittees have "requested permit coverage... in lieu of numeric restrictions on their discharges." The technical fact sheet in the discussion of finding D.1.h confirms that MALs are a form of numeric limits. Remove the requirement for MALs, a form of numeric limits.	Please see response to Comment 33. The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.
243	12	SUSMP	F.1	An NPDES permit should address pollution of surface waters and clarify what level of effort is considered MEP. Pest control is handled by other regulations. Remove	The Regional Board received comments from the Orange County Vector Control District on the 2007 draft of the Tentative Order. When not properly designed or maintained, certain BMPs implemented or required by municipalities for runoff management may create a habitat for vectors. Post construction BMPs must not be a nuisance to the public; therefore, it is appropriate that the BMPs be designed to prevent vector issues. The Tentative Order includes universal requirements to address vectors rather than prescriptive requirements, because the specific requirements are more appropriately applied by local vector control agencies.
244	12	LID	F.1	It is very challenging to incorporate LID when widening public roads. Allowance for building BMPs in roadways outside of the project footprint would allow for more successful implementation of LID in context of the watershed. Provide more latitude for applying the LID substitution program to roads, highways and freeways, with measures to ensure that the substitution attains equivalent water quality benefit.	The Tentative Order's requirements for low impact development have been modified to be consistent with Region 8's recently adopted MS4 permit for North Orange County. The substitution program is to be developed by the So. Orange County Copermittees.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
245	12	Hydromod	F.1.h	<p>Requiring all PDPs to achieve less than 5% EIA may be infeasible, particularly if the definition of a PDP includes redevelopment of an existing roadway. Also, requirements for a mandatory maximum EIA tend to be counter to smart growth goals which are a better approach when viewed at the watershed level.</p> <p>Either remove the requirement since LID requirements already exist in the permit, or provide more allowance for determining feasibility and allow exceptions for projects that are consistent with a smart growth master plan.</p>	The Regional Board has removed the language requiring maximum 5 percent EIA from the interim hydromodification requirements. Please see section F.1.d.(4) of the Tentative Order for LID requirements.
246	12	Hydromod	F.1.h	<p>Allowance for in-stream controls is appropriate but need to provide more clarification on what is meant by requirements "geomorphically referenced channel design techniques."</p> <p>Provide additional clarity.</p>	The above referenced term has been deleted from the Tentative Order.
247	12	Hydromod	F.1.h.	<p>Requiring curve hydrograph matching and less than 5% EIA and LID, seems redundant. If a project applicant significantly demonstrates hydrograph matching and includes LID where appropriate according to the site specific feasibility study, then that should be sufficient. For small projects it may be more effective to allow the applicant to incorporate a specified level of LID instead of hydrograph matching or a maximum EIA. Requiring continuous simulation modeling would be very unreasonable for small projects; therefore the nomograph or other simpler methods should be offered as an option.</p> <p>Consider revising interim hydromodification requirements based on this rationale.</p>	The Regional Board agrees that both curve-matching and 5 percent EIA criteria are redundant. The EIA discussion has been removed from this section of the Tentative Order.
248	12	WURMP	G	<p>"Goal of the work plan is to..."</p> <p>Typo</p>	The typo has been corrected.
249	12	Existing Development	F.3	<p>Establishes deadline for flood control retrofit evaluation.</p> <p>This requirement would require a substantial effort on behalf of Copermittees due to the high number of these types of structures. Therefore, the City suggests a phased or tiered evaluation approach be considered.</p>	Comment Noted. Provision F.3.a(4) shall be modified to as follows: The inventory and evaluation must be completed and submitted to the Regional Board in the second year Annual Report after issuance of this Order.
250	12	Existing Development	F.3.	<p>Allows for Copermittees to "optimize" their municipal sweeping programs based on several factors (land type, season, trash pick-up schedules, etc.) as opposed to our Permit that requires mandatory sweeping frequencies dependant on trash volumes. The City views this approach as more efficient means of conducting its jurisdictional street sweeping programs as it affords Copermittees greater flexibility in making decisions and the ability to tailor fit solutions based on the often unique challenged faced by Copermittees. The City further encourages the Regional Board to apply this adaptive approach to other municipal programs as the City feels it would result in both more efficient programs and enhanced compliance.</p>	Comment noted.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
251	12	Existing Development	F.3.	<p>Sections (a) and (b) are redundant.</p> <p>The City recommends deletion of section (b) as the implementation of the provisions in section (a) would maximize pollutant reductions by providing greater flexibility to Copermittees to manage their programs.</p>	<p>Provision F.3.a.(7)(b) has been retained within the Order. Please note that as an illicit discharge into the MS4, sewage infiltration is to be eliminated, not reduced (please see response to Comment 39). 40 CFR 122.26(d) requires that Copermittees use controls, as necessary, to limit the infiltration of sewage into the MS4 system. As an illicit discharge, it is expected that these controls will prevent and eliminate infiltration and seepage from the sanitary sewer. The controls listed under section (b) are BMP measures that currently should be a part of the Copermittees IC/ID program to prevent and eliminate illicit discharges. It is unclear how deletion would provide greater flexibility, as Copermittees are already required to implement these BMPs.</p>
252	12	Existing Development	F.3.	<p>Permit adds new subheading text "Added 'ESAs and 303(d) Listed Waterbodies'</p> <p>Recommend support of this provision since it's already in our permit, but the Orange County Permit just places more attention to these two waterbodies.</p>	<p>Development and urbanization especially threaten environmentally sensitive areas (ESAs), such as water bodies designated as supporting a RARE beneficial use (supporting rare, threatened or endangered species) and CWA 303(d)-impaired water bodies. Such areas have a much lower capacity to withstand pollutant shocks than other areas. In essence, sites and sources that are ordinarily insignificant in impacting the environment may become significant in a particularly sensitive environment. Therefore, additional control to reduce pollutants from new and existing development and commercial/industrial sites and sources may be necessary for areas adjacent to or discharging directly to an ESA.</p> <p>ESAs are defined in the Order as "Areas that include but are not limited to all CWA Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the Basin Plan; water bodies designated with the RARE beneficial use by the Basin Plan; areas designated as preserves or their equivalent under the Natural Communities Conservation Program within the Cities and County of Orange; and any other equivalent environmentally sensitive areas which have been identified by the Copermittees."</p>
253	12	Existing Development	F.3.b.	<p>Deleted "as necessary to comply with this Order."</p> <p>Recommend that this text be included in this provision in order to provide flexibility. Our permit has this text in the same provision.</p>	<p>Comment noted. Presence or absence of the language does not reduce the Copermittee's flexibility to comply with this Order. No change to the permit is made at this time.</p>
254	12	Existing Development	F.3.b	<p>Other sites and sources with a history of unauthorized discharges.</p> <p>This will add an unknown number to the inventory.</p>	<p>Provision F.3.b.(1)(a)(i)[z] is listed so that a Copermittee does not exclude a site or source from their inventory just because the category has not been listed in [a] through [y]. This subprovision also further refines the scope of what is expected by the included language "with a history of un-authorized discharge to the MS4." Therefore, no changes to the Tentative Order are made.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
255	12	Existing Development	F.3.b	<p>Permit requires, besides implementing BMPs design and implementation, that additional measures be based on inspections, incident responses, and water quality data. This is a new language provision, which is not in our Permit.</p> <p>Recommend support of this provision because it provides guidance on how to design "additional measures."</p>	<p>Provision F.3.b(2)(d) is a straight forward requirement that directs Copermittee's to implement BMPs at commercial or industrial facilities or require facility owner/operators to implement previously designated BMPs at the facilities to reduce discharges of storm water pollutants from the MS4 to the MEP, and prevents discharges from the MS4 from causing or contributing to a violation of water quality standards. "Additional measures" are those BMPs or other measures that when implemented (as seen/learned during past inspections or past implementation history) are successful in reducing discharges of storm water pollutants to the MS4 to the MEP, and preventing discharges from the MS4 from causing or contributing to a violation of water quality standards. No change to the permit is warranted.</p>
256	12	Existing Development	F.3.b	<p>This provision is in our permit but as a standalone provision - "Regulation of Mobile Businesses." Draft Orange County Permit transfers this provision to the BMP subsection.</p> <p>Recommend support of this provision, since it's currently in our permit, and it appears the transfer is intended to place more attention on BMP implementation for this business type.</p>	<p>The Regional Board notes the City of San Diego's support for this provision. Provision F.3.b.(3) requires each Copermittee to develop and implement a program to reduce the discharge of pollutants from mobile businesses to the MEP. Mobile businesses are service industries that travel to the customer to perform the service rather than the customer traveling to the business to receive the service. Examples of mobile businesses are power washing, mobile vehicle washers, carpet cleaners, port-a-potty servicing, pool and fountain cleaning, mobile pet groomers, and landscapers. These mobile services produce waste streams that could potentially impact water quality if appropriate BMPs are not implemented. Order No. R9-2002-01 also requires BMP implementation for certain mobile businesses (e.g., mobile vehicle washing and mobile carpet cleaning). The requirements of Order No. R9-2009-0002 are not significantly different from the existing requirements. The Order specifies mobile businesses for special attention based on reports from the Copermittees that mobile businesses have been difficult to control with existing programs.</p> <p>Mobile businesses present a unique difficulty in storm water regulation. Due to the transient nature of the business, the regular, effective practice of unannounced inspections is difficult to implement. Also, tracking these mobile businesses is difficult because they are often not permitted or licensed and their services cross Copermittee jurisdictions. Mobile businesses that operate within a municipality may be based in another municipality or even outside the Region. The Order takes into account the difficulties in regulating mobile businesses. Because BMPs have been developed already, but communication with mobile businesses may be difficult, the Order provides broad flexibility to the Copermittees for developing a targeted program within the Commercial portion of each JURMP.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
257	12	Existing Development	F.3.b	<p>Permit contains a new reporting requirement. The Copermittee will be mandated to notify the Regional Board of any facilities with potential SW violations prior to the rainy season.</p> <p>Recommend deletion of this provision; already provide this information in our JURMP annual report and periodic reports to the Regional Board.</p>	<p>No modification to the Order is made. Provision F.3.b(4)(b) is the standard requirement to report non-compliant sites to the Regional Board and is consistent with the reporting requirements of Provision K. The section provides more specific reporting requirements to enable the Regional Board to evaluate and prioritize inspections. Since the Annual JRMP is submitted to the Regional Board on or before September 30 prior to the wet season (October 1 - April 30) this requirement is not duplicative. Language has been added to clarify that the information may be provided in the JRMP. Please also see response to Comment No. 178.</p>
258	12	Existing Development	F.3.b	<p>Annually notify the Regional Board, prior to the commencement of the wet season of all Industrial Sites with potential violations of the General Industrial Permits.</p> <p>Recommend deletion of this provision. This is an extra reporting requirement. We already report this to the Regional Board in our Annual report as well as throughout the year as inspections occur.</p>	<p>Please see response to Comment 257.</p>
259	12	Existing Development	F.3.b	<p>At a minimum 20 percent of sites inventoried are to be inspected (excluding mobile sources and food facilities) must be inspected each year.</p> <p>Recommend deletion of this provision. This lowers the percentage of inspections but does not give credit for inspecting food facilities to meet the 20% inspections. Food facilities must still be inventoried and included in the overall number that is used to calculate the 20%. This would result in us inspecting approx. 50% of our inventory every year (-10,000/year).</p>	<p>Provision F.3.b.(1) requires a Copermittee to establish an inventory of commercial sites/sources that could contribute a significant pollutant load to the MS4. Eating or drinking establishments, including food markets, are listed as commercial site/sources to be included within an inventory. Provision F.e.b.(4)(c) describes the frequencies by which a Copermittee must inspect those facilities on the inventory excluding mobile sources and food facilities, therefore a Copermittee would subtract the number of food facilities, mobile automotive washing, and mobile carpet cleaners from their inventory before taking 20 percent to determine the number of inspections required each year. The intent of Provision F.3.b(4)(c) is to give the Copermittee flexibility to inspect the top 20 percent of their worst commercial / industrial sites for storm water violations each year. The requirement is flexible such that the facilities that are included in that 20 percent may change from year to year. Inspection requirement for food facilities is covered under Provision F.3.b(4)(d).</p>
260	12	Existing Development	F.3.b	<p>Each food facility must be inspected annually</p> <p>This dramatically increases the number of inspections required.</p>	<p>No change is made to Provision F.3.b.(4)(d). Restaurants are potential significant sources of storm water pollutants therefore, inspection of their business practices as they impact storm water are necessary. To be efficient, Code enforcement officers trained in multiple disciplines may be able to visit a restaurant and inspect under multiple programs.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
261	12	Existing Development	F.3.b.	Permit requires each food facility to be inspected annually. This is a new inspection requirement, and will result in a dramatic increase to inspection inventory because provision requires inspection of each food facility annually. Recommend deletion of this provision. Although the data is not in, the WURMP inspections program is attempting to identify certain food facilities (outdoor eateries vs. indoor eateries) which may be more prone to pollutant generation. It will not be efficient to inspect food facilities that are NOT prone to storm water contamination which this provision proposes to do by requiring inspection of each food facility.	No change is made to Provision F.3.b.(4)(d). Restaurants are potential significant sources of storm water pollutants therefore, inspection of their business practices as they impact storm water are necessary. To be efficient, Code enforcement officers trained in multiple disciplines may be able to visit a restaurant and inspect under multiple programs.
262	12	Existing Development	F.3.b	Permit adds this new provision "To the extent that third part inspections are conducted to fulfill requirements of this Order, the Copermittee will be responsible conducting and documenting quality assurance and quality control of 3rd party inspections." This provision provides flexibility for the Copermittee to decide how to evaluate and conduct quality assurance of third party inspections. Our permit contains these requirements: certification program, inspection form templates, etc, which the Orange County permit does not contain. Recommend support of this provision due to flexibility	Provision F.3.b.(4)(e) is intended to be flexible in allowing a Permittee more discretion to develop its third party inspection program to be efficient and effective. No additional change to the language is made at this time. Please see response to Comment No. 135.
263	12	Retrofitting	F.3.	The first statement says Copermittee must "require" retrofits, but subsequent sentence says "shall encourage". It is not clear to what degree these retrofits are voluntary or mandatory, or how many retrofits would be sufficient to satisfy the permit conditions. Retrofits are only feasible where there is a willingness of property owners to participate. Additionally, there will be a huge fiscal burden to implement this requirement and we think focusing the limited resource on implementing LID's in new development projects is alot more efficient. Recommend deletion of this requirement	The Regional Board has updated language to clarify that retrofits are to be done when feasible and considered a high-priority. The tentative Order has appropriate regulations addressing the constraints with retrofitting on privately held land. Please see response to Comments 46, 136 and 162.
264	12	Retrofitting	F.3.d.	Depending on the size of the retrofit program, it may be challenging for municipalities to accommodate the costs of monitoring the ongoing maintenance. Suggest further evaluation of the fiscal effects.	Please see response to Comment Nos. 46, 136, 162 and 263.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
265	12	WURMP	G	<p>Permit states that there must be an annual assessment of receiving water quality and use the information to effectively update BMP information and select management practices in response to the annual evaluation which is based on the annual assessment. Improvements to the receiving waters most likely cannot be observed after only a single year of implementing a specific BMP or specific suite of BMPs. Additionally, for a number of BMPs, implementation spans more than one year between concept and construction.</p> <p>Revise the two sections to allow for longer term assessment of the receiving waters for the purpose of setting priorities and updating BMPs strategies for each watershed.</p>	<p>The WRMP section of the Order has been restructured. Section G has been streamlined requiring one Watershed Workplan that covers the 5 year permit cycle and annual watershed review meetings. If assessment of a BMP requires more than one year, the Copermitee would report it during the annual watershed review meeting within a public setting. Assessments taking uncharacteristically long periods of time will be closely evaluated by the Regional Board and may trigger issuance of investigative or cleanup and abatement orders.</p>
266	12	WURMP	G	<p>The draft Permit states that Copermitees must implement and assess activities that improve the high priority water quality problems. While the City agrees with the intent of this requirement, it is important to note that a program that is structured in a way that mandates implementation of only activities guaranteed to be successful will serve as a major impediment to innovative approaches and ultimately improvements in program efficiencies that can lead to superior protection and improvement of water quality. This is seemingly in conflict with the intent of the increasingly complex effectiveness assessment in Section J, which would mandate additional layers of assessment as a way of forcing program improvements. Incorporating greater incentives, rather than additional restrictions to watershed activity implementation and additional components to effectiveness assessment, if structured in a way that encourages innovation and mandates improvements (rather than only mandating guaranteed outcomes). The WRMP section of the Permit should be restructured to facilitate adaptive management where innovation is encouraged and attainment of greater efficiencies through program improvements is required. For example, Section F.3.a.5 requires the implementation of a municipal street sweeping program that optimizes pickup of trash and debris.</p>	<p>The WRMP section of the Order has been restructured. Section G has been streamlined requiring one Watershed Workplan that covers the 5 year permit cycle and annual watershed review meetings. Annual watershed review meetings are required to be appropriately noticed and open to the public.</p> <p>The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.</p>
267	12	WURMP	G	<p>The Work Plan appears to require the same information that the Watershed RMP Annual Report requires.</p> <p>Remove the requirement of the Work Plan entirely or require the Work Plan to be a section within the Watershed RMP Annual Report to make reporting more efficient.</p>	<p>The WRMP section of the Order has been restructured. Section G has been streamlined requiring only one Watershed Workplan that covers the 5 year permit cycle and annual watershed review meetings. Annual watershed review meetings are required to be appropriately noticed and open to the public.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
268	12	WURMP	G	<p>This requirement conflicts with the Regional Board TMDL program. Additionally, there appear to be no economic considerations and time schedule included in this permit condition.</p> <p>Remove this requirement due to its duplication with the Regional Board's existing TMDL program. Additionally, these programs are very costly to implement in all watersheds every year and don't consider using information from one watershed across to another watershed. If this condition remains, it needs to be included in the economic analysis.</p>	<p>Provision G.c.(2) has been modified to include TMDLs as one of the factors a Copermittee can use to identify their highest priority water quality problems. If a Copermittee identifies a TMDL as their highest water quality problem, work on the TMDL can be used towards compliance with the requirements of Section G, the Watershed Runoff Management Program. Efficient use of resources was considered when developing section G. Allowing a Copermittee to count the work done on a TMDL as compliance with the Watershed component of the Order is considerate of the need to use resources efficiently.</p>
269	12	TMDL	I	<p>No need for other enforcement actions inside of a permit.</p> <p>The City questions the need for any additional enforcement mechanisms within a permit which can apply numeric limits. Recommend removal of other enforcement mechanisms from permit.</p>	<p>All references to CDOs and CAOs, in regards to TMDL implementation, have been removed from the Tentative Order and Fact Sheet. This does not, however, preclude the Regional Board from future consideration of the use of these authorities to address TMDLs.</p>
270	12	General	J	<p>Per the definition in Attachment C, environmentally sensitive areas include 303(d) listed waterbodies. It is therefore redundant and inefficient to require assessment for both 303(d) waterbodies and for environmentally sensitive areas.</p> <p>Remove either Section J.1.a(1) or J.1.a(2).</p>	<p>The commenter is correct that Environmentally Sensitive Areas (ESAs) do include 303(d) listed waterbodies.</p> <p>The Regional Board, however, does not agree that the inclusion of two separate sections is redundant. 303(d) listed waterbodies have been identified as impaired and, depending upon identified impairment sources, require a reduction of storm water pollutant loadings to the MEP, which may include further investigation into sources of pollutants in MS4 storm water discharges. This will likely entail different measures of assessment as well. The Copermittees may choose to establish different priorities under Section J.1.a.1 for 303(d) listed waterbodies than under Section J.1.a.2 for ESAs due to the impairment. Furthermore, while ESAs do include 303(d) listed waterbodies, ESAs also include other waters the Copermittees may determine need different types of management and measurements of outcome.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
271	12	General	J	<p>Requires Copermittees to establish annual assessment measures for reducing discharges of pollutants into 303(d)s and ESAs for all six outcome levels, and then annually conduct each measure to evaluate its outcome to determine effectiveness. Because Copermittees generally implement both larger jurisdictional programs and even smaller targeted watershed activities at scales larger than individual drainage areas of water bodies, the new 303(d) and ESA components to the effectiveness assessment program would result in a cumbersome assessment effort that would result in repetitious reporting of assessment information for individual water bodies.</p> <p>It is understood that the fundamental purpose of the assessment program is to facilitate improvement of Copermittee efforts. Rather than require additional detailed layers of assessment that will likely yield proportionately little new information, the Permit should be restructured to facilitate adaptive management where innovation is encouraged and attainment of greater efficiencies through program improvements is required. For example, see comment regarding Section G.1.e.</p>	<p>The effectiveness assessment states the objective for 303(d) listed water bodies as "Reduce pollutant loadings" and for ESAs as "Prevent MS4 discharges from causing or contributing to conditions of pollution, nuisance, or contamination." A separate detail of assessment is appropriate for 303(d) listed waterbodies as they have already been listed as pollutant impaired. The Environmentally Sensitive Areas also deserve a specific assessment to preserve and restore their unique character. In this way, the high priority water quality issues will receive a high level of attention, consistent with USEPA and CASQA guidance for prioritization. The Order provides flexibility to establish the actual metrics for each assessment outcome level. The Order also provides the Copermittees flexibility to develop objectives for the general program components based on the CASQA guidance.</p>
272	12	General	K	<p>Copermittees must include Reporting Checklist in each Annual Report (see attachment D for details).</p>	<p>This comment is noted.</p>
273	12	Monitoring	N	<p>Unclear where the samples are to be collected if the flow is diverted away from the outfall (Coastal Storm Drain Monitoring).</p> <p>State where the samples should be collected. (Before the diversion?)</p>	<p>Section 5 of Attachment E: Coastal Storm Drain Monitoring has been removed and replaced with Regional Bacteria Monitoring. This new section provides flexibility for Copermittees to participate in a regional monitoring effort, which is expected to reduce cost and redundancy.</p>
274	12	Monitoring	N	<p>Unclear of the purpose of storm event sampling (Coastal Storm Drain Monitoring). Are there action levels or are the results strictly for comparison?</p> <p>State what if any follow-up actions are required for storm event sampling.</p>	<p>Please see response to Comment 273.</p>
275	12	Monitoring	N	<p>Weekly sampling was determined to be unnecessary and would be excessive with over 100 monitoring stations (Coastal Storm Drain Monitoring).</p> <p>Change the sampling frequency to monthly (as it is currently).</p>	<p>Please see response to Comment 273.</p>
276	12	Monitoring	N	<p>Unclear how special investigation stations are selected (Coastal Storm Drain Monitoring).</p> <p>State selection criteria or considerations for special investigation stations.</p>	<p>Please see response to Comment 273.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
277	13	General	General	<p>The current Storm Water Permit for South Orange County (Order No. R9-2002-0001) imposed a very comprehensive and prescriptive set of storm water management and regulatory requirements on the City of Laguna Niguel and the other Co-Permittees. The Draft Permit substantially expands the requirements and prescriptions of the Current Permit without clear or compelling supportive findings, evidence or rationale. As a general comment, the City believes that the Draft Permit remains too prescriptive and limits the discretion and flexibility of the City to implement storm water management programs and practices that are appropriate, sensible and practical for our community.</p> <p>The City requests that the Regional Board carefully review and reconsider the new requirements of the Draft Permit. Wherever possible, maximum storm water management and program discretion and flexibility should be left to the Co-Permittees.</p>	MS4 permits become more prescriptive following several permit cycles. The body of knowledge and science behind protecting water quality increases and therefore, so do the MS4 requirements. The Tentative Order has balanced the Copermittee's need for flexibility by defining the minimum level of requirements through the Permit that are necessary to meet the MEP standard.
278	13	General	General	<p>A cursory comparison of the Draft Storm Water Permit for South Orange County and the Current Storm Water Permit for San Diego County reveals material differences and many new regulations and requirements that are proposed to be imposed on the South Orange County Co-Permittees. These include, but are not limited to, the following:</p> <ul style="list-style-type: none"> • Removal of the word "urban" to describe the runoff discharge that is regulated by the Storm Water Permit • Removal of landscape irrigation, irrigation water and lawn watering from the categories of non-stonn water discharges that are not prohibited by the Storm Water Permit • Establishment of Non-Storm Water Dry Weather Numeric Effluent Limits • Establishment of Stonn Water MuniCipal Action Levels • Implementation of a Retrofitting Program for Existing Development • Requirement to submit a Municipal Stonn Water Funding Business Plan <p>The City requests that the Regional Board cite the specific legal authority for the proposed inclusion of each of the above-referenced items in the proposed Storm Water Permit for South Orange County. The City further requests that the Regional Board identify the specific water quality issues and conditions that differentiate South Orange County from San Diego County and warrant the imposition of these new and different requirements on the South Orange County Co-Permittees.</p>	Please see the supplemental fact sheet for the specific legal authority. Please also see comment #24 regarding consistency with other Permits.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
279	13	LID	F.1	The Draft Storm Water Permit imposes additional requirements on New Development and Significant Redevelopment Projects. The current International / National / State economic climate suggests that this is a most inappropriate time to saddle the development community with costly new requirements such as Low Impact Development Site Design and Treatment Control BMPs, and Hydromodification Assessments and Management Strategies. The City requests that the Regional Board carefully review and reconsider the necessity, appropriateness and timing of these new requirements.	The Copermitees have two years to develop and implement the low impact development and hydromodification requirements. It is unclear what the economic climate will be in two years. Furthermore, USEPA has found that implementing low impact development is often actually cheaper than conventional storm water treatment controls and, in some cases, could increase property values. Low impact development measures also address hydromodification by retaining onsite the runoff flows.
280	13	unfunded mandate	General	The City believes that many of the new regulations and requirements in the Draft Storm Water Permit exceed the requirements of the Clean Water Act. As such, these new regulations and requirements must be considered and evaluated in accordance with applicable provisions of the State Porter Cologne Act. If such regulations and requirements are included in the Final Storm Water Permit, the City believes that they would constitute unfunded State mandates.	The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.
281	13	Economic	General	<p>As mentioned above, the imposition of new regulations and requirements on the private development community could not come at a worse time in light of the current economic climate. The same can be said about the financial impacts of the Draft Storm Water Permit on the Municipal Co-Permittees. Many of the Co-Permittees are anticipating year-over-year declines in municipal revenues in numerous revenue categories (i.e. Property Tax, Sales Tax, Real Property Transfer Tax, Planning and Building Fees, Interest Income). Yesterday, the Governor proposed a FY 09-10 State Budget Alternative that may "borrow" \$2 Billion from local government property tax revenues for up to three years. Against this backdrop, it will be challenging for the Co-Permittees to maintain current funding levels for our existing Storm Water Management Programs.</p> <p>This may be an appropriate time to extend the current South Orange County Storm Water Permit for an additional 3-5 years without burdening the Co-Permittees with new requirements and costs. At the very least, the Regional Board should make every effort to ensure that the new South Orange County Storm Water Permit is "cost-neutral" to the Co-Permittees.</p>	The low impact development and hydromodification requirements have been modified to be more consistent with Region 8's recently adopted MS4 permit for North Orange County. In addition, those programs have two years to be developed and implemented. Please see comment #279 for more information. The USEPA conducted a study that in some cases LID was actually cheaper than conventional treatment technologies and increased home values. The monitoring requirements have also been designed to remain cost neutral. Please see response to comment no. 317.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
282	13	Overirrigation	B	<p>The Draft Storm Water Permit removes landscape irrigation, irrigation water and lawn watering from the categories of non-storm water discharges that are not prohibited. In effect, this change requires the Co-Permittees to enact and enforce ordinances that prohibit any water from leaving private or public property and entering the MS4, apparently under a zero-tolerance standard rather than to the maximum extent practicable. The City questions the legal authority of the Regional Board to unilaterally declare that these categories of urban runoff are now to be deemed prohibited discharges. The City further believes that these changes will not be accepted or tolerated by the general public and may compromise continuing public education and pollution prevention programs. The City requests that the Regional Board keep these non-storm water discharges in the non-prohibited categories.</p>	<p>Please see response to Comment #s 28, 52, 75, and 174. Please also see comment # 77. Non-storm water discharges identified as a source of pollutants must be addressed under federal law.</p>
283	13	NEL	C	<p>c. - Non-Stonn Water Dry Weather Numeric Effluent Limits D. - Municipal Action Levels I. - Total Maximum Daily Loads</p> <p>The Draft Storm Water Permit proposes to incorporate enforceable numeric effluent limits at the end of every pipe for both dry weather and storm flows for numerous constituents, including those subject to TMDLs. Available data already suggest that these provisions will place the Co-Permittees in immediate and continuous violation of the Permit. This situation leaves the Co-Permittees responsible for greatly expanded monitoring, as well as vulnerable to penalties and third-party litigation. It is unknown and uncertain whether it is technically or economically feasible to bring all discharges into full compliance. The City believes that these proposed new requirements greatly exceed and overreach the Co-Permittee's basic legal obligations under the Clean Water Act to implement an iterative sequence of BMPs to reduce the discharge of pollutants to receiving waters to the maximum extent practicable. It is our understanding that no other MS4 permit in the entire country imposes numeric effluent limits at the end-of-pipe for such a broad range of constituents. The City requests that the Regional Board delete these provisions from the Permit</p>	<p>Please see response to Comments 39, 42, 43, 44, 79 and 82.</p> <p>The Regional Board has modified sampling requirements for non-storm water numeric limits to provide the Copermittees with the flexibility to adjust monitoring to best match exist levels of effort under the IC/ID program monitoring. Please see response to Comment 317 for further discussion.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
284	13	LID	F.1.	<p>The City is concerned about the appropriateness of encouraging Site Design BMPs that "infiltrate" or "filter" runoff close to the source of runoff. Many areas of Laguna Niguel and South Orange County have experienced slope failures and landslides attributable to storm water and non-storm water causes. Given local soil and geological conditions, it may be more appropriate to discourage Site Design BMPs that "infiltrate" or "filter" runoff. As mentioned before, the City is also concerned about the financial impact of such requirements on New Development and Significant Redevelopment Projects. The City requests that the Regional Board carefully review and reconsider the necessity, appropriateness and timing of these new requirements.</p>	<p>The Tentative Order already includes specific language to address the commenter's concern as Section F.1.c.(6) covers "Infiltration and Groundwater Protection." The City has the flexibility to apply more restrictive requirements on infiltration BMPs. The Tentative Order also provides a waiver for when it is technically infeasible to infiltrate on site.</p>
285	13	Retrofitting	F.3	<p>This section requires each Co-Permittee to implement a retrofitting program that solves chronic flooding problems, reduces impacts from hydromodification, incorporates Low Impact Development, supports stream restoration, systematically reduces downstream channel erosion, reduces the discharges of storm water pollutants from the MS4 to the MEP, and prevents discharges from the MS4 from causing or contributing to a violation of water quality standards. First, it is difficult to imagine the scope and cost of performing the retrofitting evaluation required by Section F.3.d. Second, even if such an evaluation was performed, the Co-Permittees have no legal authority to compel private landowners of existing developments to implement or cooperate on retrofit projects. The City requests that the Regional Board delete Section F.3.d from the Storm Water Permit.</p>	<p>The section has not been deleted from the Tentative Order. Retrofitting is a needed requirement to address pollutant load discharges from existing development that are not meeting water quality standards. Although the section lists several "goals", the requirement does not include an enforceable time schedule to meet that goal. The Regional Board realizes the limitations the Copermittees have in requiring private landowners to retrofit existing developments. Section F.3.d.(4) has been revised to reflect those limitations. Please also see response to comment Nos. 46, 136, and 162.</p>
286	13	Economic	H.	<p>This section requires each Co-Permittee to submit a Municipal Storm Water Funding Business Plan that identifies a long-term funding strategy for the Storm Water Management Program. Since the Co-Permittees have no legal authority to impose new, significant Storm Water Program revenue sources without voter or property-owner approval, the long-term funding strategy for most Co-Permittees is limited to using existing General Fund revenues to support the local Storm Water Program. This is an unnecessary administrative requirement that will not provide any useful information to the Regional Board or Co-Permittees. The City requests that the Regional Board delete Section H.3 from the Storm Water Permit.</p>	<p>This comment was addressed in the 2007 response to comments. This section has been expanded in order to develop more useful and meaningful fiscal reporting. However, the Business Plan requirement has been removed from the Tentative Order.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
287	13	Overirrigation	B	<p>The summary report for the SEEP grant project just completed by the South Orange County Copermittees in partnership with the water supply agencies.</p> <p>What's interesting about the findings is they suggest that, in this region due to peculiarities of local geology, reducing the volume of landscape irrigation runoff may increase the relative proportion of subsoil water seepage in the storm drains, and end of driving the concentrations of certain geologically-derived constituents UP, even while overall discharge loads go DOWN. The SEEP study shows this effect for phosphates. The County has done some source investigations showing that the same may be true in some locations for several metals (cadmium, nickel, zinc).</p>	<p>The Regional Board has reviewed the findings of the SEEP study and disagrees with the conclusion that reducing or eliminating the volume of landscape irrigation runoff will increase concentrations of discharges.</p> <p>Notwithstanding disagreement regarding the findings by the Regional Board, the commenter appears to present the argument that the possibility of one source of pollutants warrants the allowance of a non-storm water discharge that has been identified as a source of pollution. The Regional Board is concerned as the Copermittees have identified landscape irrigation as a source of the pollutants that are specifically impairing the waterbodies (303(d) listed, see Finding C.7) that are receiving the non-storm water discharge. If after irrigation runoff is effectively prohibited another pollutant source is revealed to be problematic, it will be addressed at that time.</p> <p>Furthermore, the Regional Board finds it disturbing that the commenter appears to favor discharges which contain larger mass loads of pollutants in lower concentrations than smaller mass loads with potentially higher concentrations, even given the scenario is such where both would be a source of pollutants. The Regional Board maintains that federal regulations make it clear that dilution is not a substitute for treatment of discharges pursuant to federal requirements(40 CFR 122.45(f)).</p>
288	14	Existing Development	F.3	<p>Here is my concern . I have spoken to several Cities in South OC. They have made it clear that as a Co Permitte, they take their direction from the County as Primary Permittee. When I have spoken to the County, their interpretation of the current Permit is that a Mobile Car Wash & Detail operation can go onto private property, detail an engine using a degreaser and knock all the grease, grime, gas, anti freeze, etc to the ground. Spray toxic acid as a cleaner for BMW rims with nasty break dust build up, etc. And as long as the water does not leave the property and enter the public right of way today, then no harm no foul. Another example is that sometimes people focus on making sure the soaps are biodegradable . but if you apply a soap, then hose it to the ground, the fish cannot distinguish the good water from the waste water. Same thing I argue with the irrigation. It is not that water hitting the conveyance system it is that the water coming off the property contains fertilizers, pesticides, pet waste, etc.</p> <p>I am suggesting that the Permit be prescriptive in the intent and clearly communicate that it is trying to capture contaminants and pollution, not contain the water. We require this with a Traditional Boulevard Car Wash, so why not hold a Mobile Car Wash to Commercial standards? The pollution created today is Non Point Source Pollution, clearly, and will become tomorrow's Storm Water Pollution.</p>	<p>Finding C defines the characteristics of the discharges regulated by the Order and brings focus to the pollutants in runoff and their potential to impact receiving waters. Provision F.3.b.(3) addresses requirements for Mobile Businesses and documents the Regional Boards intent to focus on reduction of pollutants in runoff rather than total elimination of runoff from a location. The Regional Board is aware of the potential water quality impacts from mobile car washers and addressed the discharge in this Section of the permit.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

289	14	Existing Development	F.3	<p>In my previous Comments sent, I outlined the ProntoWash model, which since we started debating the new Permit a year ago has seen tremendous increases. I welcome the competition, think it is great. But both water conservation requirements I(cleans with 1 Pint of Water) and now the requirement to control run off in San Diego & LA . not yet anywhere in Orange County !!!!!!!!!!! This model continues rapid expansion based on those compelling events. I also listed many reasonable options for the traditional wash with a bucket & hose or pressure washer where a zero discharge standard can be achieved. I say reasonable because in the LA Cities that have implemented this standard, they have many Mobile Car Wash & Detailing companies that have achieved permission to operate. Like the NRDC . I also suggest that that is evidence of "Practicable".</p> <p>I do not think "prohibit non storm water discharges" Permit language is prescriptive, and does not necessarily trigger a material change from current BMP's.</p> <p>Unfortunately, I do not have a suggestion for appropriate language. New to this. But something that clearly says prohibit from ever reaching the MS4 to necessitate a change in BMP's.</p>	Comment noted.
-----	----	----------------------	-----	---	----------------

290	14	Existing Development	F.3.b	<p>Solutions . I have several in the industry, competitors some might say, who have and will work with me and the Cities / Counties to work together on reasonable BMP's. One idea we are pushing is to get the County of Orange to do a County wide permit. Where all businesses, on a set criteria, can go to the County, pay a fee, and validate the process and chemicals used will satisfy the BMP's. Will save all a bunch of time and money!</p> <p>Lastly, if you do not intend to remove Home Car Washing from Exempt, I suggest you button up the Commercial Mobile Car Wash now, so you can make the leap in 5 , or so, years.</p> <p>Home Car Wash - I agree with the gentleman from Dana Point. Makes no sense to remove Landscape Irrigation and leave Home Car Washing.</p> <p>The State of Washington utilized the Car Wash Run Off Effluent Impact Study (I acquired it from the web site of the International Car Wash Association) as a basis for their Department of Ecology to change how Home Car Washing is done. To prevent Non Point Source Pollution and Dry Weather discharges, the Dept of Ecology requires residents to pull their car to the landscape, use a a natural filter to wash a car at home. They have deemed the driveway as a conveyance. I suggest you not utilize the same study to "build a body of knowledge", but to reasonably act.</p>	Comment noted.
-----	----	----------------------	-------	--	----------------

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
291	14	Existing Development	F.3.b	<p>Again, I think the State of Washington Dept of Ecology satisfies proof of Practicable!</p> <p>I have all the bells & whistles for my homes irrigation. Smart Timer, everything. Based on the last stakeholder's meeting, I had my Mesa Consolidated Water come out, they could not improve my efficiencies, nor provide a solution to prevent my irrigation from watering my sidewalk and traveling into the curb & gutter. So I brought out a landscaper. Almost \$1,000 to make the necessary changes prevent the violation. Which, any code enforcer will never see because my Smart Timer comes on at 4 am, and the new conservation requirements and in some cases Ordinances prohibit watering during the day or hours the Enforcement will be working. Practicable with that cost and lack of enforcement opportunity?</p> <p>The solutions to prevent run off from the Home Car wash can be achieved with as little as no cost to \$25 for a berm or waterless spray bottles and micro fiber towels. Seems more Practicable to me!</p>	Comment noted.
292	15	Urban Runoff	General	<ul style="list-style-type: none"> The current draft has removed "Urban" from the term "Urban Runoff". Runoff is a general and vague term and Permittees should not be on the hook to address all sorts of runoff. The goal of the NPDES permit is to control urban runoff, and this phrase should not be altered. 	<p>The goal of the NPDES permit is not specifically "to control urban runoff" as the commenter states. An overall goal for the NPDES permit is not specifically stated in the Tentative Order. However, the NPDES permit is required by the federal clean water act, which states its objective as "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." Therefore, the NPDES permit implements the objective of the Clean Water Act. The term "urban runoff" only appears once in the Clean Water Act and that is in response to a specifically funded program to address pollution in the Great Lakes. The term "urban runoff" does not appear in section 402(p) which regulates storm water discharges from municipal storm systems. In addition, the term "urban runoff" does not appear in the code of federal regulations section CFR 122 that implements the storm water requirements in the Clean Water Act. Please see Comment No. 47 for more information.</p>
293	15	General	Finding	<ul style="list-style-type: none"> Finding C.15 states that this Order is not intended to address naturally occurring pollutants or flows except where the MS4 has altered or concentrated those natural pollutants or flows. The City believes the nature of the MS4 is to concentrate flows, and if natural occurring pollutants enter the MS4, the Permittees should not be held accountable for these pollutants. 	<p>The referenced finding was removed from the Tentative Order following disagreement from the interested stakeholders. Where an MS4 system receives runoff from natural areas, the MS4 system unnaturally converts the discharge from a non-point source to a point source discharge. The MS4 system would not allow for natural infiltration and attenuation of pollutants and could concentrate violations at the discharge point to ultimately cause an exceedance of water quality standards. The finding is not found in the MS4 permit adopted for San Diego County.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
294	15	Overirrigation	B.	In the current draft of the subject Order, landscape irrigation, irrigation water, and lawn watering, have been removed from the “Non-Storm Water exempt discharges” table in Section B.2. The Cities are currently working with water agencies to develop and implement control measures to reduce irrigation runoff into the MS4. The foregoing discharges should remain on the exempt discharges list in the proposed fourth term permit so that the co-permittees are given an opportunity to demonstrate the effectiveness of their efforts to reduce and eventually eliminate irrigation runoff into the MS4. Direct removal of these discharges from the exemption may have a negative impact on the progress the Cities are making on this issue. The City proposes the following alternate language be added, “The Co-permittees shall work with local water purveyors to implement measures in order to eliminate irrigation runoff.”	Please see response to Comment #s 28, 52, 75, and 174.
295	15	Monitoring	D.	<ul style="list-style-type: none"> • Section D.4.e(2)b of the Tentative Order imposes new requirements that the Permittees conduct an investigation or document why a discharge does not require an investigation, within two business days of receiving dry weather field screening results that exceed action levels. This timeframe is not reasonable. The Board Staff has responded to this comment claiming that this section does not require a fully completed investigation; rather it requires the Co-Permittees to begin conducting an investigation. This clarification should be in the Tentative Order so the City is clear of the Board’s requirements. 	The Regional Board agrees that the requested change is reasonable. The Tentative Order updates have been changed to include the modified language.
296	15	Existing Development	D.	<ul style="list-style-type: none"> • Section D.4.h.1 and 2 states that co-permittees must implement management measures and procedures to contain and clean up sewage spills. It also directs the copermitees to implement a mechanism whereby they will be notified of all sewage spills. As the Water Districts regulate sanitary sewer overflows, the City would prefer this section be removed as to avoid duplicity of effort. However, if it is to remain, the City proposes the following language modification to Section D.4.h.2, “Each co-permittee must implement management measures and procedures to prevent, respond to, contain and clean up sewage from any such notification.” 	Please see response to Comment 180.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
297	15	LID	F.1	<ul style="list-style-type: none"> The Tentative Update document dated May 5, 2009 contains a new section F.1.d.(4)(c), which requires that LID structural site design BMPs to be sized and designed to ensure capture of the 85th percentile storm event for all flows from the development in accordance with Section F.1.d.(6)(a)(i) and Section F.1.h. This section should be modified to allow capture of the difference in volume between the 85th percentile storm event for the pre-development condition and the 85th percentile storm event for the post-development condition. Moreover, the term “capture” implies retention, and this is not feasible everywhere due to site constraints. The term “capture” should be removed from the language, so that the Co-Permittees are given the flexibility to treat and release, where feasible. 	<p>The Tentative Order includes waiver criteria that give the Copermittees the flexibility to require treat and release BMPs where onsite retention is not technically feasible. The Tentative Order's requirements regarding the implementation of low impact development practices has been changed to be consistent with Region 8's recently adopted MS4 permit. Treating only the delta volume of a storm is not meeting the MEP standard and not protective of water quality. The 85th percentile storm event is consistent with State Board Order No. WQ-2000-011, with the County's drainage area management plan and with other southern California MS4 permits.</p>
298	15	Economic	H.	<p>Section H.3 of the Order requires the submission of a “Municipal Storm Water Funding Business Plan” by the end of the permit term. The Plan would identify the longterm funding strategies for program evolution and funding decisions along with planned funding methods and mechanisms for Municipal Storm water Management. City Staff has stated its’ concerns on this section in both of the previous Tentative Order drafts and yet this section remains unchanged. Staff believes this provision is inappropriate, improper and unjustified. The City has consistently funded its Storm Water Management obligations and there is no evidence to suggest otherwise. Moreover, the City submits a Fiscal Analysis in its Annual reports, also known as Jurisdictional Urban Runoff Management Plans (JURMP or LIP). The Board Staff claims that the Business Plan is not subject to approval and does not restrict the Co-Permittees to the implementation of any of the methods in the plan. If that is the case, there shouldn’t be any need for the Business Plan. Furthermore, the mere existence of the requirement of a Business Plan in the Tentative Order makes it the purview of the Board regardless of the Staff’s comment. And, the Board should not work towards a funding mandate nor take any steps to involve itself in the Budget preparation of another governmental agency. The City’s budget is available for all to see as a public record and should suffice to respond to any staff concerns about funding commitments. This provision should be deleted from the Tentative Order.</p>	<p>This comment was addressed in the 2007 response to comments. This section has been expanded in order to develop more useful and meaningful fiscal reporting. However, the Business Plan requirement has been removed from the Tentative Order.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
299	16	LID	F.1	<p>First of all, we understand that the Orange County permittees desire consistency between the LID requirements adopted by the Santa Ana and San Diego Regional Boards. As noted in our letter to the Santa Ana Regional Board dated May 8, 2009 (which we provided to you earlier), with a few relatively minor clarifications, we would be comfortable with the requirements of the Santa Ana Regional Board's permit for North Orange County (May 1, 2009 version). As discussed below, however, we have certain concerns with the LID requirements of the March 13, 2009 draft permit proposed by the San Diego Regional Board as well as the tentative update of April 29, 2009. If the adopted Santa Ana Regional Board North Orange County permit satisfactorily addresses EPA's May 8 comments, we would support direct incorporation of the North Orange County permit's LID provisions into your South Orange County permit. We will continue to consult with you regarding the status of the North Orange County permit.</p>	<p>The Tentative Order's requirements regarding the implementation of low impact development practices has been changed to be consistent with Region 8's recently adopted MS4 permit.</p>
300	16	LID		<p>a) We believe the draft permit should be revised to more clearly incorporate numeric criteria for LID implementation. This has been a priority of ours in our review of draft MS4 permits across the State including the recently-reissued permit for Ventura County and for the North Orange County permit. In the South Orange County permit, numeric LID criteria should be included in section F.1.d.4 of the permit, entitled "Low Impact Development Site Design BMP Requirements." This section of the draft permit describes LID BMPs, but does not include numeric performance criteria. We recognize that in a subsequent section of the permit, section F.1.h which, addresses hydromodification, there is a section entitled "Interim Requirements for Large Projects" (section F.1.h.6) which calls for the reduction of Effective Impervious Area (EIA) to less than 5%. While we support including an interim hydromodification requirement, to avoid confusion over the permit's expectations for LID, we believe the permit would be improved by including numeric criteria in the LID section F.1.d.4. An example of this recommended approach is the permit adopted by the Los Angeles Regional Board for Ventura County on May 7, 2009. This permit includes numeric criteria in the LID sections of the permits, and also contains appropriate, separate criteria for hydromodification.</p>	<p>The Tentative Order's requirements regarding the implementation of low impact development practices has been changed to be consistent with Region 8's recently adopted MS4 permit. This includes a numeric criteria that LID BMPs are required that retain onsite and/or biofilter the 24 hour 85th percentile storm event.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
301	16	LID	F.1.	b) We would also point out that the South Orange County permit lacks storm sizing criteria to use in conjunction with the EIA requirement. The absence of such criteria resulted in criticism of an early version of the draft Ventura County permit. Additionally, we would note that the latest draft North Orange County permit no longer contains the 5% EIA requirement, but instead establishes numeric LID performance criteria in terms of a design storm volume. We are supportive of both the design storm volume approach proposed by the Santa Ana Regional Board and the 5% EIA approach used by the Los Angeles Regional Board for the Ventura County permit.	The Tentative Order's requirements regarding the implementation of low impact development practices have been changed to be consistent with Region 8's recently adopted MS4 permit. This includes a numeric criteria that LID BMPs are required to retain onsite and/or biofilter the 24 hour 85th percentile storm event.
302	16	LID	F.1.	c) We believe the South Orange County permit should include specific requirements for alternative programs when permittees conclude that implementation of LID is infeasible. However, the existing provisions in the permit related to waivers (sections F.1.d.7 and F.1.d.8) do not address this concern. Section F.1.d.7 is entitled "Waiver Provision for Numeric Sizing of Treatment Control BMP Requirements" and provides waivers for treatment requirements rather than LID. Further, section F.1.d.8, entitled "LID Site Design BMP Substitution Program" is written to substitute for "some or all treatment control BMPs." Our concern is with the draft permit's LID section (section F.1.d.a.i) which refers to a "finding of infeasibility" that permittees may make if LID implementation is not practical for a given project; additional clarification is needed concerning the circumstances when LID would be considered "infeasible."	The Tentative Order's requirements regarding the implementation of low impact development practices have been changed to be consistent with Region 8's recently adopted MS4 permit. The LID substitution program has been modified to contain specific criteria for determining the technical infeasibility of LID BMPs. The section has also been clarified that LID BMPs are required at all sites, but where technically infeasible may then be substituted with conventional treatment control devices.
303	16	LID	F.1.	a) New language would be added in section F.1.d.(4)(a)(i) which would require LID practices or participation in the LID substitution program of F.1.d.(8)(d). However, the permit still does not clarify the circumstances when LID would be considered infeasible (see comment 1c above) or require the permittees to develop such criteria for submittal to and approval by the Regional Board (as does the current draft of the Santa Ana Regional Board's permit). Further, the revised section F.1.d.(8)(d) seems misplaced (and is confusing) in that it is located within section F.1.d.(8) which sets forth an optional program to substitute LID for treatment controls.	The Tentative Order's requirements regarding the implementation of low impact development practices have been changed to be consistent with Region 8's recently adopted MS4 permit. The Tentative Order now specifies the circumstances when LID would be considered technically infeasible. The Copermitees are to develop the Substitution Program and submit it to the Regional Board. The Regional Board will accept public comments on the draft Program and the Executive Officer will determine the need for a Public Hearing prior to deciding upon the adequacy of the program in meeting permit requirements.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
304	16	LID	F.1.	<p>b) A new section F.I.d.(4)(c) would be added to the permit which would require capture of a design storm. However, the permit also provides a rather open-ended list of acceptable LID BMPs. We would recommend that acceptable LID measures be limited as suggested in the first comment in our May 8 letter to the Santa Ana Regional Board on the proposed North Orange County permit, in which LID is defined in terms of the way the BMP performs. The concern in our May 8 letter is that certain BMPs (even biofiltration which is listed in the North Orange County permit) may not necessarily perform consistent with LID principles, unless additional operational requirements are specified. Such concerns would also apply to certain BMPs on the list in your permit such as detention ponds and constructed wetlands.</p>	<p>The acceptable list of LID BMPs has been removed from the Tentative Order. Additional operational requirements have been placed on the design and implementation of LID biofiltration BMPs.</p>
305	16	TMDL	Finding	<p>We believe that additional clarification is needed concerning the consistency of the draft permit with approved TMDLs. Finding E.12 for the permit indicates the permit includes applicable wasteload allocations (WLAs) that have been adopted by the Regional Board and approved by the State Board, Office of Administration Law and EPA. However, we are not aware of any such WLAs for the MS4s subject to the permit. Table I in the fact sheet for the permit notes that certain TMDLs have been adopted by the Regional Board, but have not yet been approved by EPA. There is also a reference in the fact sheet to dry weather TMDLs included in section C of the draft permit, which apparently have received all the necessary approvals. Again, however, we are not aware of these TMDLs and the fact sheet should provide full and clear information concerning the approval status of TMDLs with WLAs applicable to the MS4s.</p> <p>Even if no applicable WLAs have been approved by EPA, it is helpful for the fact sheet to clarify this matter. Further, if applicable WLAs are approved by EPA prior to Regional Board adoption of the permit, they should be included in the permit. We are also pleased by the apparent intent of the Regional Board as indicated in Finding E.12 and Section I of the draft permit to express permit effluent limits, when necessary to ensure consistency with applicable WLAs, as numeric effluent limits. Numeric limits provide greater assurance of consistency with WLAs than the alternative of BMPs which are sometimes used, given the uncertainty in the performance of many of the BMPs commonly used for stormwater pollution control.</p>	<p>The Tentative Order has been updated to clarify that the final Waste Load Allocations (WLAs) for the Indicator Bacteria TMDL for Baby Beach in Dana Point must be met by the end of the TMDL implementation compliance schedule provided in Resolution No. R9-2008-0027, "A Resolution to Adopt an Amendment to the Water Quality Control Plan for the San Diego Basin (9) to Incorporate Total Maximum Daily Load for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay." Furthermore, the Tentative Order has also been revised to require that all discharges to Baby Beach in Dana Point meet the Numeric Targets of the TMDL by the end of the compliance schedule in order to be consistent with the assumptions and requirements of the WLAs.</p> <p>On June 16, 2009, the State Water Resources Control Board approved Resolution R9-2008-0027 amending the Basin Plan to incorporate Total Maximum Daily Loads (TMDLs) for indicator bacteria for Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay. Final approvals by the Office of Administrative Law and the USEPA are expected to be garnered prior to adoption consideration of this re-issuance of the MS4 Permit for So. Orange County.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
306	16	Urban Runoff	General	<p>You had asked for our views on the proposed replacement of the term "urban runoff", which was commonly used in the previous permit, with the terms "stormwater" and "non-stormwater" as the discharges regulated in the new permit. We would support this revision since it is actually more consistent with the terminology used in the EPA stormwater regulations at 40 CFR 122.26.</p> <p>However, we would point out that the new Finding C.14 and the discussion in the fact sheet incorrectly indicate that industrial stormwater discharges are subject to the maximum extent practicable (MEP) discharge standard in the Clean Water Act (CWA). Section 402(P)(3)(B) of the CWA provides that only municipal stormwater discharges are subject to the MEP standard; section 402(P)(3)(A) provides that industrial runoff is subject to all applicable requirements of sections 402(P) of the CWA, and section 301 of the CWA which includes BAT/BCT effluent limits and water quality standards compliance.</p>	<p>Comment noted that the removal of the term "urban runoff" is more consistent with federal storm water regulations. The Tentative Order and Supplemental Fact Sheet have been clarified as requested to reflect that Industrial Storm Water discharges are not subject to the MEP standard.</p>
307	16	NEL	C	<p>You also asked for our views on whether numeric effluent limits would be appropriate for non-stormwater discharges. As noted above in our comments on LID and TMDLs, we are seeking to ensure that permits include clear, measurable and enforceable requirements. We believe that the use of numeric effluent limits for non-stormwater discharges would be a significant step in the right direction and we support the proposed limits. In previous MS4 permits, the non-stormwater discharges addressed in the permits have typically been regulated through best management practices (BMPs) pursuant to 40 CFR 122.44(k) for the same reason that stormwater discharges themselves are often regulated by BMPs, which is the lack of good information about the discharges and the difficulty in deriving appropriate numeric effluent limits. This issue was recognized in a 1996 EPA guidance on water quality-based effluent limits for stormwater discharges which is cited by the fact sheet. However, the guidance also indicates that as additional information becomes available, more specific limits should be considered. As noted in the fact sheet, additional information has become available to the Board about the discharges over the years, and we agree that the numeric effluent limits are now appropriate.</p>	<p>Comment noted. The Regional Board appreciates the support of the USEPA as they are, arguably, the foremost experts on federal statutes regulating MS4 discharges.</p>

308	17	General	General	<p>RE: Tentative Order No. R9-2007-0002 NPDES, No. CAS0108740</p> <p>I am a resident of Laguna Beach and live a couple of blocks from Aliso Creek and State Park. I am writing to you to add my voice in support of the Board's efforts to force the cities, that are contributing to the pollution of Aliso creek and cause its toxic soup to flow into our Oceans, to clean up their acts. I understand there have been many half hearted efforts to reduce this toxic discharge. These efforts have been, apparently, more cosmetic than real as the flow of polluted runoff during dry weather is continuing to increase. There are many ways that a city can prevent the discharge of polluted water into our watercourses and then into the ocean. It is time that your Board took real, forceful action to insist that the polluting cities take appropriate action.</p> <p>The Board has a clear path:</p> <ul style="list-style-type: none"> * Insist Cities divert polluted runoff to inland SOCWA facilities for treatment and reuse as reclaimed water. * Force capture of MS4 discharges for filtration and local beneficial reuse. * Levy substantial fines against offending subwatershed, cities, homeowner associations, golf courses and others with elevated dry season discharge rates and against offending inland water districts for failing to control urban runoff. <p>Please know that you have many residents behind you in this effort. You have the regulatory as well as the moral authority to make a difference. Building the SUPER project, as proposed by Orange County is a red herring. It is just another band aid that will do nothing to control and reduce polluted runoff into our watercourses. The SUPER Project is now seen as an effort to divert the Waterboard's attention away from the real culprit in this pollution. We hope you will not fall for these stall tactics.</p> <p>Thanks! Armando Baez 30792 Driftwood Drive, Laguna Beach, Ca. 92651</p>	<p>Please see response to Comment 1, 3, 6, 14, 16, 82.</p> <p>In regards to the SUPER Project, the project will be subject to a Clean Water Act 401 Water Quality Certification from the Regional Board. The 401 Certification requires the evaluation of avoidance, minimization and mitigation measures taken by the applicant for the proposed project. It is expected that the SUPER project applicant will address the commenters concerns on the project within the 401 process.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
309	18	General	General	<p>The City of Mission Viejo shares its concerns with the County of Orange over the lack of permitting consistency with the North Orange County draft MS4 permit (Tentative Order R82009- 0030). We believe the lack of permitting consistency will lead to confusion by private developers, businesses, and residents over storm water regulatory requirements. While your staff has acknowledged that they will likely incorporate the North Orange County permit's land development provisions, they are reluctant to eliminate other areas of inconsistency. As the County points out, this disinclination will erode the credibility of the regulatory framework for stormwater in California and will confound the ability of local governments, including Mission Viejo, and the regulated community to effectively address a key environmental mandate at a time of unprecedented fiscal constraint. It is therefore necessary for us to continue to seek revisions to the Tentative Order supportive of a cohesive and cogent alignment of the North and South County pennits on the basis that consistency is important to the credibility of our respective efforts to manage urban runoff and is vital to sustaining the obvious cost effectiveness of a single and coordinated Countywide program in Orange County.</p>	<p>Please see the response to comments #24 on consistency between permits.</p> <p>The state's water quality protection requirements within the Tentative Order are authorized by Federal Law, are necessary to meet the federal MEP standard, and are not unfunded mandates. Please see comments #155 and 165.</p>
310	18	NEL	C & D	<p>The insertion of MALs and NELs is inconsistent with the State Water Board's Blue Ribbon panel report on the feasibility of numeric effluent limits. And, this conclusion continues to be the published position of USEPA on this issue.</p>	<p>Please see response to Comments 25, 33 and 39. The commenter has misinterpreted the findings of the State Board's Blue Ribbon Panel and the USEPA's published position.</p> <p>In regards to the position of USEPA, please see Comment 307.</p>
311	18	NEL	C & D	<p>The finding by the Regional Board staff that non-stonnwater discharges are not subject to the maximum extent practicable standard and therefore subject to water quality based effluent limits is not supported by law. Clean Water Act section 402(p) (3) (B) (ii) clearly states that discharges from municipal stonn sewers shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewer. We argue that the section does not require a full prohibition but rather an effective prohibition. The City agrees with the County in that the technology based standard for non-stonnwater discharges is "effectively prohibit" just as "maximum extent practicable" is the technology based standard for stonnwater discharges.</p>	<p>Please see response to Comment 33, 77 and 78.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
312	18	NEL	C	<p>The City is concerned with exposure to significant risk in complying with the Tentative Order. The County of Orange has completed a comparison of existing dry weather discharges with the selected NELs noted below.</p> <p>Constituent Hydrologic Unit Percentage of time NELs Total Dissolved Solids* Group 1 74.5 Total Dissolved Solids* Group 2 97.1 Total Phosphorus¹⁹ Group 1 and 2 93.0 Nitrate + Nitrite Group 1 and 2 93.8 Fecal colifonn Group 1 and 2 90.0 Nickel (dissolved) Group 1 and 2 0.3 Copper (dissolved) Group 1 and 2 9.5 Cadmium (dissolved) Group 1 and 2 18.1 *A factor of 0.6 was multiplied by the specific conductance measurements to estimate IDS @Proposed NEL was compared to measurements of reactive orthophosphate as P</p> <p>As a result, the City of Mission Viejo could face enforcement action for not complying with all the NELs. Where there is exceedance, the City may be faced with mandatory minimum penalties (MMPs) under Water Code §§ 13385 and 13385.1. In addition, noncompliance with the NELs may subject the City to additional enforcement actions imposed by the Regional Water Board and through third party actions under the citizen suit provisions of the Clean Water Act.</p>	Please see response to Comment 82.
313	18	NEL	C	<p>The use of numeric limits for non-stormwater discharges is premature. Extensive work has already been performed by the Stakeholders Advisory Group on the Bacteria I TMDL for San Diego Region Beaches and Creeks, which involved multiple parties environmental groups and the regulated community alike. The TMDL program provides the safety net for ensuring that our water bodies are protected in the most reasonable and effective manner. The direct translation of water quality objectives into numeric effluent limits bypasses the TMDL process. It is likely that some of our non-stormwater discharges will exceed the NEL but have no effect on the receiving water quality or beneficial uses. But under the proposed Order, the City may be obligated to expend considerable resources without a reciprocal water quality benefit. This is poor public policy and use of public funds.</p>	Please see response to Comment 83.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
314	18	Overirrigation	B	<p>The prescribed prohibition on irrigation runoff also needs to be very carefully considered. The City believes this outright prohibition would erode general public support for the City's and County's Storm Water Program. We believe implementation of the prohibition would risk eroding general public support for a Program that is successfully fostering a stewardship ethic in residential environments. For example, cities may be faced with issuing citations to a homeowner for irrigation runoff; whereas, the neighbor next door is free to wash his car in his driveway under the current Tentative Order exemption for residential car washing. There is also concern that the provision would force the expenditure of scarce resources on an issue that is already being addressed by water districts dealing with water conservation imperatives.</p>	<p>Please see response to Comment #s 28, 52, 75, and 174.</p> <p>The Regional Board is working within the parameters set forth in the federal regulations to remove exemptions to non-storm water discharge prohibitions. If the City of Mission Viejo has evidence that residential car washing is causing or contributing to a condition of pollution in receiving waters, the Regional Board would appreciate receiving the information.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

315	18	Existing Development	F.3.	<p>Page 69, Part F.3.h., of the Tentative Order states:</p> <p>"Each Copermittee must prevent, respond to, contain and clean up all sewage and other spills that may discharge into its MS4 from any source (including private laterals and failing septic systems.) Spill response teams must prevent entry of spills into the MS4 and contamination of surface water, ground water and soil. Each Copermittee must coordinate spill prevention, containment and response activities throughout all appropriate departments, programs and agencies so that maximum water quality protection is available at all times."</p> <p>For many cities (including the City of Mission Viejo), implementation of this provision is simply not feasible. For example, the City does not own or operate its own sewage system. All of the sewer systems in Mission Viejo are owned, operated, and maintained by water districts. These agencies have their own separate NPDES Permit. The City does not have the equipment or expertise to manage a sewage spill of any size, and its staff is not adequately trained to respond to potential spills. All of the water districts in Mission Viejo already respond to sewer spills (including sewer spills from private laterals). Furthermore, this provision is duplicative in the sense that the Regional Board is seeking to make the Permittees responsible for a task already delegated to the water districts. By making the City responsible for sewer spills, there is a high risk of creating confusion in determining who will respond to a spill (water district or City), who is responsible for the associated cost and reporting, etc.</p> <p>This issue is made even more troubling by the fact that the State Water Resources Control Board ("State Board") previously issued a stay of this very same issue in the prior generation of the NPDES Permit. After extensive hearings and briefing on the matter, the State Board issued Order WQO 2002-0014 on August 15, 2002, granting a stay as to this provision. In that Order, the State Board held:</p> <p>"The record shows that three separate water districts operate these sewers within Mission Viejo, and are regulated by a sanitary sewer NPDES permit issued by the Regional Board. Mission Viejo alleged that the duplication of effort that would ensue by having Mission Viejo also be responsible for preventing and responding to sanitary sewage spills could lead to delayed responses as agencies try to determine jurisdiction and primary responsibility. Orange County's cost table for the upcoming year estimated total copermittee costs of \$56,512 to implement this requirement. While these costs, by themselves do not constitute substantial harm, we find that the duplicative nature of the costs, combined with potential response delay and confusion, do." (State Board Order WQO 2002-0014, p. 6.)</p> <p>In deciding to grant a stay as to this provision, the State Board concluded:</p> <p>"The regulation of sanitary sewer overflows by municipal storm water entities, while other</p>	Please see response to Comment 180.
-----	----	----------------------	------	--	-------------------------------------

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
-------------	-----------	---------	---------	------------------	------------------

public entities are already charged with that responsibility in separate NPDES permits, may result in significant confusion and unnecessary control activities. For example, the Permit appears to assign primary spill prevention and response coordination authority to the copermittees. While the federal regulations clearly assign some spill prevention and response duties to the copermittees, we find that the extent of these duties is a substantial question of law and fact."

[State Board Order WQO 2002-0014, p. 8. (emphasis added.)] Given the previous findings of the State Board on this same issue, and given that none of the factual reasons supporting this decision have changed, the Regional Board should remove or modify this provision so as to reduce duplicity of effort and the implementation of unnecessary control activities. As an alternative, the City recommends that the Regional Board consider adopting language similar to that contained in State Board Order No. 2006-0003 titled: "Statewide General Waste Discharge Requirements for Sanitary Sewer Systems" ("Order"). This Order applies solely to municipalities and other public entities that own or operate sanitary sewer systems greater than one mile in length that collect and/or convey untreated or partially treated wastewater. Adopting this caveat would not only serve to accomplish the primary goals behind the provision, but would also ensure Statewide consistency among Water Board regulations. If the Regional Board is concerned that the City will not work in cooperation with the water districts or provide notification to the water districts regarding spills that are initially reported to the City, the Regional Board could add additional language/requirements. For example, the following condition could be added, "For the Permittees that do not own or operate sanitary sewer systems and are exempt from the responsibility for spills, said Permittees shall develop a program to notify the Agency responsible for the sewage spill and shall provide assistance to the responsible Agency as necessary to prevent sewage from entering the MS4." Please note for the record that the City of Mission Viejo already has these procedures in place.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
316	18	LID	F.1	<p>More recently the County provided the Santa Ana RWQCB with a more detailed conception of a framework for land development. It predicates permit compliance on management of the 85th percentile storm volume, presumes the application of LID BMPs based upon a prioritized consideration of infiltration, capture and re-use, evapo-transpiration, and bio-retention/biofiltration, and requires treatment of residual runoff volumes for which the application of LID BMPs has been determined to be infeasible at site, sub-regional and regional scales. The framework also integrates options for water quality credits and provides for alternate compliance approaches including participation in a watershed project and contributions to an "in-lieu" fund. It also explicitly recognizes bio-retention/bio-filtration BMPs as LID BMPs and the continued and entirely legitimate contribution of effective structural BMPs such as constructed wetlands and detention ponds to the practice of stormwater quality management. The City agrees with the County and the other Permittees that it is imperative that there be a uniform countywide development standard for water quality protection. Consequently, the framework language that is currently being supported by both the North Orange County Permittees and staff of the Santa Ana Regional Board should be the starting point for discussion with respect to the subject Tentative Order.</p>	<p>The Tentative Order's requirements regarding the implementation of low impact development practices has been changed to be consistent with Region 8's recently adopted MS4 permit.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
317	4	Economic	Attachement E:MRP	<p>The specific comments provided below are intended to ensure that any changes to environmental monitoring requirements are based on careful strategic assessments of the current effort to ensure that revisions ultimately continue to most effectively support DAMP implementation. Also, at a time of unprecedented fiscal challenge there can be no required commitment of additional resources to environmental monitoring. Any new monitoring requirements will require offsetting and compensatory reductions in existing monitoring obligations.</p>	<p>The Regional Board does not agree that "any new monitoring requirements will require offsetting and compensatory reductions in existing monitoring programs." The commenter does not provide any regulatory language or evidence to support this assertion.</p> <p>Furthermore, USEPA (61 Fed Reg 43761) has addressed the question regarding the quantity of storm water monitoring required for MS4 NPDES permits: "The amount and types of monitoring necessary will vary depending on the individual circumstances of each storm water discharge. EPA encourages dischargers and permitting authorities to carefully evaluate monitoring needs and storm water program objectives so as to select useful and cost-effective monitoring approaches. For most dischargers, storm water monitoring can be conducted for two basic reasons: 1) to identify if problems are present, either in receiving water or in the discharge, and to characterize the cause(s) of such problems; and 2) to assess the effectiveness of storm water controls in reducing contaminants and making improvements to water quality."</p> <p>The Regional Board maintains that it considers monitoring needs and program objectives when requiring monitoring. The Regional Board has considered the position of the Copermittees when evaluating the Tentative Monitoring and Reporting requirements and significant reductions and modifications have been made to the Tentative Order in an effort to maintain a cost-neutral monitoring program. The latest draft of the Tentative Order eliminates multiple monitoring requirements and allows the Copermittees to substitute participation in regional monitoring programs. These actions are expected to be more cost efficient and prevent redundancy.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
318	4	Monitoring	Attachement E:MRP	<p>The 6-hour holding time for samples of indicator bacteria limit the length of time that sampling teams can spend in the field and do not allow sampling of some episodic events. A typical day of Bioassessment monitoring at three locations requires 8 hours in the field for PHAB assessment, and collection of benthic macroinvertebrate, water quality, and toxicity testing samples. Mass Emissions monitoring of stormwater runoff can occur on weekends and holidays when contract laboratory services are not available. Most importantly, monitoring bacteriological quality of stormwater at Mass Emissions site will not produce useful information since access to flood control channels is prohibited during periods of stormwater runoff and the Mass Emissions monitoring sites are generally great distances upstream of the coastal receiving waters.</p> <p>Proposed Modification: Exempt monitoring of bacteriological quality at Bioassessment sites and during stormwater events at Mass Emissions sites.</p>	<p>The Regional Board finds the exemption of Bioassessment sampling from bacteriological sampling to be a reasonable request. The Tentative Order has been updated to reflect the exemption.</p> <p>The Regional Board finds the exemption of Mass Loading sampling from bacteriological sampling to not be a reasonable request. The information provided to support this exemption is not of sufficient concern to warrant the exemption. The commenter's concerns with monitoring at Mass Loading stations include the monitoring itself, distance from coastal receiving waters, and availability of laboratory services and are addressed as follows:</p> <p>The comment regarding monitoring accessibility for mass loading stations and holding times appears to assume composites are required for bacteriological sampling. This is not the case, as II.A.1.d.2 clearly states grab samples are to undergo bacteriological analysis.</p> <p>The comment regarding the distance from coastal receiving waters is concerning, as coastal receiving waters are not the only waters which have REC-1 as a designated Beneficial Use. Inland surface waters within Southern Orange County are all classified as having REC-1 as a Beneficial Use or potential Beneficial Use.</p> <p>Lastly, the accessibility of laboratory services within Southern Orange County is not a sufficient reason for exempting water quality sampling. Furthermore, with the exception of the initial storm event, the remaining mass loading language allows for flexibility in choosing sampling dates.</p>
319	4	Monitoring	Attachement E:MRP	<p>Monitoring for oil and grease concentration will not detect lighter petroleum fractions such as gasoline and diesel. Oil and grease has rarely been detected in 5 years of monitoring in the Dry Weather Reconnaissance Monitoring Program.</p> <p>Proposed modification: Collect a grab sample for oil and grease during stormwater runoff monitoring at Mass Emissions and Ambient Coastal Receiving Water sites. Collect a grab sample for total petroleum hydrocarbons whenever a sheen is observed</p>	<p>As in Comment 318, sampling for Oil and Grease as required in the Order shall be done using grab samples for Mass Loading stations. The Regional Board agrees with the commenter's proposal that total petroleum hydrocarbons only be tested if a sheen is observed. The Tentative Order has been updated to reflect this modification.</p>
320	4	Monitoring	Attachement E:MRP	<p>A Stormwater Monitoring Coalition (SMC) review of Bioassessment data collected in Southern California has shown that at sites where flow is year-round there is no statistical difference in IBI scores between the spring and fall seasons.</p> <p>Proposed Modification: Modify the sampling frequency for Bioassessment to once a year.</p>	<p>The Regional Board finds this a reasonable request at this time. The Tentative Order has been updated to reflect the proposed changes.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
321	4	Monitoring	Attachement E:MRP	<p>The waiver of a single, annual Bioassessment monitoring event to alternatively conduct a study on the effects of PHAB modification on WARM, WILD, and/or COLD beneficial uses of inland receiving waters would not constitute a quid quo pro exchange of resources. The special study would be much more costly.</p> <p>Proposed modification: The Regional Board should offer a more equitable option for alternative monitoring. One option could be reallocation of saved resources from a once-per-year sampling frequency (proposed above) to a collaborative SMC study on the effects of PHAB modification.</p>	<p>The Regional Board is amenable to providing flexibility and to the Copermittee's requests to address emerging issues or identified potential problems. The language under II.A.2.b.1 of the Tentative Order has been changed to allow Copermittees to propose and conduct (upon approval of the Regional Board Executive Officer) special studies or participate in regional special studies. This is also clarified in II.5.b for Regional Monitoring Programs.</p>
322	4	Monitoring	Attachement E:MRP	<p>It is unclear why the Pearl Street drain is included in the list of priority drains for special investigations. In the latest PEA submittal, Figures C-11.16b and C-11.16c show that none of the 51 samples collected from the surfzone near the drain outlet contained concentrations of indicator bacteria above the AB-411 single sample standards.</p> <p>Proposed Modification: Remove special study requirement for the PEARL street drain.</p> <p>The requirement that all special investigations be concluded by June 30, 2011 does not provide adequate time for determining if conditions in receiving waters are protective, or likely to be protective, of beneficial uses (I.B, Question 1). In order to answer Question 1 sufficiently, an epidemiological study must be conducted. The Doheny State Beach epidemiology study has shown that these methods are quite expensive and require a significant commitment of resources. Question 4 will be best answered when the methods of Microbial Source Tracking are more refined. Extending the reporting period for the special investigations will provide a better basis to address the Regional Board's concern about sources of bacteria and impacts on beneficial uses.</p>	<p>Section 5 (Coastal Storm Drain Monitoring) has been removed from the Tentative Order.</p>
323	4	Monitoring	Attachement E:MRP	<p>The requirement that the new Inland Aquatic Habitat monitoring program be implemented by the beginning of the rainy season 2010 does not provide adequate time to develop this new monitoring program nor reallocate staff resources from the existing monitoring program. Furthermore, Regional Board staff must recognize that any increase in any specific element of the monitoring effort will need to be offset by strategically considered compensatory reductions in other elements.</p> <p>Proposed modification: Program implementation of this new monitoring program should be postponed until the end of storm season 2010-11.</p>	<p>Please see response to Comment 317 regarding the commenter's statement that "Regional Board staff must recognize that any increase in any specific element of the monitoring effort will need to be offset by strategically considered compensatory reductions in other elements."</p> <p>Section 6 (High Priority Inland Aquatic Habitats) has been removed from the Tentative Order.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
324	4	Monitoring	Attachement E:MRP	<p>II.B.1 Wet Weather Runoff Monitoring – MS4 Outfall Monitoring [page 15 and May 5 updates]</p> <p>See comment above with respect to implementation schedule.</p> <p>Proposed modification: Program implementation of this new monitoring program should be postponed until the 2010-2011 monitoring year.</p> <p>II.B.2 Wet Weather Runoff Monitoring – Source Identification Monitoring [page 15] The requirement that the new Source Identification monitoring program be implemented within each watershed and must begin no later than the 2008-2009 monitoring year occurs during a timeframe prior to permit adoption.</p> <p>Proposed modification: Program implementation of this new monitoring program should be postponed until the 2010-2011 monitoring year to allow the Permittees adequate time to develop this new monitoring program and integrate it into the next budget cycle (2001-11).</p>	<p>The Regional Board finds these to be reasonable requests for the Wet Weather Runoff Monitoring requirements. The Tentative Order has been updated to reflect the changed dates.</p>
325	4	Monitoring	Attachement E:MRP	<p>The 1-hour composite sampling requirement (if flow is observed) will make monitoring of three sites in a single day (by a single team) difficult because of holding time requirements for bacteriological samples.</p> <p>Proposed modification: Dry Weather Reconnaissance monitoring should be conducted with grab samples. Composite sampling should be considered as an ancillary assessment tool for use when additional source identification efforts are deemed necessary.</p>	<p>The Regional Board finds this to be reasonable request. The Tentative Order language has been updated to reflect the proposed changes.</p>
326	4	Monitoring	Attachement E:MRP	<p>The requirement that the Planned Monitoring Program be submitted September 1st of every year, beginning on September 1, 2009, does not allow adequate time for analysis of the monitoring data from the prior year as it is affected by management actions undertaken throughout the MS4, subject of the annual Performance Effectiveness Assessment.</p> <p>Proposed modification: Rather than additional reporting requirements to describe routine monitoring efforts, Board staff and the Permittees should conduct an annual meeting after submission of the Annual Report to discuss the content of the report and any changes to the monitoring program or suggestions for special studies. This approach will promote a more collaborative relationship between the Permittees and Board staff and may help streamline the renewal of future permits.</p>	<p>Comment noted. Please see response to Comment 183.</p> <p>In addition, the Regional Board proposes that the appropriate format to discuss the content of the monitoring annual report, including any changes or suggestions, would be for the Copermittees to include the monitoring in the annual watershed review meetings (see response to Comment 267).</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
327	4	Monitoring	Attachement E:MRP	<p>The requirement that the Receiving Waters and Urban Runoff Monitoring Annual Report be submitted October 1st of every year, beginning on October 1, 2010, does not provide adequate time for relevant analysis of the monitoring data collected in the 12-month period immediately prior to the proposed reporting date. Previous annual reports were submitted on November 15th of each year and assessed the results of monitoring activities conducted in the 12-month period ending 4 ½ months prior to the reporting date.</p> <p>Proposed modification: The Receiving Waters and Urban Runoff Monitoring Programs Annual Report should be submitted in conjunction with the Unified Annual Report and Performance Effectiveness Assessments</p>	Comment noted. Please see response to Comment 183.
328	4	Construction	F	<p>Section F.2.d.(1)(c)(i) (Page 48) states that the Permittees must require implementation of advanced treatment for sediment at construction sites that are determined to be an exceptional threat to water quality.</p> <p>The Fact Sheet provides no justification for this requirement. The newly released draft Statewide Construction General Stormwater Permit identifies the Active Treatment System (ATS) as an advanced sediment treatment technology. The ATS prevents or reduces the release of fine particles from construction sites by employing chemical coagulation, chemical flocculation, or electrocoagulation to aid in the reduction of turbidity caused by fine suspended sediment. The recently released (April 2009) Draft Construction General Stormwater Permit does not require use of ATS but identifies it as an available BMP. However, that permit acknowledges that the ATS is a newly emerging technology in California. The provisions requiring the use of ATS should be deleted from this permit, and the selection of BMPs for construction operations, especially an ATS, should be done under the aegis of the Statewide Construction General Stormwater Permit.</p>	<p>The requirements for active treatment systems in the Tentative Order are consistent with the requirements in the adopted MS4 permit for San Diego County. Although the draft General Construction Permit may have some basic requirements for active treatment systems, there is no assurance that those requirements will be in the final adopted version of the permit. The Copermittees have a greater knowledge and understanding of site conditions within their jurisdiction than the general permit. Therefore, the Copermittees are more appropriate to know when and how to implement ATS within their jurisdiction.</p> <p>Advanced treatment has been effectively implemented extensively in the other states and in the Central Valley Region of California. In addition, the Regional Board's inspectors have observed advanced treatment being effectively implemented at large sites greater than 100 acres and at small, less than 5 acre, in-fill sites. Advanced treatment is often necessary for Copermittees to ensure that discharges from construction sites are not causing or contributing to a violation of water quality standards. For example, the Basin Plan lists the water quality objective for turbidity as 20 NTU for all hydrologic areas and subareas except for the Coronado HA (10.10) and the Tijuana Valley (11.10). For certain construction sites with large slopes and exposed areas, the only technology that is likely to meet 20 NTU is advanced treatment combined with erosion and sediment controls. To ensure the MEP standard and water quality standards are met, the requirement for implementation of advanced treatment at high threat construction sites has been added to the Order, while still providing sufficient flexibility for each Copermittee's unique program.</p>

Response to Comments V

Section X.5 of the Fact Sheet / Technical Report for

Tentative Order No. R9-2009-0002

November 18, 2009

A. Background

This document provides responses to the written comments received on the draft permit for reissuance of NPDES Waste Discharge Requirements for Discharges of Runoff from the Municipal Separate Storm Sewer Systems (MS4s) draining the watersheds of the County of Orange, the Orange County Flood Control District, and the incorporated Cities of Aliso Viejo, Dana Point, Laguna Beach, Laguna Hills, Laguna Niguel, Laguna Woods, Lake Forest, Mission Viejo, Rancho Santa Margarita, San Clemente, and San Juan Capistrano within the San Diego Region (Tentative Order No. R9-2009-0002, formerly Tentative Order Nos. R9-2008-0001 & R9-2007-0002, NPDES Permit No. CAS0108740).

The fifth version of revised the Tentative Order was distributed on August 12, 2009. The original Tentative Order was distributed on February 9, 2007. Four previous responses to comments documents (RTC I, II, III, and IV) have addressed written comments on the four previous versions of the Tentative Order. One additional round of written comments occurred following close of the deadline for written comments to receive a written response on the December 2007 version. These comments were received prior to the close of the public comment period at the February 13, 2008 adoption hearing and were responded to verbally by Regional Board staff at the February 13, 2008 Board Meeting. This document summarizes and responds to written comments received between May 15, 2009 and September 28, 2009 on the fourth and fifth versions of the revised Tentative Order. A public hearing on the fourth version of the Tentative Order was held on July 01, 2009 at the Ocean Institute in Dana Point. At the July 01, 2009 public hearing on the Tentative Order, the Regional Board members directed staff to incorporate draft proposed changes to the March 12, 2009 version and to release the Tentative Order again for further public comment. Interested parties had a full 45-days to review the fifth version prior to the deadline for submission of written comments that would be responded to in writing prior to the November Hearing on the Tentative Order.

B. Contents of This Document

Twenty-two interested parties submitted comments on the March 13, 2009 version of the Tentative Order and thirty submitted comments on the August 12, 2009 version. This resulted in the submission of over 400 comments. Comments came from the public, MS4 Copermittees, governmental and non-governmental organizations, and businesses. Fifteen commenters from homeowner associations submitted identical comment letters. Their comments have been collected, considered, and responded together. The Regional Board reviewed and considered every written comment received. Responses to specific comments

are provided within this document. Each specific comment has been assigned a comment number, and comments are generally grouped by commenter. A legend for commenters can be found on the Page 2 of the coversheet and in Table 1 (below).

Comments received were concerned with a variety of topics in the Tentative Order. Most comments reiterated concerns that were previously addressed in RTC I, II, III and IV. Some comments requested changes that had already been made in RTC I, II, III and IV. New responses have not been drafted for repeat comments that lacked sufficient new information. Consideration of written and verbal comments has resulted in proposed revisions to the requirements in the Tentative Order and can be found in the Tentative Errata and Updates Sheet. In this document, the comments have not been summarized or paraphrased. When comments received from one commenter were similar to other comments received, the Regional Board response usually references back to a previous comment number in order to minimize redundancy. Please note that due to limitations of the comment database system employed to handle these numerous comments, some formatting from the original comment has been lost. Readers are recommended to review the comments as submitted in their original format to fully appreciate the commenter's sentiments. The original comments can be found as Supporting Document 7.

C. Order Adoption

The California Regional Water Quality Control Board, San Diego Region (Regional Board) is scheduled to consider adoption of the Tentative Order on November 18, 2009.

Comments on R9-2009-0002

Comment No.	1	Commenter No.	19	Comment Subject	Finding
-------------	---	---------------	----	-----------------	---------

Comment Finding C14
 This Finding seeks to prohibit all types of non-storm water (dry weather) discharges from a project site. Specifically, landscape irrigation, irrigation water and lawn water will no longer be allowed to enter an MS4 stormwater conveyance system. This runoff has been established to carry pollutants that can be detrimental to the downstream receiving waters.

Comments. The first question that arises is how can this prohibition be practically achieved? Also, will this prohibition apply to both existing and proposed developments? Will compliance involve application of efficient irrigation techniques and simple reduction of watering times for each zone? Or, will compliance require upgrading existing irrigation system components (i.e. heads and controllers) so that overspray and surplus runoff are minimized? Compliance may possibly require the capture of low flows and irrigation flows in basins or underground chambers so that the dry weather runoff does not leave the site. What is certain is that some capital expenditures will be required for both existing and new developments to eliminate the prohibited discharges. Doing so, however, would appear impossible from a practical viewpoint.

Recommendation. As written, the prohibition of "no non-storm water (dry weather) discharges," including irrigation runoff, is too restrictive and too rigid. It would be reasonable to apply a percent reduction to non-storm water discharges rather than requiring total elimination. The regulation should include the framework of a program stating how this measure will be achieved, what levels of discharge are considered compliant, who will be responsible for the implementing the program, and how the program can be phased over time. If the permit was adopted as written, there would be thousands of residential and commercial properties operating in violation of the regulations. In comments prepared by Orange County, they recommend leaving the reduction of irrigation runoff in the realm of public education and water conservation. DRC agrees with that assessment.

Response The Clean Water Act section 402(p)(3)(B)(ii), permit requirements for municipal dischargers, states that municipal storm water NPDES permits: "shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers." This prohibition of non-storm water discharges has been in every MS4 permit to date. The Copermittees already have in place a program to detect and eliminate non-storm water discharges. The requirement to prohibit non-storm water discharges into the MS4 applies to the Copermittees. The specific method of compliance is up to the Copermittees to develop and enforce their ordinances. It is not certain that some capital expenditures will be required for existing and new developments to eliminate non-storm water discharges. As this is a specific, direct requirement of the Clean Water Act, we are not at liberty to apply a percent reduction to non-storm water discharges. The Regional Board expects the Copermittees to treat irrigation runoff, through ordinance and inspection, like any other prohibited non-storm water discharge.

Comment No.	2	Commenter No.	19	Comment Subject	SAL
--------------------	---	----------------------	----	------------------------	-----

Comment Finding D.1.h

Municipal Action Levels (MALs) will establish the requirement for numeric effluent limits for specific stormwater runoff pollutants.

Comments. It is not clear who is responsible for compliance with MAL levels, the co-permittee (ie. city or county) or the private land owner. The text does not establish the time interval for sampling and monitoring. Is it one time after project completion, or on an annual basis? It is likely that the co-permittees will enact ordinances that will require the discharger to take samples of stormwater discharges and process them with a certified lab in accordance with accepted testing protocols. The Fact Sheet states that exceedance of MALs could result in enforcement actions such as stop work orders or cease and desist orders. Even if current treatment measures are adequate to satisfy the numeric effluent criteria, periodic sampling and testing will result in significant costs to the discharger.

Recommendation. The application of MALs is not justified or warranted according to comments from the County of Orange. They describe the Tentative Order's proposed use of MALs as not being legal in the manner proposed, and not technically supportable or valid. In fact, the Blue Ribbon Panel Report referred to in the Supplemental Fact Sheet does not support the use of numeric effluent criteria on stormwater discharges at this time. We would recommend the deletion of MALs and numeric effluent limits from the proposed General Permit changes. It will be cost prohibitive to comply with, unenforceable based on its scope and size, and not justified according to current CWA interpretations.

Response The Copermittee(s), as holders of the NPDES permit to discharge from the MS4, are responsible for compliance with MALs. Please note the nomenclature for MALs has been changed to SALs (Stormwater Action Levels). SAL compliance points are for discharges from the MS4, not individual project sites and current language in Attachment E (Monitoring and Reporting Requirements) allows the Copermittees to propose a monitoring program for SALs, including monitoring locations and frequency. SALs are action levels, not effluent limitations.

Please also see responses to Comment nos. 25 and 33 in the July 1, 2009, Response to Comments IV.

Comment No.	3	Commenter No.	19	Comment Subject	LID
--------------------	---	----------------------	----	------------------------	-----

Comment Finding D.2.c

Sets the requirement that Low Impact Development (LID) site design strategies will be incorporated into new and existing projects.

Comments. Based on this change, LID will need to be considered in the early stages of site planning. As a developer works with an architect on a development proposal, it will be important to bring the civil engineer and landscape architect into the project at an early stage, in order to ensure that LID, Site Design BMPs and Treatment Control BMPs for stormwater quality are incorporated into the design layout. The cost impact from LID is the potential loss of developable land and the cost of additional treatment control BMPs.

Recommendation. While LID can be applied to new projects, there needs to be flexibility in how it is applied to a project based on site specific needs and constraints. The proposed changes should not impose compliance standards with respect to incorporating LID into a project design. LID should not be applied to retrofitting existing projects because the Regional Board and the co-permittees do not have the right to force private property owners to make improvements to their property at their expense.

Response The Clean Water Act requires the reduction of pollutants in storm water to the maximum extent practicable (MEP). Current management, knowledge, practices, and technology has resulted in the use of LID BMPs to meet the MEP standard. Any pollutant reduction required less than the MEP standard could be considered a violation. As such, some sites have specific technical conditions that may limit the site's ability to infiltrate, retain or evapotranspire the complete design storm volume. In those cases, the Tentative Order provides flexibility for a site to use other means of reducing pollutants.

The retrofitting requirements do not force private property owners to make improvements to their property at their expense. Rather, the Copermittees are required to cooperate with private property owners to encourage retrofitting through various means. LID may be used in retrofitting where feasible, but a project's potential to be retrofitted should not be limited by a site's capability to implement LID practices.

Comment No.	4	Commenter No.	19	Comment Subject	Hydromod
--------------------	---	----------------------	----	------------------------	----------

Comment Finding D.2.g

Requires a development to analyze and mitigate potential impacts due to increased volume, velocity, frequency and discharge duration of stormwater. The objective here is to minimize hydromodification impacts to the downstream drainage courses and downstream habitat.

Comments. This is a difficult criteria to satisfy from an engineering standpoint because land development does in fact alter the natural drainage patterns on a site. Increased volume, higher velocities and earlier time of concentration are the result of introducing rooftops, paved parking lots, streets and hardscape. The use of detention basins is one of the main tools engineers employ to control the site discharge and limit it to the pre-development peak runoff rate. This Finding expands on the solutions to be applied to site development including hydrologic distribution using LID features, determining effective impervious area and preparation of a Hydromodification Management Plan. Mitigating these factors may require extraordinary storm drainage measures and off-site improvements. Expenses will increase as the need for physical mitigation measures increase.

Recommendation. This regulation cannot be reasonably satisfied when developing a project site. Hydromodification impacts from a project site need to be limited to industry standard of practice which is to regulate the developed condition discharge rate, in cubic feet per second, to be no greater than the undeveloped condition discharge rate. The project can also reduce velocities at the discharge point to non-erosive rates in order to minimize downstream erosion potential and habitat impact. What should not be controlled by regulation are the total volume of runoff and the duration of discharge into a natural drainage course or unimproved channel. These parameters are not easily modified to match the undeveloped condition and doing so places an unreasonable burden on the property owner and developer.

Response Specific hydromodification requirements are increasingly recognized as being needed to prevent impacts to water quality and beneficial uses from increased volume, duration, and intensity of flows from developed areas. This is because traditional methods to date have been ineffective, and more stringent controls are needed.

Similar hydromodification requirements to those stated in the Tentative Order have been required in other MS4 permits throughout the State of California. It is too soon to judge the difficulty and cost in implementing hydromodification controls in southern Orange County. Collectively using distributed LID features onsite and site design measures, along with conventional detention basins and regional controls, may defray the costs associated with simply expanding traditional methods to control flows. To protect water quality, matching the peak flow rate is not sufficient by itself without matching duration as well. Matching the peak flow rate, but extending the duration of that peak flow, may result in downstream erosion in a receiving water that cannot accommodate the increased duration of the peak flow.

Comment No.	5	Commenter No.	19	Comment Subject	Retrofitting
--------------------	---	----------------------	----	------------------------	--------------

Comment Finding D.3.i

Requires the cooperation of existing land owners to retrofit projects for the preservation, restoration and enhancement of water quality.

Comments. The main question here is how does the co-permittee identify which existing properties need to be retrofitted and who will pay for the cost of the required retrofit? The Regional Board and the co-permittees do not have the right to force a private property owner to make improvements to their property at their expense.

Recommendation. This Finding should be deleted from the General Permit because it cannot be effectively implemented.

Response Copermittees must identify and rank retrofitting opportunities through an analysis of several factors listed in the permit (e.g. feasibility, pollutant removal effectiveness, etc). The Tentative Order does not force a private property owner to make improvements to their own property. The Tentative Order requires Copermittees to cooperate with private property owners in seeking out retrofitting opportunities. Identifying the funding source for retrofitting projects is ultimately up to the Copermittees. Some potential funding sources at the Copermittees discretion may include general funds, development fees, grant funds, and pollutant mitigation accounts.

Comment Finding E.10

This Finding moves to establish Total Maximum Daily Loads (TMDLs) for 303(d) impaired water bodies in Orange County. We understand this to mean that measurement of pollutants in a water body will be taken at the most downstream point of the watershed and compared with numeric limits set for each pollutant originating from the subject watershed. The Supplemental Fact Sheet lists bacteria, phosphorous, toxicity and turbidity as target pollutants. Cease and desist orders or cleanup and abatement orders would be the primary enforcement mechanisms under the TMDL regulation.

Comments. The EPA has been working to implement TMDLs for many years now and originally started with major water courses such as the Los Angeles River and Santa Ana River. Progress has been slow and is behind schedule because of the complexities of analysis and implementation. One main obstacle is determining who is responsible for reducing the pollutant load in the watershed. How to equitably apply reduction measures that involve thousands of property owners and numerous cities is another significant problem to solve.

According to a presentation given by Dr. Cindy Lin with the EPA on April 16, 2008 in Corona, CA, the TMDL process requires identifying the problem pollutants, setting numeric targets for maximum concentrations, determining the sources of the pollutants in the watershed, linking the target pollutants and sources, and allocating pollutant loads to the sources. The last part is the hardest one to complete. In order to set a maximum discharge rate for a specific discharger, you need to have knowledge of the entire watershed and the point source and non-point source origins of the target pollutant. The process requires analysis of watershed subareas along with the cooperation of counties, municipalities and individual stakeholders. Assuming the Regional Board can set the TMDLs for the several 303(d) water bodies within their jurisdiction and the State and EPA approve them, it is not possible to determine the impact that this regulation would have on individual property owners.

Recommendation. The introduction of TMDLs into the General Permit should only be done if the entire program can be clearly identified. DRC recommends that TMDL Programs should be instituted via separate Board actions that address only one impaired water body and its associated watershed at a time. As presented, monitoring TMDL loads and effectively implementing pollutant reduction measures is unworkable. You only need to look at the efforts that have been underway for years on the Santa Ana River Watershed TMDL Program to know that this stormwater quality parameter is unworkable and impractical to impose on Orange County, its co-permittees and property owners.

Response

The Tentative Order only incorporates requirements consistent with the assumptions and waste load allocations of adopted TMDLs (see Finding E.11 and response to comment no. 79 for a discussion on adopted TMDLs). Finding E.10 does not establish TMDLs; the finding merely establishes cause for "early pollutant control actions and further pollutant impact assessments." Please see Directive J.1.a.1 for more information.

See the following web page for more information on TMDLs in progress:
http://www.waterboards.ca.gov/sandiego/water_issues/programs/

Comment No.	7	Commenter No.	19	Comment Subject	Hydromod
Comment	<p>Section III, Directives, of the Supplemental Fact Sheet Finding F.1.h</p> <p>For interim projects, a limit on the Effective Impervious Area (EIP) of 5% has been added.</p> <p>Comments: Taken literally, this Finding appears to limit the amount of impervious area on a project site to 5% of the total area. This is a completely unreasonable standard to impose on any project. Even if a project employed a green roof system, porous pavement and minimal concrete walks, this threshold would be extremely difficult to achieve. Under the USGBC LEED New Construction Reference Guide, Version 2.2, the credit for maximizing open space only requires 20% of the site to be set aside for vegetated open space. That leaves 80% of the site that can be impervious surfaces.</p> <p>Recommendation. The Regional Board should eliminate the 5% EIP limit from the General Permit. If an EIP limit must be established, it should be in a reasonable range of 50% to 75% of the available site area. Setting development restrictions that cannot be practically achieved is simply not acceptable.</p>				
Response	<p>The language regarding the Effective Impervious Area has been removed from section F.1.h.(6)(i). Through discussions with the Copermittees and the interested parties, a metric using Effective Impervious Area (EIA) was not included in the Tentative Order's requirements. In lieu of using EIA as a performance metric, the draft Tentative Order requires Low Impact Development BMPs to retain and/or biofilter the volume of runoff produced from the design storm (85th percentile storm event).</p>				

Comment No.	8	Commenter No.	20	Comment Subject	General
Comment	<p>FYI - this is something I have been trying to get City of Laguna Beach to do for several years.</p> <p>Yellow Tag Warning - Water Quality Violation</p> <p>Our Beach & Your Construction Site</p> <p>You Can Help Keep Our Beaches Clean (doorhanger)</p>				
Response	<p>The Tentative Order requires the Copermittees to implement an education program for developers, contractors, construction site personnel, municipal staff, industrial site operators, commercial site personnel, and their residents. The education and enforcement mechanisms proposed by the commenter are appropriate to meet the requirements of the Tentative Order and we support such efforts.</p>				

Comment No.	9	Commenter No.	21	Comment Subject	General
Comment	<p>Living as we do at the mouth of Aliso Creek, we have long been concerned about the pollution of the creek and the ocean that is caused by runoff from upstream. Recently we have also begun to worry about an Orange County proposal to clear the creek bed of vegetation, move some 1 million cubic yards of dirt there, and install concrete-and-rock drop structures in an attempt to control the excess flows caused by upstream development. The project would do nothing to reduce the excessive amount of water in the creek, and the version of it now being studied by the U.S. Army Corps of Engineers has no water treatment component.</p> <p>The proposed new MS4 regulations, which would prohibit dry weather discharges into the creek and require low impact development and retrofitting of existing development to control runoff, seem to promise a welcome solution to the creek's problems. We urge you to adopt them.</p>				
Response	<p>Comment noted. Please also see response to Comment No. 56.</p>				

Comment No.	10	Commenter No.	22	Comment Subject	General
--------------------	----	----------------------	----	------------------------	---------

Comment SUBJECT: MS4 Permit

I am writing to give my complete support to approval of the proposed MS4 permit.

Inland cities have for far too long ignored their responsibilities and continue to allow urban runoff to pollute our ocean and coastal zones. Excuses such as "people like to wash their cars" or "People will be upset" are sad attempts by inland cities to avoid taking necessary and corrective action. At a recent public workshop I heard testimony from one city representative complaining how hard it is for people who live on hills to stop the runoff. This is a poor excuse. A simple remedy like a small grate with U-pipe below or low speed bump would send the water to plants on the side of a driveway rather than running off to the street, creeks and ocean. But, until SDWRQCB adopts the new MS4 permit, these solutions will be ignored.

There is broad public support for cleaning up our runoff and waste. This includes people who live in inland counties who are tired of their lakes and creeks being polluted as well residents of beach communities. Many inland residents go to the beach for weekends and holidays. The volume of urban runoff reaching and polluting the ocean appalls them as well as tourists and locals.

We now have laws requiring bicycle and motorcycle helmets, seat belts and the proper disposal of trash. This, too, is an issue whose time has come.

It is time that SDRWQCB took real, forceful action to stop cities from polluting. Cities have been out of compliance for the past 7 years. We need immediate relief.

Please insist that runoff be stopped or diverted to catchments/dissipaters or for filtration and beneficial reuse. Levy fines against offending violators. Until SDRWQCB uses their regulatory power to stop these polluting discharges, nothing will be done. Please do not postpone the inevitable and leave us with polluted creeks and coastal shores.

Response Comment noted.

The Regional Board has a progressive enforcement policy with multiple levels to ensure fair, firm and consistent enforcement. The possible enforcement actions at the Regional Board's discretion range from a verbal warning, staff enforcement letter, notice of violation, cleanup and abatement order, cease and desist order, time schedule order, referral to the State of California's attorney general's office, and assessment of civil liability up to \$10,000 per day per violation. When considering what enforcement action to take, the Regional Board examines the nature, extent and gravity of the violation, the magnitude of the violation, the water quality impacts resulting from the violation, and the compliance history of the violator.

Comment No.	11	Commenter No.	23	Comment Subject	General
--------------------	----	----------------------	----	------------------------	---------

Comment As the Sierra Club Task Force Chair for Save Hobo Aliso, I have attended almost every stakeholders workshop on the new permit and have spoken at the Regional Board hearings in San Diego as to the negative impacts of the proposed SUPER Project on Aliso Creek. I also attended most of the workshops for the last MS4 Permit that was derailed by the Copermittees. During most of the workshops the Copermittees have been extremely vocal about how impossible the new permit will be to implement and enforce, how unfair this new permit will be, and the poor light it will put them in with businesses and residents that feel they have a God given right to not only waste water, but also pollute the very creek and receiving waters of the Pacific Ocean that the MS4 Permits attempts to protect and preserve.

At one of the first workshops for this current permit, the EPA representative was very clear in her refute to the Copermittees. She explained to them, and the rest of the audience, that non-compliance has been going on for almost 35 years. NOW is the time to stop polluting our watersheds and NOW is the time for the Copermittees to take responsibility for their runoff and pollution.

At a subsequent workshop a representative from NRDC made it very clear that NOW is the time for the Copermittees to comply and that their non-compliance has been tolerated since 2000, while our natural resources have been devastated. NOW is the time for clean up and abatement orders should the Copermittees continue to ignore existing permit requirements while they adamantly oppose strengthened regulations. Just as many businesses and residents feel it's their God given right to pollute, so do the Copermittees. This must stop and stop now, and the only apparent way to end this devastation to our watershed and natural resources is through adoption of the new MS4 Permit.

Comment No.	12	Commenter No.	23	Comment Subject	General
--------------------	----	----------------------	----	------------------------	---------

Comment The Sierra Club supports the entire permit with emphasis on the following:
Wet weather and dry weather discharges are subject to the conditions and requirements established in the San Diego Basin Plan for point source discharges. These water quality standards must be complied with at all times, irrespective of the source and manner of discharge.

Response Comment noted.

Comment No.	13	Commenter No.	23	Comment Subject	Hydromod
--------------------	----	----------------------	----	------------------------	----------

Comment The Sierra Club supports the entire permit with emphasis on the following:
The increased runoff characteristics from new development must be controlled to protect against increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force. Special note: With this implementation there would be no need for 26 concrete drop structures in Aliso Creek.

Response Comment noted.

Comment No.	14	Commenter No.	23	Comment Subject	General
--------------------	----	----------------------	----	------------------------	---------

Comment The Sierra Club supports the entire permit with emphasis on the following:
Increased pollutant loads created by increased and uncontrolled urban development must be controlled to protect downstream receiving water quality.

Response Comment noted. The Tentative Order requires consideration of retrofitting existing development and the implementation low impact development controls at new development and redevelopment projects. These requirements are expected to address and control pollutant loads from urban developments.

Comment No.	15	Commenter No.	23	Comment Subject	SUSMP
--------------------	----	----------------------	----	------------------------	-------

Comment The Sierra Club supports the entire permit with emphasis on the following:
Development that is ordinarily insignificant in its impact on the environment may become significant in a particularly sensitive environment. Therefore, additional controls to reduce pollutants from new and existing development must be required for areas adjacent to or discharging directly to an ESA. This holds particularly true for Aliso Creek. Development has been uncontrolled and unmonitored for far too long.

Response Comment noted.

Comment No.	16	Commenter No.	23	Comment Subject	Overirrigation
--------------------	----	----------------------	----	------------------------	----------------

Comment The Sierra Club supports the entire permit with emphasis on the following:
Non-storm water discharges should be effectively prohibited unless specifically exempted. Exempted discharges identified as a source of pollutants are required to be addressed through prohibition. Dry weather non-storm water discharges have been shown to contribute significant levels of pollutants and flow in arid, urban Southern California watersheds. The Copermittees have identified landscape irrigation, irrigation water and lawn water, previously exempted discharges, as a source of pollutants and conveyance of pollutants to waters of the United States. In the case of Aliso Creek this is a chronic problem that is leading to not only destruction of the watershed and associated wildlife, but also to our receiving waters.

Response Comment noted.

Comment No.	17	Commenter No.	23	Comment Subject	General
--------------------	----	----------------------	----	------------------------	---------

Comment The Sierra Club supports the entire permit with emphasis on the following:
Copermittees MUST reduce the discharge of pollutants in storm water urban runoff. This can no longer be ignored and the ongoing pollution can no longer be tolerated.

Response Comment noted. The Storm Water Action Levels provide a measureable performance criteria on the reduction of pollutants discharged from the Copermittees MS4.

Comment No.	18	Commenter No.	23	Comment Subject	General
Comment	<p>The Sierra Club supports the entire permit with emphasis on the following:</p> <p>Pollutants can be effectively reduced in urban runoff by the application of a combination of pollution prevention, source control, and treatment control BMPs. Every available tool must be implemented now, with particular emphasis on construction and mobile businesses that include car detailing. Please see attached series of photos showing a car detailer that travels throughout the County detailing cars and allowing pollutants to run into the gutter and storm drains uncontrolled.</p>				
Response	<p>Comment noted. The Tentative Order includes requirements for the Copermittees oversight of mobile businesses such as car detailers.</p>				
Comment No.	19	Commenter No.	23	Comment Subject	General
Comment	<p>The Sierra Club supports the entire permit with emphasis on the following:</p> <p>With these photos in mind, I would like the Board to consider the adoption of a citizen based water quality monitoring program. Please see the attached draft graphics that have been developed by the City of Newport Beach. This concept has been shared with the City of Laguna Beach for several years, but due to a weakened MS4 Permit they have not seen the need to adopt.</p>				
Response	<p>Although not specifically required in the Tentative Order, a citizen based water quality monitoring program would have benefits to the Copermittees. Such a program could potentially defray monitoring costs and serve as a public education tool. Even though the Tentative Order does not require that the Copermittees develop a citizen based water quality monitoring program, the Tentative Order also does not prohibit a Copermittee from developing such a program. We leave it at the discretion of the Copermittee to develop such a program and feel that a citizen based monitoring program can be integrated with the existing requirements of the Tentative Order.</p> <p>The State is also available to assist interested citizens in forming their own monitoring group. http://www.waterboards.ca.gov/water_issues/programs/swamp/cwt_volunteer.shtml</p>

Comment	<p>The Sierra Club supports the entire permit with emphasis on the following:</p> <p>Discharges of Waste to State Water Quality Protected Areas (SWQPAs) or Areas of Special Biological Significance (ASBS) must be prohibited except where allowable under a State approved Ocean Plan Exception or Special Condition.</p>				
Response	Please see response to Comment no. 49.				
Comment No.	27	Commenter No.	23	Comment Subject	SUSMP
Comment	<p>The Sierra Club supports the entire permit with emphasis on the following:</p> <p>Discharges from each approved development project must be subject to the most stringent of management measures.</p>				
Response	The standard for management measures is specified by the Clean Water Act. It specifies that controls are required to reduce the discharge of storm water pollutants to the maximum extent practicable and to effectively prohibit non-stormwater discharges.				
Comment No.	28	Commenter No.	23	Comment Subject	LID
Comment	<p>The Sierra Club supports the entire permit with emphasis on the following:</p> <p>It is mandatory that each Copermittee must require each Priority Development Project to implement LID BMPs which will collectively minimize directly connected impervious areas, limit loss of existing infiltration capacity, and protect areas that provide important water quality benefits necessary to maintain riparian and aquatic biota, and/or are particularly susceptible to erosion and sediment loss. With this in mind, it would be virtually impossible for the County of Orange or the Army Corps of Engineers to even remotely consider a project such as the SUPER Project.</p>				
Response	Comment noted.				

Comment No.	29	Commenter No.	23	Comment Subject	Hydromod
Comment	<p>The Sierra Club supports the entire permit with emphasis on the following:</p> <p>Each Copermittee must revise its SSMP/WQMP to implement a watershed specific Hydromodification Management Plan (HMP) to include specific criteria for minimizing and mitigating hydrologic modification at all development and redevelopment projects. Again, this would require the County of Orange and Army Corps of Engineers to discard any notion of a project that contains any characteristics similar to the SUPER Project. The Army Corps has been tasked with an ecosystem restoration of Aliso Creek. The Corps' implied support of the MS4 Permit will assist in this effort which would include disconnecting impervious areas by reducing the percentage of Effective Impervious Area (EIA) to less than five percent of total project area; also disconnect impervious area from receiving waters using on-site or off-site storm water reuse, evapotranspiration, and/or infiltration for small precipitation events, based on limitations imposed by soil conditions, groundwater contamination potential and considerations for the use of amendments to improve soil conditions.</p>				
Response	<p>The hydromodification requirements have been modified to be more consistent with the requirements in the San Diego County MS4 permit. Through discussions with the Copermittees and the interested parties, a metric using Effective Impervious Area (EIA) was not included in the Tentative Order's requirements. In lieu of the EIA metric, the draft Tentative Order now requires Low Impact Development BMPs to retain and/or biofilter the volume of runoff produced from the 24-hour 85th percentile storm.</p>				

Comment No.	30	Commenter No.	23	Comment Subject	Construction
Comment	<p>The Sierra Club supports the entire permit with emphasis on the following:</p> <p>Each Copermittee must annually notify the Regional Board, prior to the commencement of the wet season, of all construction sites with potential violations such as the SUPER Project or any other construction project in the Aliso Creek watershed.</p>				
Response	<p>Comment noted.</p>				

Comment No.	31	Commenter No.	23	Comment Subject	Retrofitting
Comment	<p>The Sierra Club supports the entire permit with emphasis on the following:</p> <p>Each Copermittee must implement a retrofitting program which meets the requirements of this section, solves chronic flooding problems, reduces impacts from hydromodification, incorporates LID, supports stream restoration, systematically reduces downstream channel erosion, reduces the discharges of storm water pollutants from the MS4 to the MEP, and prevents discharges from the MS4 from causing or contributing to a violation of water quality standards.</p>				
Response	<p>Comment noted.</p>				

Comment No.	32	Commenter No.	23	Comment Subject	WURMP
Comment	<p>The Sierra Club supports the entire permit with emphasis on the following:</p> <p>The Watershed Permittees must develop, implement, and update annually, a Watershed Water Quality Work Plan that ranks each watershed's highest priority issues. The Watershed Water Quality Work plan shall identify planned watershed assessment, BMP evaluation, BMP selection, and BMP implementation efforts for each watershed planning area for the full 5-year Permit cycle. The goal of the work plan to is to demonstrate a responsive and adaptive approach for the judicious and effective use of available resources to attack the highest priority problems on a watershed basis. This element should have special emphasis and be brought to the attention of the Army Corps of Engineers in light of their Aliso Creek Mainstem Ecosystem Restoration Project.</p>				
Response	<p>Comment noted.</p>				

Comment No.	33	Commenter No.	23	Comment Subject	General
Comment	<p>Restoration of a healthy ocean must be achieved. We cannot protect the ocean by poisoning it with our wastewater and urban runoff. No less an authority than Sylvia Earle, former Director of NOAA, went on national television recently (see MSNBC) to urge immediate efforts to end ocean pollution and protect the ocean's ability to naturally modulate climate conditions. Without swift action to restore a healthy ocean, we will witness even greater, devastating climate change. Similarly, Marcia McNutt, Director of the Monterey Bay Aquarium, reminds us that every second breath comes from the ocean's ability to produce oxygen.</p> <p>The solutions are readily technologically available as soon as citizens, resource agencies and elected representatives, working together, are ready to act.</p> <p>Sierra Club applauds Congresswoman Loretta Sanchez and her senior advisor, Dolores Gonzalez-Hayes for their proactive stance in bringing the environmental community, County of Orange Watersheds and Army Corps of Engineers together. It is imperative that these two agencies move forward with a plan that will eliminate concrete from Aliso Creek while adopting the policies of the new MS4 Permit which will dramatically minimize the runoff and current flow rates that are creating pollution and destroying the creek's natural resources. As discussed in our meeting of May 20th, these agencies are morally and ethically obligated to protecting and preserving our natural resources above all other mandates.</p>

Comment	<p>Restoration of a healthy ocean must be achieved. We cannot protect the ocean by poisoning it with our wastewater and urban runoff. In addition, our County wilderness parks are set aside for recreation, wildlife habitat, open space, and protection of sensitive ecosystems and individual species of plants and animals. Our riparian wetland streambeds are the most productive ecosystems within the coastal sage-scrub and oak woodland zones of the chaparral ecosystems, and must be protected.</p> <p>Natural, non-invasive solutions are technologically available as soon as citizens, resource agencies and elected representatives, working together, are ready to act.</p> <p>FHBP applauds Congresswoman Loretta Sanchez and her senior advisor, Dolores Gonzalez-Hayes for their proactive stance in bringing the environmental community, County of Orange Watersheds and Army Corps of Engineers together. It is imperative that these two agencies move forward with a plan that will eliminate concrete from Aliso Creek (existing and future) while adopting the policies of the new MS4 Permit, which will dramatically minimize the runoff and current flow rates that are creating pollution and destroying the creek's natural resources.</p> <p>The proposal to build 26 step-dams (grade-control structures built 10' deep into the soil spanning the entire flow area) in the lower Aliso Creek should be eliminated as an alternative in this feasibility study. This "engineering wonder" would turn our park into a flood control channel device and do nothing to diminish the doubling of storm water flows and dry weather urban runoff that is polluting the ocean and eroding the banks.</p> <p>Alternatives that should be considered in the watershed and surrounding cities are as follows: large-scale cistern strategies that capture runoff for reuse; modernizing the Laguna Niguel sewage treatment plant by OCSD, including recycling of gray water and groundwater recharge, powering the facility with captured methane gas, and reducing the toxic sewage that is dumped 1.2 miles off Aliso Beach. As well, Low-Impact Development (LID) strategies must be applied to areas of the watershed where applicable including rain gardens and bioretention; rooftop gardens; sidewalk storage; vegetated swales, buffers, and tree preservation; rain barrels; permeable pavers; soil amendments; impervious surface reduction and disconnection; and pollution prevention programs instituted for residential properties.</p>				
Response	Comment noted. Interested parties with comments such as these should pay particular attention to opportunities to weigh-in on the environmental review process, for projects affecting Aliso Creek, conducted pursuant to the California Environmental Quality Act (CEQA).				

Comment No.	57	Commenter No.	25	Comment Subject	Finding
--------------------	----	----------------------	----	------------------------	---------

Comment Below is a "cut & paste" from the new permit. I was under the impression that I needed to petition the Board to achieve parity (Same Beneficial Uses and Water Quality Objectives) due to this anadromous ES/ESU via BPO Amendments during the Triennial Review Process.

Does the new permit fulfill/accomplish my parity goal to protect this aquatic? In this case, I wouldn't need to waste either Staff or Board time.

In other words, can this NPDES accomplish by "fiat" what I thought I needed to formally petition as BPO amendments (plural)?

In the first sentence below, this NPDES doesn't APPEAR to cite Water Quality & Beneficial Use objectives on a watershed-by-watershed basis but rather generically. As there is no reference to EXISTING BPO, I'm unsure if this ambiguity might subsequently be challenged by ACW copermittees or lead agency The County of Orange.

I would ask Staff to note that the Central Coast (Region 3) BPO are more in alignment with the ABSOLUTE MINIMAL Dissolved Oxygen (DO) requirements for O. mykiss, that is 7.0 mg/l, not the 6.0 mg/l required in R9-2009-0021. Aquatic biologists and fishery experts seem unanimous that 8.0 mg/l assures healthy spawning conditions in urbanized streams like ACW that experience tremendous solar gain (elevated temperatures).

Will I be allowed to petition the Board at the R9-2009-0021 Hearing to slightly increase that BPO regarding DO for this reissued permit?

E. STATUTE AND REGULATORY CONSIDERATIONS
 2. The Water Quality Control Plan for the San Diego Basin (Basin Plan), identifies the following beneficial uses for surface waters in Orange County: Municipal and Domestic Supply (MUN), Agricultural Supply (AGR), Industrial Process Supply (PROC), Industrial Service Supply (IND), Ground Water Recharge (GWR), Contact Water Recreation (REC1) Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Cold Freshwater Habitat (COLD), Wildlife Habitat (WILD), Rare, Threatened, or Endangered Species (RARE), Freshwater Replenishment (FRSH), Hydropower Generation (POW), and Preservation of Biological Habitats of Special Significance (BIOL). The following additional beneficial uses are identified for coastal waters of Orange County: Navigation (NAV), Commercial and Sport Fishing (COMM), Estuarine Habitat (EST), Marine Habitat (MAR), Aquaculture (AQUA), Migration of Aquatic Organisms (MIGR), Spawning, Reproduction, and/or Early Development (SPWN), and Shellfish Harvesting (SHELL).

Response The Tentative Order does not establish the same Beneficial Uses and Water Quality Objectives that the commenter seeks. Those designations are established by the Basin Plan in the triennial review process. We encourage the commenter to participate in the Basin Plan triennial review. Finding E.2 of the Tentative Order states in general all the Beneficial Uses identified for all of the surface waters within Orange County and is not limited to the Aliso Creek Watershed.

Comment No.	58	Commenter No.	26	Comment Subject	General
--------------------	----	----------------------	----	------------------------	---------

Comment First, the City Council wishes to compliment the Regional Board and its staff for your efforts to reduce urban runoff and enhance water quality. Our City is fully committed to aggressively pursue all reasonable efforts to improve the quality of the water in our creeks and the ocean.

Response Comment noted.

Comment No.	59	Commenter No.	26	Comment Subject	FETD
--------------------	----	----------------------	----	------------------------	------

Comment The Council believes that your Board should adopt a permit which authorizes projects which provide for the diversion of nuisance water during dry weather into treatment facilities, whether they be existing sewer treatment plants or specialized programs to cleanse water in a creek. When filtration is employed to reduce bacteria and other pollutants, it should be allowed either at the source, i.e. before the pollutants enter a waterway, or at the end of the line before a creek empties into the ocean since our beaches afford a significant water contact recreational venue for thousands of Southern California residents.

Response The approval process for diversion systems in a creek would be through a Clean Water Act section 401 certification, Waste Discharge Requirements and/or individual NPDES permits. The Tentative Order is not the appropriate mechanism to regulate such facilities. Treatment systems at the end of the line before a creek empties into the ocean do not protect and enhance water quality in the creek upstream from the treatment facility. In fact, such systems could encourage degradation of the upstream portions of the creek because dischargers are aware that treatment exists at the mouth of the creek. In addition, such systems at the end of the creek have historically had implementation problems due to excessive flows, sediment loads, and design issues.

Comment No.	60	Commenter No.	26	Comment Subject	Economic
--------------------	----	----------------------	----	------------------------	----------

Comment In supporting efforts to improve water quality in our creeks and ocean, the Council is also concerned about the cost of some of the proposed measures. Our small community is expecting a \$2 million "borrowing" of our property tax revenues by the State this year. At the same time, we are experiencing significant decreases in revenues from the sales tax and transient occupancy tax. We believe that virtually all governmental agencies in California are experiencing similar austerity. Therefore, the Board should carefully examine provisions of the proposed order to ensure that the proposed measures are both effective in reducing pollutants and reasonable in expense.

Response Several changes have been made to the Tentative Order to seek a cost neutral permit when compared to the previous permit. Most significantly, the Tentative Order eliminates multiple monitoring requirements and allows the Copermitees to substitute participation in regional Monitoring programs. These actions are expected to be more cost efficient and prevent redundancy. Regional Board staff considered submitted economic information in developing elements of the Tentative Order. The Regional Board, however, is not required to conduct a cost-benefit analysis.

Comment No.	61	Commenter No.	27	Comment Subject	NEL
--------------------	----	----------------------	----	------------------------	-----

Comment Dry weather flows may originate from a number of sources including groundwater ingress, which is a natural source of water. Dry weather flow does not originate from consistent activities or locations, or at consistent flow rates. Assigning the word "effluent" infers that this is a relatively consistent, predictable and controllable flow originating from a single industrial process (such as a wastewater treatment plant). As such, it is relatively easy to control and treat. This is not the case with dry weather flows.

Response Effluent refers to the discharge of pollutants from a point source into waters of United States. The discharge of runoff from a MS4 is considered to be a discharge of pollutants from a point source into waters of the United States as defined in the Clean Water Act.

Comment No.	62	Commenter No.	27	Comment Subject	NEL
--------------------	----	----------------------	----	------------------------	-----

Comment Assigning the term "effluent" to dry weather flow will trigger mandatory minimum penalties under the Clean Water Act. This is inappropriate for the above-referenced reasons, and will likely result in the relevant municipal separate storm sewer system (MS4) operator(s) being in immediate and consistent violation of the Clean Water Act. The term effluent should be replaced by the word "flow."

Response Please see response to Comment no. 61.

This comment has been previously addressed; please also see Comment no. 82 in the July 1, 2009, Response to Comments IV.

Comment No.	63	Commenter No.	27	Comment Subject	Urban Runoff
Comment	At present the stormwater programs apply to MS4 systems which tend to be located in urbanized areas. Removing the term "urban" infers that these requirements apply to all runoff. This is an expansion of the requirements under the Clean Water Act and would logically apply to all runoff within a jurisdiction whether or not the jurisdiction has control over the sources of runoff (agricultural sources, or undeveloped areas, for example) or the conveyance (natural drainage). Has any economic analysis been conducted to assess the impact of this change? We consider this an unfunded mandate that exceeds the requirements of an MS4 permit, as it appears to be applied to areas which do not necessarily drain to an MS4. The word "urban" should be reinstated when discussing runoff.				
Response	<p>Removal of the term "urban" is not an expansion of the requirements under the Clean Water Act and is actually more consistent with the Clean Water Act and the codified Federal Regulations. The term "urban runoff" does not appear in the Clean Water Act MS4 regulations nor the Code of Federal Regulations. The applicable regulations require a NPDES permit for all MS4 discharges in Orange County regardless if the MS4 is in an urban or rural area. Please see the discussion in the Tentative Order's fact sheet.</p> <p>The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The comment does not raise any new issues from the previous comments. The State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates.</p> <p>The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3 in the February 13, 2008 Response to Comments III; all provide discussions of these issues. No changes were made in response to this comment.</p>				

Comment No.	64	Commenter No.	27	Comment Subject	MEP
Comment	Introduction of Numeric Limits to define Maximum Extent Practicable (MEP). This is inconsistent with the concept of the iterative process where you have a chance to adapt BMPs based on observation, instead of reaching a numeric limit which is more commonly associated with Total Maximum Daily Loads (TMDLs). This is also inconsistent with the 2006 Blue Ribbon Panels recommendation that numeric limits are inappropriate for municipal permits. The NELs and the MALs should be removed from the permit.				
Response	<p>Please see response to Comments nos. 25, 33 and 39 in the July 1, 2009, Response to Comments IV, as this concern was addressed previously.</p> <p>Please also see the Regional Board Counsel Memorandum dated November 05, 2009.</p>				

Comment No.	65	Commenter No.	27	Comment Subject	SUSMP
Comment	Based on the regional model review for San Diego County updating the SUSMP annually is not feasible. It would be a more effective use of resources to update the SUSMP less frequently. Revise to incorporate findings from effectiveness studies once every permit cycle.				
Response	The Copermittees must update the BMPs in their local SSMP during the third year of implementation of the Tentative Order. The BMPs update is not required annually as the commenter implies. The Tentative Order does require the Copermittees to annually incorporate findings from local treatment BMP effectiveness studies (e.g., ones conducted by, or on-behalf of, public agencies in Orange County). This is not intended to be an annual comprehensive update of BMPs but rather an incorporation of existing data. As such, it is feasible for the Copermittees to incorporate these findings into their local SSMPs.				

Comment No.	66	Commenter No.	27	Comment Subject	Existing Development
Comment	<p>Based on our experience, not all food facilities warrant annual inspection (coffee shops, sale of largely prepackaged foods, such as ice cream parlors etc). It would not be an effective use of resources if the permittee cannot differentiate between facilities that genuinely have potential for exposures and those that do not.</p> <p>This should be revised to require that food facilities be prioritized based on potential for exposures and that the annual inspection requirement be only applied to those deemed to have the highest threat of exposure of pollutants to urban runoff. The permittees should be allowed to develop their own method to determine how the facilities should be prioritized, but this should be based on: observations from previous inspections; record of complaints and violations associated with the specific facility; potential sources of pollutants (sale of prepackaged products versus facilities with rendering bins, food preparation waste, outside eating areas, etc).</p>				
Response	<p>The Copermittees have already been inspecting restaurants annually as part of the County Health Department inspections. As such this change is not considered significant because it allows the Copermittees to continue with their existing programs. Restaurants have been found to present many threats to water quality and standard educational efforts are not effective because restaurants are subject to frequent management and personnel changes. For these reasons, the Tentative Order requires restaurants to be inspected annually.</p>				

Comment No.	67	Commenter No.	27	Comment Subject	Retrofitting
Comment	<p>Requirement to retrofit existing development (page 65). It is not clear what mechanism(s) will be available to accomplish this requirement, nor how it would be funded. Further clarification is needed on how this can be legally accomplished and how it would be funded.</p> <p>It would be a better use of resources for jurisdictions to develop measures during the review-of any discretionary project to ensure that retrofitting stormwater BMPs are considered. Preparing a comprehensive report on the City-wide potential for retrofit, when it is unlikely that there would be any legal opportunity, much less financial resources, to extensively implement it appears to be wasteful. The goal could be better attained by using the available permitting process to achieve retrofits where feasible.</p>				
Response	<p>Retrofitting existing development is a widespread practice across the United States. Although a Copermittee may not have the legal authority to explicitly require a private landowner to retrofit their property, the Copermittee has various other means to communicate and cooperate with the private property owner. The Tentative Order lists several mechanisms available to the Copermittee in cooperating with the private landowner such as demonstration projects, retrofits on public lands or easements, education and outreach, subsidies, retrofit projects as mitigation or ordinance compliance, public and private partnerships, and in lieu fee reductions for existing MS4 discharges. The Tentative Order requires the ranking and prioritization of retrofitting projects based in part on feasibility and cost effectiveness, thereby avoiding duplicative and wasteful efforts. This prioritization maximizes benefits by implementing retrofitting projects that will be most effective and affordable. No further changes have been made to this requirement.</p>				

Comment No.	68	Commenter No.	27	Comment Subject	Monitoring
Comment	<p>Expansion of monitoring requirements to include wet and year round dry sampling of MS4. Expansion of constituents to be analyzed. Introduction of new programs (sediment toxicity study and aquatic habitat monitoring)(Attachment E).</p> <p>Sediment toxicity may originate from historic sources which the permittee never had control over. Also current activities not under the control of the permittee will also impact aquatic habitats and sediment. It is inappropriate to use an MS4 permit as a catch-all for all monitoring that is conducted in a watershed. Monitoring should be focused on the impact from the MS4 and constituents of concern associated with the MS4.</p> <p>Presumably these studies are in addition to monitoring associated with TMDLs, therefore resulting in duplication of effort and costs.</p>				
Response	<p>The Regional Board has attempted to alleviate the costs from additional monitoring by introducing more flexibility into the requirements for Storm Water Action Levels and Dry Weather Non-storm Water Effluent monitoring. In addition, required Bioassessment sampling has been reduced and language has been added to allow for participation in Regionalized monitoring programs.</p> <p>The Regional Board agrees that some sediment toxicity, primarily in areas of historic industrial or agricultural activity, may be due to historic sources. For example, Dana Point harbor sediment sampling has detected DDE, indicating historic DDT use in the area. However, the Regional Board has included a required sediment toxicity study in urban streams for a number of reasons. First, as referenced in the fact sheet, recent studies and monitoring in the San Diego Region have shown that pesticides that are not "historic" impact urban stream receiving waters. Second, current bioassessment protocols include a measurement of water toxicity, but not sediment toxicity. Bioassessment conducted by the Copermittees under Order R9-2002-01 has shown consistently poor to very poor IBI scores with no strong relationship to water chemistry or physical habitat. Third, multiple waters within the San Diego Region have a current or proposed 303(d) listing for toxicity. It is expected this special study will complement, not duplicate, any TMDL efforts by the Copermittees to address these listings. Lastly, Copermittees have identified specific categories of non-storm water discharges as a source and conveyance of pollutants, including pesticides, to waters of the United States.</p> <p>Please remember that, the MS4 owner/operator is responsible for discharges into their MS4 system. Please see Comment no. 44 in the July 1, 2009, Response to Comments IV.</p>				

Comment No.	69	Commenter No.	27	Comment Subject	General
Comment	<p>Overall we are concerned at the additional layer of reporting required in the permit (annual workplans in addition to annual reports and management plans). This further diverts precious resources from direct improvements to water quality to the preparation of compliance documents that overlap. We strongly recommend that the RWQCB reconsider its need for such extensive documentation (which would be in addition to any TMDL reporting).</p>				
Response	<p>We are not aware of any additional layer of reporting requirements. A watershed workplan has taken the place of the WRMP requirements. The annual reports and management plans are preexisting requirements. As stated in section K. Reporting, the Copermittees may propose alternative reporting criteria and schedules for the Executive Officer's acceptance.</p>				

Comment No.	70	Commenter No.	28	Comment Subject	FETD
Comment	<p>I am writing on my own behalf to ensure that the action taken by the Laguna Beach City Council on June 2, 2009 is clearly represented. The following motion (taken from the Recap provided by the City Clerk) was passed in regard to item 13. COMMENTS ON NATIONAL POLLUTANT DISCHARGE ELEIMINATION SYSTEM PERMIT.</p> <p>"Moved by Mayor Pro Tem Pearson, seconded by Councilmember Rollinger and carried unanimously to send a letter to the San Diego Regional Water Quality Control Board over the Mayor's signature, incorporating the language in the first paragraph of the Memorandum written by the Environmental Committee and encouraging the allowance of dry weather diversion and filtration both at the source and at the end of the line. The letter is to include a statement that Laguna Beach is concerned, as are other cities, regarding costs related to enforcement monitoring."</p>				
Response	<p>Please see response to comment no. 59.</p> <p>Several changes have been made to the Tentative Order to seek a cost neutral permit when compared to the previous permit. Most significantly, the Tentative Order eliminates multiple monitoring requirements and allows the Copermittees to substitute participation in regional Monitoring programs. These actions are expected to be more cost efficient and prevent redundancy. To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order but the Regional Board is not required to conduct a cost-benefit analysis.</p>				

Comment No.	71	Commenter No.	28	Comment Subject	General
Comment	<p>The following is the language in the first paragraph of the Memorandum written by the Environmental Committee:</p> <p>"The City Council of the City of Laguna Beach applauds SDRWQCB in its efforts to reduce runoff and improve water quality. We are especially concerned with the watershed of Aliso Creek where excess runoff has severely incised the waterways of the Aliso and Wood Canyons Wilderness Park. The waters of lower Aliso Creek, of its estuary and of the Pacific Ocean near the mouth of the creek have long shown high levels of a wide range of pollutants. We strongly support your efforts to reduce both storm water discharge and dry-season discharge into the creek as well as your efforts to increase the quality of the water entering the creek."</p> <p>As the City's elected City Clerk for nearly thirty years prior to my election as a Member of the City Council, it is important to me that the actions taken by the City Council be clearly transmitted. Thank you for your efforts on our behalf.</p>				
Response	<p>Comment noted.</p>				

Comment No.	72	Commenter No.	29	Comment Subject	Overirrigation
Comment	<p>First, we would like to express our support for one aspect of the March 13, 2009 Tentative Draft Permit which was not covered by our May 14 letter. We recognize that section B, regarding Non-Stormwater Discharges removes "landscape irrigation, irrigation water, and lawn watering" from the listed categories of non-prohibited nonstormwater discharges. We note that the draft Fact Sheet identifies discharges from these categories to be substantial sources of pollutants. We agree that it is valid for the Regional Board to remove these sources from the list of non-prohibited non-stormwater discharges.</p>				
Response	<p>Comment noted.</p>				

Comment No.	73	Commenter No.	29	Comment Subject	LID
Comment	<p>We are encouraged by the revisions made to the draft permit's Low Impact Development (LID) provisions in the June 8 update. We have been supportive of the Santa Ana Regional Board's Orange County MS4 permit, which was adopted on May 24, 2009. The LID provisions included in the June 8 update are generally consistent with the Santa Ana Regional Board's permit. We also appreciate that the June 8 update addresses the comments pertaining to LID in our May 14 letter.</p>				
Response	<p>Comment noted.</p>				

Comment No.	74	Commenter No.	29	Comment Subject	SUSMP
Comment	Section F .1.d requires the submittal of an updated model SUSMP within two years of permit adoption. We note that in other permits, including the May 24, 2009 Santa Ana Regional Board permit for Orange County, similar plans must be submitted within one year of permit issuance.				
Response	The Tentative Order requires the SSMP to be submitted within two years at the request of the Copermitees. They specifically requested that this requirement not be consistent with the Santa Ana Regional Board permit for Orange County. This change was made in response to comment No. 102 in the July 1, 2009, Response to Comments IV. By allowing two years to develop SSMP, this allows the update of the SSMP and the development of the HMP to coincide.				
Comment No.	75	Commenter No.	29	Comment Subject	LID
Comment	Section F .1.d.4.c.ii - The updated LID language includes the term "biofiltration." Although this term is commonly used, as a general matter, its exact meaning is unclear. For example, in some circumstances, distinctions have not been made between infiltration and biofiltration. Conceptually, we believe that a well designed and operated biofiltration system can be consistent with LID principles by reducing flow volumes and protecting water quality. However, without a clear definition of biofiltration, there is the potential for the use of approaches that are contrary to LID. This section of the draft permit takes a step in the right direction by providing a total volume requirement for an acceptable biofilter. We would be interested in conferring further with you to improve the permit's definition of biofiltration.				
Response	The latest Tentative Order includes a definition of biofiltration in Attachment C.				
Comment No.	76	Commenter No.	29	Comment Subject	TMDL
Comment	Lastly, we'd like to refer to our May 14 comment letter's mention of the permit's provisions regarding the incorporation of Total Maximum Daily Loads (TMDLs). We continue to believe that the draft permit's TMDL provisions should be clarified, and would be glad to consult with you on this issue.				
Response	Please see response to comment no. 305 from the July 1, 2009, Response to Comments IV.				
Comment No.	77	Commenter No.	30	Comment Subject	General
Comment	NAIOP SoCal has reviewed the comments submitted by the County of Orange in their May 15, 2009 document. We will not repeat what they have set forth, but will incorporate them by reference as though fully set forth herein. We agree with the issues they raised and do feel that further discussions would be very beneficial in developing a final permit that addresses everyone's goal; cleaner water.				
Response	Comment noted.				
Comment No.	78	Commenter No.	30	Comment Subject	SAL
Comment	NAIOP SoCal will highlight a few of the areas of concern. First, the draft permit attempts to establish Municipal Action Levels (MALs). NAIOP does not believe MALS are justified or warranted, as well as not being technically supportable. In fact, the Blue Ribbon Panel Report does not support the use of numeric effluent criteria on stormwater discharges, and should be deleted.				
Response	The issue raised by this comment is not new. Please see responses to Comment nos. 25 and 33 in the July 1, 2009, Response to Comments IV.				

Comment No.	79	Commenter No.	30	Comment Subject	TMDL
Comment	The draft permit also attempts to establish Total Maximum Daily Loads (TMDLs) for 303(d) impaired waters. Yet, there have been no TMDLs approved by the Federal or State governmental agencies. What is set forth in the draft permit appears to be unworkable and impracticable. Any interest in pursuing TMDLs should be done by working on one impaired body and its associated watershed at a time.				
Response	<p>On June 11, 2008, the San Diego Water Board adopted Resolution No. R9-2008-0027 amending the Basin Plan to incorporate Total Maximum Daily Loads (TMDLs) for indicator bacteria Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay.</p> <p>On June 16, 2009 the State Water Resources Control Board adopted Resolution No. 2009-0053 to approve an amendment to the Water Quality Control Plan for the San Diego Region (Basin Plan) to incorporate Total Maximum Daily Loads for Indicator Bacteria in Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay.</p> <p>The State's Office of Administrative Law (OAL) approved the TMDLs on September 15, 2009. The effective date of the TMDLs is the date of OAL approval.</p> <p>The United States Environmental Protection Agency (USEPA) approved the TMDLs on October 26, 2009.</p>				

Comment No.	80	Commenter No.	30	Comment Subject	SUSMP
Comment	Next is the limit on impervious area on a project site to 5% of the total area. This really is not reasonable or practical. Setting development restrictions that cannot be practically achieved is not an approach that leads to effective means of addressing the runoff issue. The 5% limit needs to be deleted.				
Response	Through discussions with the Copermittees and the interested parties, a metric using Effective Impervious Area (EIA) was not included in the Tentative Order's requirements. In lieu of the EIA metric, the draft Tentative Order requires Low Impact Development BMPs to retain and/or biofilter the volume of runoff produced from the 24-hour 85th percentile storm.				

Comment No.	81	Commenter No.	30	Comment Subject	SUSMP
Comment	We also want to emphasize the concept of a County-wide Model WQMP that is consistent for the entire County and one that does not include different standards for new development and redevelopment for North and South County areas.				
Response	The requirements of the Tentative Order do not prevent or obstruct the implementation of a consistent County-wide WQMP. The standards for new development and redevelopment in the Tentative Order and in the Santa Ana Regional Board's North Orange County MS4 permit are not mutually exclusive. A County-wide WQMP meeting the requirements of the Tentative Order would also meet the requirements of the North Orange County permit, and would be beneficial to the watersheds of both portions of Orange County.				

Comment No.	82	Commenter No.	30	Comment Subject	SUSMP
Comment	Sections XII.B.4A and B of the North County Permit provides several options for the treatment control BMP sizing calculations, whereas the South County Permit provides only one option. We request that the language in Section F.1.d.6 of the South County Permit be updated to reflect all of these options, which is consistent with Exhibit 7.11 of the OC DAMP (Page 7.11-47).				
Response	The Tentative Order limits the selections of methods used to determine the appropriate volume of storm water runoff to be treated. This limitation ensures that priority development project proponents utilize the most accurate information to determine the volume or flow of runoff that must be treated. Using detailed local rainfall data, the County of Orange has developed the 85th Percentile Precipitation Isopluvial Map, which exhibits the size of the 85th percentile storm event throughout Orange County. Since this map uses detailed local rainfall data, it is more accurate for calculating the 85th percentile storm event than other methods which were included in Order No. R9-2002-0001. The other methods found in Order No. R9-2002-0001 were included as options to be used in the event that detailed accurate rainfall data did not exist for various locations within Orange County. The development of the 85th Percentile Precipitation Isopluvial Map makes these other less accurate methods superfluous. Therefore, these other methods for calculating the 85th percentile storm event have been removed from the current Order. This limitation also simplifies compliance and oversight for the project developer, municipality, and Regional Board.				

Comment No.	83	Commenter No.	30	Comment Subject	SUSMP
--------------------	----	----------------------	----	------------------------	-------

Comment Section XII.C.5 of the North County Permit discusses many of the issues that limit the applicability of LID principles in certain situations (e.g., unfavorable soil conditions, existing contamination issues, etc.). The option for the permittees to incorporate the LID principles into larger sustainability programs that balance the benefits of LID against other laudable sustainability objectives should be included in the South Orange County Permit.

Response Implementation of LID is a sustainability objective with the dual purpose of pollutant capture and hydromodification control. As such, it is difficult to substitute the benefits of LID with other laudable sustainability objectives that may not be measurable or water quality based. In addition, we must be careful where the ends do not justify the means. A site that meets other laudable sustainable objectives would still presumably be discharging the same pollutant load unless LID measures were implemented on site. We cannot support a program that would allow a project not to implement LID while still discharging the same pollutant load regardless of other laudable sustainability objectives. Therefore, the Tentative Order includes section F.1.d.(7)(g) allowing the Copermittee's to implement a pollutant credit system at their discretion provided that such a program exhibits that it does not allow a net impact from pollutant loadings over and above the impact caused by projects meeting LID requirements.

Comment No.	84	Commenter No.	30	Comment Subject	Overirrigation
--------------------	----	----------------------	----	------------------------	----------------

Comment As also discussed in previous comment letters provided by the County of Orange, we are concerned with the elimination of irrigation runoff required by the South County Permit. Our experience has taught us that irrigation runoff can be feasibly minimized, however complete elimination of irrigation runoff is unlikely to be 100% achievable. We recommend the language of Section XII.B.3.a that requires irrigation runoff to be minimized to the maximum extent practicable rather than eliminated.

Response The comment regarding the prohibition on overirrigation practices was addressed in the previous response to comments. The comment does not raise any new issues from the previous comments.

Please see the discussion in the Fact Sheet for finding C.15; and the July 1, 2009, Response to Comments IV, Response Nos. 28, 52, 76, and 159. No changes have been made in response to this comment.

The exemptions for irrigation runoff from prohibition have been removed as required per 40 CFR 122.26, which requires such illicit discharges be addressed where such discharges are identified as sources of pollutants. Furthermore, irrigation runoff is a non-storm water discharge that is required to be effectively prohibited by the Clean Water Act and is not subject to the maximum extent practicable standard. The Regional Board expects the Copermittees to treat irrigation runoff, through ordinance and inspection, like any other prohibited non-storm water discharge. The Copermittees current non-storm water prohibitions, that do not include prohibiting over irrigation runoff, are also not 100 percent effective. The Regional Board realizes that the large number and diffuse geography of storm drain inlets makes a 100 percent prohibition difficult to enforce. Nevertheless, the Copermittees currently have non-storm water prohibitions within their ordinances and it is expected that they make a good faith effort in enforcing those ordinances. The language suggested from Section XII.B.3.a appears to be contrary to federal regulations. Non-stormwater discharges are prohibited according to the Clean Water Act. 40 CFR 122.26 requires "a program including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program description shall address all types of illicit discharges, however the following category of non-storm water discharges or flows [including overirrigation] shall be addressed where such discharges identified by the municipality as sources of pollutants to waters of the United States."

Comment No.	85	Commenter No.	30	Comment Subject	Hydromod
--------------------	----	----------------------	----	------------------------	----------

Comment The interim hydromodification requirements of the South County Permit section F.1.h.6 are extensive and include the 1-year through the 10-year storm and potential for continuous modeling requirements along with an EIA requirement. The hydromodification requirement of the North County Permit (as set forth in Section XII.D) is limited to the 2-year storm and has clear provisions for determining compliance and for determining the applicability of the hydromodification requirement. Based on our consultation with several storm water and water quality engineers, the design and approval process for implementing a system that control multiple storms is exponentially more difficult than the design approval process for a single storm event. This increased complexity in design, however, does not translate to a radically altered design in the constructed condition. We feel the complexity does not greatly add to achieving the regional water quality objectives and recommend that the Regional Board replace the hydromodification language from the North County Permit with the South County Permit language entirely.

Response The interim hydromodification requirements have been rewritten and no longer contain references to the EIA. Additionally, the requirements call for use of a continuous simulation hydrologic model to implement flow control BMPs for flow rates that fall within 10 percent of the 2-year, and up to the 10 year, storm event. Flows leaving a project site that do not fall within this range do not need to be controlled under the interim requirements.

The Regional Board finds that mitigating runoff above the 2-year storm is necessary to prevent erosion and impacts to downstream receiving waters. Studies have shown that storms greater than the 2-year storm do most of the erosive work (SCVURPPP, 2005). The requirement for continuous modeling is necessary to help dischargers decipher both the applicability of hydrologic controls and whether or not compliance will be achieved with proposed BMPs. The Regional Board recognizes that Copermitees will need to learn how to perform continuous modeling and the design approval process associated with these hydromodification requirements. This process, however, is not without precedent. Copermitees in both the Bay area and San Diego area have successfully implemented requirements to perform continuous modeling for purposes of hydromodification management, and have been able to do so in evaluating effects from a range of storms (not a single storm event). The Regional Board disagrees that mitigating effects from a range of storms does not add to achieving regional water quality objectives because, as previously stated, storms greater in intensity than the 2-year storm perform the majority of the work that causes downstream erosion.

Comment No.	86	Commenter No.	30	Comment Subject	SUSMP
--------------------	----	----------------------	----	------------------------	-------

Comment In general, the changes that NAIOP requests will not negatively impact water quality in the region and the recommended changes are consistent with the overall approach taken for water quality protection in the region. In fact, we strongly feel that a consistent Model WQMP for the entire County will increase the probability that the design measures in the Permits will be implemented in a more consistent manner when all cities have the same requirements. The overall differences with respect to new development/redevelopment in the adopted Permit for North Orange County and the draft permit for South Orange County are minimal enough that the objectives for both Permits can be achieved by a County-wide Model WQMP that reflects the specific design and numerical requirements set forth in the northern Orange County Permit.

Response The requirements of the Tentative Order do not prevent or obstruct the implementation of a consistent County-wide WQMP. The standards for new development and redevelopment in the Tentative Order and in the Santa Ana Regional Board's North Orange County MS4 permit are not mutually exclusive. A County-wide WQMP meeting the requirements of the Tentative Order would also meet the requirements of the North Orange County permit, and would be beneficial to the watersheds of both portions of Orange County.

--------------------	----	----------------------	----	------------------------	-------

Comment Thank you for providing Rancho Mission Viejo (RMV) with the opportunity to review and comment on the referenced Revised Tentative Order ("Order"). We have received and reviewed the revised language concerning Low Impact Development recently distributed by the Regional Board. We are supportive of the addition of the Alternative Performance Criteria for Watershed-Based Projects (Section F.1.c. (8)).

Response Comment noted.

Comment No.	88	Commenter No.	32	Comment Subject	LID
Comment	NRDC believes that good policy and law require a standard both to retain onsite the design storm whenever possible and to provide offsite mitigation for any of the design storm volume not retained onsite. The most recent draft language issued by the Regional Board would require onsite retention but allow "biofiltration" to qualify toward meeting the design storm volume obligation when onsite retention is technically infeasible. Tentative Order ¶ F.1.d.(4)(c). For reasons previously elaborated in our comments and discussed briefly below, we do not support crediting water treated through biofiltration BMPs toward the onsite, 85th percentile storm retention obligation that otherwise applies to projects under Tentative Order ¶ F.1.d.(4)(c)(i). When biofiltration practices are used (we do not oppose their use when onsite retention of the design storm is technically infeasible), this should trigger the requirement to provide offsite mitigation or in-lieu funds.				
Response	<p>The Regional Board maintains that bio-filtration is part of a comprehensive LID program. Effective bio-filtration provides pollutant removal and energy dissipation. Biological removal of pollutants can even be an improvement over simply keeping pollutants on-site until rainfall over the design-storm criteria washes pollutants into receiving waters. Removal of pollutants and prevention of downstream hydromodification ensures any discharge to be low impact. The USEPA's Green Infrastructure website includes filtration as a Low Impact Development technique; http://cfpub.epa.gov/npdes/greeninfrastructure/information.cfm#glossary.</p> <p>In addition, the U.S. Department of Housing and Urban Development's report titled "The Practice of Low Impact Development," (July 2003, H-21314CA) incorporates filtration techniques. The County of San Diego's LID manual also utilizes bio-filtration as an acceptable LID practice. In the future as the science and knowledge of storm water treatment evolves, filtration may not be a suitable LID practice to meet the maximum extent practicable standard.</p> <p>For this permit iteration, LID BMPs that capture the design storm for reuse, infiltration or evapotranspiration are preferred over bio-filtration techniques. The draft permit provides design-criteria for "LID bio-filtration BMPs" in section F.1.4.d.ii and requires demonstration that retention LID BMPs are technically infeasible prior to implementing bio-filtration BMPs.</p>				

Comment No.	89	Commenter No.	32	Comment Subject	LID
Comment	To dispel misconceptions about onsite retention-based standards, such standards do not equate to a "no discharge" requirement because the design storm is relatively small and many precipitation events will exceed it. Implementing a full retention-based standard with appropriate alternative compliance provisions would mean, however, that Orange County would reap the benefit of a superior pollution discharge standard even if onsite retention were infeasible. This would be a critical step forward, particularly because the water retained, whether onsite or offsite through alternative compliance, would be infiltrated or otherwise reused. Such an approach mirrors similar approaches now being implemented or considered in locations as diverse as Washington, D.C., Philadelphia, West Virginia, and—through new requirements for federal buildings—everywhere in the United States.				
Response	Comment noted.				

Comment No.	90	Commenter No.	32	Comment Subject	LID
Comment	Critically in this connection, as discussed in our last letter, on May 7, 2009, the Los Angeles Regional Water Quality Control Board adopted NPDES No. CAS00402, a new MS4 permit for Ventura County and the incorporated cities therein. The adopted Ventura County MS4 permit requires onsite infiltration, harvesting and reuse, or evapotranspiration of the 85th percentile design storm, with no runoff. The critical difference between the Ventura County MS4 permit and the draft Tentative Order's LID performance standard is that, in Ventura County, biofiltration cannot count toward a site's LID volumetric obligations—the Tentative Order, as currently drafted, would allow a site that demonstrated technical infeasibility to discharge potentially all of its stormwater to the storm sewer system without undertaking any offsite mitigation. If the biofiltration BMPs installed are not 100% effective at removing pollutants (and they almost undoubtedly would not be 100% effective), the site will discharge more pollution than a site that meets the onsite retention standard. For this reason, offsite mitigation should be required in such situations.				
Response	Please see the response to comment No. 88. In addition, the biofiltration requirements are consistent with the Santa Regional Board's MS4 permit for North Orange County, R8-2009-0030.				

Comment No.	91	Commenter No.	32	Comment Subject	LID
Comment	A strict requirement (with appropriate alternative compliance options) for onsite infiltration, reuse, and evapotranspiration not only implements the MEP requirement (and others) contained in the Clean Water Act, it is also inarguably wise policy in drought stricken California. Governor Schwarzenegger recently declared a state of emergency in California due to severe drought. The major Southern California water supplier will cut water deliveries across the region this summer by ten percent, the first such cut since the drought of the early 1990s. Notably, the Governor's Proclamation orders public water agencies essentially to "find" more water through a variety of activities, including "...efforts to protect water quality or water supply." As such, a standard that requires retention of the design storm onsite is directly responsive to the Governor. The Tentative Order would potentially allow large quantities of biofiltered water to flow into receiving waters through storm sewers, providing no water supply benefit at all.				
Response	Please see the response to comment No. 88.				

Comment No.	92	Commenter No.	32	Comment Subject	LID
Comment	Thus, we strongly urge the Board to make a small but very important change to the Tentative Order by requiring that projects using biofiltration BMPs mitigate—through the LID substitution program—the quantity of stormwater that is not retained onsite. This will comport with the emerging stormwater management trend around the country and help ensure that the Permit meets the MEP standard.				
Response	Please see the response to comment No. 88.				

Comment No.	93	Commenter No.	32	Comment Subject	LID
Comment	We appreciate that the Regional Board has attempted to circumscribe the use of biofiltration BMPs by requiring that they be designed appropriately. However, as Orange County Coastkeeper Executive Director Garry Brown testified regarding the same issue in North Orange County, experience shows that this is easier said than actually implemented. As such, allowing biofiltration may serve as an "out" that will minimize environmental performance. In contrast to objectively clear requirements to "infiltrate, harvest and reuse, or evapotranspire," "biofilter" is a subjective term open to interpretation and abuse.				
Response	The latest Tentative Order includes a definition of biofiltration to avoid misuse and misinterpretation. Please see the response to comment No. 88.				

Comment No.	94	Commenter No.	32	Comment Subject	LID
Comment	Indeed, while we oppose the allowance for biofiltration as part of the main LID performance standard, we believe that if this language remains over our objections, clarifying language should close the loopholes that we have identified. There is consensus among the environmental NGOs and industry stakeholders, including the BIA and CICWQ, that biofiltration LID BMPs can be abused and therefore must be built and maintained to meet strong and clear requirements. CICWQ, for example, stated in its February 13, 2009 letter to the Santa Ana Regional Board: "we recommend that hard feasibility criteria should be specified in the model WQMP/DAMP upon its renewal — such that developers should not be able to bypass implementation of appropriate LID BMPs."				
Response	The Tentative Order has included some basic design criteria for biofiltration to avoid abuse. The LID biofiltration BMPs must be designed for an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP. Due to the flow through design of biofiltration BMPs, the total volume of the BMP, including pore spaces and prefilter detention volume is allowed to be no less than 0.75 times the design storm volume.				

Comment No.	95	Commenter No.	32	Comment Subject	LID
Comment	<p>Therefore, if the Board does not delete references to biofiltration in the Tentative Order's LID provisions, it should, at minimum, make the following clarifications:</p> <p>Section F.1.d.(4)(c)(ii) should be elaborated and state as follows: "LID bio-filtration BMPs shall be designed to accommodate the design flow at a surface loading rate no greater than 5 inches per hour and shall have a total volume, including pore spaces and prefilter detention volume, no less than the runoff volume generated by the design storm depth times 0.75. Maximum ponding depth shall be 12 inches; minimum drainage time shall be 12 hours."</p> <p>"Runoff from impervious areas also may be dispersed to pervious landscaped areas in a ratio not to exceed 2 parts impervious area to one part pervious landscaped area. Pervious landscaped areas must be designed to pond and infiltrate runoff produced by the design storm depth. Maximum ponding depth shall be 2 inches and minimum topsoil-turf thickness 3 inches."</p>				
Response	<p>Comment noted. The latest Tentative Order includes similar language to meet the intent of the commenter. LID biofiltration BMPs must be designed for an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP. Due to the flow through design of biofiltration BMPs, the total volume of the BMP, including pore spaces and prefilter detention volume is allowed to be no less than 0.75 times the design storm volume.</p>				

Comment No.	96	Commenter No.	32	Comment Subject	LID
Comment	<p>Currently, the Tentative Order includes provisions that establish apparently two separate alternative compliance options for regulated projects. The first—"Alternative Performance Criteria for Watershed-Based Projects"—allows the implementation of nebulously defined "planning principles" through regional LID BMPs. Tentative Order ¶ F.1.c.(8). The Tentative Order does state that these regional LID BMPs should be sized to retain or biofilter the 85th percentile storm, or else conventional treatment controls and participation in the "LID substitution program" are required. Id. This provision does not establish a hierarchy of LID practices, however, and would allow qualifying projects to use biofiltration without demonstrating the technical infeasibility of retention-based BMPs. This opens the door to inferior pollution removal and is notably less stringent than the standard LID BMP requirements of Section F.1.d.(4), which prioritize retention based BMPs. We therefore urge the Regional Board to establish the same hierarchy of LID BMPs as in Section F.1.d.(4) and to require, as suggested above, participation in the LID substitution program whenever the project does not retain the full design storm volume. Further, the provision should clearly state that any projects utilizing this alternative compliance option must ensure at least equivalent environmental performance (compared to Section F.1.d.(4)'s requirements) in terms of pollutant removal and volume reduction.</p>				
Response	<p>Comment noted. The requirement for technical infeasibility has been included in the section on regional LID BMPs. Also, Section F.1.c.(8) has been moved to section F.1.d.(11) as it is more appropriate in that section.</p>				

Comment No.	97	Commenter No.	32	Comment Subject	LID
Comment	<p>The second alternative compliance option—the LID substitution program—also does not clearly require equivalent performance for the in-lieu payment component. While Section F.1.d.(8)(a) does state that the "LID substitution program must clearly exhibit that it will not allow PDPs to result in a net impact from pollutant loadings over and above the impact caused by projects meeting LID requirements," Section F.1.d.(8)(f) describes the in-lieu payment component of the program and sets forth four requirements that do not include ensuring equivalent water quality benefits. Since there are two options for the LID substitution program (offsite mitigation and in-lieu payment) and the offsite mitigation provision is linked to pollutant load reduction, the absence of any reference to pollutant load reduction in the in-lieu payment provision is conspicuous and potentially subject to misinterpretation. For this reason, the in-lieu payment provision should be revised to include a fifth criterion that requires in-lieu payment programs to ensure that the funds contributed by priority development projects are correlated to offsetting the impact of their onsite non-compliance and ensuring equivalent environmental performance. Without such clarification, the LID substitution program will include a potential loophole that would allow permittees and projects not to fully mitigate their impacts as otherwise required by the Permit.</p>				
Response	<p>Comment noted. Section F.1.d.(7)(a) requires that prior to implementation, the LID waiver program must clearly exhibit that it will not allow PDPs to result in a net impact (after consideration of any mitigation and in-lieu payments) from pollutant loadings over and above the impact caused by projects meeting LID requirements. In addition, section F.1.d.(7)(h)(iv) requires that in-lieu payments must be proportional to the additional pollutant load discharged by not fully implementing LID.</p>				

Comment No.	98	Commenter No.	33	Comment Subject	LID
Comment	<p>There is much that the Proposed Order sets out to do which is laudable, and indeed, potentially beneficial for Camp Pendleton. Stormwater runoff can be a major source of pollutant loading - frustrating attainment of downstream beneficial uses and at times necessitating the implementation of expensive treatment as a prerequisite to use for municipal supply. Camp Pendleton, and the Department of Navy generally, support the concept of LID to decrease stormwater pollution and prevent net increases in stormwater runoff. See enclosed Department of Navy Low Impact Development Policy for Storm Water Management (November 2007). The implementation of LID-as prescribed in the Proposed Order for new development, combined with the proposed prohibition of dry-weather runoff from developed areas such as Rancho Mission Viejo-may increase the water quality (if not quantity) of flows (and baseflow) on Cristianitos and Talega Creeks into the San Mateo water production aquifers. Unfortunately, the potential benefits of LID as envisioned in the Proposed Order may also contribute to an attendant loss of flows that support Camp Pendleton's water supply.</p>				

Response Comment noted. The commenter's suggested language has been included in the Tentative Order to address this concern.

Comment No.	99	Commenter No.	33	Comment Subject	LID
Comment	<p>Camp Pendleton relies almost entirely upon local water sources-the vast majority of which are derived from wet weather surface water flows originating outside of the Base-to meet its national defense mission. The Office of Water Resources is concerned that the Proposed Order, as currently drafted, may indirectly harm Camp Pendleton's water supply by mandating a version of low impact development that has the potential to greatly diminish the volumes of water that reach (and recharge) Camp Pendleton's aquifers. In particular the Office of Water Resources is concerned about diminution of flows to the San Mateo aquifers in the northern portion of the Base. Such diminution of aquifer recharge may result from implementation of the Proposed Order's requirement of 85% stormwater recapture in existing municipal separate storm sewer system (MS4) drainages in the vicinity of Talega and Christianitos Creeks. Talega and Christianitos Creeks are tributaries of San Mateo Creek and the San Mateo groundwater aquifers which provide camp water supply to the northern portion of Camp Pendleton.</p> <p>Additionally, the stormwater recapture requirements identified for existing development in the Proposed Order could have significant implications if they are adopted as Regional Board policy and subsequently implemented in MS4 reissuances for stormwater discharges in the Santa Margarita River watershed. The Santa Margarita, and the groundwater aquifers it recharges, is the sole source of water for the entire southern portion of the Base (Camp Pendleton's primary cantonment area). The proposed Order's requirement to remove and treat 85% of storm flows during many storm events, raises legitimate concerns about Camp Pendleton's future ability to retain its water independence. However, since the Santa Margarita River watershed is not proposed for inclusion within the Proposed Order, the Office of Water Resources simply notes that the precedent associated with inclusion of large scale retrofit requirements to remove 85% of stormwater flows in existing developments, could be problematic for Camp Pendleton's sole source of water supply in the southern portion of the Base.</p>				

Response Comment noted. The commenter's suggested language has been included in the Tentative Order to address this concern.

Comment No.	100	Commenter No.	33	Comment Subject	LID
--------------------	-----	----------------------	----	------------------------	-----

Comment Implementation of the Proposed Order-which appears to require "retrofit" of existing drainages in the Christianitos, Talega and San Mateo watersheds (as well as imposing significant flow reduction requirements on "new" developments)---could result in a significant decrease in the amount of flows entering Christianitos, Talega and San Mateo Creeks. A confounding factor is whether, and to what extent, stormwater that is locally infiltrated, filtered or treated in accordance with the requirements of the Proposed Order, see Section F.1.d.(6)(a)(i), will in fact join groundwater and eventually flow down-gradient to San Mateo Creek. The Office of Water Resources is attempting to quantify the magnitude of such anticipated losses through hydrologic study. However, what is apparent is that if the Proposed Order operates as it appears to be designed, more surface water flow will be retained at the point of generation and used onsite, actively for irrigation or passively through root uptake/evapotranspiration. This greater magnitude of on-site use has the potential to adversely impact the water production capabilities of downstream riparians, overlies and appropriators.

Compounding our concerns regarding the Proposed Order's volumetric and flow restrictions is the fact that the Co-Permittees, once they receive stormflow into their MS4s, may find it difficult or impossible to return captured stormwater to the same stream system from which it was derived. As previously alluded, the Proposed Order appears to mandate that infiltrated, filtered or treated stormwater meet all basin plan standards at the point where such water is "discharged," and a discharge would appear to occur whenever such water leaves the MS4 conveyance system. See Proposed Order Sections C.2; E.g, 13. While the requirement to meet water quality standards at all times seems reasonable on its face, implementation could present difficulties that exacerbate harm to downstream water rights.

Response Comment noted. The commenter's suggested language has been included in the Tentative Order to address this concern.

Comment No.	101	Commenter No.	33	Comment Subject	LID
--------------------	-----	----------------------	----	------------------------	-----

Comment Additionally, if the Co-Permittees are required to meet basin plan standards prior to infiltrating the stormwater (or otherwise discharging to land), they may be unable to comply with the Proposed Order without constructing and implementing some form of treatment prior to discharge. Implementation of technology of this magnitude and footprint could be very expensive and would presumably require removal of stormwater from its watershed of origin in many instances so that CoPermittees could achieve sufficient economies of scale to make construction of necessary treatment facilities cost effective. Such stormwater may be lost to its watershed of origin. Moreover, if a Co-Permittee (or developer) spends many millions of dollars to construct and maintain a micro-filtration facility, they are likely to want to put such captured water to beneficial use for their own purposes after treatment (in order to recover outlays of capital needed to build the treatment facilities in the first instance). Finally, even assuming that "treated" stormwater flows are indeed infiltrated into groundwater aquifers within their watershed of origin, such aquifers may be many miles above downstream receiving waters and otherwise hydrologically disconnected from the streams and creeks that previously conveyed water to downstream water rights holders.

Response Comment noted. The commenter's suggested language has been included in the Tentative Order to address this concern.

Comment No.	102	Commenter No.	33	Comment Subject	LID
--------------------	-----	----------------------	----	------------------------	-----

Comment The problem described above is equally acute if the water is to be discharged to a surface water. Currently there is no known technology capable of reliably treating total nitrogen below 1 ppm, yet that is the default basin plan standard for total nitrogen in the San Mateo Basin and in other watersheds throughout Southern Orange County. If Basin Plan standards for nutrients are strictly applied at the point of discharge, as Section C.2 implies they must be, then even implementation of membrane technologies to "treat" or "filter" stormwater would be ineffective. A Co-Permittee could not release water from the MS4 system to receiving surface waters without violating the terms of the Proposed Order in many circumstances, leaving groundwater infiltration (which is problematic for the reasons stated above) as the only viable disposal alternative.

Response Comment noted. The commenter's suggested language has been included in the Tentative Order to address this concern.

Comment No.	103	Commenter No.	33	Comment Subject	LID
Comment	Camp Pendleton is home to 17 threatened or endangered species that rely directly (or indirectly) on the maintenance of flows in Camp Pendleton's creeks, rivers, lagoons and riparian areas. Potential impoundment of stormwater flows via the Proposed Order has the potential to also impact the maintenance of habitat that these riparian species rely upon for their survival.				
Response	Comment noted. The commenter's suggested language has been included in the Tentative Order to address this concern.				
Comment No.	104	Commenter No.	33	Comment Subject	Legal
Comment	In Section E of the Proposed Order (pages 22-24), language along the following lines should be inserted clarifying the Regional Board's intention to protect existing downstream water right holders from injury associated with stormwater recapture: a. "Nothing herein shall authorize a Co-Permittee or other discharger regulated under the terms of this order to divert, store or otherwise impound water if such action is reasonably anticipated to harm downstream water right holders in the exercise of their water rights."				
Response	The Regional Board has previously made the suggested change to the Tentative Order.				
Comment No.	105	Commenter No.	33	Comment Subject	General
Comment	Provide clarification in the Proposed Order that infiltration of water at the point of generation is not a "discharge" that requires strict compliance with basin plan standards. This would obviate the need for removal of water from the watershed of origin for off-site treatment (and probably appropriation) in a different watershed.				
Response	The clarification has been made that strict compliance with "surface" water quality standards is required.				
Comment No.	106	Commenter No.	33	Comment Subject	General
Comment	In Section F.3.d.6(d): Revise guidance for substitute regional mitigation projects for existing development to authorize: "Localized rainfall storage and reuse to the extent such projects are fully protective of downstream water rights."				
Response	The requested change has been made to the Tentative Order.				
Comment No.	107	Commenter No.	34	Comment Subject	General
Comment	Negotiations on the Draft Permit have been ongoing between the Regional Board and the Orange County Permittees since 2007. To date, the Riverside County Permittees and other Riverside County stakeholders have not been provided the opportunity to participate in the process in an equivalent manner as the Orange County Permittees and stakeholders. Nevertheless, the use of this Draft Permit as the model for the Riverside County Permit can create the false presumption that the requirements and programs contained therein have been thoroughly reviewed and commented upon by the Riverside County Permittees and Riverside County stakeholders, which is not the case. As the permit that results from this process will be specific to Orange County, the Riverside County Permittees have appropriately played a passive and mostly observational role in the development of this Permit. Although the Riverside County Permittees have provided comments on the Draft Permit, the extent and intent of their comments has been limited to addressing broad policy issues that the Riverside County Permittees are concerned are inappropriate and may set precedent for the renewed Riverside County Permit. There has been no effort on the part of the Riverside County Permittees to fully review or comment on the details of this Permit and, furthermore, the Riverside County Permittees have not been involved nor invited to the "Permittee" meetings in which the details of this Draft Permit have been discussed. Therefore, the Riverside County Permittees expect to be afforded, at minimum, an equivalent process for involvement in their permit renewal as has been provided to the Orange County Permittees and stakeholders for this Draft Permit.				
Response	Please note that the Tentative Order is for renewal of the NPDES permit for Copermittees within Southern Orange County. As such, Copermittee participation has been limited to those Copermittees under purview of R9-2002-001. While it is likely that the Tentative Order will be utilized as the model for renewal of R9-2004-001 (MS4 Permit for Riverside Co. in the Santa Margarita Hydrologic Unit), this does not imply that the public process and Copermittee/stakeholder participation for renewal of R9-2004-001 shall be limited in scope. Please note that the Regional Board does not anticipate that the duration of time needed to renew R9-2002-001 will mirror the time needed for renewal of R9-2004-001. R9-2002-001 was significantly delayed as the Regional Board lacked a quorum to hear the original draft Tentative Order.				

Comment No.	108	Commenter No.	34	Comment Subject	General
Comment	<p>Through previous permits, the Riverside County Permittees have developed watershed specific programs that are structured differently than those in Orange County. These programs have been in development and subsequent refinement for several years, and these programs have been molded into effective and efficient programs for the Upper Santa Margarita Watershed. As discussed in the 4th year annual report, these programs have been shown to be effective and are protective of receiving water quality, especially in light of the 300% growth and urbanization that has occurred within the Permit area. Forcing permit requirements upon the Riverside County Permittees that are structured based upon Orange County's existing permit and which have been negotiated between Regional Board staff and Orange County stakeholders could result in an unjustified overhaul and unnecessary re-invention of Riverside County's programs that will undermine the credibility of the Permittees' program, and will negatively affect their ability to protect water quality.</p> <p>The cookie cutter approach to permitting could negate progress the Permittees have made to date on developing Low Impact Development (LID) tools (including the District's LID BMP Testing and Demonstration Facility and pending LID Design Manual), hydromodification management tools (being developed in conjunction with the Southern California Coastal Watershed Research Program), Permittee efforts to develop and promote proper management of Pyrethroid Pesticides (including several presentations and meeting with leading scientists and Department of Pesticide Regulation managers) and other projects that we have undertaken for the last five years to manage water quality issues specific to the Santa Margarita Region of Riverside County. MS4 Permits should be written to take advantage of programs that Permittees are proactively undertaking and reflect the priorities that the Riverside County Permittees have identified for their watershed. By imposing permit requirements that obviate these existing efforts, the Regional Board is de incentivizing MS4 Permittees from being proactive.</p>				
Response	<p>Comments regarding program inclusion for the renewal of R9-2004-001 (MS4 Permit for Riverside Co. in the Santa Margarita Hydrologic Unit) will be addressed during that NPDES permit renewal process. It is expected that existing LID, hydromodification efforts and management measures will work in concert with proposed requirements, as many requirements are built upon the current Order (R9-2004-001). For example, R9-2004-001 requires Copermitees to initiate hydromodification efforts, and monitoring currently required lead to the identification of pyrethroid pesticides as a potential concern. The Regional Board will continue to build upon advances and improvements, gleaned from all three MS4 permits under their jurisdiction, when revising the next MS4 permit up for reissuance.</p>				

Comment No.	109	Commenter No.	34	Comment Subject	General
Comment	<p>Permits should reflect and accommodate the recommendations set forth by the Permittees in the Report of Waste Discharge (ROWD).</p> <p>For over 18 years, the Riverside County Permittees have been actively involved in statewide efforts to further develop and support the stormwater community and develop, review, test and implement appropriate Best Management Practice (BMP) technologies and programs. As part of the ROWD the Permittees thoroughly reviewed their existing compliance programs and committed to well thought-out programmatic revisions that will ensure that they continue to protect receiving water quality to the Maximum Extent Practicable (MEP) and implement measurable goals. Many of the recommended programs are actually proactive in that they provide similar end results as programs that are now being discussed for the draft South Orange County Permit.</p> <p>Although the recommended revisions result in an additional burden upon already stretched municipal budgets, the recommended programs have been formulated in a manner that ensure that their programs meet the MEP standard while remaining cost effective, transparent and integrate smoothly into the Riverside County Permittees' existing programs. It is important to recognize that the recommended programs described in the Riverside County Permittees' ROWD present an approach that will be more appropriate and effective within Riverside County and warrant serious consideration.</p>				
Response	<p>Comments regarding program inclusion for the renewal of R9-2004-001 will be addressed during that NPDES permit renewal process.</p> <p>Please note the MEP standard applies to storm water discharges and that non-storm water discharges are to be effectively prohibited (Please see Regional Board Counsel Memorandum dated November 05, 2009).</p>				

Comment No.	110	Commenter No.	34	Comment Subject	General
Comment	<p>Permits should focus resources on the actual water quality issues within each watershed.</p> <p>Inappropriately imposing requirements from other permit areas curtails the Permittees ability to develop and implement programs that address their specific water quality issues in a manner that is efficient and effective. Further, attempting to comply with requirements that are developed for areas with different climatic, land use and hydrologic conditions may actually decrease the effectiveness of the Permittees' overall program by diverting funding away from where it can provide the greatest benefit to water quality. The physical and socio-economic characteristics of the Santa Margarita Region of Riverside County are substantively different from Orange County and, as such, the water quality issues, and the most effective solutions to address those issues, may be vastly different than what is appropriate and effective in Orange County. Using Orange County's requirements as a model for the Riverside County Permit falsely presumes that Orange County's programs will be equally effective and efficient at addressing the water quality issues in Riverside County. On the contrary, such programs may actually be less effective than simply building upon the Riverside County Permittees' existing and already proven programs.</p>				
Response	<p>Comments regarding program inclusion for the renewal of R9-2004-001 will be addressed during that NPDES permit renewal process.</p> <p>NPDES permits are issued to protect water quality standards for those waters receiving the discharge. As such, different receiving waters may require different efforts due to 303(d) listings, TMDLs, Beneficial Uses, differing water quality criteria, and other factors that require consideration during the NPDES permitting process.</p>				

Comment No.	111	Commenter No.	34	Comment Subject	General
Comment	<p>Permit requirements should be reflective of the resources available within the permit area.</p> <p>MS4 Permit requirements are written to establish a framework by which MS4 Permittees can be measured for compliance with the MEP standard. The MEP is not and cannot be the same for all permit areas, as what is "practicable" is affected by many factors, including socio-economic factors, which are quite different between the Orange County and Riverside County Permit areas. South Orange County is a built-out, highly urbanized coastal community whereas the Santa Margarita Region of Riverside County is still essentially an urbanizing rural region in a semi-arid climate with less than 300,000 residents. These differences affect the ability of the Riverside County Permittees to secure the resources to comply with expanded permit requirements and define what is "practicable" for Riverside County. Therefore the scale, focus, and implementation of compliance programs will be necessarily different and should reflect the unique characteristics of the watershed and the communities located within it. The following information provides a limited example of some of the stark differences between the two Permit areas.</p> <p>Additionally, the sobering economic forecasts described in the 2009 ROWD have continued to not only be realized but actually exceeded in its negative impacts as Riverside County is one of the hardest hit areas in the country with a 13% unemployment rate and the 4th highest number of foreclosures in the nation. Further, City Councils and the County Board of Supervisors do not have the luxury to impose assessments nor allocate funds and resources irrespective of the general needs and will of the public. These factors further diminish the likelihood that additional assessments for enhanced compliance requirements would be voter approved in the current economic climate.</p> <p>Imposing the negotiated Orange County Permit requirements upon Riverside County would create an insurmountable burden that would likely result in unavoidable noncompliance due to their inability to secure the significant resources that would be required to not only reinvent their existing programs as described above, but to incorporate additional programmatic and reporting programs that are often excessive and do not in any way benefit water quality.</p>				
Response	<p>Comments regarding program inclusion for the renewal of R9-2004-001 will be addressed during that NPDES permit renewal process. Please also see response to Comment nos. 109 and 110.</p>				

Comment No.	112	Commenter No.	34	Comment Subject	NEL
--------------------	-----	----------------------	----	------------------------	-----

Comment Tentative updates to the Draft Permit released on May 5th describe the actions that must be taken in the event that monitoring data determines that a Numeric Effluent Limit (NEL) has been exceeded. Notwithstanding the comments provided in our previous comment letter submitted on May 15, 2009, the process that is required when an NEL is exceeded requires that the Permittees make one of three specific findings in response to the exceedance; 1) the discharge is demonstrably natural in origin, 2) the discharge results from an illicit connection and the discharge can be identified and eliminated, or 3) the discharge is determined to be a discharge that is conditionally exempt. The problem is that these options are based on the faulty assumption that a single and specific source of an exceedance can always be identified.

In at least some cases, transitory Illegal Connection/Illicit Discharge (IC/ID) events involving dissolved pollutants only detectable via lab analysis may trigger NEL provisions. However, lab results can take multiple days to process; by the time the Permittee becomes aware of the exceedance, the discharge may have ceased. In such a case, the Permittee would have not been able to make any of the allowable findings. Further, the area served by MS4s is not entirely under the control of the Permittees (compared to an industrial operator who is actually in direct control of his business) and MS4 discharges can originate from multiple diffuse sources. Detecting the source of an exceedance in such cases is complicated by many factors, including:

- a) The time it takes pollutants to migrate downstream within the MS4. By the time the exceedance is detected and a source investigation is initiated the discharge may no longer be occurring.
- b) The combination of many diffuse sources which would be difficult or impossible to individually pinpoint and quantify.
- c) The source could be natural such as arsenic, iron or selenium in rising groundwater, but making a demonstrable conclusion is not feasible given limited data sets.
- d) The exceedance may be for a constituent that can be attributed to many different types of sources and factors, (e.g., pH and TSS). As such, finding the true source can be likened to finding a needle in a haystack.

The required responses to exceedances of an NEL need to be realistic and recognized that it may not always be possible to determine with absolute certainty the source of the exceedance. Accordingly MS4 Permits should not hold Permittees responsible for inability to determine the source of an exceedance.

Response In regards to responsibility for discharges into the MS4 system, please see Comment no. 39 in the July 1, 2009, Response to Comments IV.

The Regional Board expects that the Copermittees respond to suspected illicit discharges and/or connections in compliance with Section C.1 and F.4 of the Order. Non-storm water discharges, no matter how diffuse in source, difficult to pinpoint or intermittent in nature, are a prohibited discharge unless specifically exempted. The Regional Board contends that the required responses to non-storm water discharges are realistic and required under federal regulations. The Copermittee must conduct further investigation into all non-storm water discharges unless it is known with certainty that the discharge either is exempted from prohibition or covered by another permit, as non-storm water discharges are to be effectively prohibited. This requirement to investigate the source of the discharge, regardless of chemical composition, is already part of the existing permit.

Please also see response to Comment #394.

Comment No.	113	Commenter No.	34	Comment Subject	SUSMP
--------------------	-----	----------------------	----	------------------------	-------

Comment Several provisions of the Draft Permit require the calculation of Pollutant Loads generated by sites and to determine the pollutant load reductions that occur through the implementation of BMPs. There is not a sufficient and defensible body of knowledge within the storm water community to support and justify inclusion of such requirements. These requirements need to be removed or restructured to include requirements that can be complied with utilizing the available and applicable body of knowledge.

Response Federal regulations at 40 CFR 122.26(d)(2)(iv)(A) requires, "a description of structural and source control measures to reduce pollutants from runoff ..., accompanied with an estimate of the expected reduction of pollutant loads ..." The Copermittees must calculate pollutant loads based on the available studies and knowledge. CASQA and CalTrans both have guidance on BMP pollutant removal effectiveness.

Comment No.	114	Commenter No.	34	Comment Subject	Hydromod
--------------------	-----	----------------------	----	------------------------	----------

Comment The Draft Permit requires implementation of three distinct hydromodification programs, all to be implemented potentially within the first three years of the Permit cycle. Each program is based on different sets of requirements and will likely result in three distinct programs where each program will only be implemented for approximately one year before the Permit will require the next program to be implemented. From an administrative point of view these requirements would have unreasonable impacts on the municipal staff, the development community and even the Regional Board staff. The repeated requirements to develop and re-develop programs are not reasonable and will only serve to create confusion and waste scarce resources. It is not practicable, nor is it good public policy to develop a program, train municipal staff and the development community on the program, and then implement the program all while developing a completely different successor program that will be implemented a year later. Alternatively and in light of the virtual cessation of development activity in the region, it would make more sense to require continuation of existing new development controls with possible minor enhancements until the completion of the Southern California Coastal Watershed Research Project (SCCWRP) hydromodification study, which all of Southern California has already committed to implement upon its completion.

Response Tentative Order No. R9-2009-0002 will not require the implementation of three distinct hydromodification programs, as the commenter suggests. Rather, provision F.1.h. describes the elements that must be included in a Hydromodification Management Plan (HMP) that will be developed by the Copermittees. While the HMP is being developed, the Copermittees are to immediately implement interim hydromodification criteria. This is to ensure that hydromodification controls are implemented to protect receiving waters from impacts from increased erosive force from PDPs that are approved before the permanent HMP is complete. The Copermittees are given 2 years to develop an HMP that contain specific requirements that are suitable for the Orange County area (not including time for review and approval from the Regional Board, and incorporation of the HMP into local ordinances). Interim criteria are necessary in order to protect downstream creeks and beneficial uses while the HMP is under development.

Because the interim criteria are already stated in the Order, there is no requirement to "develop and re-develop" programs. The requirement is to develop an HMP once. The commenter suggests that a preferred method is "continuation of existing new development controls." The Regional Board disagrees with this suggestion as the limited controls in place currently have done little to protect and restore the beneficial uses of downstream receiving waters, which is why a regional HMP is necessary.

The Regional Board agrees that the hydromodification study currently being done by SCCWRP will be useful in developing the HMP. The SCCWRP study is nearing completion and therefore the Copermittees will be able to access the information in developing their HMP.

Comment No.	115	Commenter No.	34	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment In closing, we would like to thank you for the continued opportunity to comment on the Draft Permit and appreciate your consideration regarding the important concerns described herein. The Riverside County Permittees reiterate their request made in the ROWD submitted in January 2009 that the next Riverside County MS4 Permit be structured and based on our existing Permit and that any expansion of compliance requirements be limited and support our efforts to improve the effectiveness of existing compliance programs in addressing specific water quality impairments. We appreciate your consideration of our comments and look forward to meeting with Regional Board staff in the development of a MS4 Permit specific to Riverside County.

Response Comment noted. Comments regarding program inclusion for the renewal of R9-2004-001 will be addressed during that NPDES permit renewal process.

Comment No.	116	Commenter No.	35	Comment Subject	LID
--------------------	-----	----------------------	----	------------------------	-----

Comment The language in the Tentative Order, while specifying a volume capture approach to sizing LID BMPs, introduces a narrow definition of LID through restrictive application of BMPs to only those that infiltrate, harvest and use rainwater, and/or evapotranspire all of the captured water (See Section F.1.d.(4)(c)). In other words, permit language now requires that projects would be limited to zero discharge of a design storm volume with no cross-boundary runoff whatsoever allowed.

Unless the Tentative Order is better clarified, the draft provisions seemingly rule out the use of LID BMPs for filtration – and instead require that no storm water (except in the largest rains) can ever leave a developed or redeveloped parcel unless an infeasibility analysis is performed. If this is intended, it is a radical measure that should not be undertaken. It would violate millennia (literally) of civil law concerning the unconstrained flow of rain water (called “diffuse surface water”). Specifically, the law in California – which itself is derived from the laws of the Roman Empire – favors what is called the “natural flow doctrine,” which states that diffuse surface flows should be permitted to flow to their natural water course. See *Gdowski v. Louie*, 84 Cal.App.4th 1395, 1402 (2000) (“California has always followed the civil law rule. That principle meant ‘the owner of an upper ... estate is entitled to discharge surface water from his land as the water naturally flows. As a corollary to this, the upper owner is liable for any damage he causes to adjacent property in an unnatural manner.... In essence each property owner’s duty is to leave the natural flow of water undisturbed.’” – emphasis added by the court, quoting *Keys v. Romley*, 64 Cal.2d 396, 405-06 (1966)).

Response The purpose of the ruling in *Gdowski vs. Louie* was to protect downstream property holders from harm. In that regard, the Tentative Order includes provisions to protect the downstream water rights holders from harm. For example, section E.1 of the Tentative Order states “Nothing herein shall authorize a CoPermittee or other discharger regulated under the terms of this order to divert, store or otherwise impound water if such action is reasonable anticipated to harm downstream water right holders in the exercise of their water rights.” The Tentative Order does not rule out the use of LID BMPs for biofiltration. Biofiltration BMPs may be used without mitigation if infiltration, capture, and evapotranspiration BMPs are technically infeasible.

Comment No.	117	Commenter No.	35	Comment Subject	LID
--------------------	-----	----------------------	----	------------------------	-----

Comment Mandating the complete on-site retention of any sizable storm volume (i.e. runoff that never crosses any property boundary as surface flows) is not a reasonable approach. The Tentative Order seemingly seeks to implement LID in a way that is contrary to the EPA definition of LID by restricting BMPs to those that only achieve zero discharge—not allowing any BMPs that appropriately “filter” runoff, such as bioretention cells or other vegetated LID BMPs. Total, 100-percent on-site retention remains impractical and unwise in most circumstances, and is not a goal that can be achieved for most projects within reasonable costs, despite best efforts. Moreover, such a mandate abandons the goal to mimic predevelopment conditions to the extent practicable, as EPA encourages.

Response The Tentative Order’s requirements for implementing LID are similar to those requirements found in the Santa Ana Regional Board’s MS4 permit for North Orange County. The Tentative Order allows the use of biofiltration where total capture is technically infeasible. Implementation of LID is expected to help a project site more easily meet the hydromodification requirements.

Comment No.	118	Commenter No.	35	Comment Subject	LID
--------------------	-----	----------------------	----	------------------------	-----

Comment We provide, in Attachment 1, a comprehensive analysis done by Geosyntec Consultants of the feasibility of implementing rainfall and stormwater harvesting systems and the utility of these systems in achieving pollutant load reductions from stormwater runoff as compared to use of all types of LID BMP features. This document shows that attempts at harvesting alone may result in poor water quality treatment performance relative to a well designed system of LID BMPs that includes all types of BMPs, not just those that capture and retain stormwater. This document also identifies the current institutional barriers--code requirements--that will need to be adjusted long before total rainwater capture systems can be considered feasible in any practical sense.

Response Thank-you for providing the Geosyntec Consultants' analysis. The Regional Board understands that complete capture is not always technically feasible at all project sites. Therefore, for those sites where LID is technically infeasible, the Tentative Order provides alternative compliance options.

We do not draw the same conclusions as the commenter from our review of the analysis. The analysis does not look at the other two options for LID capture; infiltration and evapotranspiration. Therefore, the analysis presumes that all rainfall captured must be reused, without infiltration or evapotranspiration.

The analysis of rainfall and storm water harvesting appears to be conducted on a flow basis and did not consider pollutant loading. A well-documented phenomenon in storm water runoff is the "first flush." The first flush is the most polluted portion of runoff during the initial portion of a rain event following an extended dry period. During that dry period, pollutants accumulate on the surfaces and the first rain washes away the pollutants, depositing them in receiving waters. In back to back storms as looked at in the analysis, the first storm would probably carry a significant pollutant load due to the first flush. That pollutant load in the first flush would be captured by the LID BMPs. The successive storm event would not produce the same level of pollutant load as the first event due to less time being available for pollutants to accumulate. So, although the second storm event may not be fully captured by LID BMPs, the second storm would still produce runoff with a lesser pollutant load than found in the first rain event.

Comment No.	119	Commenter No.	35	Comment Subject	LID
--------------------	-----	----------------------	----	------------------------	-----

Comment To CICWQ, the retention BMPs of infiltration, harvesting, and evapotranspiration ("ET") may be described as preferred LID BMPs, but they should not be universally mandated to the exclusion of all other options. As the EPA definition of LID indicates, biofiltration, bioretention, filter strips, and other BMPs based on using vegetation to promote stormwater treatment via filtration are fundamental to LID implementation. These BMPs may be specified as secondary options (although they best mimic pre-development conditions), but project proponents should have considerable discretion to use these BMPs, and should not be required to perform a feasibility analysis to do so.

Response The Tentative Order has included biofiltration as a compliance option where LID retention BMPs are technically infeasible. Retention BMPs have a greater assurance of pollutant removal and thus are preferred. Due to their greater efficiency at pollutant removal, project sites should strive to implement these BMPs where feasible. The requirement for a technical feasibility analysis is appropriate to ensure that project sites are striving to implement retention BMPs to protect water quality.

Comment No.	120	Commenter No.	35	Comment Subject	SAL
--------------------	-----	----------------------	----	------------------------	-----

Comment The Tentative Order establishes Municipal Action Levels (MALs) for selected pollutants (pH; TSS; chemical oxygen demand; total Kjeldahl nitrogen; nitrate & nitrite; total phosphorous; and total cadmium, chromium, copper, lead, nickel, zinc, and mercury). In comparison, the Ventura County Tentative Order MALs are set for only those pollutants that were identified as pollutants of concern by the Ventura Program. Such an approach avoids using public resources unwisely and inefficiently by not requiring actions to address pollutants that are not resulting in local water quality concerns. The revised Ventura County Tentative Order includes MALs only for the following pollutants of concern: TSS; nitrate & nitrite; and total copper, lead, and zinc. If MALs are to be included in the South Orange County Tentative Order, they should be revised to include only those pollutants that are of particular concern in southern Orange County.

Response Please note that the terminology has changed from "Municipal Action Levels" (MALs) to "Stormwater Action Levels" (SALs).

Please note SALs have been revised and now include only the following constituents: Turbidity, Nutrients, Cadmium, Copper, Lead, Nickel and Zinc. Each of the above pollutants has been identified as a pollutant of concern through CWA Section 303(d) listing and/or monitoring conducted under Order R9-2002-01.

Comment No.	121	Commenter No.	35	Comment Subject	SUSMP
--------------------	-----	----------------------	----	------------------------	-------

Comment Section F.1.d(6)(g) – Treatment Control Requirements

The Revised Tentative Order states:

“Not be constructed within a waters of the U.S. or waters of the State.” The sentence should be modified to be consistent with the statement on page 14 of the Order regarding federal authorization as follows: “Without federal authorization (e.g. pursuant to Clean Water Act Section 404), not be constructed within a waters of the U.S. or waters of the State.”

Response Please see Comment no. 69 in the July 1, 2009, Response to Comments IV. This comment was also addressed in the 2007 Response to Comments.

Comment No.	122	Commenter No.	35	Comment Subject	Hydromod
--------------------	-----	----------------------	----	------------------------	----------

Comment The hydromodification control waivers contained in this subsection should expressly include waivers for projects that do not increase the potential for hydromodification impacts over the existing site conditions, or that discharge to a receiving water that is not susceptible to hydromodification impacts. Suggested edits are as follows:

(c) On-site hydromodification control waivers: Copermittees may develop a strategy for waiving hydromodification requirements for on-site controls (not site design BMPs) in situations where assessments of downstream channel conditions and proposed discharge hydrology clearly indicate that adverse hydromodification effects to present and future beneficial uses are unlikely. The waivers must be based on the following determinations:

(i) Lack of discharge-caused hydrology changes: Waivers may be implemented where the total impervious cover on a site is increased by less than 5% in new developments and decreased by at least 10% in redevelopments within the site’s watershed at planned build-out is less than 5%. This numeric criteria may be revised to be consistent with findings from reports from the Storm Water Monitoring Coalition and Southern California Coastal Waters Research Program. Alternatively, directly connected impervious area or effective impervious cover may be used as an indicator, provided that numeric criteria for the indicators are used and are based on hydromodification studies conducted in southern California. Waivers may also be implemented for the following projects that do not increase the potential for hydromodification impacts over the existing site conditions:

(A) Projects within a natural watershed where a geomorphically-based watershed study has been prepared that establishes that the potential for hydromodification impacts is not present.

(B) Significant redevelopment projects that do not increase impervious area or decrease the infiltration capacity of pervious areas compared to the pre-project conditions.

(C) Projects that discharge directly or via a storm drain to a substantially hardened channel, sump, a lake, area under tidal influence, or other receiving water that is not susceptible to hydromodification impacts.

Response Projects are exempt from hydromodification management requirements if they do not increase the potential for impacts over the site’s pre-development, naturally occurring condition, or that discharge to a receiving water that is not susceptible to hydromodification impacts. Section F.1.h.(c) requires hydrologic control measures at PDPs where hydromodification effects are expected, but does not require controls where hydromodification effects are not expected. Therefore, there is no need to incorporate the changes suggested by the commenter.

In terms of assessing whether or not a project would have impacts over existing site conditions, the commenter must be aware that the performance standard is that of the pre-development, naturally occurring condition. This is the only way to ensure that the natural flow regime of the watershed is restored in order to protect Water Quality Standards. Section F.1.h(3) already allows the Copermittees to exempt projects that discharge to a channel that is concrete lined all the way to the ocean, enclosed bay, reservoir or lake. The Regional Board agrees that such a receiving water is not susceptible to further hydromodification impacts (although the lining of the channel is already a negative impact on beneficial uses). In terms of assessing the amount of impervious cover that results from building of a project, the text of section F.1.h has removed references to this performance standard.

Comment No.	123	Commenter No.	35	Comment Subject	Hydromod
--------------------	-----	----------------------	----	------------------------	----------

Comment Section F.1.h (3)(c)(ii)(b) – Hydromodification Control Waivers, degraded stream channel condition

The waiver for discharges into degraded stream channels has been removed in the Revised Tentative Order. As stated in the Supplemental Fact Sheet

“If requirements for currently degraded channels are removed, there will be a diminished opportunity for future restoration of Beneficial Uses of that receiving water due to the lack of hydromodification controls.”

In areas tributary to channels that have been engineered as part of a Flood Control Master Plan that incorporated channel modifications and drop structures that control channel morphology and areas tributary to streams that are geomorphically unstable and have degraded to the point that controls on Priority Projects alone would not be effective in addressing impacts, projects should be allowed to contribute to in-stream or retrofit measures in lieu of onsite hydromodification controls.

Response The waiver for discharges into concrete lined channels has not been removed. If a stream has been channelized and hardened all the way from the PDP to the ocean, enclosed bay, reservoir, or lake, then the Copermittees have the discretion to waive the hydromodification management requirements for that PDP (section F.1.h.(3)(b)). The quoted text in the fact sheet has been removed to avoid confusion regarding restoration of concrete lined channels. The Tentative Order does not require the Copermittees to restore hardened channels to their natural state.

In certain cases, projects should be allowed to contribute to in-stream or retrofit measures in addition to (not in lieu of) onsite hydromodification controls (section F.1.h.(2)). For example, if there are measures taken to restore or rehabilitate a stream, then smaller hydrologic control measures might be needed at the project site than if no in-stream measures were taken. The Regional Board encourages efforts to restore the beneficial uses of creeks by returning them to their natural state.

Comment No.	124	Commenter No.	35	Comment Subject	Hydromod
--------------------	-----	----------------------	----	------------------------	----------

Comment Section F.1.h(6) – Interim Hydromodification Requirements

The Tentative Order includes an “Effective Impervious Area” (EIA) threshold requirement for Priority Projects as an interim hydromodification control requirement. The use of EIA as a regulatory metric for LID implementation is the subject of considerable debate and concern within the stormwater management and science community, as well as among urban planners and practicing landscape architects. Specific aspects of this concern include whether an EIA criterion should be used and, if used, if its application on a site-by-site basis is appropriate given its potential impact on urban redevelopment, smart growth, and sprawl. The use of an EIA requirement needs to be fully vetted to ensure that redevelopment of brownfields and infill development are not discouraged, but rather are encouraged, by the permit.

Although managing EIA is an important tool to achieving the goal of beneficial use protection, it should not be a goal in itself as it does not reflect the goals of the Clean Water Act. The origin of this measure is that it illustrated a threshold beyond which impacts could be identified in watersheds where treatment and hydromodification controls, including source controls, were generally not implemented. The adverse effects of impervious areas can be mitigated by a variety of tools including directing runoff to pervious surfaces, incorporating pervious material, or by controls located at the project scale, sub-watershed scale, or watershed scale. The issue is achieving beneficial use protection, not tool selection.

The volumetric control standards provided in section F.1.h(6)(a)(iii) are sufficient for interim hydromodification control. The inclusion of the EIA metric in F.1.h(6)(a)(i) is unnecessary and unwarranted.

Response Please see the response to Comment No. 7.

Comment No.	125	Commenter No.	35	Comment Subject	SUSMP
Comment	<p>The definition of Development Projects should clarify that for purposes of the Revised Tentative Order a land subdivision made for financing or legal purposes (i.e. without soil disturbing activities) is not considered a "Development Project." Modify the language as follows:</p> <p>"Development Projects – New development or redevelopment with land disturbing activities: structural development, including construction and installation of a building or structure, the creation of impervious surfaces, public agency projects, and land subdivision (except for financing or legal purposes)"</p>				
Response	<p>The definition is clear that development projects must include land disturbing activities. Land subdivision that does not include land disturbance would not be considered a development project. Land subdivision was included to prevent piecemealing of larger projects in an attempt to evade the requirements of the Tentative Order. No change is necessary in response to the comment.</p>				

Comment No.	126	Commenter No.	35	Comment Subject	Hydromod
Comment	<p>The definition of "Effective Impervious Area" does not accurately reflect the studies in which the term was derived. The definition should be edited as follows:</p> <p>"Effective Impervious Area (EIA) – that portion of the impervious area or pervious area incapable of retaining design storm flow that is hydrologically hydraulically connected via sheet flow or a discrete hardened conveyance to a drainage system or a receiving water body."</p> <p>Suggested edits to the definition of "Erosion Potential" are as follows:</p> <p>Erosion Potential (EP) - is determined as follows – A ratio calculated to estimate the likelihood of stream instability due to watershed land use changes. Ep is determined as follows: The total effective work done on the channel boundary is derived and used as a metric to predict the likelihood of channel adjustment given watershed and stream hydrologic and geomorphic variables. The A sediment transport or work index (W) under urbanized conditions is compared to the work index that under pre-urban conditions and expressed as a ratio (EP). The effective work index (W) is computed using applicable sediment transport or effective work equations, as appropriate to the channel materials and morphology. These equations quantify as the magnitude of excess shear stress that exceeds a exceeding the critical value for streambed mobility or bank material erosion, integrated over time, and represents thereby represent an estimate of the total work done on the channel boundary.</p> <p>The effective work index for presumed stable stream channels under pre-urban conditions is compared to stable and unstable channels under current proposed urbanized conditions to evaluate the adequacy of proposed hydromodification BMPs. The comparison, expressed as a ratio, is defined as the Erosion Potential (Ep)¹ (MacRae 1992, 1996).</p>				
Response	<p>References to both the Effective Impervious Area and Erosion Potential have been removed from the Tentative Order.</p>				

Comment No.	127	Commenter No.	36	Comment Subject	General
Comment	<p>Over the past several months, SDRWQCB Staff, South Orange County Copermittees and other stakeholders have been meeting to discuss potential revisions to the March 2009 draft of Tentative Order No. R9-2009-0002. The City of Laguna Niguel has appreciated these opportunities to share perspectives and work toward resolution of certain issues.</p> <p>In the course of these workshop meetings, SDRWQCB Staff solicited comments and then distributed several sets of "draft updates" to various sections of the text for discussion. The Staff also committed to issuing a complete redlined track-edited draft incorporating proposed text adjustments to all interested parties by June 19. Unfortunately, June 19 was also the specified deadline for submittal of written comments for purposes of the July 1 hearing.</p> <p>While we appreciate the need for SDRWQCB Staff to have adequate time to prepare their response to comments, the June 19 deadline provides no opportunity for the Copermittees and other stakeholders to provide written comments on the complete final draft permit that will be presented to the Board. We cannot effectively comment today on something we were not to see until today (and have not yet seen as of this writing on 3:30 p.m., Friday, June 19).</p> <p>Consequently, we would like to request that the written comment period not be closed at the end of the July 1 hearing, but instead be held open for another 10 days after the hearing - especially if additional errata are presented on July 1. Closing the comment period on July 10 would still allow the Staff a full month to respond prior to the scheduled adoption hearing on August 12.</p> <p>Thank you for your consideration of this request.</p>				
Response	<p>Regional Board staff have responded to all written comments received from the close of the March 2009 draft Tentative Order public comment period to the close of the current Tentative Order (August 2009) comment period. The latest version of the Tentative Order is essentially the June 19, 2009 red-line strikeout version. Thus, the Copermittees have had ample time to review and comment on the entirety of the Tentative Order. It must be noted that the substantial changes (NELs, SALs, removal of exemption to prohibition for over-irrigation, LID and Hydromodification requirements) were extensively discussed well in advance of the July 2009 Hearing.</p>				

Comment No.	128	Commenter No.	37	Comment Subject	SAL
Comment	<p>At the July 2, 2009 public hearing, one of your board members requested clarification regarding the proposed Municipal Action Level (MAL) for nickel and the assertion made in the presentation by Richard Boon, County of Orange, that it was more stringent than the Basin Plan objective (See Attachment 1 - Presentation Slide). Mr. Boon was not present at this time to clarify the data and, in his absence, your staff opined incorrectly that Mr. Boon had used a Maximum Contaminant Level (MCL) rather than a Basin Plan objective and that the MAL was not more stringent than the Basin Plan.</p> <p>The comparison of the proposed MAL for nickel (26/ug/l) with the Basin Plan objective for nickel was first presented in our comment letter of May 15 on the March 13, 2009, version of the Tentative Order. For the nickel objective, the Basin Plan incorporates the California Toxics Rule (CTR) by reference. CTR establishes both acute and chronic objectives. Since the MAL appeared to be an instantaneous value, the comparison was made to the California Toxic Rule acute criterion. The published value (see Attachment 1 - p . 37772 Federal Register/ Vol. 65, No. 97/Thursday, May 18, 2000/Rules and Regulations) for this criterion, which assumes 100mg/l as CaCO3 hardness, is 470ug/l. The MAL is therefore significantly more stringent than this Basin Plan objective.</p> <p>Constituent Nickel</p> <p>CTR Criterion - Maximum Concentration 470 ug/l</p> <p>Proposed MAL 26 ug/l</p> <p>It is requested that this clarification be provided to your Board members to eliminate any confusion on the response to the question.</p>				

Response	<p>Please note that the terminology has changed from "Municipal Action Levels" (MALs) to "Stormwater Action Levels" (SALs).</p> <p>The Regional Board appreciates the clarification regarding the presentation made by Mr. Boon.</p> <p>Please note that Regional Board staff, prior to the July 01, 2009 presentation by the County of Orange, clarified to the County that SALs were updated to include a measure of receiving water hardness to establish metals criteria in order to determine if a SAL was exceeded. Incorporation of a site and time specific hardness measure to determine the SAL for metals is a more accurate application of CTR, and thus the Basin Plan, than assuming a hardness value of 100 mg/L. This has already been incorporated in the August 09, 2009 Tentative Order.</p>
-----------------	---

Comment No.	129	Commenter No.	38	Comment Subject	General
Comment	<p>The Water Authority supports comments provided to the Regional Water Quality Control Board by USMC Camp Pendleton, dated June 19, 2009, on the Orange County Municipal Storm Water Permit Reissuance Order No. R9-2009-0002. Although Camp Pendleton is a member of the Water Authority, they remain almost fully self-sufficient by virtue of their reliance on local groundwater supplies from both the San Mateo and Santa Margarita groundwater basins. These local supplies are critical for Camp Pendleton's long-term sustainability and help maintain the overall sustainability of the San Diego Region.</p>				
Response	<p>Comment noted. It is expected that advances made in cleaning up storm water and non-storm water surface flows should improve water quality to the benefit of ground water supplies.</p>				

Comment No.	130	Commenter No.	38	Comment Subject	LID
Comment	<p>The Water Authority supports the use of low impact development (LID) approaches to storm water management to the extent that the LID improves water quality and does not reduce water available to our member agencies that may use local groundwater basins. Stormwater capture also has the potential to augment local water supplies if it is properly managed by capturing peak flows that would otherwise be lost to the ocean. Focusing efforts on those stormwater activities that would increase local supplies would have multiple benefits and would be supported by the Water Authority.</p>				
Response	<p>Comment noted.</p>				

Comment No.	131	Commenter No.	38	Comment Subject	Retrofitting
Comment	<p>We are concerned with the approach proposed in the proposed Permit that would require LID retrofits of existing properties in South Orange County. State Board policy encourages the use of LID and hydromodification to reduce hydrograph peaking and maintain water quality. In the past, the focus has been on using LID in new development in a manner that would maintain current flows. Retrofit of existing properties has the potential to alter the downstream flows in San Mateo Creek reducing the availability of water that is currently captured, recharged, and extracted in local water supply wells. This could potentially raise serious water rights issues. For each basin where LID is contemplated, the impact of such an action on the local water supply should be evaluated. Implementation of LID, as proposed in the Permit, should not be contemplated until a comprehensive evaluation and modeling of the groundwater basin is completed that would assess the overall impacts on water supply as a result of compliance with the Permit requirements.</p> <p>We support the Camp Pendleton's recommendations that are designed to protect their local water supply and water rights.</p>				
Response	<p>The Regional Board understands this concern and has previously included Camp Pendleton's recommended language into the Tentative Order.</p>				

Comment No.	132	Commenter No.	39	Comment Subject	FETD
Comment	<p>On Page 8 of the new NPDES (Development Planning) below a #6 should be added: Diversions Impair Ocean Outfall Discharges</p> <p>b. Controlling urban runoff pollution by using a combination of onsite source control and site design BMPs augmented with treatment control BMPs before the runoff enters the MS4 is important for the following reasons: (1) Many end-of-pipe BMPs (such as diversion to the sanitary sewer) are typically ineffective during significant storm events. Whereas, onsite source control BMPs can be applied during all runoff conditions; (2) End-of-pipe BMPs are often incapable of capturing and treating the wide range of pollutants which can be generated on a sub-watershed scale; (3) End-of-pipe BMPs are more effective when used as polishing BMPs, rather than the sole BMP to be implemented; (4) End-of-pipe BMPs do not protect the quality or beneficial uses of receiving waters between the pollutant source and the BMP; and (5) Offsite end-of-pipe BMPs do not aid in the effort to educate the public regarding sources of pollution and their prevention.</p>				
Response	<p>To the extent that such diversions impair ocean outfall discharges, such matters should be taken up with that ocean outfall discharger's individual NPDES permit. We understand that these types of diversions decrease the capacity of treatment works. Again, these issues are best handled through the individual treatment works NPDES permit. In-creek diversion systems are not regulated by the Tentative Order and are more appropriately regulated through Clean Water Act Section 401 Water Quality Certifications, Waste Discharge Requirements and/or individual NPDES permits.</p>				

Comment No.	133	Commenter No.	39	Comment Subject	FETD
--------------------	-----	----------------------	----	------------------------	------

Comment It has become obvious that there has been NO attempt by the Board to halt these diversion activities. Worse, the Board has the power to deny or prohibit the local JPA, South Orange County Wastewater Authority (SOCWA) via its NPDES Ocean Outfall Pipe Discharges (off Dana Point and Aliso Creek Beaches) such diverted surface flows. The Board's silence is tacit approval.

The CLB sends almost .4 mgd, is legally allowed by SOCWA to send 50,000 gd per diversion. This equals potentially 1 mgd, and CWN!C has been able to confirm that the Coastal Treatment Plant (CTP) only processes about 3.5 mgd total of wastewater.

Co-mingled with the Aliso Creek Ocean Outfall Pipe (ACOOOP) is the recently approved .66 mgd diversion of briny waste from the Irvine Ranch Water District of the former MCAS El Toro contaminated aquifer cleanup. This has been projected to require as much as 20 years or more for remediation, and IRWD has admitted at Rehab Hearings that minor, "acceptable" traces of TCE and perchlorate are in the wastewater.

Adding insult to injury will be the .3 mgd of briny waste from the proposed South Coast Water District diversion of Aliso Creek, presently pending due to Cal Water Rights procurement.

The County of Orange, in its strategies, has included an Urban Runoff Treatment Plant with a capacity of approximately 6.5 mgd that will reduce bacteria and TDS in the Aliso Creek Estuary. Briny waste going into the ACOOP is projected to be 1-2 mgd.

CWN!C has NOT been able to ascertain exact numbers of such diversions or exact quantities/volumes of briny waste from Advanced Waste Treatment infrastructure at the Regional Plant (LNRP) in Laguna Niguel, volumes of which are included in the ACOOP discharge.

At the CTP, 1 mgd = Approx. 25% of the total emptied by the facility into the ACOOP. As the NPDES for the ACOOP isn't scheduled for renewal for several years it impinges upon the Board to stop giving tacit approval to these increased volumes NOW. It should be noted that by the time bio-assessment of longterm adverse impacts at the outfalls have taken place, "dead zones" may have occurred and be irreversible. Toxic biomagnification will have already taken its toll.

As the staff well knows, and the Board should, urban runoff contaminants are NOT reduced or removed by these plants UNLESS given AWT (tertiary) cleansing targeted or specifically designed for the pollutants of concern.

Response The regulation of in-stream diversion and treatment BMPs are not covered by this Tentative Order. These types of diversion systems are more appropriately regulated through Clean Water Act Section 401 water quality certifications, Waste Discharge Requirements and/or individual NPDES permits. Comments regarding the SOCWA ocean outfall pipe are best addressed through their NPDES permit renewal. The Tentative Order does not regulate SOCWA's ocean outfall.

Comment No.	134	Commenter No.	25	Comment Subject	FETD
--------------------	-----	----------------------	----	------------------------	------

Comment Board and staff need to address the blatant disparity between policy and implementation. It is ludicrous that MS4 Permittees are allowed to solicit and receive state or federal funds in contradiction to the very goals of the NPDES process. Funding violators to circumvent compliance makes no sense.

Setting lofty goals while allowing Permittees to siphon funds more appropriate for legitimate mitigations, pilot/demos, BMPs, BETs, BCTs and BATs, etc. needs to be brought to the forefront.

Response Comment noted.

Comment No.	135	Commenter No.	39	Comment Subject	FETD
Comment	<p>Chronic violators who initially agreed that diversions were temporary have now PERMANENTLY included the infrastructure to accomplish their purpose of compliance WITHOUT source reduction, WITHOUT enforcement. While they claim both are too expensive the State and other agencies continue to fund the diversions, the Permittees continue to supplement these funds for the O & M costs. Who in their right mind believes that the Permittees will EVER dismantle these diversions? They are now widely integrated, insinuated into the MS4 systems themselves and lead agency strategy thinking---The Permittees will claim Economic Unfeasibility or Technological Impossibility if asked to remove or return them to historical configurations.</p> <p>Allowing these runoff diversions to be added to the South County outfalls only moves the problem, in fact creates toxic bundles discharged into critically sensitive marine habitats. In the case of both the San Juan and Aliso, these creek mouths are acknowledged corridors for the endangered species and ESU Southern Steelhead (O. mykiss). The outfalls are becoming DOMINATED by CTRs and Prop. 65 chemicals.</p>				
Response	<p>It is more appropriate to regulate FETDs through an individual or regional permit. This does not, however, preclude these facilities from any enrollment requirements under the Statewide Industrial Storm Water permit for storm water runoff or from obtaining a CWA Section 401 Water Quality Certification. The intake and subsequent discharge from FETDs will require a separate NPDES permit and/or Waste Discharge Requirements. The Tentative Order does not provide funds for the operation and maintenance costs of such facilities. The South County outfalls are regulated under separate NPDES permits. Comments regarding toxicity, pollutants, and capacity for those outfall discharges should be addressed to their respective NPDES permit.</p>				

Comment No.	136	Commenter No.	39	Comment Subject	FETD
Comment	<p>It is time for the SDRWQCB to drag SOCWA and its members into the 21st Century by mandating a 5 year phase-in of 100% Advanced Waste Treatment (tertiary) at ALL of its facilities in South OC.</p> <p>NPDES compliance will never take place if the Board does not take a stronger oppositional position. If it will not, then perhaps we should just suspend the entire process, abandon MS4 Permits as they will never drive CWA or Porter-Cologne compliance. Permittees will continue to find ways or fiscal means to avoid source tracking, reduction and prevention.</p>				
Response	<p>This permit does not regulate the SOCWA and its members with respect to their waste water discharges. Please address your comment regarding Advanced Waste Treatment to the appropriate NPDES permit.</p>				

Comment No.	137	Commenter No.	40	Comment Subject	General
Comment	<p>I want to thank you for your help in bringing to the attention of the San Diego Regional Water Quality Control Board the need to address the issue of contaminated fire sprinkler discharge.</p> <p>The Board's recommendation to require co-permittees to mandate fire sprinkler maintenance activities as illicit discharges speaks loudly about the need to begin regulating a number of sources of pollutants that for the most part drain to ground surfaces and storm drains. We can no longer ignore these sources of pollutants, especially since we now have the capacity to clean discharge at the source or transport it to cleaning centers. Through filtering and cleaning, we can recycle and reuse waste water, an important point to be considered in our current time of water shortages and reduced water allowances.</p> <p>Your board has set an example that I believe will be difficult for the other regional boards not to follow. Again, thank you for your assistance, and I look forward to seeing the new language to be added to regional water quality law.</p>				
Response	<p>Comment noted.</p>				

Comment No.	138	Commenter No.	41	Comment Subject	General
Comment	<p>I am the Member at Large on the Casa Loma Homeowners' Association Board of Directors. In fact, my building is practically next to Oso Creek as the creek heads to the golf course. I have read R9-2009-0002 and have the following comments on it. I like the report. It seems well written and took along time and lots of research to put together. The parts in it for retrofitting properties like Casa Loma is very good. And making the water quality control enhancements in such a way as to complement and not destroy natural features that can be part of water quality control is a great plus. The natural features of the land should be preserved and this Order does that. Storm water should be treated at its source to the greatest extent possible before heading to the storm drain system, and this Order calls for that. Also, we are working with two water districts to have a union supply line for recycled water go by our complex so we can use recycled water for the landscape; and I saw a small part in the report looking to see if storm water runoff could not be integrated with recycled water to the fullest extent possible which is another good thing. The way it is in the Order, the Pollutant Credit System seems good. And I am happy that the Order recommends against pouring more concrete onto stream and river banks but calls for restoration to natural conditions to the greatest extent possible. There is a part of the Oso Creek Trail on the Pacific Hills side between the Marguerite Parkway and La Paz Road trail entrances where old sections of curb, old brick chimnies, and old pieces of tennis courts with the paint still on them have been dumped along the creek bank. Those things really stand out from the natural features. There are also two large storm drain openings that empty into Oso Creek on either side of the La Paz Road overpass bridge and sometimes there are plastic bottles, tin cans, plastic wrapping at the mouths of these storm drains and plastic cups and bottles floating down in the creek that probably came in through the storm drains because they are not too far from the drains. Finally, if I was giving a grade to this report, I would give it between an A and A plus. It should be implemented.</p>				
Response	<p>Comment noted.</p>				

Comment No.	139	Commenter No.	42	Comment Subject	Existing Development
Comment	<p>I contact the City of Anaheim, received the same direction to contact the County, and received the attached BMP developed as a result of the adoption of the new NPDES MS4 Permit. It appears that my concerns shared in testimony and comments are valid. I have requested the Permit be prescriptive so that BMP's would be consistent with the spirit and intent of the Permit writers. The BMP has lumped all Mobile Businesses together and I believe that there are special practices associated with Wash & Detailing a car that are not addressed.</p> <p>My primary focus of concern is and has been pollution, not the waste water. Focus on pollution, you solve any and all issues with waste water. This BMP mentions pollution in the beginning, but all other language and Practice recommendations focus on the waste water. This water can be controlled and prohibited from entering the Storm Drain. However, the BMPs do not address the pollution left behind which are picked up in Storm Water Runoff as Non Point Source Pollution.</p>				
Response	<p>The Tentative Order prohibits non-storm water discharges from mobile car washing and detailing services. In addition, the Tentative Order requires that storm water discharges are minimized to the maximum extent practicable. Where BMPs are considered to meet the MEP standard, they should be required by the Copermitttees in compliance with the Tentative Order.</p>				

Comment No.	140	Commenter No.	42	Comment Subject	Existing Development
Comment	<p>Region 9 South Orange County</p> <p>You are finalizing your permit</p> <p>Do you see why I come to every meeting to champion a more prescriptive approach and specifying the standards you expect? You set standards on LID at the 85th percentile, so I know it is possible.</p> <p>With no action, even though you have the word pollution specifically inserted into the relevant section on Mobile businesses . There is valid concern that the County will not alter the BMP's.</p> <p>There is sufficient evidence that the Cities will take their direction from the Primary Permittee, the County of Orange.</p> <p>What can we, you or I do?</p> <p>Can you please help me to get a meeting with the County of Orange?</p>				
Response	<p>The Tentative Order prohibits non-storm water discharges from mobile car washing and detailing services. In addition, the Tentative Order requires that storm water discharges are minimized to the maximum extent practicable. Where BMPs are considered to meet the MEP standard, they should be required by the Copermitees in compliance with the Tentative Order. The Tentative Order requires the Copermitees to incorporate a mechanism for public participation in the updating, development, and implementation of the Jurisdictional Runoff Management Program. Failure to do so would be a violation of the Permit.</p>				

Comment No.	141	Commenter No.	43	Comment Subject	LID
Comment	<p>As we pointed out in our previous letters, Region 9 is seeking clear, measurable, and enforceable LID requirements in MS4 permits. The LID requirements of the latest draft are quite similar to the requirements in the North Orange County MS4 permit , adopted in May 2009, with Region 9's support, by the Santa Ana Regional Board (SARB). We believe the SDRB's draft permit would be consistent with our objectives for LID implementation with a few minor revisions discussed below:</p> <p>1) Page 8 (Finding D.2.c) - We recommend either removing the word "filtration" replacing it with "retention." This would be consistent with the draft permit's Part F.1.d.(4)(d) which requires LID BMPs to be sized and designed to ensure onsite retention of the design stonn event. We believe this would also better mirror the intent of mimicking natural hydrology via infiltration, harvesting and reuse, or evapotranspiration of stormwater, as opposed to the use of filtration systems which result in stormwater, flows into the MS4 via underdrains.</p>				
Response	<p>The Regional Board maintains that bio-filtration is part of a comprehensive LID program. Effective bio-filtration provides pollutant removal and energy dissipation. Biological removal of pollutants can even be an improvement over simply keeping pollutants on-site until rainfall over the design-storm criteria washes pollutants into receiving waters. Removal of pollutants and prevention of downstream hydromodification ensures any discharge to be low impact. The USEPA's Green Infrastructure website includes filtration as a Low Impact Development technique; http://cfpub.epa.gov/npdes/greeninfrastructure/information.cfm#glossary. In addition, the U.S. Department of Housing and Urban Development's report titled "The Practice of Low Impact Development," (July 2003, H-21314CA) incorporates filtration techniques. The County of San Diego's LID manual also utilizes bio-filtration as an acceptable LID practice.</p> <p>In the future as the science and knowledge of storm water treatment evolves, filtration may not be a suitable LID practice to meet the maximum extent practicable standard. For this permit iteration, LID BMPs that capture the design storm for reuse, infiltration or evapotranspiration are preferred over bio-filtration techniques. The draft permit provides design-criteria for "LID bio-filtration BMPs" in section F.1.4.d.ii and requires demonstration that retention LID BMPs are technically infeasible prior to implementing bio-filtration BMPs. Finding D.2.C will be modified to replace "filtration" with "bio-filtration."</p>				

Comment No.	142	Commenter No.	43	Comment Subject	LID
Comment	2) Page 31 (Part F .1.c.8) - The inclusion of "LID biofiltration" in this section pertaining to large development projects is inconsistent with both section F.1.d.(4)(d) of the draft permit (described above) and with the SARB MS4 permit for Orange County (Part XII.C.2), where "bio-treatment" is only considered to meet that permit's LID provisions if infiltration, harvesting and reuse, or evapotranspiration are not feasible. This section should be revised to clarify that retention BMPs are preferred, and that the use of biofiltration will comply with this provision only if retention BMPs are not feasible.				
Response	Thank you for the comment. The Regional Board did not intend to have a lesser standard applied to regional BMP implementation. The Tentative Order has been corrected.				
Comment No.	143	Commenter No.	43	Comment Subject	LID
Comment	3) Page 31 (Part F .1.c.8) - At the first mention of the feasibility of onsite retention or "LID biofiltration" there should be a reference to the requirement that feasibility criteria will be proposed by the co-permittees and approved by the Executive Officer (EO). Based on the mention of a "technical feasibility analysis" in section F .1.d. 7., it's our understanding that if the intent of the permit that this analysis must be submitted for the approval of the EO as part of the standard stormwater mitigation plans (SSMPs) and will be subject to public review and comment. The permit should be clarified to explicitly state the expectations for the timing of the submittal of this analysis and the review and approval process. These expectations should be included initially in this section, which is the first instance in the permit where this analysis would apply.				
Response	Section F.1.c.8 has been moved, as it is more appropriately placed as section F.1.d.11.				
Comment No.	144	Commenter No.	43	Comment Subject	LID
Comment	4) Page 34 (Part F.1.d.4.(a)(iv)) - We recommend deletion of the words "filter" and "detain" since they are not consistent with the intent of onsite retention as noted above.				
Response	The word "detain" has been removed and replaced with the word "retain" since retain means to hold on to indefinitely.				
Comment No.	145	Commenter No.	43	Comment Subject	LID
Comment	5) Page 36 (Part F.1.d.4.(d)(ii)) - Given the mention of technical infeasibility in this section) it should be noted here that the conclusions of feasibility will be made based on the approved feasibility analysis.				
Response	The Regional Board agrees with the intent of this provision. The Tentative Order has been clarified.				
Comment No.	146	Commenter No.	43	Comment Subject	LID
Comment	6) Page 36 (Part F.1.d.4.(d)(iii)) - We recommend the word "may" be changed to "must" to ensure conventional treatment is required when LID is determined to be infeasible.				
Response	Thank you for the comment. The Tentative Order has been changed.				
Comment No.	147	Commenter No.	43	Comment Subject	LID
Comment	7) Page 39 (part F.1.d.7) - As noted above, mention of the technical feasibility analysis should clarify expectations for the submittal of this analysis along with the fact that there will be an opportunity for public review 'and comments' and ultimate approval by the EO.				
Response	The first paragraph of this section, F.1.d.7, requires the Copermittees to submit the LID Waiver Program as part of the SSMP. The first paragraph of Section F.1.d requires submission of the updated SSMP within two years of permit adoption and stipulates that the SSMP will be subject to public review and comment. No change has been made in response to this comment. Submission of the updated SSMP within two years is adequate because that will coincide with the submittal of the Hydromodification Management Plan (HMP) and the SSMP should be integrated with the HMP.				

Comment No.	148	Commenter No.	43	Comment Subject	TMDL
Comment	As you know, the Baby Beach TMDL has not yet been approved by the State Office of Administrative Law (OAL) or EPA. Accordingly, Finding E.II is not currently accurate in stating that the permit includes wasteload allocations (WLAs) from fully approved TMDLs. However, we anticipate the Baby Beach TMDL will be approved by OAL and EPA prior to permit adoption) and we suggest you proceed under this assumption.				
Response	The Office of Administrative Law approved the Baby Beach TMDL on September 15, 2009. The United States Environmental Protection Agency approved the Baby Beach TMDL on October 26, 2009.				
Comment No.	149	Commenter No.	43	Comment Subject	TMDL
Comment	1) Page 79 (Part I) - The reference to Finding E.12 appears to be an error, and should be corrected.				
Response	Directive I has been corrected to reference Finding E.10.				
Comment No.	150	Commenter No.	43	Comment Subject	TMDL
Comment	2) Page 79 (Part I. 1. a) - Although Finding E.II identifies the particular copermitees which are affected by the TMDL requirements, it would be helpful for additional clarification to include the names of these co-permittees in Part I.I.a of the permit as well.				
Response	The Regional Board believes it is sufficient to name the Copermitees responsible for TMDL implementation only in Finding E.11. No change has been made in response to this comment.				
Comment No.	151	Commenter No.	43	Comment Subject	TMDL
Comment	3) Page 79 (Part I.I.b) - The permit should contain clear expectations for monitoring to ensure achievement of TMDL WLAs. Given that the referenced TMDL does not include a clear monitoring plan, the permit should require submittal of a monitoring plan and specify the date by which this plan must be submitted.				
Response	Attachment E of the Tentative Order has been modified to require submission of a Mornitoring Plan within 12 months of permit adoption.				
Comment No.	152	Commenter No.	43	Comment Subject	TMDL
Comment	4) Page 79 (Part I.I.c) • Since the date for compliance with the dry weather WLA is five years after permit adoption, it appears erroneous to require both the wet weather and dry weather WLAs to be met by 2019, ten years after permit adoption. It should be noted that dry weather WLAs must be met by the end of 2014.				
Response	Directive I.1.c of the Tentative Order has been corrected to reflect 2014 as the date dry weather Waste Load Allocations must be met.				
Comment No.	153	Commenter No.	43	Comment Subject	NEL
Comment	In our previous letter of May 14, 2009, we supported the inclusion of numeric effluent limiits for non-stormwater discharges, and we continue to do so. Establishing these limits is consistent with section 402(P)(3)(B)(ii) of the Clean Water Act, which states that permits for municipal stormwater must effectively prohibit non-stomwater discharges into the storm sewers:				
Response	Comment noted.				
Comment No.	154	Commenter No.	43	Comment Subject	NEL
Comment	1) Page 22 (part C.4) - We recommend clarification regarding the "representative percentage" of the major outfalls/stations which will be monitored. The permit should provide expectations for the magnitude of required monitoring pursuant to this section.				
Response	The Regional Board appreciates the comment regarding the monitoring. Regional Board staff have retained flexibility within the monitoring language to allow for the Copermitees to adjust their existing non-storm water monitoring efforts to match the new requirements in order to prevent any increases in monitoring costs. The Copermitee's Monitoring Program must be submitted to the Regional Board, at which time the Regional Board will provide careful scrutiny of submitted plans to ensure sufficient sampling occurs to assess compliance with the NELs. This approach received support from Board members at the July 01, 2009 public hearing. Thus, no change has been made to the Tentative Order.				

Comment No.	155	Commenter No.	43	Comment Subject	NEL
Comment	2) Page 23 (Table 4.a.2) - It appears that the numeric values in the columns for the saltwater AMELs and MDELs should be reversed, i.e., the MDELs should be the larger numbers.				
Response	The Regional Board appreciates the comment and the typographical error has been changed.				
Comment No.	156	Commenter No.	43	Comment Subject	SAL
Comment	We fully support the inclusion of stormwater action levels (SALs) in the permit. These requirements help to clarify MEP. We recommend the fact sheet include additional information describing how the particular values for the SALs were derived.				
Response	Finding D.1.h. of the Tentative Order has been updated to explain the derivation of the SALs. The data utilized can be found in Attachment F of the Tentative Order.				
Comment No.	157	Commenter No.	43	Comment Subject	SAL
Comment	1.) Page 25 (Part D.2.) - Again the permit requires Sampling of a "representative percent of the outfalls." Both here and in Part C.4, the permit should provide some degree of specificity so that the permittees and the public have an idea of the expectations for the number of outfalls to be monitored.				
Response	The Regional Board has included flexible language in the monitoring requirements in order to alleviate increased costs associated with the SAL monitoring in the permit. This language allows the Copermitees to propose monitoring for both Sections for review and approval. Please also see response to Comment no. 154.				
Comment No.	158	Commenter No.	43	Comment Subject	Retrofitting
Comment	We fully support the proposed requirements in the permit for retrofitting existing development with additional controls such as LID. The benefits of adding LID measures in particular in new developments have been documented in numerous reports of which the Board is well aware. Such benefits would also accrue from adding LID to existing developments. In addition to the support provided by the fact sheet, we would note that such requirements are encouraged by the State's 2005 report entitled "NPDES Stormwater Cost Survey" which also investigated alternative approaches to stormwater control.				
Response	Comment noted.				
Comment No.	159	Commenter No.	43	Comment Subject	Hydromod
Comment	We are pleased to see the draft permit continues to include requirements related to hydromodification, and that clear, measurable requirements are included to address the issue. We believe the requirements are fully supported in the fact sheet and are consistent with the requirements of other recent MS4 permits in California.				
Response	Comment noted.				

Comment No.	160	Commenter No.	44	Comment Subject	LID
Comment	<p>Section F.1.d.(4) - Reduce pollutants to the MEP or implement LID to the MEP? The Section F.1.d.(4).(d).(iii) requirement to participate in the LID waiver program effectively replaces the Clean Water Act directive to reduce the discharge of pollutants of concern to the maximum extent practicable (MEP) with a fundamentally new and more stringent standard of implementing a very narrow subset of LID BMPs to the maximum extent practicable. The two requirements are not interchangeable.</p> <p>Section F.1.d.(4) requires on site retention where feasible. Where retention is demonstrated to be infeasible, biofiltration is required. Where that is infeasible, "conventional treatment control BMPs in accordance with Section F.1.d.(6) must be used, and the project must participate in the LID waiver program.</p> <p>However, Section F.1.d.(6).(d).(ii) states that BMPs must, at a minimum, "be correctly sized and designed so as to remove storm water pollutants to the MEP". So, essentially the permit stipulates that if it is infeasible to meet the LID requirements, a site must still meet the MEP standard, and in addition must participate in the LID substitution program. In this context it is clear that the LID requirements and the triggering of the LID substitution program are additional requirements above and beyond the requirement to meet the MEP standard.</p> <p>It would be more consistent with the MEP standard to include an MEP waiver program in the permit instead of an LID waiver program. If for some reason a project is unwilling to implement the most effective controls that are also feasible, then it is perfectly reasonable to require participation in a waiver program to ensure that at least on a watershed basis impacts of development are mitigated.</p>				

Response	<p>The Clean Water Act requires that pollutants in storm water discharges are reduced to the maximum extent practicable (MEP). Current runoff management, knowledge, practices and technology consider the use of LID BMPs as meeting the storm water MEP standard. Therefore, the storm water treatment controls must also be designed to meet this same level of pollutant reduction to be considered MEP.</p> <p>The Regional Board realizes the difficulty in design and implementation of treatment controls to be able to reduce pollutants to the same standard as LID retention BMPs. Therefore, the Tentative Order allows project proponents to design conventional treatment controls at least up to the design storm as long as mitigation or in-lieu fees, which compensate for the pollutant load that would otherwise be retained by LID BMPs, are also implemented. A project proponent may choose to design their treatment controls to treat storm flows greater than the design storm that, in effect, would provide an equal pollutant removal as LID retention BMPs. In that case, mitigation would not be needed.</p>				
-----------------	---	--	--	--	--

Comment No.	161	Commenter No.	44	Comment Subject	LID
Comment	<p>Section F.1.d – Allow regional retention facilities where on-site retention is feasible, but not desirable. Section F.1.d of this permit requires that priority development projects retain the design storm on-site where feasible. We strongly support this requirement, with the caveat that off-site retention should be allowed where local retention is feasible but not desirable. For example, where there are confining layers at some depth below the surface, it may be possible to infiltrate on site, but excess groundwater inputs may create problematic seeps downstream or could otherwise disrupt the local hydrologic balance. It may also be more feasible to manage retention facilities, groundwater tables and water harvest systems regionally. A project should be allowed to discharge runoff to a regional retention BMP in accordance with a regional management plan without needing to first show that on-site retention is infeasible.</p>				
Response	<p>The Tentative Order allows regional mitigation projects through the LID BMP Waiver program. The regional mitigation projects must clearly exhibit that it will not allow a net impact from pollutant loading over and above the impact cause by projects meeting LID requirements.</p>				

Comment No.	162	Commenter No.	44	Comment Subject	LID
Comment	<p data-bbox="194 94 852 126">Section F.1.d.(4).(d).(ii) - Replace "Biofilter" with "Filter".</p> <p data-bbox="194 157 1559 220">To resolve the conflict between implementing LID to the MEP and reducing pollutant discharge to the MEP, the term "biofiltration" in Section F.1.d.(4).(d).(ii) should be replaced with "filtration".</p> <p data-bbox="194 241 1526 367">We also strongly support the use of filtering BMPs where either local or regional retention BMPs are infeasible. However, the draft tentative order attempts to limit the range of allowable filtration BMPs by requiring "biofiltration" with storage for at least 75% of the volume of the design storm. These limitations are not justified by any clear performance benefit and may actually be counterproductive.</p> <p data-bbox="194 388 1559 609">The "bio" modifier and the term "biofilter" are unexplained. Taken literally, "biofilter" may exclude filters using inert filter media without a significant organic component, such as sand. However, nearly all filters, including sand filters will develop a biologically active microbial community of within and especially at the surface of the filter media that will improve pollutant removal and transformation. Presumably filters incorporating organic media, but not plants would qualify as "biofilters". Unfortunately, the term "bio" is often narrowly interpreted as meaning "incorporating plants". This interpretation would be especially unfortunate in this case since it would limit the range of filters allowed and would also ensure that BMPs add to irrigation water demand.</p>				
Response	<p data-bbox="194 630 1226 661">A definition of biofiltration has been included in Attachment C to clarify the interpretation.</p>				

Comment No.	163	Commenter No.	44	Comment Subject	LID
Comment	<p data-bbox="194 94 1567 157">Section F.1.d.(4).(d).(ii) – Replace the 75% design storm storage requirement with a requirement that filters must be moderately to highly effective for anticipated pollutants of concern on site.</p> <p data-bbox="194 178 1567 346">The 75% volume requirement in this section is poorly worded and unnecessary. It currently states that the “detention volume is allowed to be no less than 0.75 times the design storm volume.” Taken literally, this would require a BMP to store 75% of the total design storm volume even where a portion of the design storm is retained on-site by other BMPs. I doubt that this is the intent. At a minimum, this section must be revised to require that the biofiltration BMP be designed to retain 75% of the portion of the design storm that is not retained on site.</p> <p data-bbox="194 367 1567 493">Preferably the requirement would be removed altogether since it conflicts with an earlier observation in the same sentence that biofiltration facilities are designed as flow through BMPs. It is more appropriate to design filters based on a flow rate, rather than a volume. The 75% volume requirement will make these systems unnecessarily large and expensive. No performance based justification is given for this extra cost which will be substantial.</p> <p data-bbox="194 514 1567 672">For example, one impervious acre will produce 2,700 cubic feet of runoff from a 0.75” storm. Assuming a ponding depth of 6” and a soil depth of 18” with a generous void ratio of 30%, a landscape based “biofilter” must occupy at least 4.5% of the contributing impervious site area. This area simply will not be available downstream of impervious areas on many redevelopment sites. In such cases, a similarly effective subsurface, nonvegetated media filter would still be technically feasible since it could be installed under a paved surface.</p> <p data-bbox="194 693 1567 829">The existing 75% design storm storage standard should be replaced by a requirement that any filter implemented must have the ability to treat pollutants of concern expected to be generated on site with at least medium effectiveness as demonstrated in full scale field monitoring. With these changes, a technically feasible and effective solution will exist for all sites regardless of their development density, soil properties or other constraints.</p> <p data-bbox="194 850 1567 1123">Currently, any discussion of the required performance capabilities of a “biofiltration” device is missing from this section. The result of this oversight will be development of designs that seek primarily to meet the “bio” and volume storage requirements instead of the MEP based performance requirements in section F.1.d.(6). These two sets of criteria are potentially conflicting. Requiring conformity with design details instead of the MEP performance standards stifles innovation and may actually prevent the maximum extent practicable standard from being met. For example, a site discharging to a water body with a bacteria TMDL, may be required to install a powered filtration and disinfection system if on-site retention is infeasible. As written, the permit would also require that they participate in the LID waiver program even though the quality of discharge may be far superior to that of a “biofilter”.</p>				
Response	<p data-bbox="194 1144 1567 1386">Biofilters are designed as flow through BMPs, therefore it is allowed for the prefilter detention volume to be 0.75 times the design storm volume. We do not agree that this requirement will make the biofilters unnecessarily large. The design storm volume can be distributed throughout a site. Also, the implementation of LID site design practices such as disconnecting downspouts and installing pervious pavement/pavers will lessen any site's design storm volume for treatment. The LID waiver program is a pollutant load based system. If a project site can demonstrate that they will meet or exceed the pollutant load reduction expected from implementing LID retention BMPs, then no mitigation would be required. The overall filtration design of the biofiltration unit must be for the whole design storm. The 75 percent allowance is for the prefilter detention volume.</p>				

Comment Media Filter Design and Performance Verification

Media filters are available in a wide variety of designs including some that have been proven to be effective for common stormwater pollutants and can be installed below grade in self contained structures. Performance of any media filter is impacted by many factors including hydraulic loading rate, media gradation and chemical properties, bed thickness and orientation, influent pollutant load and concentration, and longevity. Whether a filter has a vegetated component or not is just one additional design factor and may not be a critical factor at all.

At CONTECH we have been researching stormwater filter performance for over 15 years and offer a vegetated version, the UrbanGreen BioFilter® (Attachment 1) and several nonvegetated versions including the Stormwater Management StormFilter® (Attachment 2). Throughout the United States, more than 80,000 StormFilter cartridges have been installed, often in combination with infiltration or detention systems, or other stormwater management practices. In California there are over 25,000 StormFilter cartridges in operation. During the past permit term more than 130 separate StormFilter system installations have been completed in Orange County alone. This system is typically used on the densest and most challenging sites where infiltration and landscape based BMPs are not feasible. The flexibility to use this BMP and similarly effective controls such as sand filters without triggering waiver programs must be maintained for those projects where they are in fact the most effective controls that are technically feasible.

In laboratory tests verified by the Washington Department of Ecology, the StormFilter consistently removed sediment particles 5-10 microns in diameter and larger at full treatment capacity. In the field, the StormFilter has consistently shown the ability to reduce effluent TSS concentrations to less than 20 mg/L when influent concentrations are less than 100 mg/L and to remove greater than 80% of the TSS load at higher concentrations. A variety of StormFilter media options are also available to target specific pollutants such as sediment, phosphorous, heavy metals and oil and grease. The hydraulic loading rate of each cartridge can also be set to achieve various performance objectives. For your reference, a StormFilter performance summary is included with this letter (Attachment 2).

As of June 2009, the Stormwater Management StormFilter is the only proprietary filtering technology that has been field-tested and approved for stand alone use in the following peer reviewed nationally recognized programs:

Washington State Department of Ecology

The Technology Assessment Protocol - Ecology (TAPE)

The StormFilter is approved as stand-alone facility in meeting the Washington State Department of Ecology basic treatment standards.

http://www.ecy.wa.gov/programs/wq/stormwater/newtech/use_designations/StormFilterGULD12307.pdf

Protocol for Stormwater Best Management Practice Demonstrations

Technology Assessment Reciprocity Partnership (TARP)

StormFilter field monitoring data has been verified by New Jersey Corporation for Advanced Technologies (NJ CAT). The StormFilter is certified to remove 80% of typical stormwater sediment by the New Jersey Department of Environmental Protection.

http://www.nj.gov/dep/stormwater/docs/treatment_final_cert_stormfilter.pdf

ETV Protocol– Stormwater Source Area Treatment Technologies

US EPA - Environmental Technology Verification Program

The StormFilter was tested at three separate sites following the ETV protocol.

<http://www.epa.gov/nrmrl/std/etv/vt-wqp.html>

Investigation of Structural Control Measures for New Development

Sacramento Stormwater Quality Partnership

The StormFilter is conditionally approved pending final review of testing information from 33 storms.

<http://www.sacramentostormwater.org/SSQP/development/proprietary.asp>

Response Comment noted. To the extent that conventional storm water treatment controls are able to provide the same pollutant reduction as LID retention BMPs, then that project site would not have to do mitigation or in-lieu fees as part of the LID waiver program. The conventional storm water treatment controls may be designed for greater than the design storm to provide the same pollutant load reduction as LID retention BMPs.

Comment No.	165	Commenter No.	44	Comment Subject	LID
Comment	We strongly urge you to revise Section F.1.d.(4).(d).(ii) by replacing the term "biofilter" with "filter" and replacing the 75% design storm volume storage requirement with filter a performance standard. Without these changes, the only technically feasible treatment controls on some sites with poor soils and without adequate landscape area available for biofiltration may trigger participation in the LID substitution even while still requiring the MEP standard to be met on site.				
Response	Please see the responses to Comment Nos. 162 and 163.				
Comment No.	166	Commenter No.	45	Comment Subject	Construction
Comment	Make findings consistent with JRMP. Provide separate sections for Construction vs. Existing Development.				
Response	Thank-you for the comment, but we feel this change to the Findings is not warranted and unnecessary.				
Comment No.	167	Commenter No.	45	Comment Subject	Finding
Comment	Definition of "urban stream" contradicts 40 CFR 122. Provide clearer definition as to what an "urban stream" is.				
Response	Similar comments regarding urban streams being part of the MS4 have been considered in previous response to comments. Please see the Fact Sheet; December 12, 2007, Response to Comments II, Response No. 13; and July 6, 2007, Response to Comments I, Response No. 3. In summary, an MS4 is defined in the federal regulations as a conveyance or system of conveyances owned or operated by a Copermittee, and designed or used for collecting or conveying runoff. Therefore, the Regional Board considers natural drainages that are used by the Copermittees as conveyances of runoff, as both part of the MS4 and as receiving waters. No changes have been made in response to this comment.				
Comment No.	168	Commenter No.	45	Comment Subject	MEP
Comment	Discharge category found to be a source of pollutants requires implementation of appropriate control measures to prevent the discharge of pollutants to the MS4. Should state: Implement appropriate control measures to reduce the discharge of pollutants to the MEP.				
Response	Please see response to Comment no. 1. Please also see see Comments no. 28 in the July 1, 2009 in Response to Comments IV. Please also see the Regional Board Counsel Memorandum dated November 05, 2009 regarding non-storm water discharge regulation.				
Comment No.	169	Commenter No.	45	Comment Subject	General
Comment	Discharges into MS4 require authorization from owner and operator of the MS4 system, specifically for uncontaminated pumped ground water, foundation drains, and water from crawl space pumps. Support change, and recommend that dischargers are required to obtain authorization prior to the commencement of the discharge.				
Response	Comment noted. Please note this is a requirement for enrollees under the referenced NPDES permit (R9-2008-0002).				

Comment No.	170	Commenter No.	45	Comment Subject	General
Comment	States that building fire suppression system maintenance discharges contain waste and must be prohibited. Not clear what waste the discharges contain and the basis for prohibiting it.				
Response	The Regional Board has received public comments (e.g. Comment no. 137) concerned with non-storm water discharges associated with building fire suppression system maintenance and testing. The Regional Board has found that such activities do not qualify as fire fighting flows as the activities are strictly maintenance in purpose. The current Order (R9-2002-001) and draft Tentative Order contain non-storm water discharge exemptions for discharges associated with water line flushing. While building fire suppression systems lines may be filled with potable water, the systems are not utilized until: a) a fire occurs and triggers the system, or b) the system undergoes required maintenance. The Regional Board has found that water within the lines may contain metals that that may be a significant source of pollutants upon discharge. Furthermore, many of these discharges occur to MS4s, which discharge to receiving waters 303(d) listed for toxicity or identified as requiring listing under the Draft 2008 CWA 303(d) Report. As such, these non-storm water discharges are no longer exempted from prohibition.				
Comment No.	171	Commenter No.	45	Comment Subject	General
Comment	Must identify and control any non-prohibited discharge that creates water quality problems. Should define what is meant by control the discharge.				
Response	The Regional Board appreciates the comment and has provided clarification to Section B.4.				
Comment No.	172	Commenter No.	45	Comment Subject	NEL
Comment	Attachment E, page 12, uses the phrase "Dry weather non-storm water effluent limitations" as opposed to this section's title. Inconsistent. If this is the same, please change.				
Response	The Regional Board appreciates the comment and the change has been made.				
Comment No.	173	Commenter No.	45	Comment Subject	NEL
Comment	The footer on this page does not correspond to the section title. Change footer from "Directive D: Storm Water Action Levels" to "Directive C: Non-Storm Water NEL"				
Response	The Regional Board appreciates the comment and the change has been made.				
Comment No.	174	Commenter No.	45	Comment Subject	NEL
Comment	Requires review and acceptance of a determination that a effluent limitations discharge is from a natural source. Strike "acceptance" from section.				
Response	The comment provides no explanation for striking the word from the Section. Thus, the requested change has not been made. The evidence submitted by the Copermittee to support their source determination must be of acceptable scientific rigor to the Regional Board.				
Comment No.	175	Commenter No.	45	Comment Subject	NEL
Comment	This requires the Copermittee to determine whether a discharge type should be exempt. This is the responsibility of the Regional Board.				
Response	This is the responsibility of both the Regional Board and discharger. Either the Regional Board or the discharger may identify categories that should not be exempt. Please see the Regional Board Counsel Memorandum dated November 05, 2009 for discussion of non-storm water discharge regulation. Please also see response to Comment no. 52 in the July 1, 2009, Response to Comments IV.				

Comment No.	176	Commenter No.	45	Comment Subject	NEL
Comment	<p>This is a completely new program, above and beyond any requirement of the CWA.</p> <p>This is inconsistent with the CWA. Make program consistent with 40 CFR 122.</p>				
Response	<p>This program is consistent with CWA requirements. Please see the Regional Board Counsel Memorandum dated November 05, 2009 for discussion of regulation of non-storm water discharges.</p> <p>Please also see USEPA Comment no. 153.</p>				

Comment No.	177	Commenter No.	45	Comment Subject	NEL
Comment	<p>"This Permit does not regulate natural sources and conveyances of constituents listed in Table 4"</p> <p>This sentence is confusing. If it doesn't regulate "constituents listed in Table 4." What does it regulate and why is there a Table 4?</p>				
Response	<p>The Tentative Order regulates the discharge of pollutants from a point source (the MS4). Table 4 is applicable for non-storm water discharges from the MS4 into receiving waters. An exceedance of an NEL caused by a natural source being naturally conveyed would not trigger further action from the Regional Board.</p>				

Comment No.	178	Commenter No.	45	Comment Subject	NEL
Comment	<p>This Permit does not regulate natural sources and conveyances of constituents listed in Table 4.</p> <p>Should state clearly which Table(s) 4 (4.a.1, 4.a.2, 4.b. and/or 4.c).</p>				
Response	<p>This statement in the Tentative Order applies to all Tables under Table 4 (a-c).</p>				

Comment No.	179	Commenter No.	45	Comment Subject	NEL
Comment	<p>States that for natural sources the copermitttee must demonstrate discharge is not anthropogenic.</p> <p>Are there guidelines available to make this determination?</p>				
Response	<p>The Regional Board expects this determination to be made through Section F.4.e., which requires investigation and inspection in response to suspected illicit discharges and or connections. This is already required under the current Order. Determinations of origin are likely to be made on a case-by-case basis once the supporting evidence is submitted.</p>				

Comment No.	180	Commenter No.	45	Comment Subject	NEL
Comment	<p>Copermitttees must develop monitoring plans to sample a representative percentage of major outfalls and identified stations within each hydrologic subarea.</p> <p>Make consistent with 40CFR.</p>				
Response	<p>The NPDES regulations do not specify the exact location to be used for monitoring, and the permittee is ultimately responsible for providing a safe and accessible sampling point that is representative of the discharge (40 CFR 122.41(j)). The Regional Board has prescribed the monitoring in an effort to be consistent with the current monitoring done by the Copermitttees under the existing Order. The Regional Board finds it difficult to respond to the comment without a more specific reference to 40 CFR.</p>				

Comment No.	181	Commenter No.	45	Comment Subject	NEL
Comment	<p>The NELs as defined are receiving water standards. This would apply receiving water standards to the water within the MS4. Some of the NELs are not appropriately applied. (Fecal Coliform 400 for AMEL, this is a single sample standard not an average standard).</p> <p>There needs to be a way to account for receiving water quality.</p>				
Response	<p>The establishment of water quality-based effluent limitations must consider the discharge under critical conditions, including for flow (see 40 CFR 122.44(d)). As such, no mixing zone is allowed for discharges under the Tentative Order. For further information please see the Tentative Order Fact Sheet.</p> <p>Water within the MS4 is not required to meet receiving water standards. Under the Tentative Order, the discharge of non-storm water from the MS4 must meet numeric effluent limitations to protect waters receiving the discharge.</p> <p>In regards to the referenced Fecal Coloform Standard, the clarification has been made to the Tentative Order. The standard has been included in the AMEL because it is based on a 30-day period.</p>				

Comment No.	182	Commenter No.	45	Comment Subject	NEL
Comment	<p>Non-storm water discharges from MS4 to inland surface waters.</p> <p>What about when an MS4 flow discharges to dry sediment surface waters and not to actual water?</p>				
Response	<p>The described situation would be considered critical conditions for flow. The consideration of critical flow conditions is required under 40 CFR 122.44(d). A discussion regarding flow is also found in the Fact Sheet:</p> <p>"The San Diego Region has predominately intermittent and ephemeral rivers and streams (Inland Surface Waters) which vary in flow volume and duration at spatial and temporal scales. Therefore, it is assumed that any non-storm water discharge from the MS4 into the receiving water is likely to be of a quantity and duration that does not allow for dilution or mixing. For ephemeral systems, non-storm water discharges from the MS4 are likely to be the only surface flows present within the receiving water during the dry season."</p>				

Comment No.	183	Commenter No.	45	Comment Subject	NEL
Comment	<p>Need to define WARM & COLD water for DO effluent limitations.</p> <p>Should use > < with specific temperatures.</p>				
Response	<p>A change has been made to Table 4.a to clarify the WARM and COLD Beneficial Use designation. Please note that the DO limitations are not temperature dependent, as WARM and COLD are Beneficial Uses assigned by the Basin Plan to particular receiving waters.</p> <p>While the suggested use of >< for DO is the table is appreciated, this change has not been made as the language used in the table is directly from the Basin Plan for the San Diego Region.</p>				

Comment No.	184	Commenter No.	45	Comment Subject	NEL
Comment	<p>Fecal coliform AMELs are inappropriate for multiple reasons.</p> <p>Imposes AB411 standards for Rec 1 waters on non-storm water, non-recreational flows. If it must be applied then B should move to Instantaneous Maximum column.</p>				
Response	<p>A clarification has been made regarding fecal coliform and AMELs (please see response to Comment no. 181).</p> <p>The Tentative Order includes non-storm water numeric effluent limitations that are protective of receiving waters, including those downstream of the discharge. Please note that receiving waters under the Tentative Order are designated as having an existing or potential REC-1 Beneficial Use.</p> <p>Furthermore, it is inappropriate to consider waste assimilation as a Beneficial Uses of receiving waters. Please also see Comment no. 69 in the July 1, 2009, Response to Comments IV.</p>				

Comment No.	185	Commenter No.	45	Comment Subject	NEL
Comment	<p>Enterococcus inappropriately set to Ocean Plan Designated beach area standards.</p> <p>This is non-storm water, non-recreational flow. Why is it being held to beach standards when 5+ years of paired sampling data do not indicate strong links between even higher levels of bacteria than being allowed, and detected AB411 exceedances.</p>				
Response	Please see response to Comment no. 184.				
Comment No.	186	Commenter No.	45	Comment Subject	NEL
Comment	<p>MDEL limits.</p> <p>Where are MDELs defined in 40 CFR?</p>				
Response	Please see 40 CFR 122.2 and 122.45. A definition consistent with 40 CFR 122.2 and existing State and Regional Board NPDES permits and resolutions has been added to Attachment C for further clarification.				
Comment No.	187	Commenter No.	45	Comment Subject	NEL
Comment	<p>Table 4.a.1 does not list an instantaneous maximum for Fecal Coliform.</p> <p>Should list a maximum if less than 5 samples collected in 30-day period.</p>				
Response	Please see response to Comment no. 181.				
Comment No.	188	Commenter No.	45	Comment Subject	NEL
Comment	<p>Tables 4.a.1, 4.b, and 4.c subject storm drain flows to the very stringent AB-411 Rec-1 Criteria standards.</p> <p>The maximums should be adjusted to attainable limits.</p>				
Response	Please see response to Comment no. 184.				
Comment No.	189	Commenter No.	45	Comment Subject	NEL
Comment	<p>Turbidity.</p> <p>What is the justification for turbidity limitations in Region 9 being so much lower than other regions in the state?</p>				
Response	<p>The water quality criteria for Turbidity is determined in the Basin Plan for the San Diego Region. The criteria in the Basin Plan has been set to protect the Beneficial Uses of waters within the San Diego Region. The Basin Plan Objectives were appropriately used in the development of water quality-based effluent limitations for non-storm water discharges. Please note that issues pertaining to Basin Plan Objectives are to be addressed under the Triennial review process. More information may be found at: http://www.waterboards.ca.gov/sandiego/water_issues/programs/basin_plan/tri_review.shtml</p>				
Comment No.	190	Commenter No.	45	Comment Subject	NEL
Comment	<p>Freshwater criteria are based on site-specific water quality data (receiving water hardness).</p> <p>Should be changed to effluent water hardness.</p>				
Response	The Regional Board disagrees as this is required under State Water Board Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California.				
Comment No.	191	Commenter No.	45	Comment Subject	NEL
Comment	<p>pH.</p> <p>6.5 - 8.5 for freshwater 6-9 for saline waters - based on?</p>				
Response	As cited in Tables 4.a and 4.b, pH is based upon Basin Plan Objectives and Ocean Plan Criteria found within the Basin Plan for the San Diego Region and California Ocean Plan.				

Comment No.	192	Commenter No.	45	Comment Subject	NEL
Comment	<p>Fecal coliform AMELs are inappropriate.</p> <p>Imposes AB411 standards for Rec 1 waters on non-storm water, non-recreational flows. If it must be applied then B should move to Instantaneous Maximum column.</p>				
Response	Please see responses to Comments nos. 181 and 184.				
Comment No.	193	Commenter No.	45	Comment Subject	SAL
Comment	<p>This requires "implementation of all necessary storm water controls and measures to reduce .. ." when there is no evidence of a receiving water exceedance. The assessment point is "end-of-pipe" and SALs do not have any justification for applicability.</p> <p>This seems to require an action when there is no evidence of a receiving water violation.</p>				
Response	SALs are applicable as a tool to be used by the Copermittee(s) to determine the level of effectiveness of BMPs utilized within the drainage area discharging at the SAL outfall. This is part of the iterative process to reduce the discharge of pollutants in storm water from the MS4 to the MEP standard.				
Comment No.	194	Commenter No.	45	Comment Subject	SAL
Comment	<p>Metals SALs are in direct contradiction with statement on "table Levels 4.a.2: Priority Pollutants", page 23.</p> <p>Contradiction between NEL section and SAL in terms of metals values.</p>				
Response	Storm Water Action Levels (SALs) are for discharges of storm water from the MS4. Section C is for non-storm water discharges. The SALs were computed utilizing USEPA nationwide MS4 discharge data (Arid West Region), and SALs for metals have been set as the 90th percentile for this dataset. Additionally, the SALs for metals incorporate synoptic water hardness measurements. Please see Attachment E Section II.B.1.b.				
Comment No.	195	Commenter No.	45	Comment Subject	SAL
Comment	<p>" ... assessment points for determination of SAL compliance are all major outfalls " Seems to contradict the following sentence " ... monitoring plans to sample a representative percent of the outfalls "</p> <p>Sentences seem to contradict each other.</p>				
Response	Section D of the Order has been clarified in response to the comment. The word "all" has been removed, as the Copermittees are to sample a representative percent of major outfalls within each hydrologic subarea, not all major outfalls.				
Comment No.	196	Commenter No.	45	Comment Subject	SAL
Comment	<p>" ... to have outfall storm water discharges meet all applicable water quality standards."</p> <p>This applies receiving water standards to the storm drain.</p>				
Response	This is not a requirement of the Order, but a goal as discharges that meet applicable water quality standards are protective of the Beneficial Uses of the receiving waters.				
Comment No.	197	Commenter No.	45	Comment Subject	SUSMP
Comment	<p>"centralized infiltration devices" -This term needs to be clearly defined otherwise there will be confusion on when these infiltration devices" restrictions apply.</p> <p>Provide clear definition as to what "centralized infiltration" are</p>				
Response	Please see the July 6, 2007, Response to Comments I, Response No. 24. A centralized infiltration refers to applications such as large infiltration trenches and infiltration basins that collect water from various locations for the purpose of infiltration and does not refer to small infiltration systems dispersed throughout a development. The language proposed in Section D.1.c.6 is consistent with the language used in Section F.1.b.2.h of Order No. R9-2002-0001 (the current Permit). The Copermittees may collectively or individually develop alternative restrictions on the use of treatment control BMPs which are designed to primarily function as centralized infiltration devices.				

Comment No.	198	Commenter No.	45	Comment Subject	SUSMP
Comment	In practice, this results in treatment control and hydromodification facilities being installed in single family residences, which is not a good practice in terms of assuring adequate maintenance of permanent BMPs.				
	Exclude single family residences from this category if the provided adequate site design and source control.				
Response	Environmentally Sensitive Areas are inherently sensitive habitats containing unique, rare, threatened, or endangered species, or are not achieving their designated beneficial uses. Runoff is known to contain a wide range of pollutants and has demonstrated toxicity to plants and animals. Therefore, it is necessary to apply additional storm water controls for developments within, adjacent to, or directly discharging to ESAs. This need for additional storm water controls is addressed within each component of the Order. Although maintenance of BMPs at single family residences discharging to ESAs may be perceived as being difficult, the ESAs require this added protection. The implementation of LID BMPs and site design should lessen the maintenance requirements and difficulty.				
Comment No.	199	Commenter No.	45	Comment Subject	SUSMP
Comment	It is not clear what is intended to be included this category. A steep hillside development with known erosion soil conditions would need to address erosion. Treatment control and hydromodification requirements are not justified.				
	Remove this from the Priority Development Project Categories, and define elsewhere in Section F.1 how these projects would need to include measures that protect slopes from erosion.				
Response	This requirement is identical to that in the current Permit (Order No. R9-2002-0001), the San Diego MS4 Permit (Order R9-2007-0001), and the Santa Ana Permit (Order R8-2009-0030). These provisions are based on the Los Angeles Regional Board's SUSMP upheld by the precedential State Board Order WQ-2000-11. The State Board's order found that hillside residences can be a significant source of pollutants and/or runoff following development and it is appropriate that the design standards apply so that BMPs for these categories of development result in the infiltration or treatment of a significant amount of the runoff.				
Comment No.	200	Commenter No.	45	Comment Subject	SUSMP
Comment	Retention of the 85th percentile storm event does not mimic the natural hydrology. The amount of runoff under natural conditions is dependent on soil type and other factors.				
	Retention requirements should be revised with intent of matching hydrology under natural conditions.				
Response	Retention of the 85th percentile storm event provides for a high level of pollutant removal to protect water quality. This design storm does not necessarily result in zero discharge. The design storm is between 0.7 to 0.8 inches of rainfall for most of the developed area of Orange County. Larger storms will produce runoff to receiving waters. Also, retention of the design storm will begin to compensate for decades of previous, unchecked development creating impervious surfaces that have resulted in the increased runoff volumes and flow rates discharged to receiving waters.				
Comment No.	201	Commenter No.	45	Comment Subject	SUSMP
Comment	It may be unrealistic for municipalities to implement the various processes required under this section within the amount of time allowed.				
	Provide a feasible time schedule for municipalities to put such a program in place.				
Response	The commenter provides no basis or information for the change, nor specificity regarding the requested change. Thus, no change has been made.				

Comment No.	202	Commenter No.	45	Comment Subject	Construction
Comment	<p>It is neither wise nor necessary to mandate use of a particular technology for managing sediment from construction sites. The Construction General Permit has adequate and more appropriate measures for ensuring sediment discharges will not create a pollution problem.</p> <p>Remove the requirement that Copermitees mandate use of AST. Allow Copermitees to rely on the Risk based approach that was developed for the Construction General. Permit, which does not mandate a particular technology.</p>				
Response	<p>The Tentative Order does not mandate the use of a particular technology for managing sediment from construction sites. The Tentative Order defines Active Sediment Treatment variously as using mechanical or chemical means to flocculate and remove suspended sediment from runoff at construction sites prior to discharge. Examples of coagulants include chitosan, modified starches, alum, electro-coagulation, carbonic acid, ferric chloride, and polyacrylamides. Examples of sedimentation devices include settling basins, ponds, baker tanks, weir tanks, tube settlers, and centrifuges. Examples of polishing filter types include sand, engineered media, membrane and hydrocarbon. For certain construction sites, with specific soil types that are difficult to settle, ATS is likely the only method to meet the 20 NTU water quality objective specified in the Basin Plan. The ATS requirements in the Tentative Order are identical to the ATS requirements in the San Diego MS4 Permit adopted on January 24, 2007. As such, the authors of the Construction General Permit were aware of these existing requirements concerning ATS.</p>				
Comment No.	203	Commenter No.	45	Comment Subject	Construction
Comment	<p>This section requires inspection of construction sites of 1 acre or more at least monthly.</p> <p>Propose language that is definitive and require construction site inspections monthly for sites of 1 acre or more.</p>				
Response	<p>The Tentative Order requires the Copermitees to inspect at least monthly, all sites with one acre or more of soil disturbance.</p>				
Comment No.	204	Commenter No.	45	Comment Subject	Existing Development
Comment	<p>Requirement for use of an automated database system (e.g., GIS) to maintain an updated watershed-based inventory of municipal areas and activities is too restrictive.</p> <p>The use of an automated database system, such as Geographical Information System is highly recommended when applicable, but not required.</p>				
Response	<p>The previous Order (R9-2002-01) did not require the use of GIS, but included language stating it was highly recommended. In this next permit term the use of GIS has been determined to be required (Please also see Comment no. 277 in the July 1, 2009, Response to Comments IV) . It is important to note that section K allows the Copermitees to propose alternative reporting criteria and schedules for the Executive Officer's acceptance. Thus, if a particular Copermitee has difficulty in meeting the time requirement, they may elect to request the reporting be extended. Thus, no changes have been made.</p>				
Comment No.	205	Commenter No.	45	Comment Subject	Existing Development
Comment	<p>Reduction of pesticides, herbicides, and fertilizers into the storm Pesticides, Herbicides water to the MS4 and receiving waters.</p> <p>Support inclusion of "storm water" and "and receiving waters" in the opening paragraph.</p>				
Response	<p>Comment noted.</p>				
Comment No.	206	Commenter No.	45	Comment Subject	Existing Development
Comment	<p>Inspecting and cleaning all MS4 facilities between May 1 and September 30 is infeasible for those Copermitees that have tens of thousands of structures.</p> <p>Inspection and removal of accumulated waste at least once a year between May 1 and September 30 of each year for all MS4 facilities that receive or collect high volumes of trash and debris.</p>				
Response	<p>The Tentative Order provides in section F.3.a.(6)(iii) that "Following two years of inspections, any MS4 facility that requires inspection and cleaning less than annually may be inspected as needed, but not less than every other year;" Thereby, this requirement will give the Copermitees the ability to prioritize their MS4 maintenance activities following a sufficient data collection period.</p>				

Comment No.	207	Commenter No.	45	Comment Subject	Existing Development
Comment	<p>Sections (a) and (b) are redundant.</p> <p>Delete Section (b) as the implementation of the provisions in Sanitary Sewer to Section (a) would maximize pollutant reductions by providing greater flexibility to Copermittees to manage their programs.</p>				
Response	<p>This comment has already been addressed. Please see the July 1, 2009, Response to Comments, Response No. 251.</p>				

Comment No.	208	Commenter No.	45	Comment Subject	Existing Development
Comment	<p>The separation of food facilities from other industrial and commercial facilities and requiring a completely separate inspection program is problematic.</p> <p>We currently inspect 25% of inventory. New requirements would reduce general industrial and commercial inspections by 5%, but increases food facility inspections to 100%. For the City this would result in an inspection requirement of 40% of our inventory.</p>				
Response	<p>Copermittees have been inspecting restaurants annually as part of the County Health Department inspections. Reports from the Aliso Creek watershed Copermittees demonstrate that as-needed inspections for restaurants means at least annually. Restaurants have been found to present many threats to water quality and standard educational efforts are not effective because restuarants are subject to frequent manangement changes. For these reasons, the Order requires restaurants to be inspected annually.</p>				

Comment No.	209	Commenter No.	45	Comment Subject	Existing Development
Comment	<p>"Each food facility must be inspected annually for compliance with the Copermittee's water quality ordinances and this Order."</p> <p>This could be legally not possible. Does the City have the jurisdiction to enforce provision in the Order if there is not municipal code for the regulation in question?</p>				
Response	<p>Section E.1. requires that "Each Copermittee must establish, maintain, and enforce adequate legal authority to control pollutant discharges into and from its MS4 through ordinance, statute, permit, contract or similar means. ...This legal authority must, at a minimum, authorize the Copermittee to: ... Carry out all inspections, surveillance, and monitoring necessary to determine compliance and noncompliance with local ordinances and permits and with this Order, including the prohibition on illicit discharges to the MS4." A failure to establish such legal authority would be considered a violation of the Permit.</p>				

Comment No.	210	Commenter No.	45	Comment Subject	Retrofitting
Comment	<p>The draft language requires an evaluation of potential retrofit sites in establishing a prioritized list of activities and states that "highly feasible projects expected to benefit water quality should be given a high priority" to implement BMPs. However, Copermittees should possess the discretion to evaluate where to direct limited storm water program resources in the larger context of all efforts/activities. While the current language provides the possibility for this program wide consideration, it should be explicitly stated that the Copermittees retain such discretion. For example, the highest rated retrofit project may result in only a medium priority rating when compared to education campaigns, enforcement, street sweeping, or other controls identified in the work plan.</p> <p>Proposed Language: (3) Each Copermittee must consider the results of the evaluation in prioritizing potential retrofit projects with other activities in work plans for the following year. Where feasible, the retrofit projects should be designed in accordance with the SSMP requirements within sections F .1.d.(3) through F.1.d.(8). In addition, the Copermittee shall encourage retrofit projects to implement where feasible the Hydromodification requirements in Section F .1.h.</p>				
Response	<p>The prioritization of retrofitting opportunities does not bar the implementation of other worthy high priority activities. The Copermittees prioritization and implementation of retrofitting can be integrated into other identified high priority activities. For example, education can include homeowner education on installing rain barrels or rain gardens. Enforcement actions can result in offering retrofitting as mitigation in lieu of penalties. High priority street sweeping areas can be retrofitted with trash guards on storm drains or lot -sized LID BMPs that prevent pollutant transport to the streets. In summary, the requested flexibility is already present in the Tentative Order.</p>				

Comment No.	211	Commenter No.	45	Comment Subject	Retrofitting
Comment	<p>Section F.3.d.(3) states that retrofit projects should be designed to SSMP requirements. However, other requirements, such as TMDL or ASBS requirements, may be critically important to designing to retrofit projects. Because these requirements are spatially and temporally variable, the draft Permit should be revised to state that retrofit projects should consider applicable regulations and requirements, as feasible, and should not list specific criteria.</p> <p>Permit should be revised to state that retrofit projects should consider applicable regulations and requirements, as feasible, and should not list specific criteria.</p>				
Response	<p>The Tentative Order's language provides sufficient flexibility to design retrofitting projects according to applicable regulations and requirements. To our knowledge, neither TMDLs nor ASBS have design storm requirements. The SSMP design standards are to be applied to retrofitting only where feasible. The Tentative Order also states that retrofit project "should" (rather than "must") be designed in accordance with SSMP requirements. The Regional Board feels that it is important not to limit retrofitting opportunities to the design storm. Because retrofitting occurs in an already developed area, the space requirements needed to meet the design storm may not exist on a particular site. Space restrictions should not limit being able to retrofit the property to the maximum extent practicable. For example, where a site cannot design a retrofit practice to the 85th percentile storm, the site may be able to design a retrofit practice to the 50th percentile; thereby still improving storm water quality.</p>				

Comment No.	212	Commenter No.	45	Comment Subject	Monitoring
Comment	<p>Require "inspections for illegal discharges and connections must be conducted during routine maintenance of all MS4 facilities"</p> <p>This could be an added reporting burden. How are we supposed to document that an inspection for illegal discharges and connections is done? Delete "must" from sentence.</p>				
Response	<p>Federal regulations require that illicit discharges be prevented from entering the MS4. Federal regulations also require a program to detect and remove illicit discharges and improper disposal into the MS4. It is expected that staff conducting MS4 maintenance activities be trained to detect illegal discharges and connections. It is unclear how this requires additional documentation. If staff, during MS4 maintenance activities, identify a possible illegal discharge or connection it is expected that information is used in accordance with Section F.4.e (Investigation/Inspection and Follow-up).</p>				

Comment No.	213	Commenter No.	45	Comment Subject	Monitoring
Comment	<p>"The use of GIS is required" and "The GIS layers of the MS4 map must be submitted ... "</p> <p>Not a problem for us but for those jurisdictions that do not have this capability this would be a significant expense. Delete requirement for use of GIS.</p>				
Response	<p>The previous Order (R9-2002-01) did not require the use of GIS, but included language stating it was highly recommended. In this next permit term the use of GIS has been determined to be required (Please also see Comment no. 277 in the July 1, 2009, Response to Comments IV) . It is important to note that section K. allows the Copermittees to propose alternative reporting criteria and schedules for the Executive Officer's acceptance. Thus, if a particular Copermittee may have difficulty in meeting the time requirement, they may elect to request the reporting be extended. Thus, no changes have been made.</p>				

Comment No.	214	Commenter No.	45	Comment Subject	Monitoring
Comment	<p>Vague language.</p> <p>Provide a more specific description of the information to be confirmed and updated.</p>				
Response	<p>The intent of F.4.b is to require the Copermittees to update their MS4 maps in coordination with the dry weather field screening and analytical monitoring required under Section F.4.d. and Section F.4.e. It is expected that illicit discharge detection and elimination activities will confirm the accuracy of existing MS4 maps and potentially discover new or incorrect MS4 discharge points. As such, the map is simply required to be updated.</p>				

Comment No.	215	Commenter No.	45	Comment Subject	Monitoring
Comment	Paragraph makes a reference to attachment E, which does not in fact contain a description of this particular program. Include a description of the Dry Weather Field Screening and Analytical Monitoring Program in Attachment E.				
Response	Comment noted. Section F.4.d of the Order references Attachment E. The description of the program is contained within Section II.C of Attachment E for Dry Weather Numeric Effluent Limitations. The Tentative Order gives the Copermittees great flexibility to propose a program that meets these requirements.				

Comment No.	216	Commenter No.	45	Comment Subject	Monitoring
Comment	This seems to be the dry weather program we currently have. This appears to be in addition to the "Dry Weather NEL" program. In essence this appears to be a duplicate program. This is inconsistent with the CWA. Make program consistent with 40 CFR 122.				
Response	Please see response to Comment no. 215. The description of the program is contained within II.C of Attachment E for Dry Weather Numeric Effluent Limitations. The current program under Order R9-2002-01 must continue with minor additions. Subsequently, the Copermittees must incorporate criteria for non-storm water numeric effluent limitations. There is no duplicative effort required and the monitoring required under the Tentative Order is consistent with section 402 of the CWA and 40 CFR 122.26, 122.44 and 122.48. The Regional Board finds it difficult to respond to the comment as there is no basis for inconsistency cited.				

Comment No.	217	Commenter No.	45	Comment Subject	Monitoring
Comment	Reference "Attachment E" for description of this program. Add description of program in Attachment E. There is currently not a description for this program.				
Response	Please see response to Comment nos. 215 and 216.				

Comment No.	218	Commenter No.	45	Comment Subject	Monitoring
Comment	... based on results of field screening ... Field screening is not included as a component of any monitoring programs and should be removed from this sentence.				
Response	The Regional Board disagrees, as field screening is the quantitative and/or qualitative monitoring of MS4 outfalls for non-storm water discharges and associated observations regarding a discharge. For example, if a field screening of an MS4 major outfall detects a high turbidity from sediment in a non-storm water discharge, Section F.4.e directs that this screening should be used for investigating and inspecting that portion of the MS4.				

Comment No.	219	Commenter No.	45	Comment Subject	Monitoring
Comment	References a monitoring effort that does not exist anywhere else in the permit (field screening). The inconsistency in the permit for the different programs and the referenced sections need to be straightened out. Add description of referenced program to Attachment E.				
Response	Please see response to Comment nos. 215 and 216.

Comment	<p>Punctuation error.</p> <p>Remove apostrophe from "it's" in the last line.</p>				
Response	<p>The Regional Board appreciates the comment and the correction has been made.</p>				
Comment No.	224	Commenter No.	45	Comment Subject	WURMP
Comment	<p>The workplan is for development of a BMP strategy and implementation of BMPs to improve urban runoff water quality contributions to the receiving water. Calling it a "Water Quality" workplan is misleading because the regulated parties under this permit are not responsible for every contribution to every water body in the entire watershed.</p> <p>The requirements should focus on urban runoff contributions to the receiving waters for which the regulated parties are responsible.</p> <p>Revise the section to state: The Watershed Workplan shall describe the Permittees' development and implementation of a collective watershed strategy to assess and prioritize the water quality problems due to runoff discharging to the watershed's receiving waters, identify and/or model sources of the highest priority water quality problem(s), develop a watershed-wide BMP implementation strategy to abate highest priority water quality problems and the relative contribution from runoff discharges, and a monitoring strategy to evaluate BMP effectiveness and changing water quality prioritization in the WMA.</p>				
Response	<p>The Tentative Order is for the discharges from the Copermittees MS4s. Pollutant contributions that are not discharged from the Copermittees MS4 are not addressed by this permit or required to be addressed by the WRMP section. No changes have been made in response to this comment.</p>				
Comment No.	225	Commenter No.	45	Comment Subject	WURMP
Comment	<p>The permit required monitoring program does not support this level of analysis. If an attempt was made to use the data from the monitoring programs, misrepresentation and mischaracterization would occur because the program does NOT involve collection sufficient data to do this. The requirements should focus on urban runoff contributions to the receiving water for which the regulated parties are responsible.</p> <p>Remove this section or replace with a requirement more in line with the regulated parties' responsibility of contributions of runoff discharges to the receiving waters, such as the requirements in Order No. R9-2007-0001 for the San Diego County Copermittees.</p>				
Response	<p>The watershed characterization allows the Copermittees to consider all available data, reports, monitoring and information available. The Copermittees monitoring program should be designed and implemented to be consistent with other monitoring protocols and QA/QC procedures to allow data comparison. The Tentative Order is for the discharges from the Copermittees MS4s. Therefore, the Copermittees must analyze their discharge in relationship to other potential pollutant discharges in the receiving waters. No changes have been made in response to this comment.</p>				

Comment No.	226	Commenter No.	45	Comment Subject	WURMP
--------------------	-----	----------------------	----	------------------------	-------

Comment The regulated parties are responsible for urban runoff contributions to the receiving waters and are not necessarily responsible for attainment of the receiving water quality objectives, particularly if there are contributions to the degradation of receiving water quality from parties outside the purview of this permit.

Further, to require that BMPs not contributing to measured improvements in receiving water quality be removed and replaced could lead to no water quality improvement and is flawed considering the intent of the permit. If a BMP is not assessed with regard to its direct improvement to quality of runoff from the localized site but only to the receiving waters, it could be falsely interpreted that a BMP is ineffective and will be removed. BMPs may be effective in reducing pollutants in runoff, but may need the time to be replicated and installed in multiple locations to observe improvements in receiving water quality. Additionally, there may be lag time between installation of a BMP, the end of a reporting year, and the actual observed improvements in water quality. Lastly, If regulated parties were required to expend resources to remove an ineffective BMP (for high priority water quality problems) where said BMP may not be a contributing pollutant source, resources to remove the BMP may be redirected from other, more valuable, efforts to improve water quality.

Replace with: Develop a watershed BMP implementation strategy that focuses on attainment of receiving water quality objectives in the identified highest priority water quality problem(s) by improving discharge runoff water quality. The BMP implementation strategy shall include a schedule for implementation of the BMP projects to abate specific runoff discharge contributions to receiving water quality problems. BMPs not contributing to measured pollutant reductions or improvements to runoff discharge water quality must be modified or replaced with alternative BMPs. Identified watershed water quality problems may be the result of jurisdictional discharges that will need to be addressed with BMPs applied in a specific jurisdiction in order to generate a benefit to the watershed.

Response The cited requirement states that "BMPs not contributing to measured pollutant reductions or improvements to water quality ..." A measured pollutant reduction by the BMP shows a direct improvement to the quality of runoff treated by that BMP. The Copermittees assessment should provide sufficient time to maintain and troubleshoot BMPs to improve their performance. This time frame may be over several rainy seasons and reporting periods and is not prescribed by the Tentative Order. In summary, the Copermittees should not waste their resources on BMPs that are not achieving desired outcomes and the Copermittees should redirect those resources to more effective BMPs.

Comment No.	227	Commenter No.	45	Comment Subject	WURMP
--------------------	-----	----------------------	----	------------------------	-------

Comment Requiring modeling AND monitoring improvements to water quality will require regulated parties to expend resources inefficiently. Additionally parties are regulated because of their contribution, as MS4 dischargers, to receiving water quality impairments. The regulated parties called out in this permit are MS4 dischargers and are responsible for their relative contributions, not the entire receiving water body quality.

The use of the word "proper" for installation of BMPs is subjective and not defined by this permit. There may be many different ways to "properly" design and install a BMP, and the regulated parties may or may not choose to test different ways for each BMP to determine which works best.

Revise to state: Develop a strategy to model and/or monitor improvements in runoff discharge quality resulting from implementation of the BMPs described in the Watershed Workplan. The modeling and/or monitoring strategy shall generate the necessary data to report on the measured pollutant reduction that results from BMP implementation.

Response The monitoring and modeling requirements are required to assess the effectiveness of BMPs at improving water quality in an iterative manner. Then, the Copermittees can prioritize their resource expenditure on BMPs that are more efficient at meeting water quality objectives. We agree that this Tentative Order regulates the discharge from MS4s and that Copermittees are responsible for their relative contributions. Pollutant contributions outside of the scope of this Tentative Order are addressed through other regulatory mechanisms such as separate NPDES permits, Waste Discharge Requirements, CWA section 401 water quality certifications and the nonpoint source program. The term "proper" for describing BMP implementation is purposely left undefined in the Tentative Order. The Copermittees must determine what is the proper BMP implementation through manufacturer suggestions or BMP guidance manuals (e.g. CASQA). In some cases, "proper" BMP design and implementation may later be found to be faulty. The Tentative Order provides the Copermittee the flexibility to adjust and maintain BMPs to improve pollutant removal effectiveness. No changes have been made in response to this comment.

Comment No.	228	Commenter No.	45	Comment Subject	WURMP
Comment	<p>Add a timeframe in which the Regional Board must respond/accept the work plan prior to implementation. By not having a time certain for the Regional Board's response, this could cause unnecessary delay to the implementation of the program and prolong the currently unacceptable conditions of water quality.</p> <p>Add a specific timeframe in which the Regional Board must respond to/accept the work plan.</p>				
Response	<p>Directive G.3 has been modified by adding the following sentence: "If within 30 days of submittal, the Regional Board has not taken an action, the Workplan shall be deemed acceptable."</p>				

Comment No.	229	Commenter No.	45	Comment Subject	WURMP
Comment	<p>Public review should occur prior to the workplan being submitted to the Regional Board, not after (prior to implementation). Changes to the workplan may be warranted in response to public comments. If this is the case, the version the Regional Board would approve prior to public review would essentially be a draft.</p> <p>Reverse the order of the Regional Board's acceptance and the public review period.</p>				
Response	<p>The Tentative Order requirement for acceptance by the Regional Board Executive Officer is listed as requirement G.3. The requirement for the public review period is listed as requirement G.5. This order is by chance and does not indicate a chronological order. We agree that the public review period should be prior to submittal for acceptance by the Regional Board Executive Officer. Directive G.5 has been modified to require public review prior to submission to the Regional Board.</p>				

Comment No.	230	Commenter No.	45	Comment Subject	Economic
Comment	<p>Business plan requirements</p> <p>Recommend changing from the proposed 5-year plan to a 1-year plan similar to R9-2007-01, based on the uncertainties of the economy.</p>				
Response	<p>The Business Plan requirements were removed at the request of the Copermittees.</p>				

Comment No.	231	Commenter No.	45	Comment Subject	General
Comment	<p>Per the definition in Attachment C, Environmentally Sensitive Areas include 303(d) listed waterbodies. It is therefore redundant and inefficient to require assessment for both 303(d) waterbodies and for ESAs.</p> <p>Remove Section J.1.a.(1)</p>				
Response	<p>Please see Comment no. 270 in the July 1, 2009, Response to Comments IV.</p>				

Comment No.	232	Commenter No.	45	Comment Subject	General
Comment	<p>The mention here of a Work Plan is redundant and subsequently confusing. Does the JRMP Work Plan replace the JRMP Plan (K.1.a)? Clarification is needed.</p> <p>Remove the requirement for a Work Plan or clarify that the Work Plan replaces the JRMP.</p>				
Response	<p>There is a distinction within each section regarding the JRMP Work Plan (J.4) and Jurisdictional Runoff Management Plan (K.1.a). These requirements are not redundant, but complementary. The Jurisdictional Runoff Management Plan is a "written account of the overall program to be conducted by each Copermittee to meet the jurisdictional requirements of section F" of the tentative Order. The JRMP Work Plan is "a work plan to address their (Copermittees) high priority water quality problems in an iterative manner over the life of the permit."</p> <p>It is expected that portions of the Jurisdictional Runoff Management Plan may be modified through development of the JRMP Work Plan to address high priority areas. For example, the JRMP Work Plan may identify a high priority 303(d) listed waterbody that requires additional BMP efforts. This may result in program adjustments under Section F of the Order.</p>				

Comment No.	233	Commenter No.	45	Comment Subject	General
Comment	<p>The reference to a watershed workplan should use a consistent naming convention. It is referred to as a "Watershed Workplan" in Section K.1.b., and a "Watershed Water Quality Workplan" in Section G.2.</p> <p>The reference to a watershed workplan should use a consistent naming convention.</p>				
Response	<p>Section G.2 is for the "Watershed Water Quality Workplan (Watershed Workplan)." Therefore, the "Watershed Water Quality Workplan" is subsequently referred to as the "Watershed Workplan" throughout the remainder of the Tentative Order. The term "Watershed Water Quality Workplan" is only used once in the Tentative Order at G.2. Therefore, no change has been made.</p>				

Comment No.	234	Commenter No.	45	Comment Subject	General
Comment	<p>The required components of the watershed workplans is discussed in Sections G.2 and K.1 .b.(4). The requirements should be consolidated to Section G.2, as Section K.1.b.(4) should only address reporting process/requirements.</p> <p>The requirements should be consolidated to Section G.2, as Section K.1.b.(4) should only address reporting process/requirements.</p>				
Response	<p>Section G.2, as written, provides flexibility to Copermittees in development of their Watershed Water Quality Workplans (Watershed Workplans). The section allows Copermittees to use all applicable information, identify the highest priority problems and develop strategies. It is not expected that all the information used in Watershed Workplan development be conveyed to the Regional Board. Thus, the Reporting requirements for Watershed Workplans under Section K.1.b.4 represents the minimum requirements on Watershed Workplans to be conveyed to the Regional Board. Section K.1.b. does, as the commenter requests, only address reporting process/requirements because section K.1.b.4 represents the minimum reporting requirement(s).</p>				

Comment No.	235	Commenter No.	45	Comment Subject	General
Comment	<p>The process and requirements for reviewing and updating the workplans is discussed in Sections G.6 and K.1.b. These requirements should be consolidated to one section.</p> <p>Consolidate to one section all requirements for the Watershed Workplan.</p>				
Response	<p>Please see response to Comment no. 234. Please note that the Reporting Section (K.1.b) specifies the timeframe for submittal of the Watershed Workplan(s) to the Regional Board and the minimum information to be submitted to the Regional Board. It does not specify the requirements for reviewing and updating workplans.</p>				

Comment No.	236	Commenter No.	45	Comment Subject	General
Comment	<p>Providing information for each program component by watershed is inefficient as this information is provided the WURMP annual reports. Recommend removing the reference "by watershed" from this requirement.</p> <p>Revise to state: Information for each program component as described in the following Table 9:</p>				
Response	<p>It should be noted that requirements under Section F may be different from watershed to watershed. Please see Comment no. 232. Thus, no change has been made.</p> <p>Please note under Section K, the Copermittees "may propose alternate reporting criteria and schedules, as part of their updated JRMP, for the Executive Officer's acceptance." Thus, the Copermittees can suggest the requested change as part of their updated JRMP.</p>				

Comment No.	237	Commenter No.	45	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment A requirement for a description of ordinances or similar means to prohibit non-storm water discharge categories that are allowable per Section B.2. conflicts section B.2. Section B.2. clearly allows for the prohibition of the discharged or the development and implementation of appropriate control measures to prevent the discharge of pollutants to the MS4. Additionally, it is not clear if section (4)(b) is a requirement for ALL prohibited non-storm water discharges or those that are an allowable category but are subsequently identified as a source of pollutants.

Revise to state: A description of ordinance or orders to prohibit non-storm water discharges identified as sources of pollutants per section (4)(a) above, or a description of control measures to prevent the discharge of pollutants to the MS4.

Response Section K.3.a.4.b requires:
 "A description of ordinances, orders, or similar means to prohibit non-storm water discharge categories identified under section B.2 above."

Section B.2 clearly states:
 "Where the Copermittee(s) have identified a category as a source of pollutants, the category shall be addressed as an illicit discharge and prohibited through ordinance, order or similar means. The Regional Board may identify categories of discharge that either requires prohibition or other controls."

Under federal regulations, all illicit discharges are to be prohibited by order, ordinance or similar means (see Regional Board Counsel Memorandum dated November 05, 2009). As stated in Comment no. 39 in the July 1, 2009, Response to Comments IV, for the last 19 years NPDES storm water permits for Southern Orange County have required Copermittees to prohibit illicit discharges. Section B.2 requires prohibition of exempted discharges where identified by the Copermittees as a source of pollutants or as identified by the Regional Board. The Regional Board contends that the reference is clear and no change has been made.

--------------------	-----	----------------------	----	------------------------	------------

Comment Typo at the base of the table: "Nitrate and nitrate may be Monitoring combined ... "
 Change to: "Nitrite and nitrate may be combined .. ."

Response The Regional Board appreciates the comment and the correction has been made.

Comment No.	239	Commenter No.	45	Comment Subject	Monitoring
--------------------	-----	----------------------	----	------------------------	------------

Comment Comparing Metals SALs with CTR values.
 Question is if you can use the "1 hour maximum concentration" criteria in this way?

Response The SALs have been set as the 90th percentile of arid west MS4 discharge data (please see comment no. 156). The Regional Board, however, recognizes that the impact of metals in freshwater is hardness dependent. Thus, the 1-hour maximum concentration was selected because SALs target the "first flush" of storm water from MS4s. If a SAL for a metal is exceeded, the receiving water hardness should be used to compare the "first flush" criteria with the 1 hour concentration. The Regional Board contends this comparison is more valid that the 4 day continuous concentration, which is not consistent with required post-construction BMP design for storm events and "first flush" parameters. Please also note this is done for comparative purposes, as SALs are to be used in the iterative process and are not effluent limitations.

Comment No.	240	Commenter No.	45	Comment Subject	Monitoring
--------------------	-----	----------------------	----	------------------------	------------

Comment This creates a watershed based program for monitoring MS4 discharges. MS4s are inherently jurisdictional in nature. MS4s do not typically cross jurisdictional boundaries, hence this does not lend itself to a watershed base evaluation.
 Is this suppose to be our MS4 Outfall Monitoring program broken apart into a Wet and Dry components?

Response This monitoring approach is consistent with the current Order (R9-2002-0001).

Comment No.	241	Commenter No.	45	Comment Subject	NEL
Comment	States that copermittes must conduct the following dry weather field screening and analytical monitoring tasks. Does not define or outline the field screening tasks.				
Response	The Section requires specific field screening tasks (see E.II.C.b) and requires current dry weather field screening to continue under the Order.				
Comment No.	242	Commenter No.	45	Comment Subject	NEL
Comment	"Stations must be all major outfalls" plus "other outfall points ... " This far exceeds CWA 500 point maximum for dry weather monitoring.				
Response	A clarification has been made to the section. The word "all" has been removed to be consistent with other sections of the Tentative Order (please see Section C.4 of the Order).				
Comment No.	243	Commenter No.	45	Comment Subject	NEL
Comment	Map sites as a separate GIS layer or map overlay. This is in contradiction with the 4.b. "Maintain MS4 Map" pg. 71 which states that GIS is required.				
Response	The Regional Board contends this is not in contradiction with the GIS requirement, as it is the identification of individual monitoring stations, not the MS4 system. This identification can be done as a GIS layer for the overall GIS MS4 map, which is recommended, or as a map overlay.				
Comment No.	244	Commenter No.	45	Comment Subject	NEL
Comment	"... must sample a representative number of major outfalls ... " Contradicts Section E.II.C.a.(1) of Attachment E, which states that "Stations must be all major outfalls."				
Response	Please see response to Comment no. 242 as a correction has been made .				
Comment No.	245	Commenter No.	45	Comment Subject	Monitoring
Comment	Copermittes must sample a representative number of major water effluent outfalls. Should define or outline how to determine a representative number of outfalls.				
Response	Please see response to Comment no. 154.				
Comment No.	246	Commenter No.	45	Comment Subject	NEL
Comment	If flow is evident a 1 hour composite sample may be taken. Should elaborate on sampling procedures for flowing outfalls.				
Response	Please see response to Comment no. 247.				
Comment No.	247	Commenter No.	45	Comment Subject	NEL
Comment	"if flow is evident a 1 hour composite sample may be taken" There is no definition of what comprises a composite sample. This would significantly increase this program.				
Response	Please note this is not a permit requirement, but a suggestion. The language is flexible to allow for the Copermittes to utilize grab or composite samples. Composite sampling is a technique where multiple temporally discrete samples are combined and subsequently treated as a single sample. The language includes a 1-hour requirement if composite samples are taken to allow for flexibility due to potential variation in flow conditions between monitoring locations.				

Comment No.	248	Commenter No.	45	Comment Subject	NEL
Comment	<p>Typo at bottom of page: "Effluent samples must also under analysis for .. . "</p> <p>Change to: "Effluent samples must also undergo analysis for ... "</p>				
Response	The Regional Board appreciates the comment and the change has been made.				

Comment No.	249	Commenter No.	45	Comment Subject	NEL
Comment	<p>"Develop and/or update criteria for "</p> <p>This seems to contradict the NELs from section C of the permit. They say to include the NELs from section C and LC50 values, when you develop your criteria.</p>				
Response	<p>The Copermittees are required to develop response criteria when monitoring for pollutants potentially discharged in non-storm water from the MS4. This criteria must include the NELs found in Section C of the Order, as an exceedance of an NEL requires follow-up investigation. The criteria, however, should include other criteria for pollutants which do not have numeric effluent limitations. Furthermore, a Copermittee may wish to set response criteria for pollutants that have a numeric effluent limitation at a concentration lower than the numeric effluent limitation.</p>				

Comment No.	250	Commenter No.	45	Comment Subject	NEL
Comment	<p>This section is unclear.</p> <p>Should be reworded clearly (Develop and/or update action level criteria for dry weather non-storm water effluent analytical monitoring results. Exceedances of the action level criteria require follow-up investigations to detect and eliminate the source causing the exceedance.</p>				
Response	<p>This section has been clarified to read as follows:</p> <p>"Develop and/or update criteria for dry weather non-storm water effluent analytical monitoring results:"</p>				

Comment No.	251	Commenter No.	45	Comment Subject	NEL
Comment	<p>Section refers to dry weather field screening and analytical monitoring procedures from Sections F.4.d and F.4.e.</p> <p>Sections F.4.d and F.4.e refer to the Attachment E for this program. This is a circular reference and the procedures are not defined anywhere in the permit or attachment. There is no description for dry weather field screening and analytical monitoring in either Order No. R9-2009-0002 or Attachment E.</p>				
Response	<p>The Section States:</p> <p>"If monitoring indicates an illicit connection or illegal discharge, conduct the follow-up investigation and elimination activities as described in submitted dry weather field screening and analytical monitoring procedures and sections F.4.d and F.4.e of Order No. R9-2009-0002."</p> <p>The field screening and analytical monitoring has already been done extensively under the current Order, and the references in Attachment E build upon the efforts already established and implemented to date. Additionally, the section states the following:</p> <p>"Until the dry weather non-storm water effluent analytical monitoring program is implemented under the requirements of this Order, each Copermittee must continue to implement dry weather field screening and analytical monitoring as it was most recently implemented pursuant to Order No. 2002-01."</p>				

Comment No.	252	Commenter No.	45	Comment Subject	NEL
--------------------	-----	----------------------	----	------------------------	-----

Comment "Copermittees must choose a subset of major outfalls ... that discharge to the surf zone in conjunction with the ACRWM."
 The ACRWM program is only suppose to sample within ecologically sensitive areas. There does not appear to be a link between the ACRWM and the dry weather field screening and analytical monitoring program. This needs to be further developed.

Response The commenter misconstrues the section, which states:
 "The Copermittees must choose a subset of major outfalls and identified stations that discharge to the surf zone...Sampling may be done in conjunction with Ambient Coastal Receiving Waters Monitoring."
 The language is flexible, and there is no requirement to sample at locations that discharge to ACRW areas. There are MS4 outfalls that discharge to Areas of Special Biological Significance, Marine Life Refuges and Dana Point Harbor. Furthermore, the Regional Board contends there is a link as Attachment E clearly states the purpose of the ACRW is "to assess the impact of MS4 discharge to ecologically-sensitive coastal areas by analyzing water chemistry and aqueous toxicity in both dry and wet weather."

--------------------	-----	----------------------	----	------------------------	-------

Comment We respectfully request that the language "and acceptable to the Regional Board" be deleted from the tentative order for the following reasons:

(1) The Regional Board already knows what planning principles we will be and are using in our planning to protect water quality; and

(2) As it currently is drafted this language could result in the Regional Board reviewing RMV's water quality management plans twice - once in the context of the County's approval of master area plans and once in the context of the Regional Board consideration of 401 certifications and/or waste discharge requirements. This would not appear to be the best use of staff time and RMV financial resources. In addition duplicate review places RMV in double jeopardy regarding an approval that should rightly lie with the County as the MS4 permittee.

Response The planning principles are vague and open to interpretation. We do not anticipate multiple review of the water quality management plan. Our expectation is that review of the WQMP under the context of a Clean Water Act section 401 water quality certification will suffice to meet the intent of the Tentative Order.

Comment No.	259	Commenter No.	36	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment The Draft Permit Does Not Address Cost Neutrality. Legal Authority or Consistency Issues as Directed by the Board.

At the public hearing on July 1, 2009, the Board members highlighted three issues of general concern that needed further consideration: (1) cost neutrality compared to the 2002 Permit, in the context of the impact that the prevailing economic climate has had on Cities' ability to support expanded programs; (2) legal authority for declaring that nonstormwater discharges are not subject to the Maximum Extent Practicable (MEP) standard of compliance; and (3) consistency with other regional Permits, especially North Orange County. Despite what we understood to be the Board's direction to its staff, it does not appear that these issues have resulted in substantive reconsideration of Permit provisions since the July hearing took place.

Response Please see the Regional Board Counsel Memorandum dated November 05, 2009 regarding the regulation of non-storm water discharges.

As stated in the response to Comment No. 24 in the July 1, 2009, Response to Comments IV, the Regional Board is sensitive to the Copermittee's concerns of consistency and has sought to write the draft Tentative Order to both protect Water Quality and to assist the County and those affected Cities to develop a single program. Please also see Comment no. 373.

To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. The Regional Board, however, has attempted to minimize increased costs in the Tentative Order. Since the Regional Board is prohibited from prescribing the exact manner of compliance with many provisions of the Tentative Order, it is inappropriate for the Regional Board to attempt to estimate costs. That is best left to the Copermittees. The Regional Board is only able to discuss the differences between the existing and proposed MS4 Permits.

It is important to note that existing efforts under Order 2002-001 are not sufficient to protect water quality standards, as evidenced in the Draft 2008 303(d) report, which has identified additional receiving waters proposed to be listed as impaired due to MS4 discharges, including for additional pollutants (see Comment no. 387). Additional requirements within the Tentative Order are required to address non-storm water discharges and are a component of the iterative process for treating storm water discharges to the MEP standard. These requirements are necessary to improve water quality and restore the Beneficial Uses of impaired waters.

Comment No.	260	Commenter No.	47	Comment Subject	NEL
Comment	<p>Dry Weather Numeric Effluent Limitations are Untenable</p> <p>We believe that the most critical intersection of the cost neutrality and legal authority issues is the imposition of Dry Weather Numeric Effluent Limitations (NELs) at the end-of-pipe. The City adopts and incorporates herein the legal positions taken by the County of Orange as Lead permittee and the other co-permittees regarding the applicability of the MEP standard. The practical ramifications of the proposed NELs are overwhelming: Dry Weather Monitoring Program measurements taken since 2002 at almost every pipe outfall in our City - and in all our Co- ermittee Cities - have shown that exceedances of the proposed bacteria, nutrients and dissolved solids NELs are the rule rather than the exception; and that exceedances of the metals NELs are common. A growing body of evidence suggests these constituents are largely natural in origin. Nevertheless, the proposed Permit provisions would appear to trigger the investigation requirement each time and every place that "an exceedance" occurs. Our experience has already shown that a single investigation may entail dozens of man-hours and substantial costs in equipment and laboratory analyses, and yet may still be inconclusive as to source, or be unable to confidently differentiate mixed natural versus anthropogenic sources. The way the NELs provisions are currently written, even naturally-occurring concentrations may be considered non-compliant if their "conveyance" is "anthropogenically-influenced" - a definition that would criminalize all dry-weather flow in the MS4, which locally carries spring flows and groundwater. Such stringent provisions and/or fuzzy outcomes would make the City (and all the other Co-Permittees) continuously non-compliant under the Permit provisions as currently drafted, making us subject to third-party lawsuits and/or enforcement actions and Mandatory Minimum Penalties. The potential costs cannot even be estimated. Such an ill-conceived framework will invite litigation on all fronts: even the Board itself could be subject to third-party lawsuits for failure to enforce. The City requests and recommends that the dry-weather NELs be removed from the draft Permit; or at a minimum be re-framed as Dry Weather Action Levels in essential conformance to the existing Dry Weather Monitoring Program parameters.</p>				
Response	<p>Please see Regional Board Counsel Memorandum dated November 05, 2009.</p> <p>The Copermittee must conduct further investigation into all non-storm water discharges unless it is known with certainty that the discharge either is exempted from prohibition or covered by another NPDES permit, as non-storm water discharges are to be effectively prohibited. This requirement to investigate the source of the discharge, regardless of chemical composition, is already part of the existing permit.</p> <p>Please also see Comment no. 82 in the July 1, 2009, Response to Comments IV.</p>				

Comment No.	261	Commenter No.	47	Comment Subject	General
Comment	<p>The Draft Permit Continues to be Overly Prescriptive</p> <p>The current Stormwater Permit (No. R9-2002-0001) imposed a comprehensive set of stormwater management and regulatory requirements on the Co-Permittees. The Draft Permit substantially expands the requirements and prescriptions of the current Permit without clear or compelling supportive findings, evidence or rationale. While some minor adjustments have been made to the Draft Permit language since the previous Draft version in response to these observations, the City believes that the it remains too prescriptive, increases costs, and limits the discretion and flexibility of the City to implement programs and practices that are appropriate, sensible and practical for our community. For example, the requirements for on-site storm retention, coupled with the prioritization scheme for selection of BMPs for new developments, impose procedures and costs that are locally unsuitable; furthermore the BMP maintenance tracking requirements are more detailed than is supportable. The City requests that the Regional Board carefully review and reconsider all the new requirements of the Draft permit, and wherever possible, provide maximum discretion and flexibility to the Co-Permittees.</p>				
Response	<p>Please see Comment Nos. 61 and 277 in the July 1, 2009, Response to Comments IV.</p> <p>The Copermittees requested the greater consistency in the LID provisions between the Tentative Order and the Santa Ana Regional Board's MS4 permit for North Orange County. The BMP maintenance tracking requirements are similar to those found in the San Diego County MS4 Permit and are wholly supported by the findings from audits of the Copermittee's programs and recommendations from USEPA.</p>				

Comment Intolerable Impacts on Municipal Co-Permittee Budgets

In addition to the ongoing budgetary 'wild card' represented by the Dry Weather NELs as discussed above, the City will incur significant extra one-time costs during the FY09-10 fiscal year for the development of new ordinances, plans, and assessments. Each of the new local requirements - revising the General Plan, updating the Environmental Review process, updating the Grading Ordinance, adopting Homeowner Association regulations, prohibiting irrigation runoff, reworking the Jurisdictional Urban Runoff Management Plan, setting up the Best Management Practices (BMP) Maintenance Tracking system, and developing an Existing Development Retrofitting Plan - may require dozens and in some cases hundreds of staff and/or consultant hours to be expended by each CoPermittee City for each task. Additionally, each City will be charged its cost-share for development by the Lead Permittee of new regional documents, including the Watershed Workplans, the Model Hydromodification Criteria and Waiver Programs, Regional Monitoring Programs, TMDL Load Reduction Plans, etc. The cumulative FY09-10 cost of all this is likely to be well over \$150,000 just in our City - more than doubling our Program Administration budget, without directly achieving any water quality improvement.

The City will also incur new costs on an annual basis for implementing all these new programs. While the City recognizes that the Regional Board has made some effort to 'cost-neutralize' the regional monitoring requirements by reducing some prior commitments while adding new ones in the Draft Permit, the City will still incur higher operational obligations for investigating NEL and Storm Water Action Level exceedances, inspecting existing developments, training staff, educating the public, enforcing the irrigation runoff prohibition, tracking BMP maintenance and reviewing new development proposals. Operational costs are estimated to go up by about 15%, or an additional \$200,000+ annually in this City alone. Capital improvement costs fluctuate year-to-year and cannot really be estimated before the planning efforts defining the projects are completed, but implementing retrofitting at existing developments may cost additional hundreds of thousands of dollars per year.

These cost increases could not come at a worse time for the City budget. The City has experienced a 6% decline overall in municipal revenues this year due to decreases in property tax, sales tax, real property transfer tax, planning and building fees, and interest income, so that we have had to draw on reserves just to maintain our current programs. Most of our planned capital improvement projects have been put on hold and no new ones are being scheduled for this year. Staff furloughs have been imposed in many CoPermittee cities. Against this backdrop, it is challenging for the Co-Permittees to maintain current funding levels for our existing Stormwater Programs, let alone increase funding. The City requests that the Regional Board make every effort to ensure that the new Permit is, at most, cost-neutral to the Co-Permittees. At the very least, we recommend substantially extending the timeframes for developing and deploying any new program plans and components, in order to reduce financial impacts concentrated during this lowest (we hope) point for local government operating revenues.

Response The Regional Board is well aware of the current economic climate. As such, several changes have been made to the Tentative Order to seek a cost neutral permit when compared to the previous permit. Most significantly, the Tentative Order eliminates multiple monitoring requirements and allows the Copermittees to substitute participation in regional Monitoring programs. These actions are expected to be more cost efficient and prevent redundancy.

Many of the costs associated with this permit are not new and recur every permit cycle, such as updating local ordinances and management plans. The cost to update these plans is likely lower than having to draft an entirely new management plan as was the case with the previous permit. The BMP Maintenance Tracking System is necessary in response to findings from program audits and recommendations from USEPA. The Tentative Order requires Copermittees to only inspect high priority and public agency projects. Other post construction BMPs may be verified through other means. The requirements to retrofit existing development have been extensively modified to require implementation only where feasible and should take advantage of simultaneous efforts to repair and maintain infrastructure. In addition, the South Orange County Integrated Regional Water Management Plan, May 2006, examined retrofitting opportunities in South Orange County. Many of the new programs are given several years to plan and prepare for implementation. For example, the numeric effluent limitations start after year three. The dry weather numeric effluent limitations fits into the City's already existing Illicit Discharge Detection and Elimination Program and requires only minor modification to existing monitoring by the City. The City should already be conducting follow up investigations for any dry weather flow that is prohibited and not known to be exempted or covered by another permit.

The cost share assessment by the Lead Permittee is outside of the Regional Board's control. Any concerns with the cost share by the Lead Permittee should be addressed to that Lead Permittee. The Copermittees also have the option of selecting a different Lead Permittee if they are not satisfied with the cost share or with actions taken by the Lead Permittee on their behalf.

Regional Board staff considered any submitted economic considerations in developing elements of the Tentative Order. The Regional Board, however, is not required to conduct a cost-benefit analysis.

Comment No.	263	Commenter No.	47	Comment Subject	SUSMP
--------------------	-----	----------------------	----	------------------------	-------

Comment Impacts on New Development and Re-Development

The Draft Permit's imposition of substantial additional requirements on New Development and Significant Redevelopment projects will create substantial cost impacts for developers as well as for existing businesses, institutions and residents in the City. The current economic climate - when property values are down by 30% or more - suggests that this is a most inappropriate time to create larger financial disincentives to the spread of low-impact design and re-design across the City. In particular, we note that the requirements continue to be more onerous than defined for North Orange County or for San Diego; and that new requirements to evaluate water rights and sediment loads have been added in the August Draft to the already-substantive burden of retroactively mitigating hydromodification impacts. The City requests that the Regional Board carefully review and reconsider the necessity, appropriateness and timing of these new requirements.

Response The changes are reasonable and necessary to further the protection of Water Quality Standards. In particular, the LID requirements within the Tentative Order are substantially consistent with the requirements found in the Santa Ana Regional Board's North Orange County MS4 permit. The requirements for water rights are necessary as pointed out by Camp Pendleton's comment letter. Improper implementation of the LID capture volume requirement could potentially diminish volumes of water that reach downstream receiving waters and ultimately recharge downstream aquifers. The hydromodification requirements include consideration of sediment load, as it is an important part of calculating hydromodification impacts. No changes have been made in response to this comment.

Comment No.	264	Commenter No.	47	Comment Subject	Overirrigation
--------------------	-----	----------------------	----	------------------------	----------------

Comment Impacts on Residents

The Draft Permit's defining of landscape irrigation runoff as an illicit discharge that must be eliminated will overnight convert a large percentage of the City's 20,000 landowners into unintentional scofflaws. Whether they react voluntarily or in response to enforcement actions, eliminating irrigation runoff will cost homeowners money. A new single-family controller with automatic weather-based scheduling and multi-short-cycle capacity costs \$300 to \$500. Correcting overspray and distribution problems even on a flat home lot may cost a homeowner \$200 to \$1,200. If a homeowners' association has to retrofit thousands of feet of sprinkler lines on common areas, each resident will have to pay a share of potentially tens of thousands of dollars. Enforcement against residents who do not or cannot afford to comply will not be 100% because watering happens at night, half-hidden in back yards, for a few minutes at a time; and Cities cannot issue a citation without actually seeing the offense being committed. The reality is that irrigation runoff can only be controlled to the maximum extent practicable.

Response The comment regarding the prohibition on overirrigation practices was addressed in the previous response to comments. The comment does not raise any new issues from the previous comments.

Please see the discussion in the Fact Sheet for finding C.15; and the July 1, 2009, Response to Comments IV, Response Nos. 28, 52, 76, and 159. No changes have been made in response to this comment.

In summary, over irrigation is a non-storm water discharge required by federal regulations to be prohibited where identified to be a source of pollutants. The comment is over-reaching in asserting potential new costs to homeowners and their associations. Limiting overirrigation does not necessarily have to include capital outlay expenses for landscaping improvements. Instead, overirrigation can be limited simply by adjusting watering duration and frequency. Overirrigation can also be limited by adjusting sprinkler heads to not overspray impervious surfaces.

Comment No.	265	Commenter No.	47	Comment Subject	unfunded mandate
Comment	<p>Porter Cologne Act and Unfunded State Mandates</p> <p>The City believes that many of the new regulations and requirements in the Draft Permit exceed the requirements of the Clean Water Act. As such, these new regulations and requirements must be considered and evaluated in accordance with applicable provisions of the State Porter Cologne Act. If such regulations and requirements are included in the Final Permit, the City believes that they would constitute unfunded State mandates.</p>				
Response	<p>The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The comment does not raise any new issues from the previous comments.</p> <p>The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3 in the February 13, 2008 Response to Comments III; all provide discussions of these issues. No changes were made in response to this comment.</p> <p>In summary, the State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates</p>				

Comment No.	266	Commenter No.	47	Comment Subject	Overirrigation
Comment	<p>Finding E.14 and E.1, B.2 Removing Exemption of Non-Storm water Discharges</p> <p>The Draft Permit removes landscape irrigation, irrigation water and lawn watering from the categories of non-stormwater discharges that are not prohibited, and further declares that non-stormwater discharges are not subject to the MEP standard. The City does not believe that the Regional Board has the legal authority to unilaterally declare that these categories of urban runoff are now to be deemed prohibited discharges and must be completely eliminated. Even if the City passed an ordinance to prohibit such discharges, the most cost-intensive "zero tolerance" enforcement still could only achieve compliance to the MEP, and would likely be politically unacceptable to the public. The City also notes that our Dry Weather Monitoring Program investigations have shown that it is typically reclaimed water - not potable water from residents - that causes the most common water quality problems. The producers, purveyors and users of reclaimed water are separately regulated under permits that require them to control such discharge; Cities should not be required to shoulder the primary burden in their stead. The City requests that the Regional Board keep landscape irrigation on the non-prohibited list, and remove the language asserting that non-stormwater discharges are not subject to the MEP standard.</p>				
Response	<p>The comment regarding the prohibition on overirrigation practices was addressed in the previous response to comments. The comment does not raise any new issues from the previous comments.</p> <p>Please see the discussion in the Fact Sheet for findings C.14 and C.15; and the July 1, 2009, Response to Comments IV, Response Nos. 28, 52, 76, and 159. Please also see comments Nos. 84, and 264 in this Response to Comments. No changes have been made in response to this comment.</p> <p>In summary, over irrigation is a non-storm water discharge required by federal regulations to be prohibited where identified to be a source of pollutants. CWA sections 402, 402(p)(3)(B)(ii-iii), 40 CFR 122.26(d)(2)(iv)(B)(1) clearly give the legal authority to prohibit overirrigation discharges.</p>				

Comment No.	267	Commenter No.	47	Comment Subject	LID
Comment	F.1.d.(4) & F.1.d.(7) - Low Impact Development (LID) Requirements				
	<p>The City is very concerned about the proposed Low Impact Development (LID) requirement that stormwater be retained on-site. Many areas of South Orange County, including Laguna Niguel, have experienced slope failures and landslides. The proposed LID Site Design BMPs, which emphasize infiltration, could in combination with local soil and geological conditions have the potential to increase the risk of such events. As mentioned before, the City is concerned that the significant financial impacts associated with the various reviews, assessments and site improvements necessary to comply with the proposed LID requirements would discourage New Development and Significant Redevelopment, the primary means by which water quality objectives are currently achieved. The proposed requirements also would impose additional demands on the City's water quality program both in terms of staff resources and budgetary impacts. Given the potential negative impacts of such requirements as noted above, the City is particularly concerned with the underlying and inadequately supported presumption that LID methods are superior to conventional treatment methods in achieving water quality objectives.</p>				
Response	<p>The Tentative Order's requirements for LID provide exceptions for sites demonstrating technical infeasibility. The soil type of a site would not necessarily rule out rainwater harvesting for reuse, or evapotranspiration BMPs as technically infeasible. To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. The Copermittees already have plan approval processes in place that can implement the LID provisions. No changes have been made in response to this comment.</p>				

Comment No.	268	Commenter No.	47	Comment Subject	Hydromod
Comment	G. Hydromodification Limitations				
	<p>The inclusion of hydromodification requirements in the current draft permit represents a significant shift away from the regulatory framework of prior permits. As stated in the draft permit, the purpose of this shift is to reduce erosion and/or facilitate removal of existing hardened channels. This justification however fails to address the fact that hardened channels are necessary to safeguard public health and safety and the general welfare in the event of a large storm event. The requirements also place a significant burden on the limited resources of the Copermittees to develop and implement a Hydromodification Management Plan, which includes on-going financial obligations and labor intensive tasks such as assessment of channel conditions, modifications to development review and approval processes, additional field inspections of development sites, and assessment of cumulative impacts within the watershed on channel morphology. As previously noted, these additional requirements also have the potential to inhibit the City's ability to achieve water quality objectives by discouraging New Development and Significant Redevelopment.</p>				
Response	<p>The Regional Board disagrees that the hydromodification requirements in the Tentative Order represents a significant shift away from the regulatory framework of prior permits. On the contrary, the requirements are consistent with recently adopted municipal permits such as the San Diego Municipal Permit (Order No. R9-2007-0001).</p> <p>The commenter incorrectly states that the requirements fail to address the fact that hardened channels are necessary to safeguard public health in the event of a large storm event. The Regional Board recognizes that it is not always possible to restore creek segments to their natural states because of concern for flood control. For this reason, section F.1.h of the Tentative Order does not contain requirements for the copermittees to restore creeks. Please also see response to Comment No. 123.</p> <p>The Regional Board disagrees that the requirements will place a significant burden on the Copermittees to develop a regional HMP. The Orange County Copermittees can look to HMPs developed elsewhere in the State for guidance (Contra Costa County, Santa Clara County, or San Diego County). The Regional Board expects the Copermittees to heavily reference these other HMPs in developing a local one. In terms of labor-intensive tasks, the hydromodification requirements can be incorporated into plan checking processes that already exist. Field inspections of development sites can be the responsibility of the developer, not the Copermittees. Furthermore, the Regional Board disagrees that the requirements have the potential to inhibit the City's ability to achieve water quality objectives because the requirements include measures to protect and restore degraded creeks, which will in turn help achieve water quality objectives.</p>				

Comment No.	269	Commenter No.	47	Comment Subject	Retrofitting
Comment	<p>F.3.d - Retrofitting Existing Development</p> <p>This section requires each Co-Permittee to implement a retrofitting program that reduces impacts from hydromodification, promotes Low Impact Development, supports riparian and aquatic habitat, reduces the discharges of storm water pollutants from the MS4 to the MEP, and prevents discharges from the MS4 from causing or contributing to a violation of water quality standards. First, it is difficult to imagine the scope and cost of performing the retrofitting evaluation required by Section F.3.d. Second, even if such an evaluation was performed, the Co-Permittees have no legal authority to compel private landowners of existing developments to implement or cooperate on retrofit projects. The City requests that the Regional Board delete Section F.3.d from the Storm Water Permit.</p>				
Response	<p>This comment regarding retrofitting has been considered in the previous response to comments. Please see the Fact Sheet discussion on retrofitting; and the July 1, 2009, Response to Comments IV, Response Nos. 46, 136, 161, and 162.</p> <p>In summary, the Tentative Order's requirements for retrofitting existing development is practicable for a municipality through a systematic evaluation, prioritization and implementation plan focused on impaired water bodies, pollutants of concern, areas of downstream hydromodification, feasibility and effective communication and cooperation with private property owners. The Tentative Order's requirement realized the legal limitations that the Copermittees have in requiring retrofitting on privately held land. Therefore, the Tentative Order requires the Copermittees to cooperate with private landowners in implementing retrofitting opportunities.</p>				

Comment No.	270	Commenter No.	47	Comment Subject	TMDL
Comment	<p>Finding E.11 and E.1. and I. Total Maximum Daily Loads</p> <p>The Draft Permit imposes strict concentration-based numeric targets for a bacteria TMDL in addition to strict load-based targets, for both dry and wet weather. This language disregards years of painstaking work by staff and stakeholders in crafting TMDL documents firmly promoting the need for better science and iterative-BMP-based WQBELs; and completely contradicts the implementation provisions of the Basin Plan Amendment approved last year, establishing bacteria TMDL implementation provisions under a Reference System/Natural Source Exclusion approach. The City requests and recommends that the concentration-based numeric targets and the load-based allocations both be qualified as "subject to adjustment in accordance with the bacteria TMDL implementation provisions contained in the Reference System/Natural Source Exclusion Basin Plan Amendment approved by the Board in 2008. "</p>				
Response	<p>The Tentative Order does not disregard the TMDL. The Waste Load Allocation Reductions, Final Allocations and Numeric Targets come directly from the adopted TMDL. This is in compliance with the requirement that all NPDES Permits are consistent with the assumptions and requirements of the Waste Load Allocations of adopted and applicable TMDLs [40 CFR 122.33(d)(1)(vii)(B)]. The Tentative Order requires the Copermittees to implement BMPs capable of achieving these allocations and targets. It is expected that an iterative approach will be taken. It must be remembered that the allocations and targets are chosen and designed to demonstrate protection of Water Quality Standards, which is the goal of the TMDL.</p> <p>Regional Board Resolution No. R9-2008-0028, "A Resolution Amending the Water Quality Control Plan for the San Diego Basin (9) to Incorporate Implementation Provisions for Indicator Bacteria Water Quality Objectives to Account for Loading from Natural Uncontrollable Sources Within the Context of a Total Maximum Daily Loads," has essentially revised the Water Quality Standards for bacteria in water bodies that are addressed by TMDLs. The Water Quality Standards for bacteria, within the context of a TDML, allows for exceedances of the bacteria WQOs, as long as the exceedances are due to natural and background (non-anthropogenic) sources using a "reference system and antidegradation approach" or a "natural sources exclusion approach." To date, a TMDL containing either approach has not been fully approved in Southern Orange County. The Bacterial Indicators TMDL for Baby Beach has the option of developing a "natural sources exclusion approach." Once developed, the TMDL must be amended prior to any changes to the MS4 Permit to be consistent with the assumptions and requirements of the TMDL Waste Load Allocations.</p>				

Comment No.	271	Commenter No.	48	Comment Subject	Overirrigation
Comment	We note with approval the progress the Regional Board has made towards drafting a Permit that will meet the Clean Water Act's maximum extent practicable ("MEP") standard, and again approve of the Board's decision to omit lawn irrigation from the list of permitted non-storm water discharges in section B.2. of the Discharge and Legal Provisions portion of the Permit.				
Response	Comment noted.				

Comment

A.

Biofiltration Should Not Count Towards the Permit's LID Obligations

Section F.1.d.(4)(d)(i) requires a site to use LID BMPs to retain onsite the runoff from a design storm event. Section F.1.d.(4)(d)(ii), in turn, allows a site to biofiltrate any portion of that runoff which cannot feasibly be retained onsite. The section allows biofiltrated runoff to count toward LID retention requirements, and would conceivably allow a site demonstrating technical infeasibility of onsite retention to discharge all of its stormwater to the MS4 system through biofiltration, without undertaking any offsite mitigation. But, as discussed in our previous comment letters, biofiltration is not as effective a means of reducing pollutant load as onsite retention, nor does biofiltration ensure downstream impacts such as flooding or erosion will be reduced to the same extent. As a result, biofiltration without offsite mitigation falls short of the maximum extent practicable standard.

Other jurisdictions have developed policies that reflect the strengths of retention and the shortcomings of biofiltration. As discussed in our previous letters, Philadelphia, West Virginia, and Anacostia (Washington D.C.) have adopted standards that infiltrate, use onsite, or evaporate all precipitation except that which exceeds a specified storm volume. More locally, the Los Angeles Regional Water Quality Control Board recently approved NPDES No. CAS00402, the MS4 permit for Ventura County and its incorporated cities. That permit does not, like the current draft Permit, allow biofiltration BMPs to count toward LID obligations. Rather, the Ventura permit requires that a project employing biofiltration must compensate through mitigation measures.

We recommend that you revise your Permit in a similar manner so that a site must mitigate offsite any reduction in the removal of pollutants resulting from the use of biofiltration instead of retention-based BMPs. Such a move could help to ensure compliance with the Clean Water Act and would further serve important policy goals of the State. Given our current state of drought, Governor Schwarzenegger has issued a proclamation calling on water agencies to take additional actions to protect and enhance water supplies. By requiring offsite mitigation through practices that retain stormwater runoff, captured or infiltrated water could be used to increase water supplies through onsite use or recharging groundwater, in furtherance of this goal. In contrast, as currently written the draft Permit would allow most or all of that water to be discharged through use of biofiltration, without any volume retained to increase water supplies.

Finally, given the Permit's current language we see no reason why the Regional Board should require a site to demonstrate that biofiltration is infeasible prior to deciding to implement conventional controls and participate in the LID waiver program under section F.1.d.(4)(d)(iii). The purpose of the permit's LID BMPs sizing criteria requirements is to reduce harmful water impacts to the maximum extent practicable. While onsite retention ensures that 100 percent of pollutants in the design storm volume of water never leave the site, both biofiltration and conventional controls fail to reduce impacts as effectively. But, as currently drafted, the Tentative Order would at least require a site employing conventional controls to participate in the LID waiver program, thereby ensuring that the site would achieve an equivalent level of pollutant reduction within the same hydrologic subdivision or unit. Thus, while biofiltration may in many circumstances represent an approach for addressing stormwater runoff that is preferable to the use of conventional controls, a site implementing conventional controls could counterintuitively achieve greater pollutant reduction due to its required participation in the waiver program.

The Regional Board can, and should, correct this result by requiring participation in the LID waiver program for any site implementing biofiltration to meet its LID obligations. But in the absence of any such requirement, a site should be able to participate in the waiver program even if biofiltration is a feasible practice. In the case where a site is able to demonstrate technical infeasibility of onsite retention, the site should be permitted to choose between biofiltration on the one hand, and conventional controls with participation in the waiver program on the other, and should not have to demonstrate that the use of biofiltration is infeasible as a prerequisite.

Response

The Regional Board maintains that bio-filtration is part of a comprehensive LID program. Effective bio-filtration provides pollutant removal and energy dissipation. Biological removal of pollutants can even be an improvement over simply keeping pollutants on-site until rainfall over the design-storm criteria washes pollutants into receiving waters. Removal of pollutants and prevention of downstream hydromodification ensures any discharge to be low impact.

The USEPA's Green Infrastructure website includes filtration as a Low Impact Development technique; <http://cfpub.epa.gov/npdes/greeninfrastructure/information.cfm#glossary>. In addition, the U.S. Department of Housing and Urban Development's report titled "The Practice of Low Impact Development," (July 2003, H-21314CA) incorporates filtration techniques. The County of San Diego's LID manual also utilizes bio-filtration as an acceptable LID practice.

In the future as the science and knowledge of storm water treatment evolves, filtration may not be a suitable LID practice to meet the maximum extent practicable standard. For this permit iteration, LID BMPs that capture the

design storm for reuse, infiltration or evapotranspiration are preferred over bio-filtration techniques. The draft permit provides design-criteria for "LID bio-filtration BMPs" in section F.1.4.d.ii and requires demonstration that retention LID BMPs are technically infeasible prior to implementing bio-filtration BMPs.

Comment

B.
The Permit Should Require that Watershed-Based Projects Demonstrate the Infeasibility of Onsite Retention Before Allowing the Use of Biofiltration or Conventional Controls and Offsite Mitigation Measures.

Section F.1.c.(8) of the Permit provides that, for watershed or sub-watershed based development projects, "Regional BMPs may be used provided that the BMPs capture and retain the volume of runoff produced from the 24-hour 85th percentile storm event as defined in section F.1.d.(6)(a)(i)," mimicking the performance standard required for Priority Development Projects under section F.1.d.4(d)(ii). However, unlike the Priority Development Projects provision, which requires that a site demonstrate the technical infeasibility of onsite retention prior to implementing biofiltration or prior to implementing conventional treatment controls and participating in the Permit's offsite mitigation or in-lieu program, section F.1.c.(8) states that "[a]ny volume that is not retained by the LID BMPs, up to the design capture volume, must be treated using LID biofiltration," with no required demonstration of infeasibility. Likewise, section F.1.c.(8) states that "[a]ny volume up to and including the design capture volume, not retained by LID BMPs, nor treated by LID biofiltration, must be treated using conventional treatment control BMPs in accordance with Section F.1.d.(6) . . . and participate in the LID substitution program," again failing to require that the site demonstrate infeasibility of onsite retention. The wording of these provisions suggests that, so long as a large development is involved, a site need not satisfy any threshold condition before deciding to biofiltrate water or substitute conventional treatment controls, rather than retain the water onsite.

Instead, the draft language gives the developer discretion to determine what volume of water to retain and what volume of water to biofiltrate or treat with conventional controls. Thus, (and in addition to the problems identified with allowing biofiltration to count towards a site's LID obligations above), a developer of a watershed based project could, for reasons completely unrelated to any finding of technical infeasibility, choose not to retain any water onsite, yet still comply with the permit's LID requirements. By failing to ensure that water will be retained onsite absent a finding of infeasibility, this provision fails to meet the MEP standard. To correct this oversight, the Permit should require that a large development demonstrate infeasibility of onsite retention prior to use of biofiltration or conventional treatment and participation in the Permit's LID substitution program.

Response

Section F.1.c(8) regulates the implementation of regional-based BMPs on large projects, as such we agree that technical infeasibility must be demonstrated prior to using less than full LID for the 85th percentile storm. Language to that effect has been added to the Tentative Order.

Comment No.	274	Commenter No.	48	Comment Subject	LID
Comment	<p>C. Any LID Waiver Program Credit System Must be Closely Tied to Equivalent Water Quality Benefits to be Achieved and Subject to Public Notice and Comment</p> <p>Section F.1.d.(7)(g) allows a copermittee “to implement a pollution credit system as part of the LID waiver program provided that such a credit system clearly exhibits that it will not allow PDPs to result in a net impact from pollutant loadings over and above the impact caused by projects meeting LID requirements.” While we withhold comment on the propriety of a credit system in general, we state here that any pollutant credit system designed by the copermittees must be clearly tied to resulting water quality benefits, and not to benefits derived in furtherance of other environmental or policy oriented goals. For example, while projects such as brownfield redevelopment, construction of low-income housing, or development close to public transportation or transit centers may serve admirable purposes—even purposes for which we may advocate—these types of projects also may not provide any demonstrable benefit in terms of water quality or pollutant load reduction. In addition to requiring that any credit system not result in a net impact from pollutant loadings over and above the impact from meeting LID requirements, F.1.d.(7)(g) should be revised so that it clearly requires any credit system to award credits only for measures that yield equivalent water quality benefits.</p> <p>Further, in the current draft, any credit system that a copermittee devises only need “be submitted to the Executive Officer for review and approval as part of the waiver program.” But putting such review authority solely in the Executive Officer shields the credit system from oversight and creates a self-regulatory scheme in violation of the Clean Water Act. In <i>Environmental Defense Center, Inc. v. U.S. E.P.A.</i>, 344 F.3d 832, 854-56 (9th Cir. 2003), the court explained: “[S]tormwater management programs that are designed by regulated parties must, in every instance, be subject to meaningful review by an appropriate regulated entity ... Congress identified public participation rights as a critical means of advancing the goals of the Clean Water Act in its primary statement of the Act’s approach and philosophy.” Given that implementation of a credit system has the potential to exempt development participating in the LID waiver program from portions of the Permit’s core requirements to prevent the discharge of pollutants to the MS4 system, the public and the regional board must have a way to meaningfully review the system. In order to “ensure that each [MS4 permit] program reduces the discharges of pollutants to the maximum extent practicable,” any credit system under the LID waiver program should be publically noticed and presented for comment, and subject to approval by the Regional Board.</p>				
Response	<p>Any credit system proposed by the Copermittees will be part of the SSMP, which per section F.1.d. will have a 30-day public review and comment period. We agree with the commenter that otherwise laudable projects may not provide equal water quality benefits. In other words, the ends do not justify the means. That is why any credit system must demonstrate that any participating project will not result in a net impact from pollutant loadings over and above the impact caused by projects meeting LID requirements. The pollutant loadings in the context of the permit only refers to pollutant loadings that impact water quality.</p>				

Comment No.	275	Commenter No.	48	Comment Subject	LID
Comment	<p>D. The Permit Contains a Clerical Error with Regard to the LID Waiver Program</p> <p>Finally, we note that Sections F.1.c.(8) and F.1.d.(4)(c)(iii) both, while referencing the LID waiver program, refer to that program as falling under section F.1.d.(8). It appears that this section corresponds to the LID waiver program’s location in previous drafts of the Permit. In the current draft of the Permit, the LID waiver program is located at section F.1.d.(7), and all references to the LID waiver program in the Development Planning Component should be revised to correct this error.</p>				
Response	<p>Thank-you for the comment. The Tentative Order has been corrected.</p>				

Comment No.	276	Commenter No.	49	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment At the Public Hearing on July 1, 2009, your Board members highlighted two key issues of common concern: the permit's consistency with May 2009 permit adopted in the Santa Ana Region and cost neutrality with our current permit in the San Diego Region. Permitting consistency is a key issue for the Orange County Stormwater Program because our compliance programs are integrated countywide and four jurisdictions are split between the two regions. Fundamentally different requirements between our two permits - particularly within the same city - damage the credibility of the regulatory framework and thwart our ability as local government to cost effectively address key environmental mandates. Since the Tentative Order continues to present a number of unprecedented requirements, it is necessary for us to continue to seek revisions to the Tentative Order that support alignment between the North and South County permit requirements.

Response Please see response to Comment No. 373. Please also see Comment no. 24 in the July 1, 2009, Response to Comments IV.

Please also see response to Comment 259 regarding cost neutrality.

Comment No.	277	Commenter No.	49	Comment Subject	NEL
--------------------	-----	----------------------	----	------------------------	-----

Comment With respect to "cost neutrality" and cost effectiveness, there are three aspects of the permit to bring to your attention. First, your staff has indicated its intention to remain steadfast on the inclusion of numeric effluent limits for dry weather flows. Even though exceedances of these limits are written to function as "action levels," by using the term "effluent limits" and specifically "numeric effluent limits" (NELs) the permit potentially subjects permittees to mandatory minimum penalties under the Water Code for exceedances of NELs. While we would strongly oppose any effort to impose mandatory minimum penalties in such a situation, the entire process imposes potentially significant legal and transactional costs upon the Permittees.

Response Please see Comment no. 82 in the July 1, 2009, Response to Comments IV.

Comment No.	278	Commenter No.	49	Comment Subject	NEL
--------------------	-----	----------------------	----	------------------------	-----

Comment Our analysis of environmental quality data shows that a number of these NELs will not be achieved at any time or in any part of our storm drain system. Moreover, they are not being achieved at reference sites in areas completely removed from any urban influence. Their technical derivation is clearly flawed and there is no legal requirement for their inclusion. Consequently, we strongly object to the inclusion of NELs in the Tentative Order and would once again recommend the model application of water quality benchmarks in our existing dry weather reconnaissance program as the basis of non-stormwater permitting. This approach will achieve meaningful water quality improvements in a cost effective manner and is consistent with the Santa Ana Region permit.

Response Please see Regional Board Counsel Memorandum dated November 05, 2009..

Please see response to Comment no. 317.

Comment No.	279	Commenter No.	49	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment There is a second cost concern presented by the escalating administrative burden from a number of the Tentative Order's provisions. New requirements arbitrarily establish municipal responsibility for sanitary sewer collection systems already subject to separate State regulation. Annual inspection of treatment controls in completed land development and redevelopment projects would be required for the first time. Greater regulatory oversight of and attention on private residences and mobile businesses is prescribed. There is a requirement to augment existing countywide, regional, watershed, and jurisdictional plans, with an additional jurisdictional planning process. In addition, technically challenging new standards will need to be developed and implemented for land development. There are also significant new monitoring obligations. All of these new requirements have significant resource implications for local government. In the current economy, local governments in Orange County are dealing with shrinking budgets not unlike State agencies. Consequently, a key test of the acceptability of the Tentative Order will be a calculation that shows that all of the prescriptive new requirements represent the most cost effective and cost neutral means of achieving our common goal of further improved water quality.

Response Please see Comment nos. 44, 61 and 277 in the July 1, 2009, Response to Comments IV.

Please note the Regional Board has made significant reductions in monitoring requirements in an attempt to minimize the impact of additional monitoring requirements.

To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. The Regional Board is not required, as the commenter states, to provide a "calculation that shows that all of the prescriptive new requirements represent the most cost effective and cost neutral means of achieving our common goal of further improved water quality." Please see the Fact Sheet; July 6, 2007, Response to Comments I, Response No. 5; December 12, 2007, Response to Comments II, Response Nos. 1 and 9; February 13, 2008, Response to Comments, Response No 3. No changes have been made in response to this comment.

It is important to distinguish that NPDES permits are not a right to discharge, and are issued to protect water quality standards for those waters receiving the discharge. The goal of NPDES permitting is not to determine cost neutrality, but to maintain and protect Water Quality Standards

Comment No.	280	Commenter No.	49	Comment Subject	LID
--------------------	-----	----------------------	----	------------------------	-----

Comment Finally, a major portion of the additional cost burden presented by the Tentative Order will ultimately be borne by the proponents of land development and redevelopment projects and therefore new owners of property. There is significant concern here regarding the potential imposition requirements that will stymie redevelopment, lead to limited environmental benefits and possibly even undesirable environmental outcomes, and for which there is currently no technical consensus. To illustrate this uncertainty, each recently released municipal stormwater permit in California applies its own version of hydromodification standards for land development. The North Orange County Permittees are now working to craft a model for land development that presumes the application of low impact development (LID) best management practices (BMPs) based upon a prioritized consideration of infiltration, capture and reuse, evapotranspiration, and bio-retention/bio-filtration, and requires treatment of residual runoff volumes when the application of LID BMPs has been determined to be infeasible at site, sub regional, and regional scales. The model will also integrate options for water quality credits and provide for alternate compliance approaches including participation in a watershed project and contributions to an in-lieu fund. Because it is imperative that the Order eventually adopted by the Board provide similar direction for land development as the North County permit, deliver meaningful water quality outcomes, and be accepted by the development community, there is now a vital need for a change in direction in this key area of the Tentative Order.

Response The Tentative Order's requirements for LID implementation are functionally identical to that in the Santa Ana Regional Board's North Orange County MS4 Permit, R8-2009-0030. The Tentative Order includes the same consideration of infiltration, capture and reuse, evapotranspiration, and bio-retention/bio-filtration, and requires treatment of residual runoff volumes when the application of LID BMPs has been determined to be technically infeasible. The Tentative Order's LID waiver provisions provide the Copermittees discretion to include regional or sub regional treatment of residual runoff volumes as mitigation projects. The Tentative Order also allows the Copermittees the discretion to implement a credit system as part of the waiver program.

Contrary to the Commenter's statement regarding hydromodification requirements being different, the Tentative Order's hydromodification requirements are significantly similar to those requirements found in the San Diego MS4 permit. The hydromodification requirements allow for specific differences in watersheds.

Comment

A. The Clean Water Act and Federal Regulations are Very Clear as to the Scope of Non-Stormwater Regulation Required in an MS4 Permit

Section 402(p)(3)(B)(ii) of the Clean Water Act requires that MS4 permits include a requirement to effectively prohibit non-stormwater discharges into the MS4. The federal regulations include two requirements or provisions designed to begin implementation of the "effective prohibition." 55 Fed. Reg. 47989, 48037 (Nov. 16, 1990). The first provision requires permittees to perform a screening analysis, intended to provide sufficient information to develop priorities for a program to detect and remove illicit discharges. 1 Id.; 40 C.F.R. 122.26(d)(1)(iv)(D). The second provision requires permittees to develop a recommended site-specific management plan to detect and remove illicit discharges (or ensure they are covered by an NPDES permit) and to control improper disposal to MS4s. Id.; 40 C.F.R. 122.26(d)(2)(B). The federal regulations, thus, focus on two types of non-stormwater discharges:

- Illicit discharges (discharges that are plumbed into the MS4 or that result from leakage of sanitary sewer systems); and
- Improper disposal of materials such as used oil and other toxic materials. Id. at 48055.2

Of the second provision to implement the "effective prohibition" standard, the preamble to the federal rule says that permittees are required to "detect and remove" or prevent illicit discharges (or ensure they are covered by an NPDES permit) and to "control" improper disposal. 55 Fed. Reg. at 48037.

1. Illicit Discharges

With respect to detecting and removing illicit discharges, the proposed stormwater rule required permittees to have a program to prevent all illicit discharges into the MS4. 53 Fed. Reg. 49415, 49472 (December 7, 1988); 40 C.F.R. 122.26(d)(2)(iv)(B)(1). Commenters on the proposed rule suggested that there was no need to prevent numerous categories of commonly occurring discharges that did not pose significant environmental problems. 55 Fed. Reg. at 48037. U.S. EPA disagreed that the commonly occurring discharges would never pose significant environmental problems, but did admit that it was unlikely that Congress intended to require permittees to effectively prohibit "seemingly innocent flows that are characteristic of human existence in urban environments and which discharge to municipal separate storm sewers." Id.

As a compromise, U.S. EPA revised the final rule by generally exempting from the illicit discharge prevention program the categories of discharges identified by commenters. As stated in the preamble: "the following categories of non-storm water discharges or flows [must be addressed by the program] only where such discharges are identified by the [permittee] as sources of pollutants to waters of the United States..."³ 55 Fed. Reg. at 48037 [emphasis added]. U.S. EPA summarized the requirement in its Guidance Manual for the Preparation of Part 2 of the NPDES Permit Application for Discharges from Municipal Separate Storm Sewer Systems, November 1992 ("Part 2 Guidance Manual"):

While EPA does not consider these flows to be innocuous, they are only regulated by the storm water program to the extent that they may be identified [by the permittee] as significant sources of pollutants to waters of the United States under certain conditions.

Part 2 Guidance Manual at p. 6-33.

Where a permittee identifies a specific discharge, within an otherwise exempt category, that is a source of pollutants to waters of the United States, the permittee must address the discharge as part of its illicit discharge program. See 55 Fed. Reg. at 47995 (discharges identified on a case-by-case basis); Part 2 Guidance Manual at p. 6-33 (landscape irrigation from a particular site may result in a water quality impact).

2. Improper Disposal

With respect to controlling improper disposal, the preamble provides that permittees' program is to "assist and facilitate in the proper management of used oil and toxic materials." 55 Fed. Reg. at 48056. The regulation itself provides that the program is to include a description of educational activities, public information activities, and other appropriate activities to facilitate the proper management of used oil and toxic materials. 40 C.F.R. 122.26(d)(2)(B)(6). Thus, rather than using a stick to mandate that no used oil or other toxic materials ever enter the MS4, the regulations require that permittees assist and facilitate, through public education, the proper disposal of these materials such that they shouldn't enter the MS4. Improper disposal does not have to be prevented, it has to be controlled.

The Tentative Order ignores much of these clear requirements for regulating non-stormwater through preventing illicit discharges and controlling improper disposal. It allows the Regional Board to identify as sources of pollutants discharges within otherwise exempt non-stormwater categories, rather than just permittees as provided by federal law. It deletes three entire categories of exempt non-stormwater discharges rather than just the specific discharges within those categories that may be a source of pollutants. More significantly, it imposes numeric effluent limitations on non-stormwater discharges from the MS4. Because none of these requirements or acts are authorized by federal law (and the Regional Board has not indicated it is relying on state law), as discussed below in more detail, the County requests that all of them be removed, revised or undone.

Response

Please see Regional Board Counsel Memorandum dated November 05, 2009.

The Regional Board agrees that federal regulations require the effective prohibition of non-storm water discharges into the MS4, as well as require a program to detect and remove illicit discharges.

The Regional Board, however, does not agree with the comment that there are two types of non-storm water discharges (illicit discharges and improper disposal). The federal regulations define an illicit discharge as any discharge to an MS4 that is not composed entirely of storm water except discharges pursuant to an NPDES permit and discharges resulting from fire fighting activities (40 CFR 122.26(b)). The improper disposal of materials into the MS4 is/are an activity that results in an illicit discharge, which is prohibited. Thus, federal requirements also require that activities that may result in illicit discharges be controlled through ordinance, order or similar means and not just education as the commenter states (Please see response to Comment no. 285).

Please see response to Comment no. 282 regarding categories of exempted discharges.

Comment

B. For Exempt Categories of Non-Stormwater Discharges, Only Where a Permittee Identifies a Specific Discharge of Non-Stormwater to the MS4 as a Source of Pollutants to Waters of the U.S. Must the Permittee Prevent the Discharge to the MS4

Staff's response to the County's May 15, 2009 comment on this issue ignores authority cited by the County, misreads other authority, and fundamentally misconstrues the reason U.S. EPA provided exempt categories of non-stormwater discharges.

The Part 2 Guidance Manual clearly explains, by way of example, that it is only where landscape irrigation runoff from a particular site results in a water quality impact that the MS4 permittee must address the discharge, either through its management plan or by requiring the discharger to obtain an NPDES permit. See Part 2 Guidance Manual at p. 6-33 (quoted in the County's May 15, 2009 comment letter). Staff's response to comments does not address this authority. Just because runoff from one site is a source of pollutants to waters of the United States doesn't mean that the entire landscape irrigation category loses its exempt status.

Staff does address language in the preamble to the federal regulation, but misreads it. U.S. EPA explains in the preamble the idea of exempt categories (or components) of non-stormwater:

[I]n general, municipalities will not be held responsible for prohibiting some specific components of discharges or flows listed below through their municipal separate storm sewer system, even though such components may be considered non-storm water discharges, unless such discharges are specifically identified on a case-by-case basis as needing to be addressed.

55 Fed. Reg. at 47995 (emphasis added). Staff somehow reads this language as providing authority for removing entire categories (or components) of non-stormwater discharges from the list of exempt categories of non-stormwater discharges provided in the federal regulations. The language, however, very clearly refers to "discharges" being identified on a case-by-case basis as needing to be addressed (i.e., a source of pollutants). It does not refer to "categories" being identified as needing to be addressed.

Moreover, as alluded to above, staff's position does not make sense. U.S. EPA established the list of exempt non-stormwater categories because Congress did not intend to require permittees to prohibit commonly occurring, "seemingly innocent flows that are characteristic of human existence in urban environments." 55 Fed. Reg. at 48037. Under staff's position, that is precisely the result. Any time a single discharge from an exempt discharge category is identified as a source of pollutants, the entire discharge category would be subject to the "effective prohibition" standard, regardless of whether any other discharges from that category presented a problem. This is not what U.S. EPA intended.

Finally, the County notes that the Tentative Order is inconsistent with federal law in that it allows the Regional Board to identify as sources of pollutants discharges within otherwise exempt non-stormwater categories. As discussed above, the federal regulations and guidance are clear that it is the permittees alone that are to identify such discharges.

For all of the above reasons, the County requests that the Board restore the three deleted exempt non-stormwater discharge categories in Directive B.2 (landscape irrigation, irrigation water, and lawn water) and strike "or the Regional Board" from the second line of the first paragraph of Directive B.2.

Response

The Regional Board does not agree with the commenter's assessment that Regional Board staff have ignored and misread authority as well as misconstrued the reasoning behind exempted categories. It is important to note that the copermitees have identified the discharge of landscape irrigation runoff as a source and conveyance of pollutants. The identification was not for a specific site, but for the discharge category. It is therefore appropriate to remove the category of non-storm water discharge from exempt status under 40 CFR section 122.26(d)(iv)(B). USEPA's preamble to the federal regulations clearly supports this approach. Where categories of non-storm water discharges have been identified as sources of pollutants, discharges in those categories must be addressed and the status as exempt from the effective prohibition requirement in the Clean Water Act is no longer appropriate.

Comment

C. The Proposed Numeric Effluent Limits For Discharges of Non-Stormwater From The MS4 Are Contrary to Federal Law and Could Subject Permittees to Mandatory Minimum Penalties

The Tentative Order proposes numeric effluent limitations for non-stormwater dry weather discharges from the MS4. In its May 15, 2009 comment letter the County pointed out that the Clean Water Act requires that discharges from the MS4 meet the MEP standard, not numeric effluent limitations. The Response to Comments suggests that staff fundamentally misconstrues the authority provided by federal law to regulate MS4s.

1. The Relevant Clean Water Act Provision and Federal Regulations Regulate Discharges From MS4s

In response to Comment No. 39, staff begins their analysis by stating that section 402(p) of the Clean Water Act "regulates the discharge of storm water from a point source." This is not entirely accurate. Section 402(p) does regulate discharges of stormwater from a point source (e.g., the MS4), but it also regulates discharges of non-stormwater from the MS4. More accurately stated, section 402(p)(3)(B) regulates the discharge of pollutants from the MS4. In the clearest language possible, the relevant section provides in pertinent part:

Permits for discharges from [MS4s] . . . shall require controls to reduce the discharge of pollutants to the maximum extent practicable [MEP]. . .

33 U.S.C. 1342(p)(3)(B)(iii).

Staff assert that, because section 402(p)(3)(B)(ii) requires permittees to effectively prohibit nonstormwater discharges into the MS4, the MEP standard in section 402(p)(3)(B)(iii) must apply only to discharges of stormwater. In essence, staff would re-write the Clean Water Act to provide:

Permits for discharges from [MS4s] . . . shall require controls to reduce the discharge of pollutants in stormwater to the maximum extent practicable . . .

That of course is not what the Clean Water Act says. If Congress had intended to apply the MEP standard only to stormwater discharges from the MS4, as suggested above, it would have been very easy to do. Congress, however, chose to apply the MEP standard to the discharge of pollutants from the MS4, regardless of the source. That makes sense in that it is pollutants, not stormwater or non-stormwater, that impacts receiving water quality.

This is consistent with *Defenders of Wildlife v. Browner*, 191 F.3d 1159 (9th Cir. 1999). There, in discussing the two different standards applicable to industrial dischargers and municipal dischargers, the Court consistently tracked the language from the Clean Water Act, referring to "industrial storm-water discharges" and "municipal storm-sewer discharges." See 191 F.3d at 1164-65 (emphasis added). The Court did not refer to the standard as applying to stormwater discharges or non-stormwater discharges. The Court, of course, held that "Congress did not require municipal storm-sewer discharges to comply strictly with 33 U.S.C. § 1311(b)(1)(C) [e.g., water quality standards]."

Response

Please see Regional Board Counsel Memorandum dated November 05, 2009. Noncompliance with numeric effluent limits for discharges of non-storm water from the MS4 that are subject to the effective prohibition requirement in Clean Water Act section 402(p)(3)(B)(ii) results in both a violation of the limitation and triggers the requirement to achieve one of three outcomes. The Regional Board disagrees with the Commenter's interpretation that the Clean Water Act requires discharges of unauthorized non-storm water to meet only the more relaxed MEP standard when in fact these discharges of non-storm water are required to be effectively prohibited in the first instance.

Comment No.	284	Commenter No.	49	Comment Subject	Legal
Comment	<p data-bbox="203 997 966 1039">2. All Discharges From the MS4 are Subject to the MEP Standard</p> <p data-bbox="203 1627 1534 1690">Staff assert, in their response to comments and in Finding C.14 that non-stormwater discharges from the MS4 are not subject to the MEP standard. An examination of the federal regulations and preamble indicates otherwise.</p> <p data-bbox="203 1711 1550 1921">The focus of the Clean Water Act and the federal regulations is on a management program or programs. Under the federal regulations, the overall goal of the management program is to include a comprehensive planning process to reduce the discharge of pollutants to the MEP. 40 C.F.R. 122.26(d)(2)(iv). One of the elements of the management program is the illicit discharge prevention program. 40 C.F.R. 122.26(d)(iv)(B)(1). Thus, the prevention of illicit discharges into the MS4 is intended to help achieve the overall MEP standard for discharges from the MS4. This is confirmed by the preamble to the federal regulations where U.S. EPA discusses the required elements of the management plans or programs. According to U.S. EPA:</p> <p data-bbox="203 1953 1559 2016">[Permittees are required] to develop management programs for four types of pollutant sources which discharge to large and medium municipal storm sewer systems. Discharges from large and medium municipal storm sewer systems are usually expected to be composed primarily of: (1) Runoff from commercial and residential areas; (2) storm water runoff from industrial areas; (3) runoff from construction sites; and (4) non-storm water discharges. Part 2 of the permit application has been designed to allow [permittees] the opportunity to propose MEP control measures for each of these components of the discharge.</p> <p data-bbox="203 2047 1550 2100">55 Fed. Reg. at 48052 (emphasis added). See also 55 Fed. Reg. at 48045 (“Part 2 of the proposed permit application [which includes the illicit discharge prevention requirement] is designed to . . . provide municipalities with the opportunity of proposing a comprehensive program of structural and non-structural control measures that will control the discharge of pollutants, to the maximum extent practicable, from municipal storm sewers.”) (Emphasis added.)</p> <p data-bbox="203 2142 1502 2100">Thus, just as the discharge of non-stormwater into the MS4 is subject to the “effective prohibition” standard, the discharge of pollutants in non-stormwater from the MS4 is subject to the MEP standard.</p>				
Response	<p data-bbox="203 2026 1112 2068">Please see Regional Board Counsel Memorandum dated November 05, 2009.</p>				

Comment 3. No "Narrative Prohibition" or "Zero Discharge" Requirement

In their Response to Comments, staff then go on to assert that the effective prohibition standard applicable to discharges of non-stormwater to the MS4 is, in effect a "narrative prohibition" of discharges of non-stormwater from the MS4; i.e., a "zero discharge" requirement. In support, staff assert that non-stormwater discharges are defined as "illicit discharges." This, again, is inaccurate.

First, as discussed above, "non-stormwater discharges" are not defined in federal law. As made clear in the preamble to the federal regulations, U.S. EPA intended to implement the "effective prohibition" mandate of the Clean Water Act by focusing on two types of non-stormwater discharges -- illicit discharges and improper disposal. While non-exempt categories of illicit discharges must be prevented from entering the MS4, improper disposal needs only be controlled, not prevented. Moreover, it is to be controlled not through direct enforcement or some "stick" approach, but rather through public education. In other words, U.S. EPA acknowledged and accepted that some non-stormwater likely would enter the MS4. There is not a "narrative prohibition" or "zero discharge" requirement on non-stormwater discharges from the MS4. This doesn't present significant risk to water quality, however, because all pollutants discharged from the MS4 must be controlled or reduced to the maximum extent practicable.

Second, as noted, U.S. EPA's approach to regulating non-stormwater arises from trying to implement the Clean Water Act's "effective prohibition" standard. Congress did not say that non-stormwater discharges into the MS4 had to be "absolutely prohibited" or "completely prohibited" or even just "prohibited." Congress said that non-stormwater discharges into the MS4 had to be "effectively prohibited." As indicated by U.S. EPA's regulations, something may be effectively prohibited even when some of it is allowed. Effectively prohibiting the discharge of non-stormwater into the MS4 suggests that some non-stormwater may still enter the MS4. Thus, there is no "zero discharge" requirement on discharges of non-stormwater from the MS4.

Response Please see Regional Board Counsel Memorandum dated November 05, 2009 regarding the definition of non-storm water and non-storm water regulation.

The Regional Board maintains that the federal language is clear: that the term "illicit discharge" is used to describe any discharge to (and thus through and from) a municipal separate storm sewer system that is not composed entirely of storm water and that is not covered by an NPDES permit. Such illicit discharges are not authorized under the Clean Water Act.

The Regional Board also disagrees with the comment regarding improper disposal. The federal regulations are clear under 40 CFR 122.26(d)(2)(i), which require Copermittees to:

"Control through ordinance, order or similar means, the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water." The Regional Board is concerned with the commenter's assertion that only education, and not enforcement, is required for improper disposal activities.

The Regional Board maintains that USEPA's preamble to the final storm water regulations (Please see Comment no. 39 in the July 1, 2009, Response to Comments IV) is quite clear in the "effective prohibition" of non-storm water discharges:

"Ultimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit."

The Regional Board does not agree with the interpretation by the commenter of the word "effective." "Effectively" prohibit means to accomplish the result of prohibiting, whether using the tool of imposing a "prohibition" or some other means. Considered together with the discussion in the federal regulations and USEPA's preamble thereto, effectively prohibit does not imply that some level of unpermitted (non-storm water discharges that are not permitted either by a separate NPDES permit or excepted under 40 C.F.R. 122.26(d)(2)(iv)(B)) non-storm discharges is acceptable. "Effectively" prohibit requires the control of activities and accidents that can result in an illicit discharge to the MS4. The federal regulations require the prohibition of illicit discharges to the MS4 by the Copermittees and require Copermittees control spills, dumping or improper disposal (via ordinance, order or similar means). These are activities that may occur despite the legal implementation of an illicit discharge prohibition, and they may occur by accident. This in no way, as the commenter suggests, condones the introduction of illicit discharges into and from the MS4, or subjects non-storm water flows to the MEP standard.

Comment No.	286	Commenter No.	49	Comment Subject	Legal
Comment	<p data-bbox="203 94 462 126">4. BMPs versus NELs</p> <p data-bbox="203 157 1559 241">Next staff appear to suggest that, because permittees' efforts at addressing non-stormwater discharges into the MS4 have not been successful, under 40 C.F.R. 122.44(k) and 122.44(d)(1), the Board can impose numeric effluent limits on discharges from the MS4. Once again staff is mistaken.</p> <p data-bbox="203 283 1550 493">Section 122.44(k) simply provides that NPDES permits shall include BMPs (when applicable) under certain circumstances. The regulation does not govern when NELs must be included in an NPDES permit. Staff characterize permittees' efforts to address non-stormwater discharges into the MS4 as BMPs and then, because staff assert the BMPs are not working, suggest section 122.44(d)(1) allows the Board to impose numeric effluent limits on the discharge of nonstormwater from the MS4. To the extent section 122.44(d)(1) is applicable, it does not require numeric effluent limitations. It simply provides the method for determining when effluent limitations generally -- not necessarily a numeric limit -- are required to achieve water quality standards.</p> <p data-bbox="203 525 1534 577">Because nothing in sections 122.44(k) or 122.44(d)(1) require numeric effluent limitations on the discharge of non-stormwater from the MS4, staff's reliance on these two sections is misplaced.</p>				
Response	<p data-bbox="203 598 1242 630">Please see Comment no. 307 by USEPA in the July 1, 2009, Response to Comments IV.</p> <p data-bbox="203 661 1144 693">Please also see Comment no. 39 in the July 1, 2009, Response to Comments IV.</p>				

Comment 5. State Board Order WQ 2009-0008

In the August 12, 2009 Fact Sheet/Technical Report, staff place reliance on the State Board's recent Los Angeles County TMDL decision (WQ 2009-0008 [LA County TMDL Order]) to support the notion that the Clean Water Act requires (or at least authorizes) NELs for discharges of non-stormwater from the MS4. Such reliance is misplaced.

The issue in the LA County TMDL Order was not whether the Regional Board could impose NELs on discharges of non-stormwater from the MS4. The issue addressed in the order was the implementation of dry weather wasteload allocations (WLAs) in the LA County MS4 permit. The relevant TMDL established a bacteria WLA for summer dry weather of zero days of exceedance of the bacteria water quality standards. The TMDL included a WLA for MS4s.

The Los Angeles Regional Board amended the LA County MS4 permit to implement the summer dry weather bacteria WLA. As amended, the permit provided, as a receiving water limitation, that during summer dry weather "there shall be no discharges of bacteria from MS4s into the Santa Monica Bay that cause or contribute to exceedances in the Wave Wash, of the applicable bacteria objectives." The amendment also included corresponding discharge prohibition language. Los Angeles County argued that the receiving water limitation and discharge prohibition were improper numeric effluent limits and that, therefore, the permit amendment should be remanded.

The State Board disagreed. Interpreting summer dry weather as applying only to nonstormwater flows the Board found the authority cited to by LA County as inapposite. The State Board found, generalizing federal law, an overarching principle that "[f]ederal law requires municipal storm water permit limitations to be consistent with applicable wasteload allocations."

Order WQ 2009-0008 at p. 9. Finding the permit amendment to be consistent with the dry weather bacteria WLA and with other federal and state requirements, the Board upheld the amendment.

Significantly for purposes of the Tentative Order, the Board held that the permit amendment did not impose NELs as asserted by LA County, but rather receiving water limitations.

The contested provisions are receiving water limitations, not numeric effluent limitations. The contested provisions do not impose a numeric limitation measured at a point source outfall. Instead, compliance with the limitation is measured in the receiving water, and more specifically, at the "wave wash" for the individual beaches.

Order WQ 2009-0008 at p. 10.

By comparison, the NELs at issue here are to be measured at a point source outfall -- "at the end-of-pipe prior to discharge into the receiving water." Tentative Order, Directive C.4 (emphasis added). Thus, because the LA County order pertains to implementing a TMDL through receiving water limitations, it provides no support for staff's assertion that NELs are appropriate (or required) for non-stormwater discharges from the MS4.

Because NELs are not required by federal law, the County requests that Directive C be removed from the Tentative Order.

Response The Regional Board disagrees with the commenter's assertion that State Board Order 2009-0008 does not support directives within the Tentative Order. The Regional Board is not saying the numeric effluent limitations for non-storm water discharges are specifically authorized by State Water Board Order WQ 2009-0008, but the Order does not foreclose the possibility and separate federal authority exists to establish the requirement.

Please see Regional Board Counsel Memorandum dated November 05, 2009.

Comment 6. NELs, SALs and MMPs

The Tentative Order includes both NELs for the discharge of non-stormwater and stormwater action levels (SALs) for the discharge of stormwater. Both require that permittees monitor discharges from the MS4. To the extent exceedances of either the NELs or SALs are detected, permittees have to investigate and address the probable cause of the exceedance. An exceedance of either an NEL or an SAL is not a violation of the permit per se.

With respect to the NELs in Directive C, the Tentative Order explicitly provides that compliance requires that an exceedance of an NEL must result in investigation of the source of the exceedance and a determination that the source is natural in origin, an illicit discharge, or a discharge from an exempt category of non-stormwater discharge. Depending on the source, appropriate action is required. Similarly an exceedance of a SAL requires that permittees to reevaluate and augment their stormwater control measures.

Notwithstanding that an NEL exceedance is not a permit violation and compliance with the NELs requires investigation and appropriate action, an exceedance of an NEL may still subject permittees to mandatory minimum penalties (MMPs) under section 13385 of the Water Code. The Tentative Order acknowledges this possibility in footnote 12 where it provides that permittees may not be subject to MMPs if they can show that an exceedance was caused by an intentional act of a third party.

Because there is little if any substantive difference between the NEL and SAL requirements, there is no reason for the difference in terminology. The County submits that, to the extent the final Order will include provisions similar to those currently provided in Directive C (and as discussed above the County strongly believes it should not), they should be re-characterized as non-stormwater action levels.

Response Please see Comment no. 82 in the July 1, 2009, Response to Comments IV.

The Regional Board disagrees with the deduction that there is little substantial difference between the NEL and SAL requirements and that NELs should be action levels. For non-storm water discharges, NELs are included pursuant to NPDES permitting requirements under 40 CFR 122.44, which requires a permit to contain effluent limitations when a discharge causes, has the reasonable potential to cause, or contributes to an exceedance of water quality criteria for a pollutant. Regardless of investigative outcome, an exceedance of a numeric effluent limitation may be considered a violation.

Conversely, the exceedance of a SAL is not a violation. A SAL exceedance may only be considered a violation if the SAL exceedance is not utilized as part of the iterative process to the MEP standard.

Comment No.	289	Commenter No.	49	Comment Subject	unfunded mandate
Comment	<p data-bbox="194 672 1567 703">C. Because NELs Are Not Required By Federal Law, To The Extent The Board Has Authority to Impose Them, The NELs Must Be Authorized by State Law and the Board Must Comply With All State Law Requirements</p> <p data-bbox="194 703 1567 766">Neither the Clean Water Act nor the federal regulations require NELs in MS4 permits. Staff's prior "tentative draft update" of the Tentative Order conceded this significant point: "Compliance with numeric limits does not constitute compliance with CWA requirements which require nonstorm water discharges into the MS4 to be effectively prohibited. . . " June 18, 2009 Draft Updates (Tentative) at p. 9 of 56.</p> <p data-bbox="194 766 1567 871">To the extent the Board has discretion under the Clean Water Act to impose NELs (see Defenders of Wildlife, supra), the California Supreme Court has made it clear that the Board must comply with state law requirements. See City of Burbank v. State Water Resources Control Board, 35 Cal.4th 613 (2005). These state law requirements include considering the water quality that could reasonably be achieved by the NEL requirement, and economic considerations. See Water Code sections 13263(a) and 13241. Moreover, because the NEL requirement is not mandated by federal law, it would constitute an impermissible unfunded state mandate (unless the State proposes to fund the costs of implementing the program). See, e.g., County of Los Angeles v. Commission on State Mandates (2007) 150 Cal.App.4th 898.</p> <p data-bbox="194 871 1567 934">For all of the above reasons, the County requests that the Board revise the Tentative Order consistent with and pursuant to federal and state law.</p>				

Response	<p data-bbox="194 686 1567 976">The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The commenter misinterprets and misapplies the statement "Compliance with numeric limits does not constitute compliance with CWA requirements which require nonstorm water discharges into the MS4 to be effectively prohibited." This statement does not imply that NELs in MS4 permits are beyond the scope of the federal regulations. Rather, this statement points out that in effect, the Clean Water Act prohibits all non-storm water discharges regardless if those discharges comply with numeric effluent limits. Furthermore, the Clean Water Act and federal regulations do not prohibit the use of numeric effluent limitations for storm water or non-storm water discharges as evidenced by the many NPDES permits that have NELs for storm water discharges and non-storm water discharges. Please see the Fact Sheet and Response to Comment no. 320 for more discussion on NELs.</p> <p data-bbox="194 976 1567 1081">The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3 in the February 13, 2008 Response to Comments III; all provide discussions of these issues.</p> <p data-bbox="194 1081 1567 1144">The comment regarding the Regional Board's compliance with California Water Code §13263, 13241, and 13000 and the consideration of balancing factors has been extensively considered in previous response to comments.</p> <p data-bbox="194 1144 1567 1207">Please see the Fact Sheet; July 6, 2007, Response to Comments I, Response No. 5; December 12, 2007, Response to Comments II, Response Nos. 1 and 9; February 13, 2008, Response to Comments, Response No 3.</p> <p data-bbox="194 1207 1567 1444">To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. In summary, the State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates. No changes have been made in response to this comment.</p>
-----------------	---

Comment No.	290	Commenter No.	49	Comment Subject	Legal
Comment	<p data-bbox="196 1003 1479 1056">II. Compliance With the Wasteload Allocations in The Tentative Order Should be Subject to the Iterative BMP Process</p> <p data-bbox="196 1056 1552 1213">Finding E.11 provides that the Tentative Order incorporates only those MS4 WLAs developed in TMDLs that have been adopted by the Regional Board and approved by the State Board, OAL, and U.S. EPA. However, federal law does not require that MS4 permits incorporate WLAs as numeric limits. Nowhere in the Clean Water Act, or the federal stormwater or TMDL regulations, does it say that MS4 permits shall incorporate TMDLs/WLAs. The federal regulations do say that, when developing water quality-based effluent limits (“WQBELs”) under 40 C.F.R. 122.44(d), the permitting authority must ensure that effluent limits developed to protect a narrative water quality criteria, a numeric water quality criteria, or both, “are consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA pursuant to 40 CFR 130.7” 40 C.F.R. 122.44(d)(1)(vii)(B) (emphasis added).</p> <p data-bbox="196 1213 1560 1266">This section itself does not apply to all NPDES permits. Section 122.44(d) applies only when an NPDES permit must include provisions to achieve water quality standards established under section 303 of the Clean Water Act (33 U.S.C. 1311). As discussed above, the Ninth Circuit in</p> <p data-bbox="196 1266 1516 1318">Defenders of Wildlife has held that MS4 permits do not have to strictly comply with water quality standards under section 303.12. Thus, section 122.44(d) does not necessarily apply to MS4 permits.</p> <p data-bbox="196 1318 1544 1434">Even if it is applicable, section 122.44(d)(1)(vii)(B) simply says that WQBELs in the permit must be “consistent with the assumptions and requirements” of the WLA. The permit does not have to incorporate the WLA as a numeric effluent limitation. U.S. EPA has indicated that an iterative BMP approach is appropriate for incorporating WQBELs in MS4 permits; numeric WQBELs are not required. 61 Fed. Reg. 43761 (Aug. 26, 1996) (U.S. EPA’s “Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits”).</p> <p data-bbox="196 1434 1555 1497">The County appreciates that Directive I of the Tentative Order provides that permittees are to achieve the interim and final WLAs through implementation of BMPs. To be consistent with U.S. EPA’s guidance, this section should be revised to clarify that any exceedances of the</p> <p data-bbox="196 1497 1495 1549">WLAs will be addressed through the iterative BMP approach. As receiving water limitations, this would also be consistent with the required language of State Board Order WQ 99-05.</p>				
Response	<p data-bbox="196 1297 1539 1392">Please note the the Tentative Order is an NPDES permit for non-storm water and storm water discharges from the MS4. Please see Regional Board Counsel Memorandum dated November 05, 2009 for discussion of non-storm water discharges from the MS4. 40 CFR 122.44 establishes limitations, standards and other permit conditions for NPDES permits. The Regional Board does not agree that federal regulations under 40 CFR 122.44, specifically 122.44(d) do not apply to NPDES permits for MS4s.</p> <p data-bbox="196 1392 1547 1444">None of the sections cited by the commenter prevent the Regional Board from directly incorporating the Numeric Targets and Waste Load Allocations into the Tentative Order. Once these numeric allocations and targets are met, the Water Quality Standards of Baby Beach should no longer be negatively impacted by bacterial indicators.</p>				

Comment

Any Water Quality Benefits Achieved From the Retrofitting Requirement Will Be Significantly Outweighed by The Costs

The Tentative Order would require permittees to develop and implement a retrofitting program for existing development. While the County agrees that retrofitting existing development could have beneficial water quality impacts, the program required by the Tentative Order would be very expensive to develop and implement with very little if any water quality improvement to show for the effort. Moreover, the program is not authorized or required by federal law.

Permittees would be required to identify existing development candidates, evaluate and rank the candidate sites to prioritize them for retrofitting, cooperate with landowners of priority sites and encourage them to retrofit their properties, and track and inspect all sites that do complete retrofitting. Where constraints at a candidate site preclude retrofitting, permittees may propose regional mitigation projects. The weak link of this program is that permittees cannot force private landowners to retrofit their properties. So after all the expense of developing this program, there may be nothing gained from it.

Because permittees cannot necessarily force private landowners to retrofit their developments, U.S. EPA recognized that MS4 regulation would largely be limited to undeveloped sites (and sites being developed/redeveloped).

"[O]pportunities for implementing [structural control] measures may be limited in previously developed areas." 55 Fed. Reg. at 48054. "The unavailability of land in highly developed areas often makes the use of structural controls infeasible for modifying many existing systems." Id. at 48055. As a result, none of the five required components to reduce pollutants in runoff from commercial and residential areas include a retrofitting requirement. Id. at 48054-55.

Because the retrofitting requirement as proposed in the Tentative Order would exceed the requirements of the Clean Water Act, the Board can impose the requirement, if at all, only after it has considered certain factors, including economic considerations and the water quality condition that could reasonably be achieved by the requirement. See Water Code sections 13263(a) and 13241; City of Burbank, supra, 35 Cal.4th 613. In addition, unless funded by the State, the retrofitting requirement could be considered to be an impermissible unfunded state mandate. See, e.g., County of Los Angeles v. Commission on State Mandates, supra, 150 Cal.App.4th 898.

The County therefore requests that the retrofitting requirement be significantly revised or deleted from the Tentative Order.

Response

The comment regarding retrofitting was considered in the previous response to comments. Please see the Fact Sheet discussion on retrofitting; and the July 1, 2009, Response to Comments IV, Response Nos. 46, 136, 161, and 162.

In summary, the Tentative Order's requirements for retrofitting existing development is practicable for a municipality through a systematic evaluation, prioritization and implementation plan focused on impaired water bodies, pollutants of concern, areas of downstream hydromodification, feasibility and effective communication and cooperation with private property owners. The Tentative Order's requirement realized the legal limitations that the Copermittees have in requiring retrofitting on privately held land. Therefore, the Tentative Order requires the Copermittees to cooperate with private landowners in implementing retrofitting opportunities. Please note that prioritization ranking is to include review of a project's feasibility [see Directive F.3.d(2)(a)]. The presence of reluctant property owners would necessarily decrease a retrofitting project's feasibility.

Retrofitting is authorized by federal law. The Clean Water Act in section 402(p)(3)(B)(iii) states "Permits for discharges from municipal storm sewers shall require controls to reduce the discharge of pollutants [in storm water] to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." Retrofitting existing development is an appropriate management practice and control technique that includes design and engineering methods. Because the Regional Board has determined that the requirement is necessary to meet the MEP standard, the requirement does not exceed federal law and tax monies are not required to pay for implementation of the requirement. As such, the requirement is not an unfunded mandate subject to reimbursement by the state. See also general discussion in Regional Board counsel legal memorandum dated November 5, 2009.

The comment regarding the Regional Board's compliance with California Water Code §13263, 13241, and 13000 and the consideration of balancing factors has been extensively considered in previous response to comments. Please see the Fact Sheet; July 6, 2007, Response to Comments I, Response No. 5; December 12, 2007,

Response to Comments II, Response Nos. 1 and 9; February 13, 2008, Response to Comments, Response No 3.

To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. No changes have been made in response to this comment. To date, the Regional Board has not received any specific economic evaluations regarding the retrofitting requirement; but rather, has received non-specific broad comments on the cost of retrofitting such as "...the program required by the Tentative Order would be very expensive to develop and implement ..." without any economic analysis.

Comment IV. Permittees Should be Provided Flexibility in Implementing Any Low Impact Development And/Or Hydromodification Management Plan Requirements

The County agrees that the concepts of Low Impact Development and reducing hydromodification may be effective tools in controlling the discharge of pollutants from the MS4. However, the County objects to the LID and hydromodification management plan (HMP) requirements in the Tentative Order because they go beyond the requirements of federal law and violate state law requirements.

Because nothing in the Clean Water Act or federal regulations requires that MS4 permits include LID or HMP requirements, as noted above, the Board can impose the requirements, if at all, only after it has considered certain factors, including economic considerations and the water quality condition that could reasonably be achieved by the requirement. See Water Code sections 13263(a) and 13241; City of Burbank, supra, 35 Cal.4th 613. In addition, unless funded by the State, these programs could be considered to be impermissible unfunded state mandates. See, e.g., County of Los Angeles v. Commission on State Mandates, supra, 150 Cal.App.4th 898.

In addition, because the Board can require that permittees meet the MEP standard but cannot prescribe the manner in which they do so, the LID/HMP requirements violate Water Code section 13360(a).

Response Federal law mandates that permits issued to MS4s require management practices that will result in reducing pollutants to the maximum extent practicable. The state is required, by law, to select the BMPs. (See NRDC v. USEPA (9th Cir. 1992) 966 F.2d 1292; Environmental Defense Center v. USEPA (9th Cir. 2002) 344 F.3d 832, 855; Rancho Cucamonga v. Regional Water Quality Control Bd., Santa Ana Region (2006) 135 Cal.App.4th 1377, 1389.) The Tentative Order's requirements for Low Impact Development and hydromodification controls do not go beyond federal law; but are authorized by federal law. Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(2) provides that Copermittees develop and implement a management program which is to include "A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plans shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed." The exercise of some discretion in implementing the federal program does not mean that a provision exceeds federal law. See also general discussion of unfunded state mandates in Regional Board Counsel legal memorandum dated November 5, 2009.

The comment regarding the Regional Board's compliance with California Water Code §13263, 13241, and 13000 and the consideration of balancing factors has been extensively considered in previous response to comments. Please see the Fact Sheet; July 6, 2007, Response to Comments I, Response No. 5; December 12, 2007, Response to Comments II, Response Nos. 1 and 9; February 13, 2008, Response to Comments, Response No 3.

To the extent economic information was submitted, the Regional Board staff considered it in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. No changes have been made in response to this comment.

Comment No.	293	Commenter No.	49	Comment Subject	Legal
Comment	<p>V. Stormwater Action Levels May Be a Useful Tool But Permittees Should Benefit From Their Use</p> <p>The County appreciates the revisions that have been made to the Stormwater Action Levels (SALs) section of the Tentative Order. While we do not necessarily agree that the SAL provision, as currently crafted, is appropriate, we do agree that the concept of action levels may be a useful tool in addressing water quality impacts from the discharge of pollutants from the MS4. However, just as an exceedance of a SAL may give rise to a presumption that permittees are not meeting the MEP standard, to the extent permittees are meeting the SALs, there should be a presumption that they are meeting the MEP standard. That presumption would be lost if permittees do not implement other required elements of the permit.</p> <p>The County suggests that Directive D.3. be revised accordingly.</p>				
Response	<p>The exceedance of a Stormwater Action Levels (SALs) does not result in a direct presumption that MEP is not being met. In fact, the exceedance of a SAL is to be used in the iterative process to meet the MEP standard. Continued exceedances of a SAL without consideration in the iterative process may result in MEP not being met and enforcement from the Regional Board.</p> <p>If a specific outfall sampled does not exceed a SAL, then that information should be utilized by the Copermitees to indicate that the particular area draining the discharge point is not a "bad actor" discharge point and should be considered a lower priority for additional and/or better-tailored BMPs. It does not create a presumption that MEP is being met for the permit.</p>				

Comment No.	294	Commenter No.	49	Comment Subject	Legal
Comment	<p>I. Findings Finding D.3.c. -- Urban Streams</p> <p>The County has previously objected to the Board's characterization of urban streams as part of MS4. We point out now that, in addition to all of the other reasons why urban streams should not necessarily be considered to be part of the MS4, U.S. EPA has explicitly rejected this characterization. In the preamble to its proposed stormwater rule U.S. EPA states: "The Agency also wants to clarify that streams, wetlands and other water bodies that are waters of the United States are not storm sewers for the purpose of this rule." 55 Fed. Reg. 49415, 49442 (December 7, 1988).</p>				
Response	<p>Similar comments regarding urban streams being part of the MS4 have been considered in previous response to comments. Please see the Fact Sheet; December 12, 2007, Response to Comments II, Response No. 13; and July 6, 2007, Response to Comments I, Response No. 3.</p> <p>In summary, an MS4 is defined in the federal regulations as a conveyance or system of conveyances owned or operated by a Copermitee, and designed or used for collecting or conveying runoff. Therefore, the Regional Board considers natural drainages that are used by the Copermitees as conveyances of runoff, as both part of the MS4 and as receiving waters. No changes have been made in response to this comment. Although such language may have been in the proposal for the stormwater rule, such a distinction did not appear in the final rule. In addition, this finding appeared in the previous Tentative Order, R9-2002-0001, and did not receive comment from USEPA.</p>				

Comment No.	295	Commenter No.	49	Comment Subject	Legal
Comment	<p>II. Directives Directive A.3.b -- Prohibitions and Receiving Water Limitations</p> <p>As noted in the County's May 15, 2009 comments, Finding A.3 says the permit is consistent with the State Board's precedential Order 99-05. However, the language in Directive A.3.b (which requires permittees to continue the iterative process unless directed otherwise by the Executive Officer) is not consistent with Order 99-05 (which says permittees do not have to repeat the process unless directed otherwise by the E.O.). Accordingly, Section A.3.b should be revised consistent with State Board Order 99-05.</p> <p>In their Response to Comments and June 18, 2009 errata, staff addressed this issue (albeit inadequately). The current draft of the Tentative Order does not address the concern at all.</p>				
Response	<p>Section A.3.b is consistent with State Board Order 99-05. The State Board Order does not specify the manner in which the Executive Officer directs that the process be repeated.</p>				

Comment No.	296	Commenter No.	49	Comment Subject	Legal
Comment	<p>Directive E.1 -- Legal Authority</p> <p>This provision includes a statement that nothing in the permit “shall authorize a Co-Permittee or other discharger regulated under the terms of the order to divert, store or otherwise impound water if such action is reasonably anticipated to harm downstream water right holders in the exercise of their water rights.” As noted in our technical comments (Attachment B), this statement points out the conflict that the permit’s LID provisions have with common water rights law. Directive F.1.d(4)(d)(i) would require permittees to retain onsite all stormwater runoff. However, as apparently acknowledged by Directive E.1, this could harm the rights of downstream water rights holders.</p> <p>To resolve this conflict, the County suggests simply changing “authorize” to “require” in the above quoted language in Directive E.1.</p>				
Response	<p>LID is a site-specific practice. As such, the Tentative Order is not saying that LID practices in all cases harm downstream water rights. For the vast majority of Orange County watersheds, there is not a downstream water right holder. In the small areas where there is a downstream water rights holder, it is not assured that implementing LID practices would cause a harm to their water right. In addition, LID practices are required to capture only up to the design storm (0.7-0.8 inches of rainfall in 24 hours). Storms with rainfall above the design storm would not be captured and potentially flow to downstream water right holders. Furthermore, capture of the 85th percentile ensures that downstream water right holders receive water of a higher quality. Demonstrated impacts to downstream water rights should be considered as part of the Copermittees LID Waiver Program.</p>				

Comment No.	297	Commenter No.	49	Comment Subject	Legal
Comment	<p>Directive F -- JRMP</p> <p>Throughout this section of the Tentative Order, permittees are required to develop and implement programs meeting designated elements “and” to reduce discharges to the MEP standard, prevent discharges from causing or contributing to impairments, prevent illicit discharges, etc. See, e.g., Directive F.1, Directive F.1.d, Directive F.3.a, Directive F.3.b, Directive F.3.c. The County previously pointed out, in the context of the retrofitting requirement (Directive F.3.d), that the requirement should be for permittees to develop and implement a program that meets the required elements. The goal of the program should be to meet the MEP standard, prevent illicit discharges, etc. Otherwise, permittees could meet the required elements of a program, but still face charges that they have not met MEP, etc.</p> <p>Staff revised the retrofitting provision to clarify that permittees must meet the elements of the retrofitting program and that the goal of the program is to meet the MEP standard, etc. The County requests that the rest of Directive F be similarly clarified.</p>				
Response	<p>The inclusion of the language in the cited sections is appropriate to ensure the Copermittee's focus on improving water quality and not simply superficially complying with the requirements. As such, the requirements in the sections prescribe the elements needed in the Copermittee's program to fulfill the goals of directive.</p>				

Comment No.	298	Commenter No.	49	Comment Subject	Legal
Comment	<p>Directive F.1.d(6) -- Treatment Control BMP Requirements</p> <p>This Directive appears to be a vestige from the current permit, when the consensus was that treatment control BMPs (not LID BMPs) were the best practicable means of meeting the MEP standard. The Tentative Order now requires that LID BMPs be implemented at all priority development projects (PDPs). However, it still also requires that treatment control BMPs be implemented at all PDPs. It attempts to reconcile these to inconsistent requirements by providing, in footnote 16, that certain LID BMPs are considered treatment control BMPs. However, it is not clear that LID BMPs can meet all of the elements required for treatment control BMPs. The County would ask that these two requirements be carefully reconciled before adoption.</p>				
Response	<p>Comment noted. The Regional Board has added clarifying language to the Tentative Order to reconcile these requirements.</p>				

Comment No.	299	Commenter No.	49	Comment Subject	Legal
Comment	Directives F.2.d(c) and F.2.e(c) -- BMP Implementation and Inspection of Construction Sites The County would ask that "exceptional threat to water quality" in Directive F.2.d(c) and "significant threat to water quality" in Directive F.2.e(c) be reconciled.				
Response	The Regional Board finds that those construction sites under F.2.d.c that qualify are indeed exceptional, and that the risk is more than significant. For example, a construction site tributary to a 303(d) listed waterbody impaired for sediment arguably poses an exceptional risk to that waterbody.				

Comment No.	300	Commenter No.	49	Comment Subject	NEL
Comment	Non-Stormwater Numeric Effluent Limits (NELs) – The County's concerns with the imposition of non-stormwater NELs have been presented to your staff. However, the Tentative Order continues to make the case that the non-stormwater discharges are not subject to the maximum extent practicable standard and, therefore, subject to water quality based effluent limits. The application of the MEP standard to discharges from municipal storm drain systems is a fundamental tenet of the stormwater mandate and County strongly disagrees with the inclusion of NELs for a number of technical and legal reasons.				
Response	Please see Regional Board Counsel Memorandum dated November 05, 2009.				

Comment No.	301	Commenter No.	49	Comment Subject	LID
Comment	Development Planning Component – Low Impact Development (LID), has become the defining issue of permit renewal for municipal stormwater programs in California. Reflective of the significance of this issue was the creation by the Santa Ana Regional Board of a stakeholder group to assist specifically with creating land development requirements for its municipal permit. As a result of the many stakeholder meetings and discussion at the adoption hearing, a framework was created for land development that is technically robust and is broadly supported. It is absolutely vital for Orange County that the land development standards for water quality protection be uniform on a countywide basis. Consequently, the County is providing revised language that would effect a cogent alignment of the land development requirements in the two permits.				
Response	Comment noted. The Tentative Order's requirements for LID implementation are functionally identical to that in the Santa Ana Regional Board's North Orange County MS4 Permit, R8-2009-0030. The Tentative Order includes the same consideration of infiltration, capture and reuse, evapotranspiration, and bio-retention/bio-filtration, and requires treatment of residual runoff volumes when the application of LID BMPs has been determined to be technically infeasible. The Tentative Order's LID waiver provisions provide the Copermittees discretion to include regional or sub regional treatment of residual runoff volumes as mitigation projects. The Tentative Order also includes the Copermittees the discretion to implement a credit system as part of the waiver program.				

Comment No.	302	Commenter No.	49	Comment Subject	TMDL
Comment	The Total Maximum Daily Loads – As more and more TMDLs are adopted and the resulting language and allocations incorporated into permits, it is critical that the assumptions and requirements of the allocations are incorporated into the stormwater permits as they were intended. It is of concern to the County that the Tentative Order indicates that the Regional Board staff are interpreting the TMDL instead of incorporating the TMDL into the permit. In this regard the County is providing alternate language which is consistent with EPA guidance and has been successfully adopted into other municipal stormwater permits.				
Response	The Tentative Order does not interpret the TMDL. The Waste Load Allocation Reductions, Final Allocations and Numeric Targets come directly from the adopted TMDL. This is in compliance with the requirement that all NPDES Permits are consistent with the assumptions and requirements of Waste Load Allocations of adopted and applicable TMDLs [40 CFR 122.33(d)(1)(vii)(B)]. Please also see response to Comment no. 354.				

Comment No.	303	Commenter No.	49	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment The County shares with the Board an interest in seeing a San Diego Region Municipal Stormwater Permit reasonably consistent with the Santa Ana Region Municipal Stormwater Permit (Order No. R8-2009-0030). This consistency is necessary to ensure that the Permittees who are regulated by both jurisdictions do not have conflicting and/or wholly different requirements to implement. Consistency between the permits will allow the Permittees to leverage their limited resources and increase the ability to convey consistent messages within the public education and outreach materials for the various program elements. Since, in spite of previous assurances and concerns, the August 12, 2009 Tentative Order is fundamentally different from the Santa Ana Region Municipal Stormwater Permit in many key programmatic areas, this is a critical issue identified within the technical comments presented below.

Response Please see Comment no. 24 in the July 1, 2009, Response to Comments IV.
The Regional Board contends that the Tentative Order is reasonably consistent with the Santa Anta Region Order. Please see response to Comment no. 373.

Comment No.	304	Commenter No.	49	Comment Subject	NEL
--------------------	-----	----------------------	----	------------------------	-----

Comment TENTATIVE ORDER INAPPROPRIATELY USES THE TERM "VIOLATION" INSTEAD OF "EXCEEDANCE"

The Tentative Order continues to persist in the inappropriate reference to data that exceed Water Quality Objectives (WQOs) as violations. In particular, the language in the Tentative Order has been changed from the prior Order (R9-2002-0001) to replace the term "exceedance" with the term "violation". For example, "exceedances of water quality objectives" has been replaced with "violations of water quality objectives" (emphasis added).

Although there are other instances of this within the Findings, the most notable section of the permit where this language change occurred is Page 19, Permit Section A.3. In this section of the permit the term "violation" is not only inconsistent with Order R8-2009-0030, it is also inconsistent with language within SWRCB Order WQ 99-05. The iterative language in the receiving water limitations speaks to exceedances of water quality standards, not violations. Further, it is unclear why both the terms "violations" and "exceedances" would be used within Permit Section A.3. The use of both terms would implicitly indicate that there is a difference between the interpretation and follow up actions resulting from a "violation" versus and "exceedance".

Careful use of these terms is important, because an "exceedance" does not equate with a "violation." For example, while it may be useful to compare water quality monitoring data to receiving water quality objectives and use identified "exceedances" to target geographic areas and pollutants, it is inappropriate to make this same comparison and determine that there is a "violation". The term "violation" connotes that the point of compliance is the actual comparison of the urban runoff data to the receiving water quality objective rather than the process and follow up actions as described within the receiving water limitations.

Urban runoff data should not be used, in itself, to indicate a violation of water quality standard since the standard consists of the beneficial use(s) and the water quality objective established to protect that use. The exceedance of a water quality objective does not necessarily result in a violation of a water quality standard. Runoff data can be described as exceeding water quality objectives, but the assessment of whether or not water quality standards are violated is based upon samples and data from the receiving water and impacts or lack of impacts on beneficial uses.

The County requests that the term "violation" in the noted sections be modified to the term "exceedance" to more accurately reflect point of compliance as well and the assessment and follow up action(s) that are required.

Response This comment repeats earlier comments to Revised Tentative Orders R9-2008-001 and R9-2007-002 that were addressed via written response for the 2007 and 2008 tentative Orders.
Please also see Comment no. 62 in the July 1, 2009, Response to Comments IV.

Comment No.	305	Commenter No.	49	Comment Subject	NEL
--------------------	-----	----------------------	----	------------------------	-----

Comment DISCHARGE CHARACTERISTICS

- Compliance with Water Quality Standards (Finding C.2, Page 2) Finding C.2. seems to be establishing the fact that MS4s are responsible for all sources of pollutants and manner of discharges (see last sentence). The County would submit that municipalities are limited in their ability to control all sources of pollutants (e.g. air deposition) and, in fact, are not responsible for discharges outside of the jurisdiction/control of the Permittees as well as those non-stormwater discharges that are identified in Section B.2. unless they are found to be a source of pollutants.

In fact, Order No. R8-2009-0030 recognizes this limitation within Findings C.8. and C.10. on pages 3 and 4, respectively.

C.8. This order is intended to regulate the discharge of pollutants in urban storm water runoff from anthropogenic (generated from human activities) sources and/or activities within the jurisdiction and control of the permittees and is not intended to address background or naturally occurring pollutants or flows.

C.10. The permittees may lack legal jurisdiction over urban runoff into their systems from some state and federal facilities, utilities and special districts, Native American tribal lands, waste water management agencies and other point and non-point source discharges otherwise permitted by the Regional Board. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges. Similarly, certain activities that generate pollutants present in urban runoff may be beyond the ability of the permittees to eliminate. Examples of these include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear and leaching of naturally occurring minerals from local geography.

The County requests that this Finding be modified to recognize that the permittees lack legal jurisdiction over runoff into their systems from some facilities, utilities, special districts, agencies and other point and non-point source discharges otherwise permitted by the Regional Board and that some pollutants in urban runoff may be beyond the ability of the permittees to eliminate.

Response Please see Comments nos. 44 and 159 in the July 1, 2009, Response to Comments IV.

It is important to note that the Tentative Order does not regulate discharges outside of the Copermitees jurisdiction. Once pollutants have entered the MS4, however, the Permittee is responsible for that discharge from their MS4. Please also see Finding D.4.c.

Comment No.	306	Commenter No.	49	Comment Subject	NEL
--------------------	-----	----------------------	----	------------------------	-----

Comment Water Quality Monitoring Data (Finding C.9, Page 4) Finding C.9. states, in part, that the water quality monitoring data collected to date indicates that there are persistent violations of Basin Plan objectives for a number of pollutants and that the data indicates that runoff discharges are a leading cause of such impairments. While the receiving water quality may exceed Basin Plan objectives for constituents identified by the municipalities as pollutants of concern, there is inadequate data to make such a definitive statement that the runoff discharges are the leading cause of impairment in Orange County.

The County requests that the last sentence of Finding C.9. be modified to read:

“In sum, the above findings indicate that urban runoff discharges may be causing or contributing to water quality impairments, and warrant special attention.

Response Please see Comment no. 64 in the July 1, 2009, Response to Comments IV as this comment has been previously submitted and addressed.

Comment New or Modified Requirements (Finding D.1.c, Page 6)

Finding D.1.c. states that the Tentative Order “contains new or modified requirements that are necessary to improve the Copermittees’ efforts to reduce the discharge of pollutants to the MEP and achieve water quality standards”. The Finding further states some of these new or modified requirements “address program deficiencies that have been noted in audits, report reviews, and other Regional Board compliance assessment activities.” In fact, in many cases the new or modified requirements do not have adequate findings of fact and technical justification within the accompanying Fact Sheet.

In many instances the Fact Sheet not only provides little or no justification of the need for the new requirement, it also does not identify the “program deficiency” that warrants the modification. In many cases the Fact Sheet also does not consider the thorough program analysis that the Permittees conducted as a part of their preparation of the ROWD and the deficiencies and program modifications that Permittees themselves identified as necessary for the program.

The Permit Provisions comments in the next section of these comments identify many of the areas where new or modified provisions of the Tentative Order lack factual or technical support in the Fact Sheet.

Response Please see the Fact Sheet discussion for Finding D.1.c. The Copermittees are required to update and expand their runoff management programs on jurisdictional and watershed levels in order to improve their efforts to reduce the contribution of storm water pollutants in runoff to the MEP and meet water quality standards. Changes to Order No. R9-2002-01’s requirements have been made to help ensure these two standards are achieved by the Copermittees

The Orders’ jurisdictional requirements have changed based on findings by the Regional Board during typical compliance assurance activities or receipt of complaints. The Regional Board performed full jurisdictional program audits of 8 of the 13 Copermittees during the Order No. R9-2002-01 permit term. Where the audits found common implementation problems, requirements have been altered to better ensure compliance. In addition, the Regional Board conducted detailed reviews of every jurisdictional annual report submitted by the Copermittees. Updates to the Copermittees’ programs are also based on recommendations found in the Copermittees’ ROWD. In many instances, the Copermittees and the Regional Board have identified similar issues that merit program modifications.

To better focus on attainment of water quality standards, the Order’s watershed requirements have been improved. The conditions of the receiving waters now drive management actions, which in turn focus diminishing resources on the highest priority water quality problems within the receiving waters in each watershed. Improvements to watershed requirements were also made to facilitate a mutually clear understanding of the requirements between the Regional Board and Copermittees.

No changes have been made in response to this comment.

Comment No.	308	Commenter No.	49	Comment Subject	Finding
--------------------	-----	----------------------	----	------------------------	---------

Comment Development Planning - Treatment Control BMPs (Finding D.2.b, Page 8)

Finding D.2.b. seems to be making the case that treatment control BMPs are ineffective and should not be used. This Finding overstates or incorrectly states the constraints of treatment control BMPs. It is fair to say that without a performance standard for treatment control BMPs then treatment control BMPs can suffer from the constraints noted. However, treatment control BMPs can be effective in removing pollutants for a wide range of storms and, when combined with source control BMPs, provide a comprehensive pollutant reduction strategy. This finding should be significantly modified to support the statement that “using a combination of onsite source control and site design BMPs augmented with treatment control BMPs... is important.”

NOTE: The previous comments on this issue made by the Permittees were not adequately addressed in the Regional Board’s Response to Comments document dated July 1, 2009, and are therefore resubmitted. The Response to Comments document dated July 1, 2009 identifies that “The Finding simply points out the difference between on-site source control / site design BMPs and end-of-pipe BMPs.”, however the finding goes further to identify that “end of pipe BMPs are often incapable of capturing and treating a wide-range of pollutants”, and that end-of pipe BMPs are more effective when used as polishing BMPs”. These statements are incorrect and should be deleted from the finding as many treatment control BMPs are very effective at removing pollutants and should not just be considered as a polishing BMP.

Given the insufficient technical basis for these statements the County requests that Finding D.2.b be deleted from the Tentative Order.

Response Please see the response to comment #66 in the July 1, 2009, Response to Comments IV. The Regional Board agrees that a combination of source control and treatment BMPs are both necessary components of a comprehensive strategy. Experience has shown that end of pipe treatment systems, such as the Munger Sand Filter Water Quality Project and the J01P28 Media Filter and UV treatment system, are not always reliable and sometimes even fail to deliver any substantial benefits.

Comment Hydromodification (Finding D.2.g, Page 9)

Finding D.2.g. identifies that hydromodification measures for discharges to hardened channels are needed for future restoration of the hardened channels to their natural state, thereby restoring the chemical, physical, and biological integrity and Beneficial Uses of local receiving waters. The Response to Comments document dated July 1, 2009 identifies that "The goal of hydromodification requirements are to prevent or further prevent hydromodification impacts on downstream watercourses and eventually restore natural flow regimes.", however if the downstream watercourses are designed (i.e hardened channels) to accept flows from upstream development then no hydromodification impacts would occur. The goal of eventually restoring natural flow regimes is not feasible in most parts of urbanized Orange County as the hardened channels in most cases are designed as a flood control features to prevent flooding and damage to the surrounding urbanized area. Removal of hardened channels in these areas would result in an unacceptable significant danger to life and property due to flooding and/or erosion and so removal and restoration of natural flow regimes is simply not feasible.

The concept of 'restoring' channels to a 'natural' state has been examined by the researchers at SCCWRP, they note that restoration is not feasible in watersheds with a total impervious area greater than about 10% (SCCWRP, 2005)3. This is due to the fact that the channel cross section, grade, and sediment supply have also been changed in the watershed. Simply restoring pre-development flows will not allow restoration of the channel to pre-development conditions and this reality should be acknowledged in the Finding.

Furthermore, the Santa Ana Regional Water Quality Control Board has identified in Order NO. R8-2009-0030 (MS4 Permit for Orange County) that a Hydrologic Condition of Concern does not exist if "All downstream conveyance channels that will receive runoff from the project are engineered, hardened and regularly maintained to ensure design flow capacity, and no sensitive stream habitat areas will be affected." Finding D.2.g should be revised to be consistent with the Santa Ana Regional Board Order NO. R8-2009-0030.

The County requests that Finding D.2.g be modified as follows:

The increased volume, velocity, frequency and discharge duration of storm water runoff from developed areas has the potential to accelerate downstream erosion in natural drainages, impair stream habitat in natural drainages, and negatively impact beneficial uses. Development and urbanization increase pollutant loads in stormwater and volume of stormwater runoff. Impervious surfaces can neither absorb water nor remove pollutants and thus lose the purification and infiltration provided by naturally vegetated soil. Some channels that are either engineered and maintained, or hardened may not be susceptible to the impacts of hydromodification.

Response

The stated objective of the Clean Water Act is "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." As such, the Copermittees in compliance with the Clean Water Act should seek to restore the physical integrity of these creeks and channels that have been greatly impaired by flood control projects. As a goal, it is premature to say it is infeasible to restore hardened channels to their beneficial uses without a full-blown assessment. Hydromodification controls alone may not be sufficient to restore some of the hardened channels. Some areas may need floodplain restoration, easements and setbacks. Nevertheless, the Copermittees are not required by the Tentative Order to restore concrete lined channels. Finding D.2.g has been modified to: "hydromodification measures for discharges to hardened channels allow for the future restoration of the hardened channels to their natural state..." This change has been made to avoid confusion regarding the perceived requirement to restore concrete lined channels. The Copermittees' development planning approval process, however, should explore creek restoration as an alternative to meet the hydromodification requirements of the Tentative Order.

The Commenter misinterprets the findings of the SCCWRP study. The SCCWRP study recommended four general strategies; preservation, restoration, rehabilitation, and stabilization. Areas with 10 to 20 percent total impervious area have stream channels that probably have experienced irreparable change and efforts will be to create a new "natural" stream channel configuration given existing constraints. Likewise, the Commenter has misinterpreted the findings of the Santa Ana Regional Water Quality Control Board's MS4 permit for Orange County that says "... no sensitive stream habitat areas will be affected." The reasoning that no sensitive stream habitat area will be affected is because sensitive stream habitat no longer exists in these engineered, hardened, and regularly maintained channels. The Santa Ana Regional Board's finding does not speak about the potential for future restoration of beneficial uses in the channel.

Comment Treatment and Waters of the U.S. (Finding E.7, Page 14)

Finding E.7. states that, "[u]rban runoff treatment and/or mitigation must occur prior to the discharge of urban runoff into a receiving water." We believe that Finding E.7. is based on a misinterpretation of CWA regulations and misconstrues USEPA guidance on stormwater treatment BMPs. The Fact Sheet refers to USEPA Guidance from 1992, which refers to locating structural controls in a natural wetland and not waters of the U.S. Furthermore in the Regional Board Response to Comments dated December 12, 2007 the Regional Board states "The Regional Board agrees that there is not a federal prohibition on placing pollution control practices within waters of the U.S." We wish to comment here on the implications it has for watershed restoration activities.

This concern has been discussed in detail in comments on previous versions of the Tentative Order (see, e.g., Attachment A (Pages 1-7) to the County's April 4, 2007 comment letter). We wish to comment here on the implications it has for watershed restoration activities

Prohibiting treatment and mitigation in receiving waters severely limits the potential locations for installation of treatment control BMPs and will adversely affect many watershed restoration projects. For example, this Finding may have unintended adverse effects for the Aliso Creek Water Quality SUPER Project.

The Aliso Creek Water Quality SUPER Project proposes a multi-objective approach to Aliso Creek watershed development and enhancement, accommodating channel stabilization, flood hazard reduction, economic uses, aesthetic and recreational opportunities, water quality improvements, and habitat concerns. The project is aimed at water supply efficiency and system reliability through reclamation, along with benefits for flood control and overall watershed management and protection. The ecosystem restoration and stabilization component of the project will include:

- Construction of a series of low grade control structures and reestablishment of aquatic habitat connectivity;
- Shaving of slide slopes to reduce vertical banks; and

Invasive species removal and riparian revegetation and restoration of floodplain moisture.

The Permittees are concerned that some of these activities may be deemed "urban runoff treatment and/or mitigation" in a receiving water and, thus, may not be allowed, compromising the project objectives. In addition, this Finding seems to conflict with Existing Development Component Section 3.a.(4) Page 51 of the Tentative Order, which requires the Permittees to evaluate their flood control devices and identify the feasibility of retrofitting the devices to provide for more water quality benefits.

Given the lack of any proper legal or factual basis for these limitations as well as the adverse impacts on watershed restoration efforts, the County requests that Finding E.7 be deleted from the Tentative Order.

Response The comment was responded to in the 2007 response to comments and again in the July 1, 2009, Response to Comments IV (Please see Comment no. 69). Furthermore, the commenter misconstrues the 2007 Regional Board response by only quoting a single sentence from the entire response. We have discussed the purported "implications" below:

The Regional Board remains firm in that federal regulations under 40 CFR 131.10(a) are very clear: "In no case shall a State adopt waste transport or waste assimilation as a designated use for any waters of the United States." The Regional Board encourages the restoration of waters of the United States via activities such as reestablishment of aquatic habitat connectivity (e.g. re-connection with the floodplain), invasive species removal, and riparian revegetation and restoration. It is important to make clear such activities are considered the restoration of Beneficial Uses of these waters. These activities are not and should not be considered as treatment BMPs for MS4 discharges. As quoted from the full 2007 Regional Board response:

"The Regional Board agrees that there is not a federal prohibition on placing pollution control practices within waters of the U.S. Finding E.7 was previously revised to provide clarification, and Response No. 11 of RTC 1 provided a detailed discussion with numerous examples to demonstrate the factors that must be considered when evaluating such proposals. It is also relevant to distinguish practices used to meet waste discharge / NPDES requirements from practices used to improve conditions within a water body. The NPDES regulations clearly require the use of management practices to remove pollutants to the maximum extent practicable from MS4 storm water discharges before such discharges enter waters of the U.S. Therefore, the Tentative Order must require treatment BMPs (Section D.1.6) to be implemented prior to receiving waters. In cases where practices are proposed within waters to improve ambient water quality conditions, the Regional Board will evaluate such proposals and consider the guidance provided by the U.S. EPA on constructed treatment wetlands. This may occur under the Regional Board's

responsibilities in the NPDES program or elsewhere, such as federal Clean Water Act Section 401 or CWC Section 13260. No changes have been made in response to this comment."

Thus, it is unclear if the purpose of the SUPER Project is to restore Beneficial Uses and improve ambient receiving water conditions or to treat discharges from the MS4.

Comment TMDLs (Finding E.11, Page 16-17)

This finding indicates that it is the intention of the Regional Board to incorporate MS4 WLAs as end-of-the-pipe numeric Water Quality Based Effluent Limitations for adopted TMDLs. US EPA's 2002 guidance memorandum on establishing stormwater permit requirements to implement WLAs stated that EPA expected that most WQBELs for NPDES-regulated municipal ... will be in the form of BMPs and that numeric limits will be used only in rare instances [emphasis added]. This reference was specifically cited in the Beaches and Creeks TMDL Technical Report and reflects the intent of the Regional Board staff and the understanding of the Stakeholder Advisory Group as to how the TMDL would be incorporated into the NPDES permit. This approach to incorporating WLAs into stormwater permits is maintained in the draft handbook TMDLs to Stormwater Permit, in which Chapter 6 identifies methods of coordinating TMDLs and stormwater permits. Six options are put forward as methods for permit writers to incorporate TMDLs in a stormwater permit, the last of which is to consider numeric effluent limitations. Furthermore, the County would also note that as required by 40 C.F.R. §122.44(d)(1)(vii)(B), the Permit must be "consistent with the assumptions and requirements of available WLAs".

The Regional Board should follow the guidance in the 2002 Memorandum and the Draft Handbook and the intent of the Regional Board TMDL staff and express the WLAs in the Tentative Order as being implemented through the BMPs. This is especially true in California where an implementation plan is required for TMDLs and which in turn may be incorporated into the Permit consistent with EPA guidance.

In addition, it is of concern to the County that the Finding indicates that the Regional Board staff are interpreting the TMDL instead of incorporating the TMDL into the permit. The County submits that it is inappropriate for the Board staff to be interpreting the TMDL and, instead, that they should only be establishing in the permit effluent limitations consistent with the WLAs from any adopted TMDL.

In order to provide the greatest amount of flexibility and to be consistent with the adopted TMDL, the County requests that the Board replace the existing language with the following language from the recently adopted Ventura County MS4 Stormwater Permit (R4-09-0057 Pages 12 and 14):

This order incorporates applicable WLAs that have been adopted by the Regional Water Board and have been approved by the Office of Administrative Law and the U.S. EPA. The TMDL WLAs in the Order are expressed as water quality-based effluent limits in a manner consistent with the assumptions and requirements of the TMDL from which they are derived.

Collectively, the restrictions contained in the TMDL Provisions for Storm Water and Non-Storm water Discharges of this Order on individual pollutants are no more stringent than required to implement the provisions of the TMDL, which have been adopted and approved in a manner that is consistent with the CWA. Where a TMDL has been approved, NPDES permits must contain effluent limits and conditions consistent with the assumptions and requirements of the available WLAs in TMDLs (40 C.F.R. 122.44(d)(1)(vii)(B)).

Response Please see responses to comments nos. 59 and 72 in the July 1, 2009 Response to Comments IV as the majority of this comment is a repeat of a previously submitted comment.

The TMDL Wasteload Reduction Milestones, Final Waste Load Allocations, Final Numeric Targets and compliance dates come directly from adopted TMDL. No changes have been made to this section of the permit in response to the latest submission of this comment.

Comment No.	312	Commenter No.	49	Comment Subject	General
Comment	<p>Prohibitions and Receiving Water Limitations (Section A, Page 19)</p> <p>Despite the fact that this issue was raised during the last comment period, the Regional Board have further modified the permit to inherently make it inconsistent and counter to State Water Board WQ Order 99-05. The Response to Comments IV (comment #57 and #74) state “The Tentative Order has been modified to clarify that through the adoption of this Tentative Order, the Executive Officer issues a standing order that the Copermittees must repeat the process until directed otherwise.” In addition, this modification also sets up an inconsistency between the Tentative Order and the Fact Sheet for Finding A.3. which states “This Order is consistent with the following precedential Orders adopted by the State Board addressing municipal storm water NPDES Permits:.....Order 99-05”. In fact, this language is inconsistent with Order 99-05 as well as Order No. R8-2009-0030.</p> <p>In section A.3.b., the Regional Board has modified the standard state-wide receiving water limitations language to require the Permittees to repeat the assessment process for exceedances of the same water quality standard. In the previous permit, and in permits throughout the state, including the permit recently issued by the Regional Board to MS4 dischargers to the watersheds draining San Diego County, this provision of the RWL language is set up such that the process is only repeated once unless otherwise directed. The original language recognizes the length of time it can take for new BMP programs to be developed, deployed, and fully implemented before a change in water quality may be observed and avoids pointless reassessments of the same pollutant. Even in cases where there has been a significant reduction of the source of a pollutant, it typically takes several years for monitoring programs to see the change in the receiving water. In cases where the pollutant is persistent in the environment, it can take decades to detect changes in water quality or indicator monitoring.</p> <p>The County requests that the Regional Board reinstate the original language from WQ Order 99-05 (see below) regarding iterations of the assessment process for exceedances of the same water quality standard.</p> <p>So long as the Copermittee has complied with the procedures set forth above and is implementing the revised Jurisdictional Urban Runoff Management Program, the Copermittee does not have to repeat the same procedure or continuing or recurring exceedances of the same receiving water limitations unless directed by the Regional Board to do so.</p>				
Response	<p>Under Order State Board Order no. 99-05, Permittees do not have to repeat the process unless directed to do so by the Regional Board. Under the Tentative Order, the Executive Officer has directed that the Permittees must repeat the process until directed otherwise. It is unclear how this is inconsistent with State Board Order no. 99-05, as the Executive Officer has made the direction to continue.</p>				

Comment

Conditionally Exempt Non-Stormwater Discharges (Section B, Page 20-21)

The Regional Board has modified the list of conditionally exempt non-stormwater discharges so that it no longer includes landscape irrigation, irrigation water, and lawn watering. We would contend that a prohibition on these discharges is potentially problematic from the perspective of fostering and sustaining public support for the Program and that the approach should be focused more on collaborative public education and water conservation in conjunction with the water agencies.

The Orange County DAMP contains a variety of BMPs and efforts to reduce pollutants in discharges associated landscape irrigation. These practices include public outreach on the use of landscape chemicals (fertilizers and pesticides) and overwatering, implementation of integrated pest management (IPM) practices within municipal programs, and water conservation measures that mandate the use of efficient irrigation systems, as well as other programs that general control pollutant sources which reduce the pollutants that might be conveyed into the MS4s by excess irrigation flows. The use of BMPs to reduce pollutants associated with runoff is a preferable and more practical approach.

Additionally, the Permittees have sought grant funding to assist with the implementation of programs to reduce irrigation-related urban runoff. Grant programs frequently prohibit the award of grants to meet requirements of NPDES permits requirements. The inclusion of the prohibition may limit the types of grants the Permittees might otherwise be eligible for to help address this discharge since it will be a permit requirement.

Finally, a prohibition of irrigation-related runoff may be in conflict with other permits that allow such discharges including the industrial general permit and the construction general permit. In particular, the construction permit authorizes such discharges if they are necessary for the completion of construction (and are identified in the SWPPP with appropriate BMPs). The final phase of construction includes the installation and establishment of landscaping (also known as vegetative stabilization). The establishment of new plantings to ensure long-term survival typically requires higher than normal levels of irrigation to ensure good root growth and vegetative cover prior to the onset of the rainy season to reduce erosion and sediment transport from the project site. The complete prohibition of irrigation related runoff may impede the ability of the Permittees to establish erosion resistant vegetative covering.

The County requests that Section B. Non-Storm Water Discharges be modified to include landscape irrigation, irrigation water, and lawn watering in Section B.2.

Response

The Regional Board recognizes the efforts to date from the Copermittees to implement BMPs for non-storm water discharges such as landscape irrigation. The Regional Board, however, maintains that the federal regulation regarding the identification of exempted non-storm water discharges is clear (Please see Regional Board Counsel Memorandum dated November 05, 2009). Furthermore, the Regional Board cannot consider the ability of a Copermittee to obtain grants when considering the protection of water quality standards.

The removal of landscape irrigation as an exempted discharge is not in conflict with other NPDES requirements. As previously stated in Comment no. 227 in the July 1, 2009, Response to Comments IV, Copermittees are responsible for accepting flows into their MS4, and are required under federal regulations to have the legal authority to prevent these flows from occurring. In regards to vegetative stabilization, the establishment of vegetation is required under the NPDES General Construction permit as a post-construction BMP for erosion protection. Additional construction BMPs are available for use during the establishment of vegetation.

The comment regarding the prohibition on over-irrigation practices was addressed in the previous response to comments. The comment does not raise any new issues from the previous comments. Please see the discussion in the Fact Sheet for findings C.14 and C.15; and the July 1, 2009, Response to Comments IV, Response Nos. 28, 52, 76, and 159. Please also see comments Nos. 84, and 264 in this Response to Comments. No changes have been made in response to this comment.

In summary, over irrigation is a non-storm water discharge required by federal regulations to be prohibited where identified to be a source of pollutants.

Comment

The technology based effluent limitation of “effectively prohibit” should continue to be the compliance standard for non-stormwater.

CWA section 402(p) (3) (B) (ii) reads as follows:

(B) Municipal Discharge – Permits for discharges from municipal storm sewers –

(ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewer;

The corresponding regulations associated with the CWA section is 40 CFR 122.26.(d)(2)(iv)(B)(1) which clarified “effectively prohibit” by acknowledging that discharge exemptions are allowed if determined not to be sources of pollutants. Thus the CWA section and corresponding regulations may be read that a permit shall “effectively prohibit nonstormwater discharges” but may exempt certain discharges that are not sources of pollutants (i.e. de minimis discharges) from the prohibition. The CWA section does not require a full prohibition but rather an effective prohibition. The more correct finding for the Orange County permit is that non-stormwater discharges are effectively prohibited (per 402 (p) (3) (B) (ii)). However discharges that are not sources of pollutants are exempted from the prohibition.

The County would submit that the technology based standard for non-stormwater discharges into the MS4 is “effectively prohibit” just as “maximum extent practicable” is the technology based standard for all pollutants from the MS4. Furthermore, the County would submit that this technology based limit is in fact protective of water quality and compliance with water quality standards. The County has an extensive dry weather monitoring program to identify problematic discharges, including illegal discharges, which support the protection of water quality standards. It is unclear to the County how the Board has determined that these efforts are in fact inadequate to necessitate the development of water quality based effluent limits. Furthermore the TMDL program as noted in Finding E.10 and E.11 provide the appropriate regulatory vehicle to address discharges from the MS4 (both stormwater and non-stormwater discharges) that are causing and contributing to an exceedance of a water quality standard in impaired waters.

Moreover, not only are the proposed numeric WQBELs not technically or legally appropriate, they may put the permittees in constant non-compliance and subject to more draconian enforcement action (i.e. mandatory minimum penalties –see discussion below).

Response

Please see Regional Board Counsel Memorandum dated November 05, 2009.

Please note the development of water quality-based effluent limitations is discussed in the Tentative Order Fact Sheet.

Please also see responses to Comments nos. 317 and 319.

Comment The San Diego draft permit for Orange County is inconsistent with the Santa Ana adopted permit for Orange County

The Santa Ana issued permit for Orange County mirrors the approach noted above, that being non-stormwater discharges are subject to the “effectively prohibit” standard. The findings and provisions relevant to non-stormwater discharges in the Santa Ana issued permit are provided below:

Findings:

C.10. The permittees may lack legal jurisdiction over urban runoff into their systems from some state and federal facilities, utilities and special districts, Native American tribal lands, waste water management agencies and other point and non-point source discharges otherwise permitted by the Regional Board. The Regional Board recognizes that the permittees should not be held responsible for such facilities and/or discharges. Similarly, certain activities that generate pollutants present in urban runoff may be beyond the ability of the permittees to eliminate. Examples of these include operation of internal combustion engines, atmospheric deposition, brake pad wear, tire wear and leaching of naturally occurring minerals from local geology.

C. 11. This order regulates storm water runoff and certain types of de-minimus discharges specifically authorized under Section III of this order (collectively referred to as urban runoff) from areas under the jurisdiction of the permittees. For purposes of this order, urban runoff includes storm water and authorized non-storm water (see Section III) discharges from residential, commercial, industrial and construction areas within the permitted area and excludes discharges from feedlots, dairies, and farms. Urban runoff consists of surface runoff generated from various land uses in all the hydrologic drainage areas that discharge into waters of the US. The quality of these discharges varies considerably and is affected by land use activities, basin hydrology and geology, season, the frequency and duration of storm events, and the presence of illicit discharge practices and illicit connections.

M. 68. The MS4s generally contain non-storm water flows such as irrigation runoff, runoff from non-commercial car washes, runoff from miscellaneous washing and cleaning operations, and other nuisance flows generally referred to as de-minimus discharges. Federal regulations, 40 CFR Part 122.26(d)(2)(i)(B), prohibit the discharge of non-storm water containing pollutants into the MS4s and to waters of the U.S. unless they are regulated under a separate NPDES permit, or are exempt, as indicated in Discharge Prohibitions, Section III.3 of this order. The Regional Board adopted a number of NPDES permits to address de-minimus type of pollutant discharges.

Provision

III. 3. The permittees shall effectively prohibit the discharge of non-storm water into the MS4s, unless such discharges are authorized by a separate NPDES permit or as otherwise specified in this provision.

The County’s approach is consistent with Federal and State law and regulations. The significantly different approach being proposed by San Diego Board will lead to considerable costs not commensurate with the water quality benefits and unhelpfully redirect Program resources from baseline program implementation to special studies.

Response Please see Regional Board Counsel Memorandum dated November 05, 2009.

Please see Comments nos. 44 and 159 in the July 1, 2009, Response to Comments IV.

It is important to note that the Tentative Order does not regulate discharges outside of the Copermitees jurisdiction. Once pollutants have entered the MS4, however, the Permittee is responsible for that discharge from their MS4. Please also see Finding D.4.c

The Regional Board contends the Tentative Order is consistent with federal and State regulations.

Comment No.	316	Commenter No.	49	Comment Subject	NEL
Comment	<p>Numeric effluent limits were developed primarily based on Basin Plan water quality objectives and not all the constituents with NELs are relevant to water quality issues in southern Orange County.</p> <p>Notwithstanding the argument that water quality based effluent limits are inappropriate and not justified, the Board, if it determines that technology based limits are insufficient to meet water quality standards, is obligated to stipulate additional requirements consistent with 40 CFR 122.44. In this context the Regional Board must determine whether the discharge has a “reasonable potential” to cause or contribute to an excursion of the applicable water quality standard. (40 CFR 122.44 (d)(1)(i-iii). If determined to “cause or contribute” then effluent limits (either narrative or numeric) must be developed for the discharge. Furthermore, if numeric effluent limits are developed then they must be consistent with 40 CFR 122.45. However upon closer review there appears to be some inconsistencies between Table 4 and Finding E. 10. In Table 4 the Board has established numeric effluent limits for a list of some 17 constituents. This table would imply that the Board has determined reasonable potential for each of these constituents. However, in Finding E.10 the Board acknowledges that only four pollutants have been shown to have reasonable potential, indicator bacteria, phosphorus, toxicity, and turbidity. Furthermore Finding E.10 does not differentiate between non-stormwater and stormwater thus it’s difficult to determine which pollutant is associated with the different types of discharges.</p>				
Response	<p>The constituents included in the referenced Finding E.10 are based on the 2006 303(d) list for pollutants that have reasonable potential for both non-storm water and storm water discharges. Please refer to the Tentative Order Fact Sheet for the full reasonable potential analysis for non-storm water discharges from the MS4.</p>				

Comment No.	317	Commenter No.	49	Comment Subject	NEL
Comment	<p>Preliminary compliance assessment of outfall data showed frequent and ongoing exceedances of numeric limits which equates to ongoing investigation.</p> <p>Of primary importance to the County is that the Regional Water Board adopt a permit that protects water quality in a reasonable and feasible manner. As currently drafted, the Permittees are exposed to significant risk to comply with the NELs for dry weather discharges. We have completed a comparison of existing dry weather discharges with the selected NELs noted in Table 4. The results of that comparison are shown below:</p> <p>Constituent Percentage of time > NELs Turbidity 4.9 Surfactants 5.7 Dissolved Oxygen 5.4 below 5 ppm Total Phosphorus@ 93.6 Orthophosphate Fraction Nitrate + Nitrite >93.8 – NEL changed to Total N Fecal coliform 90.0 Enterococcus 97.3 Nickel (dissolved) >5.0 Copper (dissolved) >3.0 Cadmium (dissolved) >16.0</p> <p>Clear from this analysis is that for certain constituents, notably nutrients and bacteria, the entire drainage system will very rarely be found to be meeting the NELs. An analysis of data from Orange County stream reference sites, i.e. sites removed from urban influence, shows the same patterns of NEL exceedance.</p>				

Response	<p>Language has been added to the Order (Section C.3) to clarify that the Tentative Order does not regulate natural sources and conveyances of constituents.</p> <p>The Regional Board contends that the primary importance is to adopt a NPDES permit that protects water quality standards.</p> <p>It is important to note that the Copermitees have identified over-irrigation activities to be a source and conveyance of pollutants to waters of the United States, and that nutrients and indicator bacteria were included as identified pollutants. Thus, eliminating over-irrigation is likely to reduce the frequency of NEL exceedances for these constituents.</p> <p>Furthermore, the commenter has made a blanket statement regarding reference sites, but has failed to provide the analysis, nor the data, in support of their claim. Evidence exists in information submitted to the Regional Board that contradicts the Counties statement. For example, required aqueous chemistry conducted at bioassessment reference sites for the 2007-2008 reporting period shows receiving waters do not exceed NELs for dissolved oxygen, nutrients, turbidity, or metals (no reported measurement for surfactants).</p>				
-----------------	---	--	--	--	--

Comment No.	318	Commenter No.	49	Comment Subject	NEL
Comment	<p>Current language still exposes Municipalities to Mandatory Minimum Penalties for not complying with the numeric limits.</p> <p>As demonstrated above, the County/Permittees will face enforcement action for not complying with all the NELs. Where there is exceedance, the Permittees will be faced with financial liability under several different enforcement regimes. First, the NELs, as proposed in the Revised Tentative Order, would clearly constitute numeric effluent limitations. Violation of effluent limitations in an NPDES permit subjects the Permittees to potential mandatory minimum penalties (MMPs). (See Water Code §§ 13385(h) and 13385.1). In addition, non-compliance with the NELs may subject the Permittees to additional enforcement actions imposed by the Regional Water Board and through third party actions under the citizen suit provisions of the CWA. Although the Tentative Order is structured to clarify that compliance with Non-Stormwater Dry Weather Numeric Effluent limits Section C is met by one of three follow-up actions, the structure appears in conflict with the options available under §13385 to avoid MMPs. Once a numeric limits is established then there are limited options available to avoid MMPs. As a case in point during the 09/02/09 State Water Board hearing regarding the subject of MMPs resulting from non-compliance with proposed numeric effluent limits in the Construction General Permit, the State Board chair was seeking flexibility in implementing the numeric effluent limits without subjecting the discharger to MMPs. He suggested a phase in period. When this question was posed to Board legal counsel she said that such an approach was not legally valid and that MMPs would apply immediately. Thus it would appear that even though the San Diego Board staff may have intentions to provide flexibility to the Permittees to conduct the iterative process and follow up investigation efforts to avoid MMPs, the California Water Code does not provide such flexibility and the Permittees would be subject to MMP should they violate the NELs.</p>				
Response	<p>Please note the iterative process does not apply to non-storm water discharges (see Regional Board Counsel Memorandum dated November 05, 2009).</p> <p>Please see Comment no. 82 in the July 1, 2009, Response to Comments IV.</p>				

Comment

Derivation of numeric effluent limits are based on numerous assumptions and puts the Permittees in a position of endless monitoring and investigation.

Notwithstanding our comments above regarding the inappropriateness of WQBELs the County reviewed the derivation of the NELs and found a number of assumptions that will need to be verified to support modification of the NELs. We have highlighted some of the major assumptions below:

- No dilution was available for inland surface water bodies and bays and harbors. Such an approach assumes a worst case situation and essentially results in the dischargers having to meet water quality objectives at the point of discharge.
- Reasonable potential was not conducted on individual outfalls but rather on the overall drainage system, resulting in a single set of effluent limits for all outfalls to a specified water body. If, however, reasonable potential is done on an outfall by outfall basis the number of constituents and magnitude of the effluent limitations will be different.
- With the exception of chromium VI, freshwater water quality criteria were not used in determining effluent limitations. The Water Board calculated all effluent limitations using saltwater water quality criteria, which are not hardness-dependent. This approach essentially assumes that the receiving waters are all saltwater which is inappropriate for discharges to inland surface waters. The Tentative Order does allow adjustment in site specific hardness for determining the applicable water quality criteria when calculating effluent limitations. However, the use of the hardness-based water quality criteria equations needs to be clarified as to whether they apply to the receiving water and used in effluent limitation calculations or if they are the actual effluent limitations. In addition, all hardness-based water quality criteria equations should include an appropriate compliance period.
- Default conversion factors were used to convert dissolved metal water quality criteria to total metal water quality criteria. Again this assumption has typically been shown to be a worst case assumption and more appropriate conversion factors are available.

The overall effect of these assumptions is that reasonable potential was determined for a number of constituents for all outfalls. Given the exposure and liability of NELs the Permittees would be well served to conduct numerous special studies (e.g. dilution studies, translator studies) to validate the assumptions and develop site specific objectives for individual outfalls. Such an effort, although prudent from the Permittees perspective, seems misplaced and not the best use of our limited resources.

Response

The Regional Board followed required federal requirements when evaluating non-storm water discharges and considering a mixing zone or dilution. The Regional Board considered critical conditions for flow, pollutant concentrations and environmental effects. This is fully discussed in the Tentative Order Fact Sheet on page 109.

The Tentative Order is considered a General Order under 40 CFR 122.28.

In regards to freshwater water quality criteria, the Tentative Order is consistent with the requirements of the State Board Policy for Implementation of Toxics Standards for Surface Waters, Enclosed Bays and Estuaries. Section C.5 of the Order (see Table 4.a.2) specifically states:

"The Effluent Limitations for Cadmium, Copper, Chromium (III), Lead, Nickel, Silver and Zinc will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data (receiving water hardness). For these priority pollutants, the following equations (40 CFR 131.38.b.2) will be required:

- Cadmium (Total Recoverable) = $\exp(0.7852[\ln(\text{hardness})] - 2.715)$
- Chromium III (Total Recoverable) = $\exp(0.8190[\ln(\text{hardness})] + .6848)$
- Copper (Total Recoverable) = $\exp(0.8545[\ln(\text{hardness})] - 1.702)$
- Lead (Total Recoverable) = $\exp(1.273[\ln(\text{hardness})] - 4.705)$
- Nickel (Total Recoverable) = $\exp(.8460[\ln(\text{hardness})] + 0.0584)$
- Silver (Total Recoverable) = $\exp(1.72[\ln(\text{hardness})] - 6.52)$
- Zinc (Total Recoverable) = $\exp(0.8473[\ln(\text{hardness})] + 0.884)$ "

Thus, the hardness of the receiving water determines the effluent limitation.

In regards to conversion factors, again the Regional Board followed requirements of the State Board Policy for Implementation of Toxics Standards for Surface Waters, Enclosed Bays and Estuaries. The Policy clearly states that it is necessary to express a dissolved metal as total recoverable and, when a site-specific factor has not yet been developed, the Regional Board shall use the applicable conversion factor found in 40 CFR 131.38. The Regional Board will consider other conversion factors that are developed. The commenter provides a statement that there are more appropriate factors available, but fails to provide that information.

In summary, what the commenter claims to be "assumptions" are actually requirements under federal and State regulations for NPDES permitting. Furthermore, monitoring is required under 40 CFR 122.44. It is unclear how "endless monitoring and investigation" is a problem, as NPDES permits to discharge require monitoring and investigation of exceedances of effluent limitations. This is done to protect water quality standards.

Comment

Closing

In closing, the County would submit that the use of NELs for non-stormwater discharges is inappropriate and premature at best. The TMDL program provides the safety net for ensuring that our water bodies are protected in the most reasonable and effective manner. The direct translation of water quality objectives into numeric effluent limits bypasses the TMDL process. Some of our non-stormwater discharges will exceed the NEL but have no effect on the receiving water quality or beneficial uses. But under the proposed Order the Permittees would be obligated to expend considerable investigative resources without a reciprocal water quality benefit. This requirement will prove to be poor public policy and use of public funds.

The establishment of NELs for non-stormwater discharges is fundamentally flawed from a technical and legal perspective. The current TBEL of "effectively prohibit" for non-stormwater discharges from the MS4 when implemented fully, coupled with the MEP standard for discharges of all pollutants from the MS4, will lead to compliance with water quality standards, negating the need for WQBELs. If, on the other hand, they are proposed as water quality based numeric limits then their derivation must also follow Federal and state regulations (primarily the State Implementation Plan). The County has suggested and continues to suggest that the values be used as "Non Stormwater Action Levels", similar to the approach taken with stormwater (see discussion that follows). Furthermore, the technical feasibility of complying with these numeric limits is questionable especially since our drinking water supply would not be able to comply with the limits.

Response

The Regional Board contends that the derivation of numeric effluent limitations follows Federal and State regulations as outlined in the Tentative Order Fact Sheet. Furthermore, as previously stated in Comment no. 39 in the July 1, 2009, Response to Comments IV, the Copermitees have implemented BMPs for the last 18 years for non-storm water discharges, and have failed to meet water quality standards, as evidenced by 303(d) listings and monitoring conducted to date.

In regards to the "effectively prohibit" interpretation and MEP, please see Regional Board Counsel Memorandum dated November 05, 2009 and Comment nos. 78 and 84 in the July 1, 2009, Response to Comments IV.

In regards to the drinking water comment please see Comment no. 84 in the July 1, 2009, Response to Comments IV.

Please also see responses to Comments nos. 319 and 391.

Comment

The County appreciates the Regional Board staff efforts to address our many concerns with the earlier draft Orders regarding municipal action levels. The County believes that the current structure for storm water action levels (SWALs) is consistent with the approach proposed by the State Water Resources Control Board's "Blue Ribbon Panel of Experts," as expressed in the June 2006 Blue Ribbon Panel Report ("BRP Report"). This approach would also meet the Regional Water Board's desire to include performance measures in a municipal stormwater program for Orange County.

To achieve these goals, we support an approach that "would set "an 'upset' value, which is clearly above the normal observed variability, which would allow bad actor catchments to receive additional attention" (see BRP Report at p. 8.). The BRP Report further clarified that upset value as "...an Action Level because the water quality discharge from such locations are enough of a concern that most all could agree that some action should be taken..." (Id.) In general, the August 12, 2009 Tentative Order accomplishes this goal.

However, the SWAL would be even more relevant and constructive to our Program by considering the following:

- Not all constituents for which action levels were developed are identified as pollutants of concern by the Program;
- Considerable resources are required to address this requirement without relief from other monitoring efforts; and
- No 'safe harbor' provision - thus municipalities may be in a never ending iterative process.

The County submits that Table 5 should be modified to reflect the Program constituents of concern (COCs). As such, SWALs should only include turbidity, nitrogen forms, total phosphorus, copper, lead and zinc. By focusing our limited resources on our COCs we will be better able to address water quality issues relevant to our discharges. In addition, some of our constituents of concern may serve as surrogates for a generic class of pollutants. Thus, by addressing one constituent, the program will receive the benefit of addressing the entire generic class (e.g. by addressing copper we will likely address lead, nickel and zinc).

More importantly, the Tentative Order represents a quantum leap in program costs associated with monitoring and follow-up investigations. Given our limited to non-existent ability to raise revenues to support our program and the general state of the economy, we respectfully request that the constituents subject to SWAL be limited to the constituents of concern noted above. Furthermore, we request that the Board develop a "program cost neutral" permit, meaning that the new Order will reflect the costs currently encumbered. SWAL monitoring for 2 outfalls in each hydrologic sub-area would require an immediate investment of an additional \$217,000 - \$224,000 in monitoring equipment and a significant subsequent commitment of staff and analytical resources.

The County requests that the SWALs only include turbidity, nitrogen forms, total phosphorus, copper, lead and zinc and that an opportunity to validate the utility of wet weather outfall monitoring using no more than 7 outfalls be provided prior to possible system-wide application of this approach to benchmarking.

Response

The Regional Board has reduced the list of required pollutants under the SALs. Those that remain have been identified as pollutants of concern through monitoring required under the current Order (R9-2002-0001).

In regards to relief from other monitoring efforts, the Regional Board has already reduced significant monitoring requirements in addition to allowing participation in a Regional Bacteria monitoring program. Furthermore, language in the monitoring section encourages proposals for participation in other regional monitoring efforts to supplement or replace existing monitoring requirements. The Regional Board expects the Copermittees to propose a monitoring program for SALs in compliance with Section D.2, which provides for flexibility in monitoring a representative percent of outfalls within each hydrologic subarea. It does not require 2 per hydrologic subarea.

While the Regional Board agrees that addressing one pollutant may benefit an entire class of pollutants., certain pollutants are associated with specific activities within the watershed area discharging at a particular SAL monitoring location. This will enable the Copermittees to better target BMPs at activities that produce that pollutant within the watershed.

Comment

Effectiveness of BMPs (Section E.1.j, Page 27)

The Tentative Order continues to include a new provision that requires the Permittees to demonstrate that they have the legal authority to require documentation on the effectiveness of BMPs. In fact, the County is unaware of any other MS4 permit within the State of California with this requirement. The County has concerns about this provision for the following reasons:

- As it is currently written, this provision broadly applies to any aspect of the stormwater program where BMPs have been implemented – the result is that this provision sets up a process for the establishment of multiple third party monitoring programs and expenditure of a significant amount of funds to monitor the effectiveness of BMPs. If the desire is to document the effectiveness of certain types of BMPs, it would be much more effective and scientifically sound to establish special studies by entities qualified to conduct such sampling instead of requiring potentially hundreds of third parties to conduct a monitoring program for every BMP that is implemented.
- This provision is redundant with other requirements in the permit in that it ignores the fact that the New Development/Significant Redevelopment section of the DAMP (Section 7.0) establishes a process for the selection, design, and longterm maintenance of permanent BMPs for new development and significant redevelopment projects and requires developers to select BMPs that have been demonstrated as effective for their project category. By going through a thorough process, the Permittees have determined what BMPs would be effective for a particular project – thus eliminating the need to establish a monitoring program for every BMP implemented.
- This provision ignores the fact that the Permittees have already established legal authority for their development standards so that project proponents have to incorporate and implement the required BMPs.
- In the Response to Comments IV, Regional Board staff state, as a part of their justification for this requirement, that USEPA identified that the MS4s need to have the authority to enter, sample, review, inspect, and require regular reports (in addition to some other aspects). However, while USEPA identified that they want the MS4s to establish basic legal authority – the legal authority did not, in fact, specifically extend to the monitoring of all BMPs implemented by third parties. In addition, this section of the guidance speaks to the municipalities legal authority to control the discharge of pollutants, which the County has pursuant to the codes and ordinances that have been adopted and the guidance documents that have been developed.

The County requests that this provision be deleted from the Order.

Response

This comment has been previously addressed in the July 1, 2009, Response to Comments IV (Comment no. 98).

The requirement is that the Copermittees have the legal authority to ensure that effective BMPs are being implemented by requiring the third parties to document BMP effectiveness. This legal requirement is not, as the commenter states, "a process for the establishment of multiple third party monitoring programs and expenditure of a significant amount of funds to monitor the effectiveness of BMPs." It does not, as the commenter implies, require that every BMP implemented by a third party be monitored for pollutant removal effectiveness. It requires the Copermittees have the legal authority to ensure that BMPs implemented are effective at treating storm water discharges.

The Regional Board acknowledges that the Copermittees already are required to review and approve BMPs for new/re-developments, and that BMP effectiveness is reviewed in the development phase. However, many post-construction BMPs can be rendered ineffective at treating storm water. For example, BMPs can be removed, reconfigured or lack proper maintenance. As such, no change has been made to the Tentative Order.

Comment No.	323	Commenter No.	49	Comment Subject	Legal
--------------------	-----	----------------------	----	------------------------	-------

Comment Water Rights Issue (Section E.1. Page 26 and Section F.1.d.(4)(d) Page 35-36) The Tentative Order appears to have conflicting objectives regarding water rights. The conflict arises in the following permit sections (the conflicting language is underlined below).

E.1. Each Copermittee must establish, maintain, and enforce adequate legal authority to control pollutant discharges into and from its MS4 through ordinance, statute, permit, contract or similar means. Nothing herein shall authorize a Co-Permittee or other discharger regulated under the terms of this order to divert, store or otherwise impound water if such action is reasonably anticipated to harm downstream water right holders in the exercise of their water rights. [emphasis added]

F.1.d.(4)(d) LID BMPs sizing criteria
 (i) LID BMPs shall be sized and designed to ensure onsite retention without runoff, of the volume of runoff produced from a 24-hour 85th percentile storm event, as determined from the County of Orange's 85th Percentile Precipitation Map15 ("design capture volume"); [emphasis added]

The LID BMP criterion clearly changes the natural water balance and may be construed to harm the downstream water rights holders. The effort to determine whether downstream water rights users are harmed from upstream development that changes the water balance will be a challenge and may ultimately lead to legal action. Given the uncertainty of downstream water rights, the Tentative Order should provide flexibility with the LID standard to allow runoff when conditions limit on-site retention. Whether these conditions are technical or legal in nature it is important to have flexibility in the permit to accommodate either or both conditions.

Since the framework for addressing new development and significant redevelopment must be as flexible in order to address the variety of issues that will arise during the course of the permit implementation, the County strongly recommends that the Development Planning Component be modified as necessary for greater consistency with Order R8-2009-0030 (Water Quality Management Plan for Urban Runoff) which provides for flexibility.

Response Please see response to Comment no. 296.

Comment No.	324	Commenter No.	49	Comment Subject	LID
--------------------	-----	----------------------	----	------------------------	-----

Comment LID BMPs (Section F.1.c.(2), Page 29)

Provision F.1.c.2 identifies that the LID BMPs listed in the provision shall be implemented at all Development Projects where applicable and feasible, however no definition of "applicable and feasible" is identified in the provision or within the fact sheet. The determination of feasibility of implementing the LID BMPs identified in the provision should be the responsibility of the Permittees.

NOTE: The previous comments on this issue made by the Permittees were not adequately addressed in the Regional Board's Response to Comments document dated July 1, 2009, and are therefore resubmitted. The Response to Comments document dated July 1, 2009 identifies that the LID requirements have been substantially modified and that more robust criteria is expected in the Copermittee's updated SUSMP document. The updated SUSMP document is the responsibility of the co-permittees which will include a definition of applicable and feasible for LID BMPs so ultimately it will be the determination by the permittee of where LID BMPs are applicable and feasible.

The County requests that the Provision be modified as follows:

Response This comment was adequately addressed in the July 1, 2009, Response to Comments IV, Response to comment No. 99, which states: "The LID requirements have been extensively modified following meetings with the Copermittees and the interested stakeholders. The Tentative Order addresses the conditions of technical infeasibility. More robust criteria is expected in the Copermittee's updated SUSMP document." LID BMP requirements are applicable at all priority development projects. The Copermittees are required to develop the specific criteria for the technical feasibility analysis per Section F.1.d(7)(b).

Comment	<p data-bbox="203 1003 1023 1039">Infiltration and Groundwater Protection (Section F.1.c.(6), Page 29-30)</p> <p data-bbox="203 157 1559 399">The Regional Board Response to Comments dated July 1, 2009 identifies that the criteria set forth in this section are the minimum requirements for infiltration and that there is flexibility in the Tentative Order for the Copermittees to develop criteria for infiltration treatment devices. We have a number of concerns with this provision. First is the apparent free pass onsite infiltration BMPs receive even in areas with high groundwater and/or brown fields with legacy contamination issues. Such environmental conditions should be acknowledged and addressed. Second the “minimum requirements” identified in the Tentative Order are not minimum but are very prescriptive and no current technical basis is provided for these provisions in the Fact Sheet or in the Response to Comments dated July 1, 2009.</p> <p data-bbox="203 430 1542 766">The document U.S. Environmental Protection Agency. 1994. Potential Groundwater Contamination from Intentional and Nonintentional Stormwater Infiltration. EPA 600 SR- 94 051 that is referenced as guidance for infiltration of stormwater in the Order No. R9-2002-0001 Fact Sheet and in the Response to Comments dated July 1, 2009 is more than 15 years old and does not provide an adequate technical basis for the requirements related to infiltration of stormwater, except for provision F.1.c.(6) g.. And even for provision F.1.c.(6)g, a closer review of this document will show that the study evaluated the impact of industrial stormwater discharges into local groundwater. However, the site soil conditions had a poorly defined soil structure and included gravel. Thus stormwater from the industrial site was discharged in an almost direct conduit to the groundwater. The County would submit that the Tentative Order should require the Permittees to develop criteria for the use of infiltration BMPs (both on site and centralized BMPs) that consider land use, runoff quality, groundwater depth, site soil conditions and other information relevant to groundwater protection.</p> <p data-bbox="203 787 1510 882">Since the Fact Sheet, and the Regional Board Response to Comments dated July 1, 2009 does not provide adequate technical basis for the requirements, the County requests that Section F.1.c.(6) should be deleted and replaced with the following language:</p> <p data-bbox="203 913 1534 997">The Copermittees shall, within 2 years of the adoption of this order, develop criteria for the use of infiltration BMPs that consider land use, runoff quality, groundwater depth and quality, site soil conditions and other information relevant to groundwater protection.</p>				

Response	<p data-bbox="203 1029 1559 1239">This comment regarding the infiltration requirements has been answered in previous response to comments. The language proposed is consistent with the language used in Section F.1.b.2.h of Order NO. E9-2002-0001 (the current Permit). As discussed in the Fact Sheet for Order No. R9-2002-0001, the restrictions placed on urban runoff infiltration are based on recommendations provided by the U.S. EPA Risk Reduction Engineering Laboratory and supported by the State Water Board. The language contained in the Tentative Order also allows the Copermittees to develop alternative criteria to replace the suggested restrictions. Any separate infiltration criteria developed by the Copermittees, must be submitted as part of their updated SSMP for public review and comment.</p> <p data-bbox="203 1270 1494 1323">Please see the July 6, 2007, Response to Comments I, Response No. 24; December 12, 2007, Response to Comments II, Response No. 17; and July 1, 2009, Response to Comments IV, Response to comment No. 100.</p>
-----------------	--

Comment No.	326	Commenter No.	49	Comment Subject	LID
Comment	<p>The Copermittees shall, within 2 years of the adoption of this order, develop criteria for the use of infiltration BMPs that consider land use, runoff quality, groundwater depth and quality, site soil conditions and other information relevant to groundwater protection.</p> <p>Notwithstanding our comment and recommendation above we have specific concerns regarding the restrictions being specified in the draft Order.</p> <p>First, the requirement in Section F.1.c.(6)(a) to implement pretreatment prior to infiltration is excessive. It may be appropriate to require pretreatment for sites with certain pollutant generating activities but to have a broad brush requirement for pretreatment for all land uses make little sense and is not technically supported.</p> <p>In Section F.1.c.(6)(b) the requirement that infiltration BMPs cannot be used for dry weather flows containing significant pollutant loads is impractical and does not reflect the performance of the soil. The soil mantel is an effective treatment media and the blanket prohibition of the use of infiltration BMPs for dry weather flows eliminate an effective BMP from the permittees tool box.</p> <p>Section F.1.c.(6)(g) restricts the use of infiltration treatment control BMPs in areas of industrial or light industrial activity and areas subject to high vehicular traffic. High vehicular traffic is defined as 25,000 or greater average daily traffic on main roadway or 15,000 or more average daily traffic on any intersecting roadway. The Regional Board Response to Comments dated July 1, 2009 identifies that "The restriction on areas with high vehicular traffic is included on the recommendation of the USEPA guidance that the commenter (County of Orange) cited." The USEPA guidance that was cited is the U.S. Environmental Protection Agency. 1994. Potential Groundwater Contamination from Intentional and Nonintentional Stormwater Infiltration. EPA 600 SR-94 051, which contains no recommendation regarding vehicular traffic and infiltration devices and therefore doe not provide a specific technical basis for this restriction. As such, prescriptive requirements should not be included in the Tentative Order unless there is a strong technical basis. Moreover, we are not aware of any demonstrated relationship between traffic counts and frequency of materials deposited on the street, nor are such restrictions placed on the California Department of Transportation, which operates facilities that routinely exceed the ADT level indicated.</p> <p>Since the Fact Sheet, and the Regional Board Response to Comments dated July 1, 2009 does not provide adequate technical basis for the requirement, the County requests that Section F.1.c.(6)(g) should be deleted from the permit.</p>				

Response	<p>This comment regarding the infiltration requirements has been answered in previous response to comments. The language proposed is consistent with the language used in Section F.1.b.2.h of Order NO. E9-2002-0001 (the current Permit). As discussed in the Fact Sheet for Order No. R9-2002-0001, the restrictions placed on urban runoff infiltration are based on recommendations provided by the U.S. EPA Risk Reduction Engineering Laboratory and supported by the State Water Board. The language contained in the Tentative Order also allows the Copermittees to develop alternative criteria to replace the suggested restrictions. Any separate infiltration criteria developed by the Copermittees, must be submitted as part of their updated SSMP for public review and comment.</p> <p>Please see the July 6, 2007, Response to Comments I, Response No. 24; December 12, 2007, Response to Comments II, Response No. 17; and July 1, 2009, Response to Comments IV, Response to comment No. 100.</p> <p>The requirement in Section F.1.c.6.(g) restricting infiltration in certain areas has been modified to be allow infiltration, provided the runoff is treated or filtered to remove pollutants prior to entering the infiltration device. This change is in light of the findings of the Los Angeles and San Gabriel Rivers Watershed Council's Water Augmentation Study Phase II Final Report. The study found that "Filtration methods employed at industrial sites seemed to be effective at removing certain pollutants prior to entering the infiltration system, which may make infiltration more feasible at these more polluted sites." This provision is in keeping with the goal of maximizing infiltration opportunities to benefit surface water quality and maximize local sources of water supply.</p>

Comment No.	327	Commenter No.	49	Comment Subject	SUSMP
Comment	Native/Low Water Landscaping (Section F.1.c.(7), Page 31)				
	<p>This provision identifies that landscaping with native or low water species where feasible shall be preferred in areas that drain to the MS4 or waters of the U.S. The Regional Board Response to Comments dated July 1, 2009 identifies that this provision is not an Order requirement, and is simply a suggestion to use native species where feasible. However, the language in provision F.1.c seems to counter this position as it states clearly that the project must include management measures that include native landscaping. Furthermore the provision, as written, requires the whole project areas to be subject to the native plant requirement</p> <p>The County requests that provision F.1.c.(7) be deleted from the Tentative Order.</p>				
Response	<p>Section F.1.c states that "Discharges from each approved development project must be subject to the following management measures:" which includes Section F.1.c.(7), which states: "Where feasible, landscaping with native or low water species shall be preferred in areas that drain to the MS4 or to waters of the United States."</p> <p>The management measure is that, where feasible, landscaping with native or low water species shall be preferred. Thus, using native species is not required.</p>				
Comment No.	328	Commenter No.	49	Comment Subject	LID
Comment	<p>Alternative Standards (Section F.1.c.(8), Page 31)</p> <p>The principles provided in this section are very similar with the approach specified in the Santa Ana permit for the North County. In fact we had suggested similar modifications to Section F.1.d.(4)(d) (page 35-36).</p> <p>The County requests that the language from this alternative standard section be incorporated into section F.1.d.(4)(d).</p>				
Response	The Regional Board agrees and has made the change to the Tentative Order.				

Comment No.	329	Commenter No.	49	Comment Subject	SUSMP
--------------------	-----	----------------------	----	------------------------	-------

Comment Standard Stormwater Mitigation Plans (SSMPs) (Section F.1.d, Page 31-32)

Section F.1.d. requires each Permittee to implement an updated local SSMP within twelve months of adoption of the Order. This is a change from the language in the June 18th Errata Sheet, where two years was provided to update the local SSMP. The Regional Board Response to Comments dated July 1, 2009 identifies that "The Tentative Order has been revised to allow up to two years to develop the updated SSMP in conjunction with the hydromodification management plan." The Tentative Order, however has not been revised to allow two years to develop and updated SSMP. This provision includes language that requires the inclusion of the hydromodification requirements in provision F.1.h in an updated local SSMP within one year of the adoption of the Order. The requirements in provision F.1.h include the development of an HMP within two years of adoption of the Order. The timeframe to update the local SSMPs in Provision F.1.d should be consistent with the time frame identified to develop the HMP in provision F.1.h.

The County requests that provision F.1.d be modified as follows:

Within 12 months of adoption of this Order, the Copermittees must submit an updated model SSMP, to the Regional Board's Executive Officer for a 30 day public review and comment period upon completion of the HMP as identified in section F.1.h. The Regional Board's Executive Officer has the discretion to determine the necessity of a public hearing. Within 180 days of determination that the Model SSMP is in compliance with this Permit's provisions, each Copermittee must update their own local SSMP, and amended ordinances consistent with the model SSMP, and shall submit both (local SSMP and amended ordinances) to the Regional Board. The Model SSMP must meet the requirements of section F. 1. d. of this Order and (1) reduce Priority Development Project discharges of storm water pollutants from MS4 to the MEP, (2) prevent Priority Development Project runoff discharges from the MS4 from causing or contributing to a violation of water quality standards, (3) manage increases in runoff discharge rates and durations from Priority Development Projects that are likely to cause increased erosion of stream beds and banks, silt pollution generation, or other impacts to beneficial uses and stream habitat due to increased erosive force and (4) implement the hydromodification requirements in section F.1.h.

Response The revised Tentative Order states that within 12 months of adoption the Copermittees must submit an updated Model SSMP. Within 180 days of determination that the Model SSMP is in compliance with the Permit's provisions, each Copermittee must update their own local SSMP. We agree with the commenter's concern regarding the timing of SSMP development and the HMP. Therefore language in F.1.d. has been revised to allow 2 years for SSMP submission.

Comment No.	330	Commenter No.	49	Comment Subject	SUSMP
Comment	<p>Section F.1.d.(2) defines Priority Development Project Categories. In an introduction to the listed categories, this section states that, where a new development project feature, such as a parking lot, falls into a Priority Development Project Category, the entire project footprint is subject to SUSMP requirements. As currently written this provision would require a new development that has a 5,000 square foot parking lot feature and 100,000 square feet of other land uses that are not Priority Development Project Categories, to provide treatment for the entire project (105,000 square feet). This requirement would unduly burden the landowner in this case with the cost of treating runoff from 105,000 square feet when only 5,000 square feet should be subject to SUSMP requirements and treatment controls. The need to treat runoff from a greatly increased land area will require an increase in the size of treatment controls, which will increase the volume of water treated without a likely commensurate increase in pollutant removal.</p> <p>The Fact Sheet fails to provide any information showing that development land uses that are not in the Priority Development Project Category contribute pollutants to the MS4 and are a threat to water quality. The Fact Sheet (page 125) states that this provision “is included in the Order because existing development inspections by Orange County municipalities show that facilities included in the Priority Development Project Categories routinely pose threats to water quality. This permit requirement will improve water quality and program efficiency by preventing future problems associated with partially treated runoff from redevelopment sites.” This explanation does not demonstrate any connection between development land uses that are not in the Priority Development Project Category and the observed “threats to water quality.”</p> <p>Since the Fact Sheet does not provide any technical information showing that land uses that are not Priority Development Project Categories are a significant source of pollutants and a threat to water quality, the County requests the introductory paragraph of Section F.1.d.(2) subjecting the entire project footprint to SUSMP requirements should be deleted from the permit.</p>				

Response	<p>This comment has been considered in previous response to comments. Please see the July 6, 2007, Response to Comments I, Response No. 28; and the July 1, 2009, Response to Comments IV, Response No. 103 and 104.</p> <p>In summary, the language in the introduction of Section D.1.d.2 of the Tentative Order regarding the inclusion of the entire project when at least one aspect of the project is categorized as a Priority Project is consistent with the Regional Board’s 2002 approval of the San Diego SUSMP. This is a particularly important requirement since municipalities have greater latitude during development to require pollution prevention than they have with existing development. Moreover, this is a reasonable requirement in that it limits confusion for property owners and ensures consistent implementation of SUSMP requirements. This section and related Finding have not been revised.</p>
-----------------	--

Comment No.	331	Commenter No.	49	Comment Subject	SUSMP
Comment	<p>Streets, Roads, Highways, and Freeways (Section F.1.d.(2)(g), Page 34)</p> <p>County comments regarding this provision were not addressed in the Regional Board Response to Comments dated July 1, 2009 and there is no mention of this provision in the Fact Sheet and so previous comments are resubmitted. Section F.1.d.(2)(g) includes as a Priority Development Project Category streets, roads, highways, and freeways including any paved surface of 5,000 square feet or greater that is used for transportation. Highways and freeways are not the jurisdiction of Permittees and fall under the jurisdiction of the California Department of Transportation, which is regulated by its own statewide stormwater permit.</p> <p>The County requests that the Provision be modified as follows:</p> <p>(i) Streets and roads, highways, and freeways. This category includes streets and roads any paved surface that is are 5,000 square feet or greater used for the transportation of automobiles, trucks, motorcycles, and other vehicles.</p>				
Response	<p>The inclusion of streets, roads, highways, and freeways as a priority development project was a requirement in the current Permit, Order No. 2002-0001, section F.1.b(2)(a).viii. The threshold only applies to streets, roads, highways, and freeways under the Copermittees jurisdiction. If the Copermittees do not have jurisdiction over any freeways, the threshold will not apply to freeway projects. Removal of the term, therefore, is not necessary. Although the Copermittees currently do not have any jurisdiction over highways or freeways, they may in the future have such jurisdiction, as is found in other California counties.</p>				

Comment

LID Site Design BMP Requirements (Section F.1.d.(4), Page 34-36)
 In this provision the Order contains a combination of planning procedures, design principles, and design criteria. However, all these ideas are labeled as LID BMPs which makes for a confusing provision. The provision would greatly benefit by reorganizing it around planning procedures, design principles, and design criteria. Our redline mark-up was prepared with this reorganization in mind.

Section F.1.d.(4)(a)
 This provision requires each PDP to perform an assessment of the potential for collection of storm water for on-site or off-site reuse opportunities. The Tentative Order is silent regarding how extensive the analysis should be and there is no supporting language in the Fact Sheet as to why this analysis should be done. This analysis should only be required when the project cannot meet the LID performance standard. The important effort in this section is to have the permittees require all PDP that cannot meet the LID standard perform an assessment of their efforts to comply with the LID performance standard. This effort would ultimately complement a request for a waiver should that option become necessary.

Section F.1.d.(4)(b) and Section F.1.d.(4)(d).
 Similar to the discussion above, this provision characterizes LID planning principles as LID BMPs. These principles are consistent with the definition of LID and should be acknowledged and supported. However, the County would like to note that Section F.1.d.(4)(b)(ii) is inconsistent with the LID sizing criteria in Section F.1.d.(4)(d). In section F.1.d.(4)(b)(ii) the permit correctly notes that site conditions will limit the amount of runoff that can be infiltrated. However, in Section F.1.d.(4)(d) no such acknowledgement is noted and full retention, with no runoff, is required for the water quality capture storm. The permit attempts to mitigate this requirement with granting off ramps for sites not able to meet the retention requirement. However, the two sections should be consistent and section F.1.d.(4)(d) should be modified to reflect the definition of LID and the language found in F.1.d.(4)(b).

The County requests that Section F.1.d.(4) be modified as follows:

(4) Low Impact Development BMP Requirements

Each Copermittee must require each Priority Development Project to implement LID BMPs which will collectively minimize directly connected impervious areas, limit loss of existing infiltration capacity, and protect areas that provide important water quality benefits necessary to maintain riparian and aquatic biota, and/or are particularly susceptible to erosion and sediment loss.

(a) In selecting LID BMPs the Co-permittees shall develop plan review procedures that The following LID BMPs must be implemented:

- (i) Require LID BMPs or make a finding of infeasibility for each Priority Development Project in accordance with the LID waiver program in Section F.1.d.(8);
- (ii) incorporate formalized consideration, such as thorough checklists, ordinances, and/or other means, of LID BMPs into the plan review process for Priority Development Projects;
- (iii) Ensure that the review of each Priority Development Project must include an assessment of potential collection of storm water for on-site or off-site reuse opportunities;
- (iv) Ensure that the review of each Priority Development Project must include an assessment of techniques to infiltrate, filter, store, evaporate, or detain runoff close to the source of runoff; and
- (v) Within 2 years after adoption of this Order, each Copermittee shall review its local codes, policies, and ordinances and identify barriers therein to implementation of LID BMPs. Following the identification of these barriers to LID implementation, where feasible, the Copermittee must take, by the end of the permit cycle, appropriate actions to remove such barriers.
- (vi) Within 12 months of the adoption of this order, the principal permittee, in collaboration with the co-permittees, shall develop technically-based feasibility criteria to determine the feasibility of implementing LID BMPs including infiltration, harvest and reuse, evapotranspiration, and biofiltration. The criteria shall include a prioritized selection process for BMP implementation

(b) The following LID design principles where technically and economically feasible shall be implemented at all Priority Development Projects as required below:

(i) Post development hydrograph shall mimic predevelopment hydrographs.

(ii) Maintain or restore natural storage reservoirs and drainage corridors (including depressions, areas of permeable soils, swales, and ephemeral and intermittent streams).

(iii) Projects with landscaped or other pervious areas must, where feasible, drain runoff from impervious areas (rooftops, parking lots, sidewalks, walkways, patios, etc) into pervious areas prior to discharge to the MS4. The amount of runoff from impervious areas that is to drain pervious areas shall not exceed the total capacity of the project's pervious areas to infiltrate or treat runoff, taking into consideration the pervious areas' geologic and soil conditions, slope, and other pertinent factors.

(iv) Projects with landscaped or other pervious areas must, where feasible, properly design and construct the pervious areas to effectively receive and infiltrate or treat runoff from impervious areas, prior to discharge to the MS4. Soil compaction for these areas shall be minimized. The amount of the impervious areas that are to drain to pervious areas must be based upon the total size, soil conditions, slope, and other pertinent factors.

(v) Projects with low traffic areas and appropriate soil conditions must construct walkways, trails, overflow parking lots, alleys, or other low-traffic areas with permeable surfaces, such as pervious concrete, porous asphalt, unit pavers, and granular materials.

(c) To protect ground water resources any infiltration LID BMPs must comply with Section F.1.(c)(6).

(d) LID BMPs sizing criteria:

(i) LID BMPs shall be sized and designed to ensure onsite retention, of the volume of runoff produced from a 24-hour 85th percentile storm event, as determined from the County of Orange's 85th Percentile Precipitation Map ("design capture volume");

(ii) If onsite retention LID BMPs are technically infeasible biofiltration BMPs may treat any volume that is not retained onsite by the LID BMPs. The LID biofiltration BMPs must be designed for an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP. Due to the flow through design of biofiltration BMPs, the total volume of the BMP, including pore spaces and prefilter detention volume is allowed to be no less than 0.75 times the design storm volume;

(iii) If it is shown to be technically infeasible to treat the remaining volume up to and including the design capture volume using LID BMPs (retention or biofiltration), the project may implement conventional treatment control BMPs in accordance with Section F.1.d.(6) below or must participate in the LID waiver program in Section F.1.d.(8).

(e) All LID BMPs shall be designed and implemented with measures to avoid the creation of nuisance or pollution associated with vectors, such as mosquitoes, rodents, and flies.

Response

Planning procedures, design principles and design criteria are considered management practices. The assessment for storm water reuse is necessary to ensure that a project proponent has examined all options at LID retention BMPs prior to entering the LID waiver program. The full capture of the design storm may be through infiltration, evapotranspiration or retention for reuse. Storm water capture for reuse would fulfill the LID capture criteria. If a project meets the LID performance standard through other methods, then the assessment for storm water reuse would not need to be conducted.

Section F.1.d.(4)(b)(ii) ensures that runoff directed to pervious areas, such as lawns or landscaping, are able to adequately handle the storm flows. The requirements in section F.1.d.(4)(b)(ii) work with section F.1.d.(4)(d). In other words, a project site must direct runoff from impervious areas to pervious areas; and a project site must size and design LID BMPs to ensure onsite retention of the design storm. Where pervious areas cannot handle the storm flows from impervious areas, other LID retention BMPs, such as infiltration trenches or rain gardens, must be implemented.

Comment No.	333	Commenter No.	49	Comment Subject	SUSMP
Comment	<p>Treatment Control BMP Requirements (Section F.1.d.(6)(f) and (g), Page 38)</p> <p>The Fact Sheet does not provide any technical basis for these provisions and the Regional Board Response to Comments dated July 1, 2009 refers to the Regional Board Response to Comments dated July 6, 2007. The Regional Board Response to Comments dated July 6, 2007 regarding this section does not provide any technical basis for these provisions. Furthermore in the Regional Board Response to Comments dated December 12, 2007 the Regional Board states "The Regional Board agrees that there is not a federal prohibition on placing pollution control practices within waters of the U.S." Since the previous comments on this issue were not adequately addressed in the Regional Board's Response to Comments, the comments are being resubmitted.</p> <p>Section F.1.d.(6)(f) require treatment control BMPs be implemented prior to discharging into waters of the U.S. and provision F.1.d.(6)(g) prohibits the construction of treatment controls within waters of the U.S. or waters of the State. These provisions taken together limit the use of regional BMP and watershed-based approaches such as the Irvine Ranch Water District Natural Wetland System Project or Aliso Creek Water SUPER project. Such projects should be encouraged and not prohibited by the Order.</p> <p>The Tentative Order encourages a renewed focus on the 'watershed approach' but the proposed restriction on regional BMPs is antithetical to a watershed approach. The USEPA in its National Management Measures Guidance to Control Nonpoint Source Pollution from Urban Areas, Management Measure 5: New Development Runoff Treatment dated November 2005 (page 5-38) states that "regional ponds are an important component of a runoff management program." and that the costs and benefits of regional, or off-site, practices compared to on-site practices should be consider part of a comprehensive management program. The EPA guidance acknowledges that a regional approach can effectively be used for BMPs.</p> <p>The County requests that provisions F.1.d.(6)(f) and (g) be combined and modified to enable regional approaches to move forward. Our suggested language reflects this concept. (f) Be implemented close to pollutant sources, and prior to discharging into waters of the U.S. and not be constructed within a waters of the U.S. or waters of the State unless the BMP obtains coverage under a Section 404 permit.</p>				
Response	<p>Again, the commenter misconstrues the Regional Board's past response to comments by only quoting the first sentence of the response. Please see response to Comment no. 310.</p>				

Comment No.	334	Commenter No.	49	Comment Subject	LID
Comment	<p>LID BMP Waiver Program (Section F.1.d.(7), Page 38-40)</p> <p>On July 15, 2009 the Permittees met with the staff of the Regional Water Board to discuss, among many issues, the LID Waiver Program. One of the critical elements of that discussion was how to establish a pollutant credit system that is consistent with the water quality program. The fundamental principle that was agreed upon in that discussion was that regardless of which BMPs (LID based or treatment control based) is chosen for a site that the net impact from pollutant loadings be equal. Thus for a site that implements LID BMP for full retention of the water quality capture storm or implements a conventional BMP that captures the same pollutant loading the two are viewed equal in reducing pollutants. As an example and for the sake of comparison, an LID BMP designed to retain the 85% storm (i.e. the water quality capture storm) removes 85% of the pollutant load on an annual basis is equivalent to a conventional BMP if the conventional BMP can be designed to remove 85% of the annual pollutant load (in this case the conventional BMP would have to design to treat a larger storm than the water quality capture storm). In this situation the conventional BMP would be judged to be equivalent to the conventional BMP and the PDP would not be subject to additional mitigation measures. It is our understanding that the current draft Order allows this type of pollutant credit system to be established.</p> <p>If this is not the case then the County requests that the Tentative Order be modified to support the principle.</p>				
Response	<p>The Regional Board staff agrees with the comment.</p>				

Comment No.	335	Commenter No.	49	Comment Subject	SUSMP

Comment Treatment Control BMP Maintenance Tracking (Section F.1.f.(3), Page 42-43)

This provision identifies that each Copermitee must verify that post-construction BMPs are operating effectively. In provision F.1.f(3)(c)(i) there appears to be conflicting statements. The first statement of this provision seems to imply annual verification of SSMPs while the second statement implies verification of BMPs once every four years. The provision is confusing and should be re-written or deleted. The Fact Sheet and the Regional Board Response to Comments dated July 1, 2009 does not effectively identify why 90 percent of approved and inventoried final public and private SSMPs must be verified annually. The finding in the Fact Sheet that "90 percent is a reasonable annual target" obviously does not take into account the significant amount of resources needed to complete these inspections. The North Orange County MS4 Permit provides an adequate provision related to inspection of structural treatment controls and inclusion of similar language would provided consistency between the two permits.

The County requests that Section F.1.f.(3) be deleted and replaced with the following language:

Within 12 months of adoption of this order and annually thereafter, all public agency structural treatment control BMPs, and at least 25% of priority development project structural treatment control BMPs, shall be inspected prior to the rainy season. All structural treatment control BMPs shall be inspected within every four year period. The permittees shall ensure that the BMPs are operating and are maintained properly and all control measures are working effectively to remove pollutants in runoff from the site. All inspections shall be documented and kept as permittee records. The permittees may accept inspections conducted and certified by state licensed professional engineers in lieu of permittee inspections.

Response The provision requires 90 percent of BMPs be verified annually. Theoretically, a Copermitee may choose to verify the same BMPs every year, leaving 10 percent of the BMPs to never have been verified. The second sentence ensures that all of the BMPs are verified every four years, in that way this ensures that the remaining 10 percent will be verified at least once during those four years. We assume that the Copermitees would not be verifying 100 percent of the BMPs in the fourth year but rotating which BMPs are verified each year.

The Copermitees 2007 DAMP proposes to verify 90 percent of WQMPs (including structural and non-structural BMPs) by inspection, self-certifications, surveys or other means. The Regional Board agrees and finds that 90 percent is a reasonable annual target given the ease of self-certifications and surveys.

Comment No.	337	Commenter No.	49	Comment Subject	Hydromod
Comment	Requirements for Hydromodification and Downstream Erosion (Section F.1.h, Pages 44-48)				
<p>Section F.1.h.(1)(b) discusses requirements for the HMP, and identifies the range of runoff flow rates and durations that must compensate for the loss of sediment supply due to the development. Areas of a development, outside of natural stream courses, produce fine grain sediments in a naturally occurring state. This material is known as wash load because it often moves through the river system in suspension without being present in the river bed in significant quantities (Colby, 1957). Wash load consists of particles so small that they are essentially absent on the stream bed (Ritter, 1995)9. Decreased wash load does not cause erosion, because it is transported well below capacity (ASCE, 2008). Natural stream courses within a development do contribute to bed load of a downstream receiving water as the stream course bed material is composed of larger particle sizes. The provision should be changed to reflect that compensation for sediment loss is due to the affected natural stream courses within a development.</p> <p>The waiver for PDPs that discharge to concrete-lined or significantly hardened channel should be included as hydromodification requirements are not appropriate for cahnnels that are designed to accept increased flows from upstream development as the potential for erosion is minimal or not present.</p> <p>The County requests that provision F.1.h.(1)(b) be modified as follows:</p> <p>(b) Utilize continuous simulation of the entire rainfall record (or other analytical method proposed by the Copermittees and deemed acceptable by the Regional Board) to identify a range of runoff flows for which priority Development Project post-project runoff flow rates and durations shall not exceed pre-development (naturally occurring) runoff flow rates and durations by more than 10 percent, where the increased flow rates and durations will result in increased potential for erosion or other significant adverse impacts to beneficial uses. In addition, the identified range of runoff flow rates and durations must compensate for the loss of sediment supply due to affected natural stream courses within the development.</p>					

Response	<p>The commenter states that sediment loss is due to the affected natural stream courses within a development, and that the text of section F.1.h.(1)(b) should be changed to reflect that. The Regional Board agrees that sediment loss is due to the affected natural stream courses within a development. This is because once development occurs, course sediment that was once available to erode naturally from a landscape and aggregate into streams providing bed and bank replenishment is no longer available. Once developed, this natural sediment supply is entombed beneath concrete and asphalt, contributing to erosion of downstream receiving waters by preventing bed and bank replenishment. The Regional Board disagrees that the proposed changes regarding sediment loss improve the clarity of the text.</p> <p>The Regional Board disagrees with the suggestion to remove the qualification "naturally occurring" from the description of pre-development runoff flow rates. As stated in Finding D.2.g., the goal of the hydromodification requirements are to prevent or further prevent hydromodification impacts on downstream watercourses and eventually restore natural flow regimes. Only by using the "naturally occurring" pre-development runoff flow rates will the goal of restoring natural flow regimes be achievable. Natural flow regimes are necessary to protect downstream receiving waters.</p> <p>The commenter also suggests deleting language pertaining to the identification of the range of flow rates that must be controlled, including the removal of the description of the lower boundary of flows. The Regional Board disagrees with these proposed changes, as describing the lower boundary of the range of flows is necessary for Copermittees to understand the expectations of the requirements.</p>

Comment No.	338	Commenter No.	49	Comment Subject	Hydromod
--------------------	-----	----------------------	----	------------------------	----------

Comment Section F.1.h.(2) identifies that the HMP must include a suite of management measures to be used on PDPs to protect and restore downstream beneficial uses. As noted in our comments for Finding D.2.g. downstream restoration to its natural state is not always possible in highly urbanized areas and could lead to catastrophic impacts from flooding.

The County requests that provision F.1.h.(2) be modified as follows:

(2) In addition to the hydrologic control measures that must be implemented per section F.1.h.(1)(c), the HMP must include a suite of management measures to be used on Priority Development Projects to protect and restore downstream beneficial uses and prevent or further prevent adverse physical changes to downstream channels. The measures must be based on a prioritized consideration of the following elements in this order:

Response The Regional Board recognizes that it is not always possible to restore creek segments to their natural states because of concern for flood control. For this reason, section F of the Tentative Order does not contain requirements for the Copermittees to restore creeks.

The requirements set forth in section F.1.h do not necessarily apply to concrete lined channels that are hardened all the way from the point of discharge to ocean waters, enclosed bays, or water storage reservoirs and lakes (section F.1.h.(3)(b)). The Copermittees have the discretion to waive the requirements in these situations. If, however, there is a portion of a creek that is not concrete lined all the way from the point of discharge to the ocean, then the beneficial uses of this portion of the creek must be protected and restored. The management measures described in the HMP will aid in protecting and restoring the beneficial uses of any soft-bottomed creek segments occurring downstream of PDPs. The intent of the HMP requirements are to protect and restore the beneficial uses of soft-bottomed creek segments; however, there are no requirements to restore or rehabilitate concrete lined channels.

Although not a requirement, the Regional Board supports efforts to restore and rehabilitate degraded creek segments. In some instances, this entails removing concrete and restoring natural flow regimes. For this reason, section F.1.h.(1)(b) contains language regarding characterizing the erosive flows for concrete lined channels as if they were soft-bottomed creeks. This standard is useful because if concrete lined channels are restored to their full physical, biological and chemical integrity, then the HMP already describes the maximum flow that this creek can sustain before erosion and degradation of beneficial uses occurs. As stated earlier, if a creek is concrete lined from the point of discharge of the PDP all the way to the ocean, enclosed bay, or water storage reservoir, the project can be exempt from the requirements of section F.1.h.

Comment

Section F.1.h.(3) identifies where hydromodification requirements are not required at the Copermittees discretion. The waiver for PDPs that discharge to concrete-lined or significantly hardened channels should be included as hydromodification requirements are not appropriate for channels that are designed to accept increased flows from upstream development as the potential for erosion is minimal or not present. The comments for Finding D.2.g. are reemphasized for this provision as restoration is not always feasible. Furthermore the Fact Sheet and the Regional Board Response to Comments dated July 1, 2009 do not provide adequate technical basis for removing the waiver. The burden should not be on a PDP to identify if a downstream receiving water can be restored, rather that is the responsibility of the Regional Board. Further more it is very important that the exemptions to HMPs be consistent between north and south Orange County otherwise we have consistency and equitable issue that exposes the permittees to undue legal exposure.

The County requests that provision F.1.h.(3) be modified as follows:

(3) Section F.1.h. does not apply to Priority Development Projects where the project:

- (a) Discharges storm water runoff into underground storm drains discharging directly to bays or the ocean; or
- (b) Discharges storm water runoff into conveyance channels that are engineered, concrete lined, or are significantly hardened, and are regularly maintained to ensure flow capacity.
- (c) Site infiltrates at least the runoff from a two-year storm event. The permittees may request for a variance from these criteria, based on studies conducted by the Storm Water Monitoring Coalition, Southern California Coastal Water Research Project, or other regional studies. Requests for consideration of any variances should be submitted to the Executive Officer.
- (d) The volume and the time of concentration of storm water runoff for the post development condition do not significantly exceed those of the predevelopment condition for a two year frequency storm event (a difference of 5% or less is considered insignificant). This may be achieved through site design and source control BMPs.

Response

The Regional Board recognizes that creek restoration is not always feasible, and that hydromodification requirements are not appropriate for channels designed to accept increased flows (concrete lined). As such, section F.1.h of the Tentative Order does not contain any requirements for creek restoration.

Contrary to this comment, the revised section F did not remove the waiver of hydromodification management requirements for concrete-lined channels. Section F.1.h(3)(b) states that Copermittees have the discretion to waive the requirements for discharges of storm water runoff into conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to ocean waters, enclosed bays, or water storage reservoirs. Furthermore, section F.1.h of the Tentative Order does not require the PDP or Copermittee to identify if a downstream receiving water can be restored. In cases where there is a soft-bottomed portion of a creek that is located downstream from the point of discharge of a PDP, however, then the requirements are needed to protect and restore the beneficial uses of this soft-bottomed creek segment.

The Regional Board disagrees with the commenter's suggestions for revised language regarding the exemptions. In terms of consistency with Order No. R8-2009-0030, the Copermittees can avoid consistency and equitable issues if they choose to adopt the more stringent requirements of the Tentative Order as the regional standard. The commenter suggests exempting projects that discharge into hardened channels that are maintained, yet this approach offers no protection to creek segments that are soft-bottomed, located downstream of hardened channels. The commenter further suggests exemptions from PDPs that infiltrate the runoff from a 2-year storm event, or volume or time of concentration of the discharge does not significantly exceed that of the 2-year storm event. Yet, much of the work done by erosive force occurs from storms larger than the 2-year event (SCVURPPP, 2005). As such, the suggestions from the commenter are not acceptable as they do not protect and restore the beneficial uses of receiving waters to the MEP. The Regional Board recommends that the Copermittees review hydromodification management plans in other parts of the State in developing the regional HMP, as the requirements are similar.

Comment No.	340	Commenter No.	49	Comment Subject	Hydromod
Comment	<p>Section F.1.h.(4)(a) requires within 2 years of adoption of the Order the Copermittees develop a draft HMP. The timeframe for development of HMPs for each watershed is too short to ensure an optimized program. Interim criteria assures that there will not be unregulated development in the interim. A minimum of three years, which was the length of time to develop criteria identified in the previous Tentative Order, should be allowed for their development.</p> <p>The County requests that provision F.1.h.(4)(a) be modified as follows:</p> <p>(a) Within 3 years of adoption of the Order, the Copermittees shall submit to some watersheds within south Orange County already have comprehensive watershed he County requests that the following provision be added to Section F.1.h. as follows: the Regional Board a draft HMP that has been reviewed by the public, including the analysis that identifies the appropriate limiting range of flow rates per section F.1.h(1)(b).</p>				
Response	<p>The commenter incorrectly states that HMPs for each watershed are required. Section F.1.h of the Tentative Order requires the Copermittees to collaborate to develop one HMP that serves all of Southern Orange County.</p> <p>The language in the Tentative Order allows the Copermittees 2 years to develop the first draft of the HMP. The Regional Board anticipates that the Copermittees will develop HMPs similar to others available in the State: Contra Costa County, Santa Clara County, and San Diego County. Given the available and newly developed resources related to this subject, extra time to develop the HMP is not warranted.</p>				

Comment No.	341	Commenter No.	49	Comment Subject	Hydromod
Comment	<p>Some watersheds within south Orange County already have comprehensive watershed plans that address hydromodification impacts. These watershed plans where appropriate can substitute for HMPs.</p> <p>The County requests that the following provision be added to Section F.1.h. as follows:</p> <p>(6) HMP Substitution. In watersheds where a comprehensive watershed plan has been developed and addresses hydromodification impacts consistent with this Order, the Copermittees may petition the Executive Officer to substitute the watershed plan for the HMP for that specific watershed.</p>				
Response	<p>See Response to Comment 119 dated July 1, 2009.</p>				

Comment No.	342	Commenter No.	49	Comment Subject	Hydromod
Comment	<p>Section F.1.h.(5) identifies interim hydromodification criteria and identifies those PDPs where the interim hydromodification criteria does not apply. A waiver of the interim hydromodification requirements should also be provided for PDPs per the proposed language for Section F.1.h.(3) identified above.</p> <p>The County requests that Section F.1.h.(5) be modified as follows:</p> <p>Within one year of adoption of this Order, each Copermittee must ensure that all Priority Development Projects are implementing the following criteria by comparing the predevelopment and post-project flow rates and durations using a continuous simulation hydrologic model such as USEPA's Hydrograph Simulation Program—Fortran (HSPF):</p> <p>(a) For flow rates from 10 percent of the 2-year storm event to the 5 year storm event, the post-project peak flows shall not exceed pre-development peak flows.</p> <p>(b) For flow rates from the 5 year storm event to the 10 year storm event, the post project peak flows may exceed pre-development flows by up to 10 percent for a 1-year frequency interval.</p> <p>The interim hydromodification criteria do not apply to Priority Development Projects that meet the conditions identified in Section F.1.h.(3).</p> <p>Within one year of adoption of this Order, each Copermittee must submit a signed, certification statement to the Regional Board verifying implementation of the interim hydromodification criteria.</p>				
Response	<p>The Regional Board disagrees with the proposed language regarding the exemptions from hydromodification management requirements for the reasons discussed in the response to Comments Nos. 337 (regarding the need to include "naturally occurring" to describe the pre-development condition) and 339 (regarding the rationale for the exemptions from the requirements).</p>				

Comment Although not directly addressed within the Tentative Order, the Permittees take issue with the requirement that they must pay a significant fee for the municipal stormwater permit, which covers their construction responsibilities and are also required to pay an additional fee when they submit an NOI to obtain coverage under the Statewide Construction General Permit.

In the Response to Comments IV, Regional Board staff indicate that "the Regional Board does not have the discretion to combine, reduce, or waive fees for waste discharge requirements". However, the County understands that there is some discretion and that this discretion could be consistent with the process that is established within Order No. R8-2009-0030.

Section XV of Order R8-2009-00030 (page 65 and 66) states:

1 This order authorizes the discharge of storm water runoff from construction projects that may result in land disturbance of one (1) acre or more (or less than one acre, if it is part of a larger common plan of development or sale which is one acre or more) that are under ownership and/or direct responsibility of any of the permittees. All permittee construction activities shall be in accordance with DAMP Sections 7 and 8.

2 All construction activities shall be in compliance with the latest version of State's General Permit for Storm Water Discharges Associated with Construction Activities except that an NOI need not be filed with the State Board.

3 Prior to commencement of construction activities, the permittees shall notify the Executive Officer of the Regional Board concerning the proposed construction project. Upon completion of the construction project, the Executive Officer shall be notified of the completion of the project.

4. The permittees shall develop and implement a storm water pollution prevention plan (SWPPP) and a monitoring program that is specific for the construction project greater than one acre, prior to the commencement of any of the construction activities, except for routine maintenance activities. The SWPPP shall be kept at the construction site and released to the public and/or Regional Board staff upon request.

5. The SWPPP (and any other plans and programs required under the General Permit) and the monitoring program for the construction projects shall be consistent with the requirements of the latest version of the State's General Construction Permit.

6. The permittees shall give advance notice to the Executive Officer of the Regional Board concerning any planned changes in the construction activity, which may result in non-compliance with the latest version of the State's General Construction Permit.

Based on the above language the municipalities convey the information that is necessary to the Santa Ana Region, but they do not have to file a formal NOI under the State Construction General permit or pay the permit fee since they have already paid the municipal stormwater program permit fee.

The County requests that language similar to Order R8-2009-0030 be included within the permit so that the municipal stormwater permit fees cover all municipal activities including construction and that they not be held liable for additional fees when submitting NOI-based information.

Response Federal regulations and guidance clearly establish a system of dual regulation by both the municipalities and the NPDES permitting authority (in this case the State) for industrial and construction sites that are subject to NPDES permits. The regulations do not provide any discretion to the permitting authority to waive the NPDES permit requirements for construction sites in areas covered by a MS4 permit. To our knowledge, the Region 8 MS4 permit is the only permit throughout California that waives enrollment in the construction general permit. This action appears contrary to federal law.

Comment No.	344	Commenter No.	49	Comment Subject	Construction
Comment	<p>BMP Implementation (Section F.2.d, Page 50)</p> <p>The Response to Comments IV misunderstood the request in the previous comment letter, therefore the comment is resubmitted.</p> <p>Section F.2.d.(1)(a)(ii) requires the development and implementation of a site-specific stormwater management plan, however this is inconsistent with Section F.2.c.2.</p> <p>The County requests the following change to F.2.d.(1)(a)(ii)</p> <p>(ii) Development and implementation of a site-specific stormwater management plan runoff management plan (or equivalent construction BMP plan such as an erosion and sediment control plan);</p>				
Response	<p>An erosion and sediment control plan is not considered equivalent to a site-specific stormwater management plan, because construction sites are also a source of non-visible pollutants such as metals and nutrients. To the extent that a storm water pollution prevention plan required by the Statewide Construction General Permit meets the requirements of the local jurisdictions codes and ordinances; such a plan may be considered equivalent. Keep in mind that local codes and ordinances can be more specific and stringent than those requirements found in the construction general permit. This requirement to develop a site-specific stormwater management plan also applies to sites less than one acre that are not covered by the Statewide Construction General Permit.</p>				

Comment No.	345	Commenter No.	49	Comment Subject	Construction
Comment	<p>BMP Implementation (Section F.2.d, Page 51-52)</p> <p>Since the County's comments on this issue, the State Water Board has reissued the Statewide Construction General Permit. Section F.2.d.(1)(c)(i) (Page 51-52) states that the Permittees must require implementation of advanced treatment for sediment at construction sites that are determined to be an exceptional threat to water quality.</p> <p>The Statewide Construction General permit adopted by the State Water Board on September 2, 2009, identifies Active Treatment Systems (ATS) as advanced sediment treatment technology. ATS prevents or reduces the release of fine particles of sediment (silts and clays) by employ chemical coagulation, chemical flocculation or electrocoagulation to aid the reduction of turbidity caused by fine suspended sediments.</p> <p>The recently adopted Construction General Permit also lays out a risk-based approach to permit requirements whereby the minimum requirements of the permit (e.g., BMPs, monitoring, and reporting) progressively increase as the risk level increases. Higher risk sites are also subject to numeric action levels and numeric effluent limitations for turbidity and pH.</p> <p>The Construction General Permit identifies ATS as an available technology that may be employed on construction sites, but does not mandate the use of ATS. The Construction General Permit acknowledges that ATS is an emerging technology in California, and establishes conditions (e.g. operation and monitoring requirements) for its use.</p> <p>Given that the Construction General Permit has established a risk approach whereby the highest risk construction projects will be subject to more stringent BMPs, rigorous monitoring, and compliance with numeric action levels and numeric effluent limitations, the County requests that the provisions requiring the use of ATS be deleted from this permit and that the selection of BMPs for construction operations, especially ATS be done under the aegis of the Statewide Construction General Permit.</p>				
Response	<p>The ATS requirements in the Tentative order are identical to the ATS requirements in the San Diego MS4 Permit adopted on January 24, 2007. As such, the authors of the construction general permit, that was only recently adopted, were well aware of these existing requirements for ATS. No changes are made in response to this comment.</p> <p>Please also see response to Comment no. 202.</p>				

Comment No.	346	Commenter No.	49	Comment Subject	Construction
Comment	<p data-bbox="203 997 1079 1039">Construction Reporting of Non-compliant Sites (Section F.2.g.(2), Page 54)</p> <p data-bbox="203 1627 1567 1690">The County appreciates that the Regional Board staff clarified the intent of this provision regarding the need and use of the data being requested by the Permittees (see Response to Comments IV comment #128).</p> <p data-bbox="203 1711 1567 1837">However, the provision also states that the data be submitted from the Permittees to the Regional Board “prior to the commencement of the wet season” which is typically September and then further states “Information may be provided as part of the JRMP annual report” (which is November). Thus, the timeframe for submittal of the information needs to be clarified.</p> <p data-bbox="203 1858 1567 1984">Since F.2.g.(1) already requires that the Permittees notify the Board when the Permittee “issues a stop work order or other high level enforcement to a construction site” and the Permittees must follow the notification requirements in Attachment B, the County requests that the JRMP annual report be the mechanism for conveying the information so that the information is not submitted twice.</p> <p data-bbox="203 2005 771 2047">The County requests the following modifications:</p> <p data-bbox="203 2068 1567 2100">(2) Each Copermittee shall annually notify the Regional Board, of all construction sites with alleged violations. Information may be provided as part of the JRMP annual report. Information provided shall include, but not be limited to, the following:</p> <ul data-bbox="203 2152 998 2100" style="list-style-type: none"> (a) WDID number if enrolled under the General Construction Permit; (b) Site Location, including address; (c) Current violations or suspected violations. 				
Response	<p data-bbox="203 1879 1567 2047">At the least, the Copermittees need to notify the Regional Board prior to the commencement of the wet season. Submission prior to the rainy season allows the Regional Board to coordinate inspections in a timely manner. Per Section K, the Copermittees may propose an alternate schedule. If the Copermittees propose a schedule where the JRMP annual reports are submitted prior to the commencement of the rainy season; then the notification of sites with alleged violations may be done as part of the JRMP annual report. Directive F.2.g.(2) has been corrected.</p>				

Comment Flood Control Structures (Section F.3.a.(4)(c), Page 56)

Section F.3.a.(4)(c) requires the Permittees to evaluate existing flood control devices to identify those that are causing or contributing to a condition of pollution, identify measures to reduce or eliminate the structure's effect on pollution, and evaluate the feasibility of retrofitting the structure. While some minor changes were made, the intent of the previously submitted comments has not been addressed.

The federal regulations [40 CFR, Part 122.26(d)(2)(vi)(A)(4)] focus on evaluating flood control devices and determining if retrofitting the device is feasible. The regulations state:

(4) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from stormwater is feasible.

The County requests that the language be modified so that it is aligned with the current stormwater permit, recognizes the work that has been completed to date, is consistent with the intent of the federal regulations, is consistent with the justification within the Fact Sheet, and is more consistent with Provision XIV.10. in Order No. R8-2009-0030. The proposed language modification is as follows:

(4) BMP Implementation for Flood Control Structures

(c) Each Copermittee who owns or operates flood control devices/facilities must continue to evaluate its existing flood control devices/facilities, and identify opportunities and the feasibility of configuring and/or reconfiguring channel segments/structural devices to function as pollution control devices to protect beneficial uses.

The inventory and evaluation must be completed by and submitted to the Regional Board in the 2nd year JRMP Annual Report.

Response The comment regarding flood control structures was considered in previous response to comments. Please see the Fact Sheet discussion for section F.3.a.(4)(c); the July 6, 2007, Response to Comments I, Response No. 42; the December 12, 2007, Response to Comments II, Response No. 26; the February 13, 2008, Response to Comments III, Comment No. 26; and the July 1, 2009, Response to Comments IV, Response No. 129.

In summary, the Tentative Order's requirements to evaluate retrofitting existing flood control devices are consistent with the intent of the federal regulations. The federal regulations call for flood management projects to assess the impacts on the water quality of receiving water bodies. In order to conduct such an assessment, the Copermittees will have to evaluate and identify those flood control devices that are causing or contributing to a condition of pollution. In order to evaluate feasibility of retrofitting flood control projects, they must first identify proposed measures to reduce or eliminate the structure's effect on pollution.

Comment No.	348	Commenter No.	49	Comment Subject	Existing Development
Comment	<p>Infiltration from Sanitary Sewer to MS4 (Section F.3.a.(7), Page 57-58)</p> <p>There continue to be several concerns with this section of the Tentative Order as outlined below:</p> <p>First - Although (7)(a) is consistent with the current permit (Order No. R9-2002-0001), the Permittees submit that the provisions regarding sanitary sewer maintenance are more applicable to sanitary sewer agencies, not stormwater agencies. It is fundamentally inappropriate to include sanitary sewer maintenance requirements in a stormwater permit even where the two systems may be operated by the Permittee. Where similar maintenance requirements are included in the wastewater treatment plant or collection system permit, these provisions are an unnecessary duplication of other regulatory programs.</p> <p>In addition, it is an inappropriate and ineffective use of public money to try to “prevent and eliminate infiltration of seepage from sewers to MS4s”. How are the permittees supposed to know where the infiltration is occurring throughout the hundreds of miles of storm drains so that the efforts can be focused to those areas? How are the permittees supposed to prevent infiltration in the storm drain system without sliplining the entire system? Although it may seem like this is something that the permittees can simply do through “routine preventative maintenance” this simply isn’t the case. Instead, the owner/operator of sewer system must have the primary responsibility to prevent exfiltration/leaks from occurring in the first place rather than relying on the recipient of the leaks to manage the problem.</p> <p>Second - On a similar issue, the State Board stayed a provision in the existing permit finding that “the regulation of sanitary sewer overflows by municipal storm water entities, while other public entities are already charged with that responsibility in separate NPDES permits, may result in significant confusion and unnecessary control activities.” [emphasis added] (WQ 2002-0014 at p.8).</p> <p>It is unclear why the Board staff are not conforming with this Stay from the previous permit. In addition, this portion of the comment was not addressed within the Response to Comments IV.</p> <p>The County requests that part (a) of the provision (7) should be deleted from the Tentative Order.</p>				
Response	<p>The comments regarding sanitary sewer infiltration and spill response have been extensively considered in previous response to comments. Please see the July 6, 2007 Response to Comments I, Response Nos 44, & 50; the December 12, 2007, Response to Comments II No. 28; the July 1, 2009, Response to Comments IV, Response No. 130 & 180.</p>				

Comment No.	349	Commenter No.	49	Comment Subject	Existing Development
Comment	<p>While the Permittees agree that stormwater agencies must also address aspects of sanitary sewer incursions into the MS4s, the provisions in (7)(b) are aspects of other portions of the stormwater program and should be moved to those sections of the Tentative Order.</p> <p>The County requests the following proposed changes:</p> <ol style="list-style-type: none"> i. Adequate plan checking for construction and new development – incorporate in the Construction and New Development programs ii. Incident response training for municipal employees that identify sanitary sewer spills – incorporate in the Illegal Discharges/Illicit Connections (ID/IC) program. iii. Code enforcement inspections – delete, this is covered by other programs iv. MS4 maintenance and inspections – incorporate in the Municipal program, provision D.3.a(6). v. Interagency coordination with sewer agencies – incorporate in the ID/IC program. vi. Proper education of municipal staff and contractors conducting field operations on the MS4 or municipal sanitary sewer (if applicable) – incorporate in the Municipal program. 				
Response	<p>This comment has previously been addressed please see the July 1, 2009 Response to Comments IV, Response No. 251.</p>				

Comment Mobile Businesses (Section F.3.b(3)(a), Page 62)

Although the Response to Comments IV addresses the County’s previously submitted comments, we respectfully disagree with Board staff that the new permit section “is not a significant change from the existing Order” and that our proposed recommendation of a pilot program focused on one or two categories of mobile business would be “a lessening of the requirement and considered backsliding”. In fact, the latter statement is not supported by the structure and description of the new section of the permit which states that the Permittees must develop the following (i.e. this is a new program that is not currently in existence pursuant to the previous Order):

- “a program to reduce the discharge of storm water pollutants from mobile businesses to the MEP”
- “minimum standards and BMPs”
- “an enforcement strategy”
- “an outreach and education strategy”

In our previous comment letter we noted the difficulties associated with developing this program, concerns which were mirrored in the Fact Sheet. For the reasons previously noted and acknowledged by the Regional Board, we request that the requirement for this program be changed to the development of a pilot program for the mobile business category. The pilot program would allow the Permittees to work together on a regional basis to develop an appropriate framework for addressing mobile business and determine whether the program is effective prior to expending a significant amount of resources on multiple categories of mobile businesses.

In addition, this would be consistent with the approach taken in the Santa Ana Region pursuant to Order No. R8-2009-0030 – Section X.8. (page 45) which states:

“Within 12 months of adoption of this order, the permittees shall develop a mobile business pilot program. The pilot program shall address one category of mobile business from the following list: mobile auto washing/detailing; equipment washing/cleaning; carpet, drape and furniture cleaning; mobile high pressure or steam cleaning. The pilot program shall include at least two notifications of the individual businesses operating within the County regarding the minimum source control and pollution prevention measures that the business must implement. The pilot program shall include outreach materials for the business and an enforcement strategy to address mobile businesses. The permittees shall also develop and distribute the BMP Fact Sheets for the selected mobile businesses. At a minimum, the mobile business Fact Sheets should include: laws and regulations dealing with urban runoff and discharges to storm drains; appropriate BMPs and proper procedure for disposing of wastes generated.”

The County requests that the Board modify this section of the permit to identify that a program will be developed as a pilot program focusing on one category of mobile businesses.

Response The Regional Board stands by their response in the July 1, 2009, Response to Comments IV, No. 29.

To elaborate, the previous permit, R9-2002-0001, section F.3.c, requires the Copermitttees to:

- "reduce pollutants in runoff", section F.3.c
- "designate a set of minimum BMPs", section F.3.c.(3)
- "enforce its storm water ordinance for all commercial sites and sources", Section F.3.c.(5)
- "develop an education component to address commercial communities", Section F.4.b

In comparison to the previous order, the commercial source identification inventory is identical regarding mobile businesses except for the addition of mobile pet services, and the Regional Board has not received comments contrary to their inclusion.

Comment Inspection of Industrial and Commercial Sites/Sources (Section F.3.b(4)(b), Page 63)

The County appreciates that the Regional Board staff clarified the intent of this provision regarding the need and use of the data being requested by the Permittees. However, the provision also states that the data be submitted from the Permittees to the Regional Board "prior to the commencement of the wet season" which is typically September and then further states "Information may be provided as part of the JRMP annual report" (which is November). Thus, the timeframe for submittal of the information needs to be clarified.

Since the Permittees already notify the Board when there are compliance issues at an industrial site/facility subject to the General Industrial Permit and the Permittees must follow the notification requirements in Attachment B, the County recommends that the JRMP annual report be the mechanism for conveying the information so that the information is not submitted twice.

The County requests the following modifications:

(2) Each Copermittee shall annually notify the Regional Board, prior to the commencement of the wet season, of all Industrial sites and Industrial Facilities subject to the General Industrial Permit or other individual NPDES permit with alleged violations. Information may be provided as part of the JRMP annual report.

Response At the least, the Copermittees need to notify the Regional Board prior to the commencement of the wet season. Submission prior to the rainy season allows the Regional Board to coordinate inspections in a timely manner. Per Section K, the Copermittees may propose an alternate schedule. If the Copermittees propose a schedule where the JRMP annual reports are submitted prior to the commencement of the rainy season; then the notification of sites with alleged violations may be done as part of the JRMP annual report. Directive F.3.b.(4)(b) has been corrected.

Comment Retrofit Existing Development (Section F.3.d, Pages 68-70)

This provision requires that each Permittee must implement a retrofitting program for existing developments (i.e. municipal, industrial, commercial, residential). These requirements present a significant change and present a substantial burden to the municipal stormwater program by requiring a host of engineering studies, capital improvements, land acquisition, etc.) This requirement is also inconsistent with Order R8-2009-0030.

Currently, new development requirements are imposed as conditions of approval for new projects and projects that are voluntarily undergoing redevelopment. A thorough legal review is required to determine whether municipalities have the authority to compel land development requirements absent a voluntary land development application and if such authorities can be developed given other legal constraints.

The Permittees do not concur with the statement of the Regional Board staff in the fact sheet that "Retrofitting existing development is practicable for a municipality..." A systematic evaluation of the technical and legal opportunities and constraints of a requirement to require retrofitting, especially of private landowners, is necessary to determine whether or not such a requirement is practicable. The evaluation must precede the permit provision to mandate MS4s require retrofitting of existing development.

These provisions of the permit represents an entire new approach to existing development that places an unknown significant burden on the Permittees and ultimately to property owners in the south Orange County area. It is concerning to the County that this provision sets up a process that goes well beyond the Federal regulations, especially regarding potential efforts on private property.

In addition, the provision sets up a requirement that will likely require the Permittees to address most, if not all, of the areas within the geographic area regulated under this permit, which simply is not feasible. The Permittees are required to inventory a multitude of candidate areas, prioritize them and then proceed with projects in those areas where retrofitting is feasible. In addition, provision d.6. further states that, "where constraints on retrofitting preclude effective BMP deployment...the Copermittee may propose a regional mitigation project", which then means that additional projects will have to be undertaken – not just those that are prioritized as "highly feasible".

The County requests that this unprecedented requirement be eliminated from the permit.

Response The comment regarding retrofitting has been considered in the previous response to comments. Please see the Fact Sheet discussion on retrofitting; and the July 1, 2009, Response to Comments IV, Response Nos. 46, 136, 161, and 162.

In summary, the Tentative Order's requirements for retrofitting existing development is practicable for a municipality through a systematic evaluation, prioritization and implementation plan focused on impaired water bodies, pollutants of concern, areas of downstream hydromodification, feasibility and effective communication and cooperation with private property owners. The Tentative Order's requirement realized the legal limitations that the Copermittees have in requiring retrofitting on privately held land. Therefore, the Tentative Order requires the Copermittees to cooperate with private landowners in implementing retrofitting opportunities.

Comment Watershed Urban Runoff Management Program (Section G, Page 74)

The County appreciates the modification to the WURMP section to provide for the flexibility that is necessary within a watershed management program.

The County requests that the WURMP Workplan be expanded to include the following so that the watershed work plans are comprehensive and address water quality in a more holistic manner:

- Municipal retrofit provision;
- Hydromodification;
- Water supply; and
- Habitat

Since it is not always necessary to “model” to demonstrate water quality improvements in the receiving waters, the County requests that provision G.2.e. be modified to allow for modeling and/or monitoring as necessary.

Response It is unnecessary to specifically reference or include those sections in the Watershed Workplan requirement. All jurisdictional components could be integrated into the watershed workplans depending on the specific pollutants of concern in the watershed. By not specifying specific components within the watershed workplan, the Tentative Order is actually more flexible for the Copermittees to determine BMPs and strategies to address pollutants of concern. The modeling will be necessary to assist the Copermittees in assessing the effectiveness of the BMPs, selecting BMPs for deployment, and prioritizing their resource expenditures.

Comment

This provision is supported by Finding E.11 which identifies that adopted TMDL WLAs will be incorporated as numeric effluent limits for specific pollutants and watersheds.

As noted previously, the Permittees are concerned that it appears that Regional Board staff plan to incorporate WLAs as numeric effluent limits in the MS4 permit without consideration of other options or as to how the TMDL may be written, which might include:

- Requiring implementation of specific BMPs in the permit;
- Providing a recommended menu of potential BMPs in the TMDL, implementation plan, or the permit for sources to evaluate and select;
- Referencing BMP performance standards in the TMDL, implementation plan, or the permit;
- Recommending the selection of BMPs and developing benchmark values or performance measures; and
- Requiring the review of existing BMPs and selecting additional BMPs to achieve progress.

The USEPA draft handbook TMDLs to Stormwater Permit lists the above options and notes that:

“There are no guidelines for determining which approach is most appropriate to use. It is likely that a variety of factors, including type of source, type of permit, and availability of resources, will influence which approach makes the most sense.”

However, it does not appear that the Regional Board has considered the variety of factors in determining that numeric effluent limitations are most appropriate method of incorporating the WLAs for all pollutants in all watersheds into the MS4 stormwater permit.

The County requests that the following language, which is from the adopted Ventura County MS4 Stormwater Permit (R4-09-0057 Page 95) be incorporated into this section within the introduction to clarify how the WLAs will be attained:

The Permittees shall attain the Waste Load Allocations by implementing BMPs in accordance with the TMDL Technical Report, Implementation Plan, or as identified as a result of TMDL special studies specified in the Basin Plan Amendment.

The Permittees shall comply with the Waste Load Allocations, consistent with the assumptions and requirements of the Waste Load Allocations documented in the Implementation Plans, including compliance schedules, associated with the State adoption and approval of the TMDL at compliance monitoring points established in the TMDL Monitoring Program (40 CFR 122.44(d)(1)(vii)(B)).

Response

The Regional Board has considered all options when considering how best to incorporate the TMDL into the Tentative Order. The Copermitees are given great flexibility in implementing BMPs capable of meeting the Waste Load Allocation Reductions, Final Allocations and Numeric Targets that come directly from the adopted TMDL. The USEPA approves of this approach as is evident by their letter of September 28, 2009 that supports adoption of the Tentative Order. No change has been made in response to this comment.

This comment has been previously submitted (albeit in a slightly different format). Please see response to Comment no. 144 from the July 1, 2009, Response to Comments IV. Please also see response to Comment nos. 59 and 72 from the July 1, 2009, Response to Comments IV.

Comment No.	355	Commenter No.	49	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment Section J. of the Tentative Order requires the Permittees to assess the effectiveness of their JURMP, identify necessary program modifications, and report that information to the Regional Water Board on annual basis. Section J.1.a. identifies specific water quality-based objectives for 303(d) listed water bodies, environmentally sensitive areas (ESAs), and the major program components.

Although the concept and intent of the provision is understood and supported by the Permittees, the specificity and inclusion of the required water quality-based objectives and focus on the 303(d) listed water bodies and ESAs is misplaced and has not been developed within the context of the California Stormwater Quality Association (CASQA) Guidance or through the State's Storm Water Quality Task Force which was established pursuant to AB 739 to develop a comprehensive guidance document for evaluating and measuring the effectiveness of Municipal Storm Water Management Program (Guidance Document). Although the Guidance Document has not been finalized, it builds off of the CASQA Guidance Document concepts. In addition, this section is not consistent with Order R8-2009-0030.

As written, this section of the Tentative Order is not consistent with the CASQA Guidance Document and does not provide flexibility for the Permittees to develop objectives and an overall strategy for the effectiveness assessment and will result in resources being expended without achieving the intended goal.

Since the Permittees have already developed and implemented a program effectiveness assessment framework and programmatic and environmental performance metrics and have committed to developing metric definitions and guidance to improve the efficacy of the assessments in the ROWD, the provision should be modified to allow the Permittees to continue to use the approach that they have been using for several years.

The County requests that this provision be replaced with the following text: The annual report shall include an overall program assessment. The permittees may use the "Municipal Stormwater Program Effectiveness Assessment Guidance" developed by the California Stormwater Quality Association in May 2007 as guidance for assessing program activities at the various outcome levels. The assessment should include each program element required under this order, the expected outcome and the measures used to assess the outcome. The permittees may propose any other methodology for program assessment using measurable targeted outcomes.

Response This comment has been submitted and responded to twice previously. Please see Comment No. 145 in the July 1, 2009, Response to Comments IV and Comment No. 56, Response to Comments on Tentative Order No. R9-2007-0002, July 6, 2007.

In regards to consistency, please see Comment no. 373 . Please also see Comment No. 24 in the July 1, 2009, Response to Comments IV.

Comment No.	356	Commenter No.	49	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment Section G.7. requires that the Permittees submit the Aliso Creek WURMP annual report by March 1 of each year. Since the Watershed Action Plan Annual Report for the Aliso Creek Watershed has historically been submitted in November of each year and has been based on the fiscal year like the other WURMP reports, it is unclear why Board staff are requiring this change. As such, the Aliso Creek WURMP submittal is now inconsistent with the other WURMP submittals both in the date for submittal and the time period for which the report covers. The County would prefer that the Aliso Creek WURMP annual report submittal date be aligned with the other WURMP submittals.

The County requests that the new language incorporated as a part of Section K. on page 84 also be included in the introduction to Section G.7. so that the reporting schedules are consistent.

The Copermittees may propose alternate reporting criteria and schedules, as part of their updated JRMP, for the Executive Officer's acceptance.

Response The language under Section K applies to all reporting criteria and schedules in the Tentative Order, not just for JRMP requirements. Any proposed criteria and suggested schedules should be included in the updated JRMP.

Comment No.	357	Commenter No.	49	Comment Subject	Monitoring
Comment	To enable staff, monitoring, and analytical resources for new monitoring program requirements to be acquired and integrated into current efforts, it is requested that implementation of new requirements should be specified in Attachment E to begin 12 months from the date of permit adoption.				
Response	The earliest monitoring required under the Tentative Order does not begin until October 01, 2010 (see E.III.B). Multiple facets of the monitoring (e.g. mass emissions and non-storm water) are continuations of monitoring programs under R9-2002-001. Furthermore, there are multiple extended time frames for other monitoring programs, such as the sediment toxicity special study. The Regional Board contends this is an ample time frame, as not all new monitoring requirements take effect October 01, 2010.				
Comment No.	358	Commenter No.	49	Comment Subject	Monitoring
Comment	<p>The 6-hour holding time for samples of indicator bacteria limits the length of time that sampling teams can spend in the field and consequently does not allow sampling of some episodic events. For example, a typical day of bioassessment monitoring at three locations requires 8 hours in the field for PHAB assessment and collection of benthic macroinvertebrate, water quality, and toxicity testing samples. Also, mass emissions monitoring of stormwater runoff can occur on weekends and holidays when contract laboratory services are not available. Additionally, monitoring bacteriological quality of stormwater at mass emissions site will not useful information considering access to flood control channels is prohibited during periods of stormwater runoff and the mass emissions monitoring sites are generally great distances upstream of the coastal receiving waters.</p> <p>The County requests that the requirement to conduct monitoring of bacteriological quality at bioassessment sites and during stormwater events at mass emissions sites be removed.</p>				
Response	Please see Comment no. 318 in the July 1, 2009, Response to Comments IV. The request for exemption of bacteriological sampling during bioassessment sampling was accepted in the July 01, 2009 response to comments. This has been clarified in Attachment E.				
Comment No.	359	Commenter No.	49	Comment Subject	Monitoring
Comment	<p>Monitoring for oil and grease concentration will not detect lighter petroleum fractions such as gasoline and diesel. Oil and grease has been detected in 13 of 900 samples in the Dry Weather Reconnaissance Program since 2003.</p> <p>The County requests that the requirement to collect a grab sample for oil and grease during stormwater runoff monitoring be limited to Mass Emissions and Ambient Coastal Receiving Water sites.</p>				
Response	Under Attachment E, the only required storm water sampling for oil and grease is for Mass Emissions and Ambient Coastal Receiving Water Monitoring sites.				
Comment No.	360	Commenter No.	49	Comment Subject	Monitoring
Comment	<p>Section E.II.B.1.b requires measurement of hardness in the receiving waters during composite stormwater sampling of the MS4 major outfalls. Since the hardness of the receiving waters can fluctuate considerably during a storm, a composite sampling of the receiving water would be the most appropriate method of determining the water hardness. This sampling of the receiving water however would require an extra automatic sampler.</p> <p>The County requests that if the total metal concentration of the composite sample from the major outfall exceeds the SAL, comparison will be made to the CTR CMC adjusted to a hardness value calculated from the Mass Emissions Database. The representative hardness value from each watershed area will be calculated as the median of the timeweighted hardness values of all storms monitored (2000-2008 reporting years) in the mass emissions program within the respective watershed area. The current mass emission monitoring protocol includes collection of 3-5 composite samples during a 4-day period after the onset of a storm. In order to more accurately characterize receiving water hardness during the first 24 hours (MS4 Major Outfall monitoring protocol) only the first two composite samples (1-hour first flush + second composite) of each storm would be used to calculate the time-weighted average concentration.</p>				
Response	<p>Attachment E of the Tentative Order currently does not prescribe the exact sampling methodology, and only states that a grab sample may be utilized.</p> <p>The Regional Board appreciates the suggestion to use historic mass emissions data, but this is more appropriate to propose in the Planned Monitoring Program, due September 1, 2010 (see Attachment E.III.A.1) under the Tentative Order. Since an exceedance of an SAL is to be combined with other information when the Copermitees consider iterative actions, the use of a median hardness value should not be a problem.</p>				

Comment No.	361	Commenter No.	49	Comment Subject	Monitoring
Comment	<p>Section E.II.C.b.(3) states that effluent samples must also include analysis for chloride, sulfate, and total dissolved solids. Although these constituents are listed in the Basin Plan they were removed from the lists of NELs that were in prior iterations of the permit.</p> <p>The County requests the removal of these three constituents from the Non-stormwater monitoring suite.</p>				
Response	<p>Chloride, sulfate and total dissolved solids have been identified as pollutants of concern, and may be found in illicit discharges and/or connections to the MS4. These pollutants were removed from the initial list of NELs as more information, including monitoring, was found to be required in order to evaluate the need for effluent limitations. The commenter provides no reason for their removal from IC/ID monitoring. Thus, no change has been made.</p>				
Comment No.	362	Commenter No.	49	Comment Subject	Monitoring
Comment	<p>Section F.4.e.(2)(c) of the Program Provisions states that: "Within two business days of receiving analytical laboratory results that exceed action levels, the Co-Permittees must either initiate an investigation to identify the source of the discharge or document the rationale for why the discharge does not pose a threat to water quality and does not need further investigation." The two-day response is an unrealistic expectation considering the weekly volume of data received from the laboratories, the time required to enter the data into the Co-Permittee database, and the data review process.</p> <p>The County requests the establishment of a protocol that specifies that within five business days of receiving analytical laboratory results that exceed action levels the Co-Permittee responsible for the watershed from which the discharge emanated will be notified. Within 2 business days after notification Co-Permittee will either initiate the an investigation to identify the source of the discharge or document the rationale for why the discharge does not pose a threat to water quality and does not need further investigation.</p>				
Response	<p>Please see response to Comment no. 260.</p> <p>The Regional Board has changed the required response criteria from 2 business days to 5 business days.</p>				
Comment No.	363	Commenter No.	49	Comment Subject	Monitoring
Comment	<p>The requirement that the Planned Monitoring Program be submitted September 1st of every year, beginning on September 1, 2009, does not allow adequate time for analysis of the monitoring data from the prior year as it is affected by management actions undertaken throughout the MS4, subject of the annual Performance Effectiveness Assessment.</p> <p>The County requests that consideration be given to an annual meeting after submittal of the Annual Report to discuss the content of the report and any changes to the monitoring program or suggestions for special studies. This approach will promote a more collaborative relationship between the Permittees and Board staff and may help streamline the renewal of future permits.</p>				
Response	<p>The Regional Board has already agreed that this is a good idea. Please see Comment nos. 326, 267 and 183 in the July 1, 2009, Response to Comments IV.</p>				
Comment No.	364	Commenter No.	49	Comment Subject	Monitoring
Comment	<p>The requirement that the Receiving Waters and Urban Runoff Monitoring Annual Report be submitted October 1st of every year, beginning on October 1, 2010, does not provide adequate time for relevant analysis of the monitoring data collected in the 12-month period immediately prior to the proposed reporting date. Previous annual reports were submitted on November 15th of each year and assessed the results of monitoring activities conducted in the 12-month period ending 4½ months prior to the reporting date.</p> <p>The County requests that the Receiving Waters and Urban Runoff Monitoring Programs Annual Report continue to be submitted in conjunction with the Unified Annual Report and Performance Effectiveness Assessments.</p>				
Response	<p>Please see Comment no. 183 in the July 1, 2009, Response to Comments IV.</p>				

Comment No.	365	Commenter No.	50	Comment Subject	LID
Comment	<p>We appreciate the Board's recognition that properly engineered LID filtration BMPs are available to a project developer to meet the LID performance standard. The Tentative Order language states that "due to the flow through design of biofiltration BMPs, the total volume of the BMP, including pore spaces and prefilter detention volume is allowed to be no less than 0.75 times the design storm volume."</p> <p>At a minimum, we ask that this section be revised to require that the biofiltration BMPs be designed to retain no less than 75% of the portion of the design storm that is not retained on site. We believe the intent of the Board is to allow biofiltration (or better stated, filtration LID BMPs) BMPs to be used to handle all or a portion of the design storm volume when it is shown through infeasibility that onsite retention BMPs alone cannot handle the total design storm volume. Sizing each and every biofiltration BMP to handle up to 0.75 of the total design storm volume is unnecessary and expensive.</p>				
Response	<p>The Regional Board agrees that the intent of the Tentative Order's requirement is that the total prefilter volume be 75 percent of the portion of the design storm that is treated by the biofiltration BMP. But please understand that the overall filtration design of the biofiltration unit must be for the whole design storm. The 75 percent allowance is for the prefilter detention volume.</p>				

Comment No.	366	Commenter No.	50	Comment Subject	Hydromod
Comment	<p>The hydromodification control waivers contained in this subsection should expressly include waivers for projects that do not increase the potential for hydromodification impacts over the existing site conditions, or that discharge to a receiving water that is not susceptible to hydromodification impacts. Suggested edits are as follows:</p> <p>Waivers may also be implemented for the following projects that do not increase the potential for hydromodification impacts over the existing site conditions:</p> <p>(A) Projects within a natural watershed where a geomorphically-based watershed study has been prepared that establishes that the potential for hydromodification impacts is not present.</p> <p>(B) Significant redevelopment projects that do not do not increase impervious area or decrease the infiltration capacity of pervious areas compared to the pre-project conditions.</p> <p>(C) Projects that discharge directly or via a storm drain to a substantially hardened channel, sump, a lake, area under tidal influence, or other receiving water that is not susceptible to hydromodification impacts.</p>				
Response	<p>Please see the response to Comment No. 122.</p>				

Comment No.	367	Commenter No.	51	Comment Subject	LID
Comment	<p>Our comments focus on the development and implementation of effective Low-Impact Development ("LID") utilizing progressive standards and reviews in order to ensure the integrity of the latest MS4 permit. Coastkeeper has consistently supported the inclusion and implementation of LID principles throughout the development of MS4 permits in Orange County and the Inland Empire. LID provides an environmentally preferred avenue for the reduction of harmful pollutants from the waterways of southern California as well as providing for groundwater recharge and a reduction in our region's reliance on imported water. In as much as we support the incorporation of LID principles into the south Orange County MS4 permit, we are also dedicated towards the adoption of a permit which accurately reflects the various LID best management practices ("BMPs") in a way which maximizes their utility.</p> <p>Chief among our concerns is this permit's pervasive reliance on "biofiltration" without including a working definition of the term or providing verifiable standards of which biofiltration BMPs must satisfy. Rather than provide clarity the permit instead reinforces ambiguity by providing a potentially unworkably vague term which does not guarantee onsite retention of pollutants. If biofiltration is adopted, then there should be additional guidance on the Regional Board's definition of biofiltration. Additionally, the Regional Board should ensure proper oversight of any proposed biofiltration device to guarantee that it is properly sized and designed.</p>				
Response	<p>The Tentative Order includes a definition of biofiltration in Attachment C and has included design criteria in section F.1.d(4)(c)(ii).</p>				

Comment No.	368	Commenter No.	51	Comment Subject	LID
Comment	Coastkeeper agrees with the Regional Board that structural, proprietary, and/or engineered biofiltration devices should be permitted where appropriate. However, the Regional Board should hold those biofiltration devices to equivalent water quality standards and require proper monitoring to prove their initial and continued effectiveness as pollution control devices. For example, a four to five year postconstruction monitoring regimen with at least annual reporting which includes data on wet and dry seasons would be an appropriate mechanism for analyzing biofiltration effectiveness for major developments.				
Response	<p>The Regional Board maintains that bio-filtration is part of a comprehensive LID program. Effective bio-filtration provides pollutant removal and energy dissipation. Biological removal of pollutants can even be an improvement over simply keeping pollutants on-site until rainfall over the design-storm criteria washes pollutants into receiving waters. Removal of pollutants and prevention of downstream hydromodification ensures any discharge to be low impact. The USEPA's Green Infrastructure website includes filtration as a Low Impact Development technique; http://cfpub.epa.gov/npdes/greeninfrastructure/information.cfm#glossary. In addition, the U.S. Department of Housing and Urban Development's report titled "The Practice of Low Impact Development," (July 2003, H-21314CA) incorporates filtration techniques. The County of San Diego's LID manual also utilizes bio-filtration as an acceptable LID practice.</p> <p>In the future as the science and knowledge of storm water treatment evolves, filtration may not be a suitable LID practice to meet the maximum extent practicable standard. For this permit iteration, LID BMPs that capture the design storm for reuse, infiltration or evapotranspiration are preferred over bio-filtration techniques. The draft permit provides design-criteria for "LID bio-filtration BMPs" in section F.1.4.d.ii and requires demonstration that retention LID BMPs are technically infeasible prior to implementing bio-filtration BMPs.</p>				

Comment No.	369	Commenter No.	51	Comment Subject	LID
Comment	Finally, Coastkeeper encourages the Regional Board to view the utilization of biofiltration as a "trigger" for LID offsite programs. As stated earlier, the use of biofiltration does not guarantee that pollutants are retained onsite and therefore the adoption of additional programs to address pollution should be included in a comprehensive approach to combat the discharge of harmful pollutants into the waters of Orange County. Possible offsite programs are discussed in the permit concerning the LID waiver program and include "green streets projects, existing development retrofit projects, retrofit incentive programs, regional BMPs and stream restoration."				
Response	Please see the response to Comment No. 368.				

Comment No.	370	Commenter No.	51	Comment Subject	LID
Comment	In conclusion, Coastkeeper appreciates the effort the Regional Board and its staff have put towards developing an effective MS4 permit for south Orange County which effectively and efficiently addresses the environmental concerns of the watershed in a transparent and comprehensive approach. We look forward to a constructive relationship with the Regional Board and hope our comments will assist in the development of a thoughtful and progressive permit.				
Response	comment noted.				

Comment

Section F.1.d.(4)(d)(ii) allows LID biofiltration BMPs to treat any volume that is not retained onsite by the LID BMPs, if onsite retention LID BMPs are technically infeasible. Section F.1.d.(4)(d)(iii) permits conventional treatment controls if it is shown to be technically infeasible to treat the remaining volume up to and including the design capture volume using LID BMPs (retention or biofiltration), and importantly, if the project participates in the LID waiver program in Section F.1.d.(8).

A critical failure of this section is that the use of biofiltration does not implicate the Waiver Program – a project using biofiltration would still be in compliance with the LID requirements. Although biofiltration is a legitimate and often effective technique to clean stormwater, it is simply not as effective as onsite recapture. Capture onsite ensures that absolutely zero pollution leaves the site via stormwater. By definition, any other technique, including biofiltration, is less effective since pollution could be released.

Additionally, biofiltration remains poorly defined in the permit. As such, it is a subjective term and could be abused. Simply allowing stormwater to pass over a lawn could meet the standard, a practice that would not meet the intent or goals of preventing downstream pollution.

Even if implemented properly, biofiltration will not be completely effective. It is unacceptable to imply an equal substitution of biofiltration for onsite retention when the two processes do not produce equal results.

If onsite retention is truly infeasible, and biofiltration is appropriate, the project should be governed by the Waiver Program, which would require the project to implement a mitigation project and payment into an in-lieu funding program. See Section F.1.d.(7). As part of the Waiver Program, a project would be allowed to implement either biofiltration or treatment control BMPs with off-site mitigation. This still encourages developers to use a biofiltration system after retention as biofiltration is often much less expensive than conventional controls, but prevents the loophole of equating onsite retention and biofiltration.

Response

The Regional Board maintains that bio-filtration is part of a comprehensive LID program. Effective bio-filtration provides pollutant removal and energy dissipation. Biological removal of pollutants can even be an improvement over simply keeping pollutants on-site until rainfall over the design-storm criteria washes pollutants into receiving waters. Removal of pollutants and prevention of downstream hydromodification ensures any discharge to be low impact. The USEPA's Green Infrastructure website includes filtration as a Low Impact Development technique; <http://cfpub.epa.gov/npdes/greeninfrastructure/information.cfm#glossary>. In addition, the U.S. Department of Housing and Urban Development's report titled "The Practice of Low Impact Development," (July 2003, H-21314CA) incorporates filtration techniques. The County of San Diego's LID manual also utilizes bio-filtration as an acceptable LID practice.

In the future as the science and knowledge of storm water treatment evolves, filtration may not be a suitable LID practice to meet the maximum extent practicable standard. For this permit iteration, LID BMPs that capture the design storm for reuse, infiltration or evapotranspiration are preferred over bio-filtration techniques. The draft permit provides design-criteria for "LID bio-filtration BMPs" in section F.1.4.d.ii and requires demonstration that retention LID BMPs are technically infeasible prior to implementing bio-filtration BMPs. The requirements for LID have been written to provide the Copermittees consistency with the provisions of the Santa Ana Regional Board's North Orange County MS4 permit.

The Tentative Order includes a definition of biofiltration in Attachment C and has included design criteria in section F.1.d(4)(c)(ii).

Comment No.	372	Commenter No.	52	Comment Subject	SUSMP
Comment	<p>The Tentative Order currently allows large-scale watershed based projects to go straight to biofiltration without first proving technical infeasibility. See Revised Tentative Order No. R9-2009-0002 at F.1.c.(8). Section F.1.c.(8) states “Any volume that is not retained by the LID BMPs, up to the design capture volume, must be treated using LID biofiltration.” If “any volume” not retained by the LID BMPs can immediately be treated using biofiltration, without any proof of technical infeasibility, then a developer could avoid any retention efforts and simply use biofiltration.</p> <p>By contrast, Priority Developments “require LID BMPs or make a finding of infeasibility for each Priority Development Project in accordance with the LID waiver program in Section F.1.d.(8).”</p> <p>There is no justification for treating large-scale watershed based projects differently. Both Priority Developments and large-scale watershed based projects have the potential to cause a great deal of damage if the lack of treatment techniques allows run-off. Section F.1.d.(2)(e) includes Environmentally Sensitive Areas (“ESA”) under the definition of a Priority Development Project. Because of their proximity to ESAs, any discharge from these Priority Developments would be especially damaging to the environment. These projects are similar to the large-scale watershed based projects, which are defined as a development project greater than 100 acres in total project size or smaller than 100 acres in size yet part of a larger common plan of development over 100 acres, that has been prepared using watershed and/or sub-watershed based water quality, hydrologic, and fluvial geomorphic planning principles that implement regional LID BMPs. Because of their size, any discharge from these projects has the same high potential as Priority Developments to cause damage.</p> <p>Because large-scale watershed based projects are similar to Priority Developments in that there is an increased risk of damage from run-off, Section F.1.c.(8) should be changed to include a finding of infeasibility before biofiltration is permitted, identical to the language governing Priority Developments in Section F.1.d.(4)(a)(i).</p>				
Response	<p>The Regional Board thanks you for the comment. The language in the tentative Order has been revised accordingly. Please also see response to Comment No. 273.</p>				

Comment The City of Mission Viejo continues to express its concerns with the lack of permitting consistency with the North Orange County MS4 Permit (Order R8-2009-0030). We believe the lack of permitting consistency will lead to confusion by private developers, businesses, and residents over storm water regulatory requirements. Specifically, the land development standards for water quality protection should be uniform on a countywide basis to lend credibility to our efforts to manage urban runoff and to sustain the obvious cost effectiveness of a single and coordinated County-wide NPDES Program in Orange County. Therefore, we support the County's comments and suggested language improvements on the Tentative Order to ensure that it is uniform with the North Orange County MS4 Permit.

Response To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. Please also see response to Comment no. 259.

As stated in the response to Comment No. 24 in the July 1, 2009, Response to Comments IV, the Regional Board is sensitive to the Copermittee's concerns of consistency and has sought to write the draft Tentative Order to both protect Water Quality and to assist the County and those affected Cities to develop a single program. First and foremost, the draft Tentative Order is consistent with the Clean Water Act, Code of Federal Regulations and USEPA guidance. These federal regulations are the driving force behind the requirement for the MS4 permit and this reissuance. To reach consistency with the federal regulations, several changes are in the draft Tentative Order, namely, the removal of the term "urban runoff," prohibition of over-irrigation discharges, and the numeric effluent limitations for dry weather non-storm water discharges. In addition, the draft Tentative Order must comply with the anti-backsliding requirements found in 40 CFR 122.44(l): "[W]hen a permit is renewed or reissued, interim effluent limitations, standards or conditions must be at least as stringent as the final effluent limitations, standards, or conditions in the previous permit."

It is important to note the draft Tentative Order has to be consistent with the San Diego Regional Board's Basin Plan, TMDLs for the San Diego Region, and take into account 303(d) listed water bodies receiving discharges upon reissuance. The Basin Plan defines the unique water quality objectives and beneficial uses in Southern California that the draft Tentative Order is seeking to protect and restore. Southern Orange County has Warm and Cold habitat beneficial uses, whereas in Northern Orange County receiving waters have not been identified as having those same beneficial uses. Water quality standards may differ between regions, and NPDES permits are required to protect these standards.

The Regional Board also has to be concerned about consistency with other MS4 permits issued by the San Diego Regional Board. The Regional Board has three separate MS4 permits to write and enforce. To have a fair and consistent enforcement policy implemented by the Regional Board, the MS4 permits issued by the Regional Board need to be consistent. The difficulty for Regional Board staff to understand, review reports and adequately enforce inconsistent MS4 permits puts an unnecessary strain on the Regional Board's limited resources.

The criteria for consistency cannot be a hindrance to improvements in the science and regulation of water quality. Some might argue that to be truly consistent would be a return to the regulations and water quality observed in 1990 when the first NPDES permit was issued for MS4 discharges. USEPA guidance supports this progressive increase in regulation as water quality science and knowledge advances. For example, in its "Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits" (61 FR 43761), USEPA states, "In cases where adequate information exists to develop more specific conditions or limitations to meet water quality standards, these conditions or limitations are to be incorporated into storm water permits, as necessary and appropriate."

Even with these constraints on consistency, the draft Tentative Order is reasonable consistent with the Santa Ana Regional Board's North Orange County MS4 permit, especially in regard to the requirements for Low Impact Development at Priority Development Projects. While being consistent, this draft Tentative Order is also implementing the USEPA's policy on watershed permitting. At this point in time, adopting an identical permit to that in a separate watershed could be construed to be in violation of USEPA's stated policy on implementing NPDES permitting activities on a watershed basis.

Additionally, the commenter is concerned regarding confusion by private developers, businesses and residents regarding regulatory requirements. The Regional Board, in past response to comments, has acknowledged the Copermittees success in implementing educational BMPs regarding non-storm water and storm water regulations. It is expected the Copermittees will continue these successful efforts under the re-issued permit.

Comment No.	374	Commenter No.	53	Comment Subject	NEL
--------------------	-----	----------------------	----	------------------------	-----

Comment The City of Mission Viejo continues to object to the inclusion of Numeric Effluent Limits (NELs) in the Tentative Order, but appreciates the Board staffs attempt to make the previously proposed Municipal Action Levels (MALs) more palpable by offering the use of Storm Water Action Levels (SWALs). Our main argument to the imposition of NELs are:

- The insertion of NELs is inconsistent with the State Water Board's Blue Ribbon panel report on the feasibility of numeric effluent limits.
- The finding by the Regional Board staff that non-stormwater discharges are not subject to the maximum extent practicable standard and therefore subject to water quality based effluent limits is not supported by law. Clean Water Act section 402(P) (3) (B) (ii) clearly states that discharges from municipal storm sewers shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewer. We argue that the section does not require a full prohibition but rather an effective prohibition. The City agrees with the County in that the technology based standard for non-stormwater discharges is "effectively prohibit" just as "maximum extent practicable" is the technology based standard for stormwater discharges.
- The use of numeric limits for non-stormwater discharges is premature and bypasses the Bacteria I TMDL for San Diego Region Beaches and Creeks process. It is likely that some of our non-stormwater discharges will exceed the NEL but have no effect on the receiving water quality or beneficial uses. But under the proposed Order, the City may be obligated to expend considerable resources without a reciprocal water quality benefit. This is poor public policy and use of public funds.

Response Please see Regional Board Counsel Memorandum dated November 05, 2009.
Please also see responses to Comment nos. 317 and 391.

Comment No.	375	Commenter No.	53	Comment Subject	Overirrigation
--------------------	-----	----------------------	----	------------------------	----------------

Comment The prescribed prohibition on irrigation runoff also needs to be very carefully considered. The City believes this outright prohibition would erode general public support for the City's and County's Storm Water Program. We believe implementation of the prohibition would risk eroding general public support for a Program that is successfully fostering a stewardship ethic in residential environments. For example, cities may be faced with issuing citations to a homeowner for irrigation runoff; whereas, the neighbor next door is free to wash his car in his driveway under the current Tentative Order exemption for residential car washing. There is also concern that the provision would force the expenditure of scarce resources on an issue that is already being addressed by water districts dealing with water conservation imperatives. We ask that Section B, Non-Storm Water Discharges, be modified to include landscape irrigation, irrigation water, and lawn watering in Section B.2.

Response The comment regarding the prohibition on overirrigation practices was addressed in the previous response to comments. The comment does not raise any new issues from the previous comments.

Please see the discussion in the Fact Sheet for findings C.14 and C.15; and the July 1, 2009, Response to Comments IV, Response Nos. 28, 52, 76, and 159. Please also see comments Nos. 84, and 264 in this Response to Comments. No changes have been made in response to this comment.

In summary, over irrigation is a non-storm water discharge required by federal regulations to be prohibited where identified to be a source of pollutants. The Regional Board disagrees that removing the exemption for irrigation-related discharges from the non-storm water prohibition will erode the public from fostering and stewarding their residential environments. Several citizens at recent public meetings have voiced their support for this action. As public agencies, the Copermittees must be aware and address their public's concerns and the Copermittees are expected to use appropriate discretion through their education and enforcement mechanisms to alleviate those public concerns. As long as the Copermittees have a program in place to effectively prohibit over-irrigation runoff from entering the MS4, they are likely to be in compliance with this Tentative Order. Coordination with the water districts is an acceptable and preferred method of compliance.

Comment Page 73, Part F.4.f., of the Tentative Order states:

"Each Copermittee must implement management measures and procedures to prevent, respond to, contain and clean up all sewage and other spills that may discharge into its MS4 from any source (including private laterals and failing septic systems.) Copermittees must coordinate with spill response teams, must prevent entry of spills into the MS4 and contamination of surface water, ground water and soil. Each Copermittee must coordinate spill prevention, containment and response activities throughout all appropriate departments, programs and agencies so that maximum water quality protection is available at all times."

We continue to object to the inclusion of this provision. The revision of "implement management measures and procedures" being introduced by the Tentative Order to preface the required actions the cities must undertake still leaves the cities responsible for responding to sewage spills. We suggested other language in our May 15, 2009 comment letter that is more appropriate.

As we have previously stated, the City does not own or operate its own sewage system. All of the sewer systems in Mission Viejo are owned, operated, and maintained by water districts. These agencies have their own separate NPDES Permit. The City does not have the equipment or expertise to manage a sewage spill of any size, and its staff is not adequately trained to respond to potential spills. All of the water districts in Mission Viejo already respond to sewer spills (including sewer spills from private laterals). Furthermore, this provision is duplicative in the sense that the Regional Board is seeking to make the Permittees responsible for a task already delegated to the water districts. By making the City responsible for sewer spills, there is a high risk of creating confusion in determining who will respond to a spill (water district or City), who is responsible for the associated cost and reporting, etc.

The "implement management measures and procedures" phase does not negate the previous State Water Resources Control Board Order issuing a stay on this same issue in the prior generation of the NPDES Permit. After extensive hearings and briefing on the matter, the State Board issued Order WQO 2002-0014 on August 15, 2002, granting a stay as to this provision. In that Order, the State Board held:

"The record shows that three separate water districts operate these sewers within Mission Viejo, and are regulated by a sanitary sewer NPDES permit issued by the Regional Board. Mission Viejo alleged that the duplication of effort that would ensue by having Mission Viejo also be responsible for preventing and responding to sanitary sewage spills could lead to delayed responses as agencies try to determine jurisdiction and primary responsibility. Orange County's cost table for the upcoming year estimated total copermittee costs of \$56,512 to implement this requirement. While these costs, by themselves do not constitute substantial harm, we find that the duplicative nature of the costs, combined with potential response delay and confusion, do." (State Board Order WQO 2002-0014, p. 6.)

In deciding to grant a stay as to this provision, the State Board concluded:

"The regulation of sanitary sewer overflows by municipal storm water entities, while other public entities are already charged with that responsibility in separate NPDES permits, may result in significant confusion and unnecessary control activities. For example, the Permit appears to assign primary spill prevention and response coordination authority to the copermittees. While the federal regulations clearly assign some spill prevention and response duties to the copermittees, we find that the extent of these duties is a substantial question of law and fact." [State Board Order WQO 2002-0014, p. 8. (emphasis added.)]

Given the previous findings of the State Board on this same issue, and given that none of the factual reasons supporting this decision have changed, the Regional Board should remove this provision so as to reduce duplicity of effort and the implementation of unnecessary control activities.

We once again, as an alternative, offer that the Regional Board consider adopting language similar to that contained in State Board Order No. 2006-0003 titled: "Statewide General Waste Discharge Requirements for Sanitary Sewer Systems" ("Order"). This Order applies solely to municipalities and other public entities that own or operate sanitary sewer systems greater than one mile in length that collect and/or convey untreated or partially treated wastewater. Adopting this caveat would not only serve to accomplish the primary goals behind the provision, but would also ensure Statewide consistency among Water Board regulations.

Response The Regional Board fully understands that some Copermittees may not own, operate or manage sewer systems.

This comment has been addressed during the prior two response to comments, and the response is still applicable. The comments regarding sanitary sewer infiltration and spill response have been extensively considered in previous response to comments. Please see the July 6, 2007 Response to Comments I, Response Nos 44, & 50; the December 12, 2007, Response to Comments II No. 28; the July 1, 2009, Response to Comments IV, Response No. 130 & 180.

In summary, when the State Water Board stayed the sewage provision from Regional Board Order No. R9-2002-01, it found that the costs of the requirement did not constitute harm, but agreed that harm could ensue from potential response delay and confusion (Order WQO 2002-0014). Subsequently, the Copermittees and the local sewer agencies have developed mature relationships regarding sewage spill response. As a result, the concerns expressed by the State Water Board are no longer warranted. For instance, the Copermittees have developed and implemented procedures for spill response and sewage spill response. The Model Sewage Spill Response Procedure is outlined in the Copermittees' Proposed 2007 Drainage Area Management Plan (DAMP). According to the 2007 DAMP, regardless of where the spill originates, if the spill has entered or may enter the storm drain system, the Copermittees respond to assist with the cleanup and remediation of the area.

Section D.3.a.7 of the Tentative Order includes requirements for measures that must be taken to prevent sewage spills. Examples of measures being implemented by Copermittees include inspections of fats, oils, and grease management at restaurants. Other preventative measures can be implemented during routine planning efforts for new development and redevelopment projects. Similarly, building permit inspections should be used to verify the integrity of the sanitary and storm sewer infrastructure and ensure that cross-connections between the two are avoided.

Comment No.	377	Commenter No.	54	Comment Subject	General
Comment	<p>As stated in previous correspondence, the City is subject to the jurisdiction of both the San Diego and Santa Ana Regional Water Quality Control Boards. Significant differences in the large municipal stormwater permits issued by either jurisdiction causes the City to incur unnecessary administrative costs. Moreover, disparities between the Santa Ana and San Diego permits are likely to cause confusion among the public, and discourage public acceptance and participation in clean water efforts. During the July 1, 2009, workshop, the SDRWQCB expressed concern about this cost burden, and stated a desire to have the Draft Permit be consistent where possible. Nonetheless, the Draft Permit remains basically unchanged from the draft considered at the July 1 workshop.</p> <p>Consistency among stormwater permits implicates the larger issue of compliance with the MEP standard. It is not feasible for stormwater permits with significantly different requirements to be mandated by the same, federal standard. Such permits may be consistent with a baseline MEP standard, however major deviations from one another demonstrate that the baseline has been exceeded. While the SDRWQCB may have the authority to exceed the MEP standard under the appropriate circumstances, as described more fully below, this requires compliance with applicable state laws, including but not limited to the California Constitution's prohibition on unfunded state mandates.</p> <p>This concern was also raised by the SDRWQCB members during the July 1, 2009 workshop on the Draft Permit. At that time, the SDRWQCB directed Regional Board staff to prepare a chart comparing the Draft Permit to the North Orange County permit, and explaining why it is different. As of September 28, 2009, the deadline for submitting written comments on the Draft Permit, that document has not been made public. Moreover, the Draft Permit is not any more consistent with other the other Southern California stormwater permits than it was at the July 1, 2009 Workshop. The following table provides a comparison of key permit requirements, and whether they are included in other regional permits (North Orange County, Ventura County, and San Diego County Permits).</p> <p>The Draft Permit and the Fact Sheet do not address why these requirements are different. The distinctions are especially meaningful for the North Orange permit and San Diego County permit. These permits govern areas geographically similar to South Orange County, yet do not impose many of the stringent requirements included in the Draft Permit. The City therefore requests that the SDRWQCB revise the Draft Permit to make it consistent with the North Orange and San Diego County permits on these issues.</p>				
Response	<p>We agree that Regional Board members directed Regional Board staff to prepare a comparison of the Tentative Order to the North Orange County permit. However, the commenter implies that this direction was required to be completed and sent out for public comment. That is incorrect, as the Regional Board members requested the comparison be made for Board consideration.</p> <p>The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The comment does not raise any new issues from the previous comments. The State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates. The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3 in the February 13, 2008 Response to Comments III; all provide discussions of these issues.</p> <p>In regards to consistency between the San Diego and Santa Ana Regional Board, please see Comment no. 24 in the July 1, 2009, Response to Comments IV. Additionally, the commenter states that the Tentative Order is inconsistent with both the Santa Ana Order and San Diego County Order (R9-2007-001). The Regional Board contends that the Tentative Order builds upon the San Diego County Order, including the efforts and experiences by Regional Board staff and Copermittees under R9-2007-001. Please also see Comment no. 61 in the July 1, 2009, Response to Comments IV. Please also see response to Comment No. 373.</p>				

Comment

The Draft Permit will increase costs for the City. Attached as Exhibit B is a chart that was filed with the County of San Diego's Test Claim challenging the San Diego County Permit as an unfunded state mandate. That chart lists how much each permittee is expected to spend on permit-related programs alleged to be unfunded state mandates. Similar programs have the potential to cost the City millions of dollars. For instance, in San Diego County, development of a Hydromodification Management Plan cost the Permittees \$1.5 million over two years. Countywide, costs associated with each of the challenged programs were estimated at over \$66 million in new unfunded program costs. Similar costs are likely in South Orange County, and in fact could be higher as a result of the large number of new programs in the Draft Permit that were not included in the San Diego County permit.

The SDRWQCB may have the discretion to impose some of the programs in the Draft Permit. However, imposing requirements more stringent than that required by the Clean Water Act and its implementing regulations triggers applicable state law requirements. (See *City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613.) For waste discharge requirements that exceed the requirements of federal law, California law requires consideration of the following:

- (a) Past, present, and probable future beneficial uses of water.
- (b) Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto.
- (c) Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area.
- (d) Economic considerations .
- (e) The need for developing housing in the region.
- (f) The need to develop and use recycled water. (Cal. Water Code § 13241.)

Of the above listed factors, the economic considerations can be the most difficult to navigate. In *City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, the California Supreme Court held that where an NPDES Permit exceeds the requirements of federal law, the Regional Boards are required to consider the "economic" impacts on dischargers. The Supreme Court defined the economic impact as the "discharger's cost of compliance." (Id. at 618, 625.) To date, the SDRWQCB has maintained that the entire Draft Permit is federally mandated, and thus consideration of the factors listed in Water Code section 13241, including the economic impacts to the Permittees, is not required.

As a result, the SDRWQCB has failed to fully consider the economic costs associated with the Draft Permit. The Fact Sheet includes a cursory discussion of costs associated with Large MS4 permits in general, but it does not analyze the cost of compliance for dischargers under the Draft Permit. As stated above, compliance with the Draft Permit's new requirements will run into the millions of dollars. Before the SDRWQCB imposes this obligation on the City, it needs to consider the direct economic costs placed on the City and the other permittees. The purpose of Water Code section 13241 is to ensure that the public has an opportunity to have an honest, open discussion about the ramifications, costs, and benefits of those permit requirements that exceed federal law. Sidestepping these considerations not only violates Section 13241, but more importantly denies the public this opportunity.

Lastly, pursuant to Article XIII B, Section 6 of the California Constitution, any NPDES requirements that are not explicitly required by federal law must be funded by the state. (*County of Los Angeles v. Commission on State Mandates* (2007) 150 Cal.App.4th 898, 915-916.) Where, as here, a federal program provides discretion to the State agency to impose a local program on a municipality, such as a TMDL, the municipality is entitled to reimbursement from the state. (See *Hayes v. Commission on State Mandates* (1992) II Cal. App.4th 1564, 1570.) Numerous programs in the Draft Permit exceed the requirements of federal law and thus represent state mandates. Pursuant to Article XIII B, Section 6 of the California Constitution, the City is entitled to reimbursement for the cost of implementing these programs.

Response

The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The comment does not raise any new issues from the previous comments.

The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3; in the February 13, 2008 Response to Comments III; all provide discussions of these issues.

The Table in Exhibit B of the comment letter is highly questionable. The table includes basic performances tasks undertaken by any City regardless of when or if they have an NPDES permit. For example, costs are accounted for street sweeping and conveyance system cleaning. In addition, the table accounts for costs that are very specifically required by federal regulations such as watershed programs, effectiveness assessment, education, and MS4 cleaning. Finally, the table includes costs initiated by the Lead Permittee or requested by the Copermittees such as Working Body support and Regional management programs. The Tentative Order's hydromodification plan requirements are similar to the MS4 permit for San Diego County. Therefore, the Orange County Copermittees are expected to reduce costs in developing their hydromodification plan by building on the efforts of the San Diego County Copermittees.

In summary, the State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates.

Comment

The Draft Permit's Numeric Effluent Limit ("NEL") requirements are fundamentally flawed and should be removed. The numbers assigned to each NEL do not reflect existing conditions in the South Orange County watersheds, nor do they reflect the limits of current technology to locate, analyze, and treat discharges that are causing NEL exceedances. To further this point, a County assessment indicates that the NELs are not even achievable at reference sites unaffected by urban influences. Moreover, the rationale relied upon for imposing the NELs is based on a flawed interpretation of the Clean Water Act. The Draft Permit's findings related to the need to require NELS are therefore factually untrue and fail to bridge the analytical gap between the Draft Permit's requirements and conditions in the South Orange County region.

The Clean Water Act requires MS4 permits to effectively prohibit non-stormwater discharges into the MS4, and holds all discharges from the MS4 are subject to the maximum extent practicable (MEP) standard. (33 USC § 1342(p)(3)(B).) Clean Water Act section 402(p)(B) states:

Municipal discharge. Permits for discharges from municipal storm sewers-

(i) may be issued on a system- or jurisdiction-wide basis;

(ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and

(iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control

techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.

(33 USC § 1342(p)(3)(B) [emphasis added].)

Thus the Clean Water Act does not impose a separate standard on the discharge of nonstormwater from the MS4. The discharge of any pollutant from the MS4 is subject to the MEP standard. The Draft Permit ignores this plain language of the Clean Water Act. It differentiates between discharges of stormwater and non-stormwater from the MS4, and attempts to justify imposition of NELs on the grounds that the Clean Water Act imposes different compliance standards on discharges of each. As demonstrated by the plain language of the act, the Clean Water Act does not distinguish between stormwater and non-stormwater when regulating discharges from an MS4. (33 USC § 1342(p)(3)(B)(iii).) The MEP standard expressly applies to discharges of pollutants from the MS4.

Application of the MEP standard to discharges from the MS4 is important in the instant case because it speaks to the appropriateness of including NELs in the Draft Permit. Both the State Water Resources Control Board (SWRCB), and US EPA have stated on numerous occasions that an iterative, BMP-based process should be employed to implement MS4 permits. Indeed, the SWRCB explicitly recognized this in Order WQ 2001-15, when it directed the SDRWQCB to revise the 2001 San Diego County Permit to clarify that the MEP standard applies to discharges from the MS4.

The permit must be clarified so that the reference to the iterative process for achieving compliance applies not only to the receiving water limitation, but also to the discharge prohibitions that require compliance with water quality standards. The permit should also be revised so that it requires that MEP be achieved for discharges "from" the municipal sewer system.

(SWRCB Order WQ 2001-15, pages 9-10, 17.)

If the Draft Permit is going to require compliance with NELs in an MS4 permit, the SDRWQCB needs to directly address why those authorities mandating an iterative, BMP based approach to municipal stormwater are not applicable. Side stepping the issue by claiming that the approach is mandated by federal law denies the public an opportunity to have an honest, open discussion about the ramifications, costs, and benefits of imposing NELs on the Permittees.

In addition to the flawed rationale, the actual numeric limits established for the NELs are overly conservative, and in some cases essentially guarantee that the Permittees will violate the Draft Permit's NEL requirements. For instance, for discharges of certain criteria pollutants, "inland surface waters, enclosed bays, and estuaries have conservatively been allotted a mixing zone and dilution credit of zero. As such, any discharge of these priority pollutants is likely to impact the receiving water, regardless of the quantity or rate of discharge." (Fact Sheet, p 112.) As a result, the NEL for these discharge points has been set at the water quality objective for the receiving water. (Fact Sheet, p 113.) There is no basis for imposing this discharge standard on the City and the other Permittees. The SDRWQCB's action in imposing such a standard is arbitrary and not reflective of current technological limits.

Response Please see Regional Board Counsel Memorandum dated November 05, 2009.
Please see responses to Comment nos. 181 and 319.

Comment No.	380	Commenter No.	54	Comment Subject	NEL
-------------	-----	---------------	----	-----------------	-----

Comment The Draft Permit needs to be revised to include a clear, meaningful exclusion for discharges caused by natural sources or third parties over which the City has little or no control. In its present form, the Draft Permit does not provide a safe harbor for discharge violations caused by natural sources or third party entities. This is best demonstrated by the Draft Permit's NEL requirements. The Draft Permit will impose the following NEL requirements on the City:

Compliance with numeric limitations does not excuse compliance with the nonstormwater discharge prohibition in Section B.I. Compliance with NELs provides an assessment of the effectiveness of the prohibition of non-stormwater discharges and of the appropriateness of exempted non-stormwater discharges.

Compliance with Section C of this Order requires that an exceedance of an NEL must result in one of the following outcomes:

- a. Copermittees investigate the source of the exceedance and determine that it is natural (non-anthropogenically influenced) in origin and conveyance. The findings are to be conveyed to the Regional Board for review and acceptance.
- b. Copermittees investigate the source of the exceedance and determine that the source is an illicit discharge or connection. The Copermittees are to eliminate the discharge to their MS4 and report the findings, including any enforcement action(s) taken, to the Regional Board. Those seeking to continue such a discharge must become subject to a separate NPDES permit.
- c. Copermittees investigate the source of the exceedance and determine that the source is an exempted non-stormwater discharge. The Copermittees shall investigate the appropriateness of the discharge continuing to be exempt and report the findings to the Regional Board.

The Draft Permit's NEL requirements do not provide an exemption for exceedances caused by natural sources or discharges from third parties beyond the City's jurisdiction. As a result, pursuant to Water Code section 13385, the City could still be held liable for NEL violations even if it complied with all of the listed remedial measures, and even if the violation was caused by a natural source or a source beyond the City's authority to control.

Response Please see Comments nos. 44 and 159 in the July 1, 2009, Response to Comments IV.

It is important to note that the Tentative Order does not regulate discharges outside of the Copermittees jurisdiction. Once pollutants have entered the MS4, however, the Permittee is responsible for that discharge from their MS4. Please also see Finding D.4.c.

Please also see Comment no. 82 in the July 1, 2009, Response to Comments IV.

Comment No.	381	Commenter No.	54	Comment Subject	Urban Runoff
Comment	<p>As drafted, the Draft Permit does not limit the impact Section 13385's mandatory minimum penalty requirements. In fact, since the term "Urban" has been removed from the text the Draft Permit, the Draft Permit appears to attempt to hold the City directly responsible for discharges from natural sources, agricultural sources, and other third party entities over which the City has little to no control. Draft Permit Finding D.3. is emblematic of this problem:</p> <p>As operators of the MS4s, the Copermittees cannot passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or control.</p> <p>The City has no authority to refuse to accept discharges from other jurisdictions or entities. California law applies a "rule of reason" to flood control issues that requires cities to accept surface water flows from neighboring property owners. (Locklin v. City of Lafayette (1994) 7 CalAth 327, 349.) Thus the City cannot refuse to accept drainage from adjacent jurisdictions. The City likewise lacks authority over the conduct of state and local agencies within its jurisdiction. These entities are exempt from many conditions in the Draft Permit. (See Cal. Gov. Code § 53091; see also Hall v. Taft (1956) 47 Cal.2d 177 [holding that when the State engages in sovereign activities it is not subject to local regulations unless the California Constitution says it is, or the legislature has consented to it].)</p> <p>The Draft Permit's attempt to hold the City responsible for such discharges is especially frustrating given that many of the entities implicated by this requirement are required to obtain their own NPDES permits, and thus should be regulated directly by the SDRWQCB. The SDRWQCB's failure to regulate discharges from these entities should not be imputed to the City. The SDRWQCB's attempt to regulate such entities through the Draft Permit is therefore arbitrary, capricious, and without justification.</p>				
Response	<p>These issues have been fully considered previously.</p> <p>The Regional Board has removed the term "urban runoff" as it is more consistent with the federal regulation (40 CFR 122.26). Response to Comment No. 47 in the July 1, 2009, Response to Comments IV, provides discussion of this issue. No changes have been made in response to this comment.</p> <p>The Regional Board has followed federal guidance regarding third party discharges into the Copermittees' MS4s. Responses No. 2 and No. 7 in the July 7, 2007, Response to Comments I, provide discussions of these issues. No changes have been made in response to this comment.</p>				

Comment No.	382	Commenter No.	54	Comment Subject	SAL
Comment	<p>The Draft Permit's Stormwater Action Levels ("SALs") are unnecessary, exceed the requirements of federal law, and should be removed. The Draft Permit's SAL provisions represent a major increase in monitoring and reporting requirements for the City. Compliance with the SAL requirements will significantly increase the City's monitoring costs without a defined benefit to water quality. The Clean Water Act and its implementing regulations do not require the SDRWQCB to impose SALs in large MS4 permits, and the SDRWQCB has not demonstrated that SALs are necessary at this time. For that reason, the City requests that the SDRWQCB remove the SALs from the Draft Permit.</p>				
Response	<p>In regards to monitoring, the Tentative Order has provided the Copermittees flexibility in determining the level of monitoring under the SALs.</p> <p>Please see response to Comment no. 33 in the July 1, 2009, Response to Comments IV.</p>				

Comment No.	383	Commenter No.	54	Comment Subject	Overirrigation
Comment	<p>The Draft Permit has eliminated irrigation water as an exempt discharge. The federal stormwater regulations include a list of categories of "exempt" non-stormwater discharges or flows. (40 CFR 122.26(d)(2)(iv)(B)(1).) The City must address these discharges or flows when they have been identified by the City as sources of pollutants to waters of the U.S. (Id.) Where individual sources of discharge are identified they are to be addressed on an individual basis.</p> <p>Irrigation runoff may act as a conveyance of pollutants in some instances, however, it is not a conveyance of pollutants in all cases. Additionally, many of the pollutants that may be conveyed by irrigation overflows are naturally occurring, are regulated by the State under different permits or programs, or are diffuse and uncontrollable by the Permittees. Enforcing discharges of potable irrigation water from residential homes will therefore be very difficult. Residents without a significant water quality background are unlikely to agree that potable irrigation water is a pollutant. This will discourage public acceptance and participation in the water quality program, a program whose foundation is outreach and public education.</p> <p>It is also important to recognize that over irrigation is being addressed as a water conservation issue. The City, the other Permittees, and water districts throughout the region are working toward limiting excessive irrigation (and irrigation runoff) through numerous water conservation programs and ordinances. Reduction of irrigation runoff will therefore be achieved through other means, and does not need to be regulated in the Draft Permit. Regulation as a water conservation issue has the added benefit of public acceptance and participation in conservation programs. This will allow irrigation overflows to be regulated without undermining public support for the City's water quality program. The City therefore requests that the exemption for landscape irrigation be restored.</p>				

Response	<p>The comment regarding the prohibition on overirrigation practices was addressed in the previous response to comments. The comment does not raise any new issues from the previous comments.</p> <p>Please see the discussion in the Fact Sheet for findings C.14 and C.15; and the July 1, 2009, Response to Comments IV, Response Nos. 28, 52, 76, and 159. Please also see comments Nos. 84, and 264 in this Response to Comments. No changes have been made in response to this comment.</p> <p>In summary, over irrigation is a non-storm water discharge required by federal regulations to be prohibited where identified to be a source of pollutants. As long as the Copermittees have a program in place to effectively prohibit over-irrigation runoff from entering the MS4, they are likely to be in compliance with this Tentative Order. Coordination with the water districts is an acceptable and preferred method of compliance.</p>
-----------------	--

Comment No.	384	Commenter No.	54	Comment Subject	LID
Comment	<p>The City appreciates the SDRWQCB's efforts to revise the Draft Permit's Low Impact Development requirements to make them more similar to those in the North Orange County Permit. However, the City objects to the mitigation and fee requirements that the Draft Permit will impose on projects that cannot retain and treat stormwater on site. The Draft Permit has a stated preference for LID BMPs that treat stormwater on site. It is possible to require these development techniques where feasible, however such BMPs will not be feasible for all projects. There is no rationale basis for requiring these projects to pay a penalty when they can deploy other traditional BMPs that will treat stormwater to levels that are equivalent or better than the LID and retention requirements currently espoused by the Draft Permit. For that reason, the City requests that the Draft Permit be revised to remove this penalty.</p>				
Response	<p>The Clean Water Act requires that pollutants in storm water discharges are reduced to the maximum extent practicable (MEP). Current runoff management, knowledge, practices and technology consider the use of LID BMPs as meeting the storm water MEP standard. Therefore, the storm water treatment controls must also be designed to meet this same level of pollutant reduction to be considered MEP.</p> <p>The Regional Board realizes the difficulty in design and implementation of treatment controls to be able to reduce pollutants to the same standard as LID retention BMPs. Therefore, the Tentative Order allows project proponents to design conventional treatment controls at least up to the design storm as long as mitigation or in-lieu fees, which compensate for the pollutant load that would otherwise be retained by LID BMPs, are also implemented. A project proponent may choose to design their treatment controls to treat storm flows greater than the design storm that, in effect, would provide an equal pollutant removal as LID retention BMPs. In that case, mitigation would not be needed.</p>				

Comment No.	385	Commenter No.	54	Comment Subject	Retrofitting
--------------------	-----	----------------------	----	------------------------	--------------

Comment Section F.3.d of the Draft Permit will require the City to develop a plan to retrofit existing development within its jurisdiction. The City has land use authority to impose requirements on new development as a condition of development, but lacks comparable authority to require property owners to retrofit existing development. The Draft Permit ignores this lack of authority and includes requirements to identify, inventory and prioritize existing developments that are potential sources of pollutants. (Draft Permit, section F.3.d(1)-(6).

The Draft Permit will require the City to identify existing development candidates, evaluate and rank the candidate sites to prioritize them for retrofitting, cooperate with landowners of priority sites and encourage them to retrofit their properties, and track and inspect all sites that do complete retrofitting. This will require the City to invest a significant amount of time and resources developing and implementing this program. The City's lack of authority to impose retrofit requirements on existing development means there will be no corresponding benefit to water quality. For that reason, the Draft Permit's retrofit requirements should be removed.

Response The comment regarding retrofitting has been considered in the previous response to comments. Please see the Fact Sheet discussion on retrofitting; and the July 1, 2009, Response to Comments IV, Response Nos. 46, 136, 161, and 162.

In summary, the Tentative Order's requirements for retrofitting existing development is practicable for a municipality through a systematic evaluation, prioritization and implementation plan focused on impaired water bodies, pollutants of concern, areas of downstream hydromodification, feasibility and effective communication and cooperation with private property owners. The Tentative Order's requirement realized the legal limitations that the Copermittees have in requiring retrofitting on privately held land. Therefore, the Tentative Order requires the Copermittees to cooperate with private landowners in implementing retrofitting opportunities.

Comment No.	386	Commenter No.	54	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment Section J.4 of the Draft Permit will require the City to develop a Work Plan to address high priority water quality programs in an iterative manner. This requirement is duplicative, of other existing programs and is wholly unnecessary. At least four other planning level documents cover these issues. The City uses the Drainage Area Management Plan as the principal policy and guidance document; each jurisdiction also has a related Local Implementation Plan; the South Orange County area uses an Integrated Regional Water Management Plan; the watersheds are assessed and managed with a Watershed Action Plan; and the Aliso Creek Watershed has its own Watershed Runoff Management Plan. There is no reason to add yet another bureaucratic layer to the Draft Permit. This requirement will only increase costs without providing a corresponding benefit to water quality.

Response The Drainage Area Management Plan is not jurisdiction specific; nor is it a requirement of the Tentative Order; and it is not an enforceable document. The Integrated Regional Water Management Plan is also not a requirement of the Tentative Order. The Jurisdictional work plan closes the loop on implementation, monitoring, and effectiveness assessment. The work plan is the strategy by which the effectiveness assessment is used to prioritize the implementation of the Copermittee's storm water program. The work plan requirement in the JRMP section has been added to ensure Copermittees are allocating resources and efforts to address priority problems and pollutants identified in the watershed analysis. This section has been added to ensure Copermittees use the annual assessment to adjust and tailor their JRMP programs. The work plan is specifically designed for the Copermittees to prioritize their limited resources on water quality problems and on efforts that improve water quality. By planning and adapting, the Copermittees will be able to use their resources more effectively and not waste time and effort on actions that do not improve water quality. Other plans that meet the requirements of the Jurisdictional Work plan may be used to demonstrate compliance with this directive.

Comment No.	387	Commenter No.	55	Comment Subject	NEL
--------------------	-----	----------------------	----	------------------------	-----

Comment Water quality improvement has been the top priority strategic goal for the City of Dana Point this during past Permit Cycle. Dana Point and our fellow South Orange County Cities have been making great strides in Water Quality Improvement some of which we expressed in our Power Point presentation on July 1st. The San Diego Region's Draft 2008 303(d) listing proposal, released this August, proposes to delist or not list 28 of 42 locations covering the entire South Orange County coastline for the cities of Laguna Beach, Dana Point, and San Clemente. This is proof of our ongoing success in reducing current listings and using the iterative BMP approach for MEP, and non point sources without fines for compliance.

Yet as we turn our attention to better addressing dry weather flows in this new Permit Cycle, Staff has developed a new approach; mandatory minimum fines for Numeric Effluent Limits (NEL's). No other California NPDES Regional Permit has this regulatory bludgeon. There are multiple problems with this approach, seven of which we discuss below.

Response While the Regional Board acknowledges that certain 303(d) listed waters are proposed to be delisted, the Draft 305(b) and 303(d) Report shows that existing controls on discharges from the MS4 remain inadequate to protect water quality standards. For the San Juan hydrologic unit the 2006 303(d) list includes 17 waterbodies and 25 pollutant waterbody combinations. For 2008, the Draft 303(d) Report includes 33 waterbodies and 75 waterbody pollutant combinations.

Please see Regional Board Counsel Memorandum dated November 05, 2009.

Please also see Comment no. 82 in the July 1, 2009, Response to Comments IV.

Please also note that other State and Regional Board NPDES Regional Permits do contain narrative and/or numeric effluent limitations.

Comment No.	388	Commenter No.	55	Comment Subject	NEL
--------------------	-----	----------------------	----	------------------------	-----

Comment First, the Board has no flexibility in making reasonable decisions with this NEL proposal. Witness the July 1, 2009, Board Meeting when the Board's hands were tied, according to Staff, in fining SOCW A and SCWD \$204,000 for what we believe the board recognized was a permit language violation, not a water quality violation at the ocean discharge point.

Response Please see Comment no. 82 in the July 1, 2009, Response to Comments IV.

Comment No.	389	Commenter No.	55	Comment Subject	unfunded mandate
--------------------	-----	----------------------	----	------------------------	------------------

Comment Second, inclusion of NEL's is the top priority concern with the draft permit for the County and the Co-Permittees. It really makes the Permit untenable and invites litigation. Similar concerns exist with the inclusion of language indicating that Permittees must strictly comply with waste load allocations in a TMDL, and strictly meet Stormwater Action Levels. Strict compliance with any of these numeric limits is not "reasonably achievable" as required by the California Water Code. Nor has there been any attempt to analyze the "economic" impacts of these requirements, as required under the Water Code. Please see our attached legal comments, responding to the discussion at the July I Board.

Response Non-storm water discharges are not storm water and must be effectively prohibited. As such, they are not subject to the MEP standard. They are appropriately regulated under CWA section 402, which allows the imposition of NELs. The Copermittees have ample time and method discretion to meet the Wasteload Allocation Reductions, Final Allocations and Numeric Targets. These allocations and targets are chosen because they are designed to protect Water Quality Standards, which is the goal of a TMDL. Please note that Storm water Action Levels are not numeric effluent limitations, and are a part of the iterative process.

The comment regarding the Regional Board's compliance with California Water Code §13263, 13241, and 13000 and the consideration of balancing factors has been extensively considered in previous response to comments. Please see the Fact Sheet; July 6, 2007, Response To Comments I, Response No. 5; December 12, 2007, Response To Comments II, Response Nos. 1 and 9; February 13, 2008, Response to Comments, Response No 3.

To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. No changes have been made in response to this comment.

Comment No.	390	Commenter No.	55	Comment Subject	NEL
Comment	Third, the potential costs of mandatory minimum fines, and their impacts could be astronomical. The State Board is contemplating a standard non-compliance fine of \$2 per gallon per day for violations. As an example, Salt Creek dry weather flow is 300,000 to 600,000 gallons per day. This is just one medium sized outflow and fines could exceed one million-dollars a day. Per the proposed NEL criteria, we believe that Salt Creek will be in exceedance of NEL's from Day 1 of the new Permit for the Total Nitrogen standard. Nitrogen is abundantly found in the natural environment from air and decaying vegetation. Staff says that proof of natural occurrence will be accepted by RWQCB Staff as compliance. But what constitutes proof? How much study and cost justification will be acceptable? Will a Standard of Proof be litigated by a third party and will unfair fines be imposed by mandate?				
Response	Non-storm water numeric effluent limitation exceedance investigations will be handled on a case-by-case basis. Please see Comment no. 82 in the July 1, 2009, Response to Comments IV regarding MMPs.				

Comment No.	391	Commenter No.	55	Comment Subject	NEL
Comment	Fourth, the NEL standards proposed by Staff are unattainable in some cases, even in naturally occurring and pristine creeks, indicator bacteria is an example. Indicator bacteria has been studied by expert scientists at SCCWRP and has been found to be at levels which may exceed the NEL s in reference watersheds - the watersheds that represent the untouched/undeveloped areas of the County. Why is bacteria included as an NEL when we already have TMDL's for bacteria that the Board has approved? The TMDL recognizes this complex non-point source will probably take 10 years to control in huge watersheds like San Juan Creek which drains a 13.5 square mile area, yet the NEL requires compliance as soon as the permit is in effect.				
Response	Please see response to comment no. 317. Please also see Comment no. 83 in the July 1, 2009, Response to Comments IV. 303(d) listing of a receiving water as impaired is done because the existing controls on discharges to that waterbody has been found to be insufficient to protect Beneficial Uses. The 303(d) listing or subsequent TMDL does not prevent additional controls, including water quality-based effluent limitations, being implemented in NPDES permits.				

Comment No.	392	Commenter No.	55	Comment Subject	NEL
Comment	Fifth, dry weather flow is more characteristic of non-point source than point source flow. Every single property has the potential to over-irrigate and the source varies each day of the week. MS4 36" diameter pipes requiring monitoring each drain hundreds, and in many cases, more than 1000 properties each. The MEP standard for stormwater, which includes non rain water runoff, recognizes the practical unreasonableness of tracking down and treating every storm drain back to every watershed source to eliminate every pollutant immediately.				
Response	Please see Regional Board Counsel Memorandum dated November 05, 2009.				

Comment No.	393	Commenter No.	55	Comment Subject	NEL
Comment	Sixth, the detailed Permit language is flawed - for example in determining if the dry water flow is natural (non-anthropogenic), it requires permittees must determine it is from a natural influence in both "origin and conveyance". Since the MS4 is generally manmade pipe (the conveyance) this is generally an impossible standard to meet on its face.				
Response	The Regional Board contends that MS4 may receive natural flows which, upon entry into the MS4, are modified within the MS4 system. This includes, but is not limited to, the concentration of pollutants, addition of anthropogenic non-storm water discharges, and modified location of discharge. Please also see response to Comment no. 394.				

Comment No.	394	Commenter No.	55	Comment Subject	NEL
Comment	Seventh, Coastal bluff groundwater contributes heavily to South Orange County dry weather runoff. A confounding problem is that much of our dry weather flow is made up of groundwater. Our groundwater is known for having constituents such as Iron, Manganese, Nitrates, etc. Although the Permit language purports to "accept" natural constituents, again what is the standard of proof? This can be particularly difficult and costly to study and may be unable to yield completely definitive answers - again leading to potential third party litigation and potential fines.				
Response	Please see Comment no. 82 in the July 1, 2009, Response to Comments IV. Section C.3 of the Order includes language which states the Tentative Order does not regulate natural sources and conveyances of constituents. Though source investigation can be difficult, it is already required under the current Order. The Regional Board will handle each investigation and subsequent finding(s) on a case-by-case basis.				

Comment No.	395	Commenter No.	55	Comment Subject	NEL
Comment	<p>In summary, regarding NEL's, we currently we have a successful program that meets the intent of the NEL's. Orange County's dry weather monitoring program to identify and then address controllable pollutants is well recognized for the investigative information it provides, and Permittees are required to address pollutant discoveries. Please further consider the County's proposed program as an effective alternative to the NEL's. Let's explore and evaluate reasonable standards, natural sources and positive effects of reducing irrigation runoff during this cycle together.</p> <p>We are three months into the Fiscal Year and looking at how we can trim another 5% off of our operating budget due to declining revenues. The magnitude of the added costs for this Permit are addressed in the County's letter and are of significant concern. Please heed the facts stated therein as no economic analysis has been prepared or considered by Board Staff to date, in spite of the requirement under California Law to do so. Further, no cost consideration based changes have been made since the July 1 Board Meeting, despite Board Member inquiries, as well as the Board's expressed concern with imposing unfunded mandates on the Permittees.</p> <p>Please reconsider the issues of consistent regulations with the North Orange County Santa Ana Region Permit as no consistency related changes to the tentative draft have been made since the July 1 Board Meeting, despite Board inquiries.</p>				
Response	<p>Please see Regional Board Counsel Memorandum dated November 05, 2009.</p> <p>The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The comment does not raise any new issues from the previous comments. The State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates.</p> <p>The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3 in the February 13, 2008 Response to Comments III; all provide discussions of these issues. No changes were made in response to this comment.</p>				

Comment No.	396	Commenter No.	55	Comment Subject	unfunded mandate
Comment	As you can see from the attached legal comments, as well as the comments submitted by the County of Orange, there continues to be fundamental disagreement on the propriety of including NEL's, SALs and TMDLs in the Permit, particularly without the Regional Board first complying with the requirements of California Water Code sections 13241 and 13000. Further, there continues to be a significant difference of opinion on the legality of the Regional Board Staff's new permit requirement which would force the City to prohibit all "dry weather" runoff, specifically including "landscape irrigation," "irrigation waters," and "lawn waters," from entering the City storm drain system. Not only does the City believe that this requirement goes far beyond what is required by federal law, as evidenced by the fact that these discharges are allowed to be discharged into the storm drain system under the current permit, but in addition, it is apparent that the Regional Board Staff is attempting to impose this mandate on the City without first complying with the requirements of California Water Code sections 13241 and 13000.				
Response	<p>The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The comment does not raise any new issues from the previous comments.</p> <p>The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3; in the February 13, 2008 Response to Comments III; all provide discussions of these issues.</p> <p>In summary, the State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates. No changes have been made in response to this comment.</p> <p>The comment regarding the Regional Board's compliance with California Water Code §13263, 13241, and 13000 and the consideration of balancing factors has been extensively considered in previous response to comments.</p> <p>Please see the Fact Sheet; July 6, 2007, Response To Comments I, Response No. 5; December 12, 2007, Response To Comments II, Response Nos. 1 and 9; February 13, 2008, Response to Comments, Response No 3.</p> <p>To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. No changes have been made in response to this comment.</p>				

Comment No.	397	Commenter No.	55	Comment Subject	unfunded mandate
Comment	Finally, because the imposition of NEL's, SALs, and WLAs from TMDLs are all new mandated limits that are not required under federal law, and similarly because a prohibition on dry weather and irrigation waters from entering the MS4 is a new mandate not required by federal law, as are the new LID and retrofitting and related requirements, none of these requirements may lawfully be imposed without the Regional Board first providing funding as required under the California Constitution for such mandates. For example, the retrofitting provisions in the Permit specifically require the City to "develop and implement a retrofitting program." This is a new program being mandated on the City, but without the State first providing funding as required by the California Constitution.				
Response	<p>The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The comment does not raise any new issues from the previous comments.</p> <p>The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3; in the February 13, 2008 Response to Comments III; all provide discussions of these issues.</p> <p>In summary, the State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates. No changes have been made in response to this comment.</p>				

Comment

THE MEP STANDARD UNDER THE CLEAN WATER ACT APPLIES TO ALL "DISCHARGES OF POLLUTANTS" FROM THE MS4, REGARDLESS OF WHETHER THE POLLUTANTS IN THE DISCHARGE ARISE FROM "STORM" WATER" OR ALLEGED "NON-STORMWATER."

The federal Clean Water Act ("CWA" or "Act") expressly applies the Maximum Extent Practicable ("MEP") Standard to all "pollutants" discharged "from" the Municipal Separate Storm Sewer System ("MS4"), whether the discharges are classified as "non-stormwater" or "stormwater." Although "non-stormwater" is required to be "effectively prohibited" from entering "into" the MS4, the CWA does not treat discharges "from" the MS4 any differently if the "pollutants" in issue arose as a result of a "stormwater" versus an alleged "non-stormwater" discharge. (33 U.S.C. § 1342(p)(3)(B)(iii).)

As such, if "dry weather" is improperly classified as "non-stormwater," such a classification should not in any way change how the "pollutants" in the discharge are to be addressed. Instead, under the CWA, regardless of the nature of the discharge, i.e., be it "stormwater" or alleged "non-stormwater," the MEP standard continues to apply. Moreover, the MEP Standard is the only standard required under the CWA to be applied to discharges from a City's MS4, and no numeric limits are required by the Act, regardless of whether the original sources of the discharge is non-stormwater.

The language in the Act requires municipalities to "require controls to reduce the discharge of pollutants to the maximum extent practicable." (Id.) The Act then applies the MEP Standard to the "discharge of pollutants" from the MS4, not to the discharge of "stormwater" or "non-stormwater" from the MS4. As such, the State Board's attempted classification of "dry weather" as "non-stormwater," for example, has no relevance to the issue of the types of "controls" required under the Act to address the "pollutants" in issue.

Section 1342(p)(3)(B) of the Act entitled "Municipal Discharge" provides, in its entirety, as follows:

Permits for discharges from municipal storm sewers -

- (i) may be issued on a system- or jurisdictional- wide basis;
- (ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and
- (iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. (33 U.S.C. § 1342(p)(3)(B), emphasis added.)

This language in the CWA has consistently been interpreted as requiring an application of the MEP Standard to municipal discharges, rather than an application of a standard requiring strict compliance with numeric limits. Specifically, federal law only requires strict compliance with numeric effluent limits by industrial dischargers, but not by municipal dischargers. As the Ninth Circuit in *Defenders of Wildlife v. Brown* ("Defenders") (9th Cir. 1999) 191 F.3d 1159 found, "Congress required municipal storm-sewer dischargers 'to reduce the discharge of pollutants to the maximum extent practicable' finding that the Clean Water Act was 'not merely silent' regarding requiring 'municipal' dischargers to strictly comply with numeric limits, but in fact found that the requirement for traditional industrial waste dischargers to strictly comply with the limits was 'replaced' with an alternative requirement, i.e., 'that municipal storm-sewer dischargers 'reduce the discharge of pollutants to the maximum extent practicable ... in such circumstances, the statute unambiguously demonstrates that Congress did not require municipal storm-sewer discharges to comply strictly with 33 U.S.c. § 1311(b)(J)(C). (Id. At 1165; emphasis added.)

Similarly, in *Building Industry Association of San Diego County v. State Water Resources Control Board* ("BIA") (2004) 124 Cal.App.4th 866, there as well the Appellate Court, relying upon the Ninth Circuit's holding in *Defenders*, agreed that "with respect to municipal stormwater discharges, Congress clarified that the EPA has the authority to fashion NPDES permit requirements to meet water quality standards without specific numeric effluent limits and instead to impose 'controls to reduce the discharge of pollutants to the maximum extent practicable.'" (Id. at 874, emphasis added.) The Court of Appeal in the BIA Case explained the reasoning for Congress' different treatment of Stormwater dischargers versus industrial waste dischargers when it stated that:

Congress added the NPDES storm sewer requirements to strengthen the Clean Water Act and making its mandate correspond to the practical realities of municipal storm sewer regulation. As numerous commentators pointed out, although Congress was reacting to the physical differences between municipal storm water runoff and other pollutant discharges that made the 1972 legislation's blanket effluent limitations approach impractical and administratively burdensome, the primary points of the legislation was to address these administrative problems while giving the administrative bodies the tools to meet the fundamental goals of the Clean Water Act in the context

of stormwater pollution. (Id. at 884, emphasis added.)

The Draft Permit, by attempting to impose a series of numeric effluent limits on municipal dischargers, goes beyond what was required by Congress with the 1987 Amendments to the CW A, and treats municipal dischargers in precisely the same manner as industrial waste dischargers. Because the Draft Permit imposes a standard of strict compliance with numeric limits on municipalities, it goes beyond the requirements mandated by the CW A, and as such, plainly triggers the need to comply with Water Code sections 13000 and 13241. Moreover, and as also discussed below, such a significant shift in policy is directly contrary to well-established State Board and US EPA policy.

In State Board Order No. 91-04, the State Board addressed the propriety of the 1990 Municipal NPDES Permit for Los Angeles County, and particularly whether such permit, in order to be consistent with applicable State and federal law, was required to have included "numeric effluent limitations." In addition to the State Board's interchangeable use of the terms "storm water" and "urban runoff" when discussing the applicable standard to be applied under the CW A (see discussion below), the State Board confirmed that the MEP standard applies to the "discharge of pollutants" from the MS4, and made no mention of the need to apply a different standard if the "discharge of pollutants" arose from alleged "non-stormwater" rather than "storm water." To the contrary, the State Board recognized the MEP standard applied to "pollutants in runoff," irrespective of the source of the pollutants, finding as follows:

We find here also that the approach of the Regional Board, requiring the dischargers to implement a program of best management practices which will reduce pollutants in runoff, prohibiting non-storm water discharges, is appropriate and proper. We base our conclusion on the difficulty of establishing numeric effluent limitations which have a rational basis, the lack of technology available to treat storm water discharges at the end of the pipe, the huge expense such treatment would entail, and the level of pollutant reduction which we anticipate from the Regional Board's regulatory program. (State Board Order No. 91-04, p. 16-17, emph. added.)

This State Board Order, and others as discussed below, all show that although there are two requirements imposed upon municipalities under the CW A, one requiring that municipalities effectively prohibit "non-stormwater" "into" the MS4, and a second requiring municipalities to "reduce the discharge of pollutants to the maximum extent practicable," that the MEP standard applies to "pollutants in runoff" coming out of the MS4 system, regardless of whether such discharges are storm water or non-stormwater. The only difference in the requirements to be imposed upon the municipalities between stormwater and non-stormwater, involves the need for municipalities to "effectively prohibit non-stormwater discharges into the" MS4.

In addition, it is the present policy of the State of California not to use strict numeric limits as a means by which to implement the MEP standard under the Act. Instead, it is State policy to apply the MEP standard through an iterative BMP process, and not through the use of strict numeric discharge limitations. This policy is reflected in numerous State Board orders and other legal documentation from the State Board. (See, e.g., State Board Order No. 91-04, p. 14 ["There are no numeric objectives or numeric effluent limits required at this time, either in the Basin Plan or any statewide plan that apply to storm water discharges." p. 14]; State Board Order No. 96-13, p. 6 ["federal laws does not require the [San Francisco Reg. Bd] to dictate the specific controls."]; State Board Order No. 98-01, p. 12 ["Stormwater permits must achieve compliance with water quality standards, but they may do so by requiring implementation of BMPs in lieu of numeric water quality-based effluent limitations."]; State Board Order No. 2001-11, p. 3 ["In prior Orders this Board has explained the need for the municipal storm water programs and the emphasis on BMPs in lieu of numeric effluent limitations. '1; State Board Order No. 2001-15, p. 8 ["While we continue to address water quality standards in municipal storm water permits, we also continue to believe that the iterative approach, which focuses on timely improvements of BMPs, is appropriate. ']; State Board Order No. 2006-12, p. 17 ["Federal regulations do not require numeric effluent limitations for discharges of stormwater"]; Stormwater Quality Panel Recommendations to The California State Water Resources Control Board - The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm water Associated with Municipal, Industrial and Construction Activities, June 19, 2006, p.8 ["It is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban dischargers."]; and an April 18, 2008 letter from the State Board's Chief Counsel to the Commission on State Mandates, p. 6 ["Most NPDES Permits are largely comprised of numeric limitations for pollutants . . . Storm water permits, on the other hand, usually require dischargers to implement BMPs."].)

Moreover, as to TMDLs, the WLAs within a TMDL are similarly not required under the CW A to be strictly complied with by municipal dischargers. This conclusion was confirmed by U.S. EPA itself in an official November 22, 2002 EPA Guidance Memorandum, entitled "Establishing Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs) for Storm Water Sources and NPDES Permit Requirements Based on those WLAs." In this official Guidance Memorandum, EPA explained that for NPDES Permits regulating municipal storm water discharges, any water quality based effluent limit for such discharges, should be "in the form of BMPs and that numeric limits will be

used only in rare instances." (EPA Guidance Memo p. 6, emphasis added.) The EPA recommended that "for NPDES-regulated municipal... dischargers effluent limits should be expressed as best management practices (BMPs), rather than as numeric effluent limits." (Id. at p. 4.) EPA went on to expressly recognize the difficulties in regulating stormwater discharges, explaining its policy as follows:

EPA's policy recognizes that because storm water discharges are due to storm events that are highly variable in frequency and duration and are not easily characterized, only in rare cases will it be feasible or appropriate to establish numeric limits for municipal and small construction storm water discharges. The variability in the system and minimal data generally available make it difficult to determine with precision or certainty actual and projected loadings for individual dischargers or groups of dischargers. Therefore, EPA believes that in these situations, permit limits typically can be expressed as BMPs, and that numeric limits will be used only in rare instances. (EPA Guidance Memo, p. 4.)

Because EPA has expressly found, particularly when it comes to the incorporation of a TMDL into a Municipal NPDES Permit, "that numeric limits will be used only in rare instances," and because in this case there is no evidence this Permit is a "rare instance" that would justify the inclusion of numeric limits, any incorporation of the subject TMDLs, or any other numeric limits, into the Municipal NPDES Permit in issue should be limited to the inclusion of MEP-complaint BMPs, and not "numeric limits." In short, neither State or federal law, nor State or federal policy, provide for the incorporation of strict numeric limits into a Municipal NPDES Permit. In fact, they provide for the contrary, and recognize that numeric limits should only be incorporated into a municipal NPDES Permit in "rare instances," with the State Board's Numeric Effluent Limits Panel concluding going so far as to conclude that "it is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban dischargers." (Numeric Limits Permit Report, p. 8.)

Response The Regional Board disagrees with the commenter's interpretation of the Clean Water Act. Please see Regional Board Counsel Memorandum dated November 05, 2009.

Comment No.	399	Commenter No.	55	Comment Subject	Legal
-------------	-----	---------------	----	-----------------	-------

Comment The Draft Permit contains a number of provisions requiring strict compliance with Numeric Effluent Limitations ("NELs") for dry weather runoff, Stormwater Action Levels ("SALs") for wet weather runoff, and waste load allocations ("WLAs") and other numeric limits for both, pursuant to adopted and to be adopted Total Maximum Daily Loads ("TMDLs"). It also contains new requirements when compared to the existing municipal NPDES Permit that, in effect, require the Permittees to prohibit all "dry weather" discharges from entering the MS4, except for identified exempted discharges. Moreover, the prohibition on the discharge of dry weather discharges into the MS4 now specifically includes "Landscape Irrigation," "Irrigation Waters," and "Lawn Waters," all of which are exempted discharges in the existing Municipal NPDES Permit for South Orange County. Similarly, the Draft Permit seeks to impose a number of provisions known as "low impact development" ("LID") requirements, including new Standard Stormwater Mitigation Plan ("SSMP") requirements, along with Retrofitting and new Hydromodification requirements. None of the aforementioned proposed Draft Permit terms, however, appear to have been developed in accordance with Water Code sections 13241 and 13000.

Moreover, the NELs, SALs, and TMDL requirements, as well as the new dry weather prohibition requirement and the new LID, Retrofitting, Hydromodification and related requirements, are all new permit terms which are not required under the CW A or under any of the regulations thereunder. As such, these are requirements which can only be imposed once the Regional Board complies with the requirements under the Porter-Cologne Act, specifically including Water Code sections 13241 and 13000.

Response Please note that the SALs are not "effluent limitations" as defined in 40 CFR 122.2 and the commenter is incorrect in the statement that there is "strict compliance" required for SALs. SALs are action levels to be utilized in the iterative process for storm water discharges from the MS4.

Please see Regional Board Counsel Memorandum dated November 05, 2009.

Please also see Comment nos. 39 and 277 in the July 1, 2009, Response to Comments IV. The commenter states that the Tentative Order "contains new requirements when compared to the existing municipal NPDES Permit that, in effect, require the Permittees to prohibit all "dry weather" discharges from entering the MS4." As stated in Comment no. 39 in the July 1, 2009, Response to Comments IV, for the last 19 years NPDES storm water permits for Southern Orange County have required Copermitees to prohibit non-storm water discharges. Thus, the commenter is incorrect in stating this is a new requirement. The requirements complained of do not exceed federal law and the Regional Board is not required to conduct an analysis under Water Code section 13241 or 13000. Nonetheless, the Regional Board has considered all economic information provided.

Comment No.	400	Commenter No.	55	Comment Subject	Legal
Comment	<p>Section C.5. of the Draft Permit requires each co-permittee to "obtain the non-stormwater dry weather numeric limitations" set forth therein, including NELs for bacteria, nitrogen, phosphorus, and others, and including NELs for metals based on the California Toxics Rule ("CTR"). There are also separate NELs for dry weather runoff for the Dana Point Harbor and saline lagoon/estuaries, as well as for discharges to the surf zone.</p> <p>The Draft Permit also establishes various SALs, and provides that the "failure to appropriately consider and react to SAL exceedences in an iterative manner creates a presumption that the co-permittees have not complied with the MEP standard." (Draft Permit, D.1.)</p> <p>In addition, Section I of the Draft Permit entitled "Total Maximum Daily Loads" requires strict compliance with the waste load allocations ("WLAs") set forth in the Baby Beach bacteria TMDL, and also provides that the WLAs "of fully approved and adopted TMDLs are incorporated as Water Quality Based Effluent Limitations on a pollutant by pollutant, watershed by watershed basis." For Baby Beach, the Draft Permit requires that the WLAs "are to be met in Baby Beach receiving waters by the end of the year 2019" and that "the numeric targets are to be met once 100 percent of the WLA reductions have been achieved."</p> <p>Accordingly, the Draft Permit seeks to impose strict numeric effluent limits on both dry weather and wet weather discharges, either in the form of NELs for dry weather discharges, SALs for wet weather discharges, or TMDLs for both. However, as discussed in prior comments and further elaborated on herein, the CW A plainly only imposes a "maximum extent practicable" standard on all discharges "from" a municipalities' separate storm sewer system ("MS4").</p> <p>Because no aspect of the CW A, whether for dry weather or wet weather runoff, requires municipalities to strictly comply with numeric limits, but only requires compliance with the MEP Standard, all aspects of the California Porter-Cologne Act, Water Code section 13000, et seq., must be complied with, including, but not limited to, conducting an analysis of the factors set forth under Water Code section 13241, as well as of the policies and factors in section 13000. Yet, there is no indication anywhere in the record that such a 13241/13000 analysis has ever been conducted for any of the proposed NELs, SALs, or WLAs (from TMDLs), nor are there any findings anywhere in the Draft Permit indicating compliance with Water Code sections 13241 and 13000.</p>				
Response	<p>Please note that the SALs are not "effluent limitations" as defined in 40 CFR 122.2.</p> <p>Please see Regional Board Counsel Memorandum dated November 05, 2009.</p>				

Comment

The Draft Permit also attempts to mandate that the Permittees prohibit the discharge of all dry weather discharges from entering the MS4, by redefining all such discharges as "non-storm water" discharges. Specifically, the Draft Permit deletes from the list of exempted discharges any "Landscape Irrigation," "Irrigation Water," and "Lawn Waters." Deleting these previously exempted categories of discharges from entering the MS4, is an attempt to impose additional requirements upon the Permittees that are not mandated by the CW A, and as such, is an attempt to impose non-federal mandates without the Regional Board having first conducted the analysis required under Water Code sections 13241 and 13000.

As discussed further herein, and in other legal comments being submitted on behalf of the County of Orange, the definition of the term "stormwater" includes "surface runoff" and "drainage," and as such, the discharge of all dry weather runoff including Landscape Irrigation, Irrigation Water and Lawn Waters, cannot properly be classified as "non-stormwater," and, thus should not be categorically prohibited from entering the MS4. Accordingly, section 13241 (b)(3)(B)(ii) of the CW A requiring that Permittees effectively prohibit the discharge of "non-stormwater" into the MS4, has no application to the discharge of non-point source Landscape Irrigation, Irrigation Waters or Lawn Waters. For example, the federal regulations define an "illicit" discharge as a discharge that is not composed entirely of "stormwater" except for discharges allowed pursuant to an NPDES Permit and discharges resulting from fire fighting activities. (40 CFR § 122.26(b)(2).) Because the term "stormwater," as discussed below, plainly includes surface runoff and drainage in addition to precipitation (discussed below), all such Landscape Irrigation, Irrigation Waters and Lawn Waters cannot correctly be classified as an "illicit" discharge, and the CW A plainly does not require that the Permittees prohibit such discharges from entering the MS4. If the CWA did so require, then of course the Regional Board would have included such a prohibition in prior Municipal NPDES Permits.

Response

Please see Regional Board Counsel Memorandum dated November 05, 2009.

Interestingly, the commenter makes the argument that dry weather discharges are not "non-storm water discharges" and are in fact considered storm water. As outlined in the Regional Board Counsel Memorandum dated November 05, 2009, the Regional Board finds this assessment to be incorrect. Furthermore, the Regional Board finds the commenter's arguments to be contradictory, as the comment states:

"the discharge of all dry weather runoff including Landscape Irrigation, Irrigation Water and Lawn Waters, cannot properly be classified as "non-stormwater," and, thus should not be categorically prohibited from entering the MS4."

In previous comments, the commenter claims that all discharges from the MS4 are subject to the MEP standard, including non-storm water discharges. However, the commenter clearly states above that all dry weather runoff into the MS4 cannot be classified as non-storm water as it is storm water. This is contradictory as there would then be no non-storm water discharges, since they are all storm water, and there thus would be nothing required to be prohibited per 402(p) of the CWA. Furthermore, there would then be no non-storm water discharges from the MS4.

Moreover, the federal regulations exempt certain enumerated categories of non-storm water discharges" unless they are identified as sources of pollutants. Deletion of categories identified as sources of pollutants is required by federal law.

Comment No.	402	Commenter No.	55	Comment Subject	Legal
Comment	<p>The LID requirements and the related new SSMP, Retrofitting and Hydromodification requirements are similarly not mandated under the CW A. As such, these provisions can only be imposed after the Regional Board has first complied with the requirements of Water Code sections 13241 and 13000, as well as all other applicable requirements under California law.</p>				
Response	<p>The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The comment does not raise any new issues from the previous comments. The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3; in the February 13, 2008 Response to Comments III; all provide discussions of these issues.</p> <p>In summary, the State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates. No changes have been made in response to this comment.</p> <p>The comment regarding the Regional Board's compliance with California Water Code §13263, 13241, and 13000 and the consideration of balancing factors has been extensively considered in previous response to comments. Please see the Fact Sheet; July 6, 2007, Response to Comments I, Response No. 5; December 12, 2007, Response to Comments II, Response Nos. 1 and 9; February 13, 2008, Response to Comments, Response No 3.</p> <p>To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. No changes have been made in response to this comment.</p>				

Comment

As discussed above, in *BIA San Diego County v. State Board*, supra, 124 Cal.App.4th 866, 874, the Court held that under the CWA, Congress distinguished between industrial and storm water discharges and clarified that with respect to municipal storm water discharges, "the EPA has the authority to fashion NPDES Permit requirements to meet storm water quality standards without specific numeric effluent limits" Accordingly, any attempt to proceed at this time and impose a permit term that requires strict compliance with any numeric limit, is a requirement that clearly goes beyond what is mandated under federal law.

In addition, clearly federal law does not require that municipalities prohibit the discharge of "Landscape Irrigation," "Irrigation Waters" or "Lawn Waters" from entering the MS4 or from treating all dry weather discharge as non-stormwater. If this were, in fact, a requirement under the CW A, such a prohibition would have been included in prior Municipal NPDES permits issued by the Regional Board. Because the definition of "stormwater," "surface runoff" and "drainage," in addition to "storm water" runoff and "snow melt," as discussed below, includes all landscape runoff and other dry weather runoff, it cannot properly be defined as "nonstormwater" under the CWA.

Furthermore, there is nothing in the CW A or the federal regulations, or otherwise, that would suggest that such discharges are to be classified as "illicit" discharges, or to otherwise be prohibited from entering the MS4. The fact that these discharges were previously consistently permitted in prior Municipal NPDES Permits issued by this Regional Board, is confirmation of the fact that the CWA does not require such a prohibition of these types of discharges from entering the MS4. Accordingly, any attempt at this time to force the Permittees to prohibit the discharge of all dry weather runoff, including but not limited to, Landscape Irrigation, Irrigation Waters or Lawn Waters, from entering the MS4, is a new requirement that goes beyond the requirements of the CW A, and is thus a new requirement that can only be imposed after the Regional Board has first complied with all aspects of the Porter-Cologne Act, specifically including, but not limited to, Water Code sections 13241 and 13000.

In addition, the new LID and related new SSMP, Retrofitting and Hydromodification requirements in the Draft Permit, are all provisions that are not required under any provision of the CW A or the regulations thereunder. As such, compliance with Water Code sections 13000 and 13241 is necessary before any such new permit terms can be imposed upon the Permittees.

Under the California Supreme Court's holding in *City of Burbank v. State Water Resources Control Board* (2005) 35 Ca1.4th 613, a regional board must consider the factors set forth in Water Code sections 13000 and 13241 when adopting an NPDES Permit, unless consideration of those factors "would justify including restrictions that do not comply with federal law." (Id.. at 627.) According to the Supreme Court in Burbank, "Section 13263 directs Regional Boards, when issuing waste discharger requirements, to take into account various factors including those set forth in Section 13241."

In Burbank, the California Supreme Court held that to the extent the NPDES Permit provisions in that case were not compelled by federal law, that the Boards were required to consider their "economic" impacts on the dischargers themselves, with the Court finding that the Water Boards must analyze the "dischargers cost of compliance." (Id .. at 618.) The Court specifically interpreted the need to consider "economics" as requiring the consideration of the "cost of compliance" on the cities involved in that case. (Id .. at 625 ["The plain language of Sections 13263 and 13241 indicates the Legislature's intent in 1969, when these statutes were enacted, that a regional board consider the costs of compliance when setting effluent limitations in a waste water discharge permit."].) And according to the California Supreme Court, the goal of the Porter-Cologne Act is to "attain the highest water quality which is reasonable, considering all demands being made and to be made on those waters and the total values involved, beneficial and detrimental, economic and social, tangible and intangible." (Id. at 618, citing Water Code § 13000.)

Accordingly, under the Burbank decision, Section 13241 compels the Boards to consider the following factors when developing NPDES Permit terms.

- (a) Past, present, and probable future beneficial uses of water.
- (b) Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto.
- (c) Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area.
- (d) Economic considerations.
- (e) The need for developing housing in the region.
- (f) The need to develop and use recycled water.

In *US. v. State Board* (1986) 182 Cal.App.3d 82, the State Board issued revised water quality standards for salinity control because of changed circumstances which revealed new information about the adverse affects of salinity on the Sacramento-San Joaquin Delta ("Delta"). (Id.. at 115.) In invalidating the revised standards, the Court recognized the importance of complying with the policies and factors set forth under both Water Code sections 13000 and

13241, and emphasized section 13241 's requirement of an analysis of "economics," finding:

In formulating a water quality control plan, the Board is invested with wide authority "to attain the highest water quality which is reasonable, considering all demands being made and to be made on those waters and the total values involved, beneficial and detrimental, economic and social, tangible and intangible." (§ 13000.) In fulfilling its statutory imperative, the Board is required to "establish such water quality objectives ... as in its judgment will ensure the reasonable protection of beneficial uses ... " (§ 13241), a conceptual classification far-reaching in scope. (Id .. at 109-110, emphasis added.)

* * *

The Board's obligation is to attain the highest reasonable water quality "considering all demands being made and to be made on those waters and the total values involved, beneficial and detrimental, economic and social, tangible and intangible." (§ 13000, italics added.) (Id. at 116.)

Justice Brown in her concurring opinion in Burbank also made several significant comments regarding the importance of considering "economics" in particular, and the Water Code section 13241 factors in general, before including numeric effluent limitations in an NPDES Permit. These comments are equally relevant today to the Regional Board's Draft Order:

Applying this federal-state statutory scheme, it appears that throughout this entire process, the Cities of Burbank and Los Angeles (Cities) were unable to have economic factors considered because the Los Angeles Regional Water Quality Control Board (Board) - the body responsible to enforce the statutory framework -failed to comply with its statutory mandate.

For example, as the trial court found, the Board did not consider costs of compliance when it initially established its basin plan, and hence the water quality standards. The Board thus failed to abide by the statutory requirements set forth in Water Code section 13241 in establishing its basin plan. Moreover, the Cities claim that the initial narrative standards were so vague as to make a serious economic analysis impracticable. Because the Board does not allow the Cities to raise their economic factors in the permit approval stage, they are effectively precluded from doing so. As a result, the Board appears to be playing a game of "gotcha" by allowing the Cities to raise economic considerations when it is not practical, but precluding them when they have the ability to do so. (Id. at 632, J. Brown, concurring; emphasis added.)

Justice Brown went on to find that:

Accordingly, the Board has failed its duty to allow public discussion - including economic considerations - at the required intervals when making its determination of proper water quality standards.

What is unclear is why this process should be viewed as a contest. State and local agencies are presumably on the same side. The costs will be paid by taxpayers and the Board should have as much interest as any other agency in fiscally responsible environmental solutions. (Id. at 632-33.)

The above-referenced statutory, regulatory and case authority all confirm not only that municipal dischargers are to be treated differently than industrial dischargers, but also that "numeric limits" may only be applied to municipal dischargers after the analysis under Sections 13241/13000 have been complied with. They also confirm that "[i]t is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban dischargers." (Numeric Limits Panel Report, p. 8.) Accordingly, strict compliance with any numeric limits in a municipal NPDES Permit cannot be required at this time, and to the extent a numeric limit is attempted to be incorporated into the Draft Permit and strictly enforced as such through a means other than through the use of MEP-complaint BMPs, then all applicable requirements of State law, specifically including the analysis required under Water Code sections 13241/13000, must be plainly met.

Moreover, the new proposed requirements in the Draft Permit mandating that the Permittees prohibit the discharge of "Landscape Irrigation," "Irrigation Waters" or "Lawn Waters," from entering the MS4, are not requirements found anywhere in the CWA, and are thus new permit requirements that can only be imposed after the Regional Board has first complied with the requirements of Water Code sections 13241 and 13000.

Finally, as none of the LID, SSMP, Retrofitting and Hydromodification requirements are requirements that are mandated under federal law, the above-referenced provisions of Water Code sections 13241 and 13000 must be met before any such permit terms can lawfully be imposed under California law.

Response Please see Regional Board Counsel Memorandum dated November 05, 2009.

The comment regarding the prohibition on overirrigation practices was addressed in the previous response to comments. The comment does not raise any new issues from the previous comments. Please see the discussion

in the Fact Sheet for findings C.14 and C.15; and the July 1, 2009, Response to Comments IV, Response Nos. 28, 52, 76, and 159. Please also see comments Nos. 84, and 264 in this Response to Comments. No changes have been made in response to this comment. In summary, over irrigation is a non-storm water discharge required by federal regulations to be prohibited where identified to be a source of pollutants.

The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The comment does not raise any new issues from the previous comments. The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3; in the February 13, 2008 Response to Comments III; all provide discussions of these issues. In summary, the State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates. No changes have been made in response to this comment.

The comment regarding the Regional Board's compliance with California Water Code §13263, 13241, and 13000 and the consideration of balancing factors has been extensively considered in previous response to comments. Please see the Fact Sheet; July 6, 2007, Response To Comments I, Response No. 5; December 12, 2007, Response To Comments II, Response Nos. 1 and 9; February 13, 2008, Response to Comments, Response No 3.

To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. No changes have been made in response to this comment.

Comment

The Draft Permit improperly provides that: "Non-storm water (dry weather) discharge from the MS4 is not considered a storm water (wet weather) discharge and therefore is not subject to regulation under the Maximum Extent Practicable (MEP) standard from CW A 402(p)(3)(B)(iii), which is explicitly for 'municipal ... Stormwater Discharges (emphasis added)' from the MS4 Non-storm water discharges per CWA 402(p)(3)(B)(ii), are to be effectively prohibited." (Draft Permit, Finding C.14.) The Draft Order then proceeds to not only require that the co-permittees prohibit all "non-storm water" discharges into the MS4, including prohibiting any dry weather runoff from entering the MS4 unless otherwise expressly permitted under the Permit, but also to impose strict numeric effluent limitations, i. e., NELs upon all such dry weather discharges.

Yet, the assertion that "dry weather" is something other than "storm water" is inaccurate and is directly controverted by the very regulations cited in the Draft Order. In addition, this purported finding that the term "storm water" does not include "dry weather," i.e., "urban runoff," was already been rejected by the Orange County Superior Court in that case entitled *City of Arcadia v. State Board*, OCSC Case No. 06CC02974, Fourth Appellate District Case No. G041545 (hereafter the "Arcadia Case"). This fact that the definition of "stormwater" includes "urban runoff," was also recently admitted to by the State Board and the Los Angeles Regional Board in the Arcadia Case, as well as by the NRDC, the Santa Monica Baykeeper and Heal the Bay. As such, any attempt to redefine the term "stormwater" to exclude "dry weather," is contrary to law and should be rejected.

First, it is clear from the plain language of the regulations that the term "Stormwater" includes all forms of "urban runoff" in addition to precipitation events. Specifically, section 122.26(b)(13) reads as follows: "Storm water means storm water runoff, snow melt runoff, and surface runoff and drainage." (40 C.F.R. § 122.26(b)(13); italics in original, bolding and underlining added.) This definition starts with the inclusion of "storm water" and "snow melt runoff," and is then further expanded to include not only "storm water" and "snow melt runoff," but also "surface runoff" and "drainage."

The Regional Board's proposed interpretation of this definition is an attempt to read the terms "surface runoff" and "drainage" out of the regulations. Such an interpretation is contrary to the plain language of the regulation itself, and is contrary to law. (See e.g., *Astoria Federal Savings and Loan Ass'n v. Solimino* (1991) 501 U.S. 104, 112 ["[W]e construe statutes, where possible, so as to avoid rendering superfluous any parts thereof."]; *City of San Jose v. Superior Court* (1993) 5 Cal.4th 47, 55 ["We ordinarily reject interpretations that render particular terms of a statute as mere surplusage, instead giving every word some significance."]; *Ferraro v. Chadwick* (1990) 221 Cal.App.3d 86, 92 ["In construing the words of a statute ... an interpretation which would render terms surplusage should be avoided, and every word should be given some significance, leaving no part useless or devoid of meaning. "]; *Brewer v. Palel* (1993) 20 Cal.App.4th 1017, 1022 ["We are required to avoid an interpretation which renders any language of the regulation mere surplusage."; and *Hart v. ,McLucas* (9th Cir. 1979) 535 F.2d 516, 519 ["[I]n the construction of administrative regulations, as well as statutes, it is presumed that every phrase serves a legitimate purpose and, therefore, constructions which render regulatory provisions superfluous are to be avoided. '])

Second, beyond the plain language of the federal regulation, prior orders of the State Board confirm that the term "urban runoff" is included within the definition of "storm water." For example, in State Board Order No. 2001-15, the State Board regularly interchanges the terms "urban runoff" with "storm water," and discusses the "controls" to be imposed under the Clean Water Act as applying equally to both. In discussing the propriety of requiring strict compliance with water quality standards, and the applicability of the MEP standard in Order No. 2001-15, the State Board asserted as follows:

Urban runoff is causing and contributing to impacts on receiving waters throughout the state and impairing their beneficial uses. In order to protect beneficial uses and to achieve compliance with water quality objectives in our streams, rivers, lakes, and the ocean, we must look to controls on urban runoff. It is not enough simply to apply the technology-based standards of controlling discharges of pollutants to the MEP; where urban runoff is causing or contributing to exceedances of water quality standards, it is appropriate to require improvements to BMPs that address those exceedances.

While we will continue to address water quality standards in municipal storm water permits, we also continue to believe that the iterative approach, which focuses on timely improvements of BMPs, is appropriate. We will generally not require "strict compliance" with water quality standards through numeric effluent limits and we will continue to follow a iterative approach, which seeks compliance over time. The iterative approach is protective of water quality, but at the same time considers the difficulties of achieving full compliance through BMPs that must be enforced through large and medium municipal storm sewer systems. (See Order 2001-15, p. 7-8; emphasis added.)

Moreover, at the urging of the petitioner in Order No. 2001-15, the State Board went so far as to modify the "Discharge Prohibition A.2" language, which was challenged by the Building Industry Association of San Diego County ("BIA"), because such Discharge Prohibition was not subject to the iterative process. The State Board found as follows in this regard: "The difficulty with this language, however, is that it is not modified by the iterative process. To clarify that this prohibition also must be complied with through the iterative process, Receiving Water Limitation C.2 must state that it is also applicable to Discharge Prohibition A.2 Language clarifying that the iterative approach applies to that prohibition is also necessary." (State Board Order No. 2001-15, p. 9.)

The State Board further required that the Municipal NPDES permit challenged in that case be modified because the permit language was overly broad, as it sought to apply the MEP standard not only to discharges "from" MS4s, but also to discharges "into" MS4s, with the BIA claiming that it was inappropriate to require the treatment and control of discharges "prior to entry into the MS4," and with the State Board agreeing that such a regulation of discharges "into" the MS4 was inappropriate. [Id at 9 ["We find that the permit language is overly broad because it applies the MEP standard not only to discharges 'from' MS4s, but also to discharges 'into' MS4s."].)

In State Board Order No. 91-04 discussed above, the State Board specifically relied upon EPA's Stormwater Regulations, to find that: "Storm water discharges, by ultimately flowing through a point source to receiving waters, are by nature more akin to non-point sources as they flow from diffuse sources over land surfaces." (State Board Order No. 91-04, p. 13-14.) The State Board then relied upon EPA's Preamble to said Stormwater Regulations, and quoted the following from the Regulation:

For the purpose of [national assessments of water quality], urban runoff was considered to be a diffuse source for non-point source pollution. From a legal standpoint, however, most urban runoff is discharged through conveyances such as separate storm sewers or other conveyances which are point sources under the [Clean Water Act]. 55 Fed.Reg. 47991. (State Board Order No. 91-04, p. 14; emphasis added.)

The State Board went on to conclude that the lack of any numeric objectives or numeric effluent limits in the challenged permit: "will not in any way diminish the permit's enforceability or its ability to reduce pollutants in storm water discharges substantially In addition, the (Basin] Plan endorses the application of 'best management practices' rather than numeric limitations as a means of reducing the level of pollutants in storm water discharges." (Id at 14, emphasis added.) (Also see Storm Water Quality Panel Recommendations to the California State Water Resources Control Board - The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities, June 19, 2008, p. 1 ["MS4 permits require that the discharge of pollutants be reduced to the maximum extent practicable (MEP)"], and p. 8 ["It is not feasible at this time to set enforceable numeric effluent criteria for municipal BMPs and in particular urban dischargers."]; State Board Order No. 98-01, p. 12 ["Storm water permits must achieve compliance with water quality standards, but they may do so by requiring implementation of BMPs in lieu of numeric water quality-based effluent limits."]; and State Board Order No. 2001-11, p. 3 ["In prior Orders this Board has explained the need for the municipal storm water programs and the emphasis on BMPs in lieu of numeric effluent limitations."].)

Third, in the Arcadia Case, in its Decision, Judgment and Writ of Mandate, the Superior Court found that the term "stormwater" was defined in the federal regulations to include not only "stormwater" but also "urban runoff." (See, Decision, Exhibit "1" hereto, p. 1 ["... the Standards apply to storm water [i.e., storm water and urban runoff]."]; Exhibit "2," Judgment in the Arcadia Case, p. 2, fn 2, [citing to 40 C.F.R. § 122.26(b)(13) and finding that: "Federal law defines 'storm water' to include urban runoff, i.e., 'surface runoff and drainage'."]; and Exhibit "3," Writ of Mandate in the Arcadia Case, p. 2, n. 2 ["Federal law defines 'storm water' to include urban runoff, i.e., 'surface runoff and drainage.'"].)

It is further important to note that this interpretation of the term "storm water" as including "urban runoff," by the Superior Court in the Arcadia Case, has not been challenged on appeal by the State or Los Angeles Regional Boards, and in fact, has been agreed to by both of these Boards, as well as by the Intervenor environmental organizations. Specifically, in the State and Regional Boards' Opening Appellate Brief in the Arcadia Case, they agreed that the term "Stormwater" is to include "urban runoff," where they stated as follows:

"Storm water," when discharged from a conveyance or pipe (such as a sewer system) is a "point source" discharge, but stormwater emanates from diffuse sources, including surface run-off following rain events (hence "storm water") and urban run-off. (See Exhibit "4" hereto, which is a true and correct copy of the cited portion from the Boards' Opening Appellate Brief in the Arcadia Case; emphasis added.)

Thus, both the State and the Los Angeles Regional Boards have acknowledged that the term "stormwater" includes not only "stormwater" runoff from "rain events," but also other discharges from a storm sewer conveyance system, specifically including "urban runoff." (Id.)

This definition of the term "Stormwater" as including "urban runoff," has also been accepted by the NRDC, the Santa Monica Baykeeper, and Heal the Bay (collectively, "Intervenors"). In the Intervenor's Opening Brief in the Arcadia Case, said Intervenors admit as follows:

For ease of reference, throughout this brief, the terms "urban runoff" and "stormwater" are used interchangeably to refer generally to the discharges from the municipal Dischargers' storm sewer systems. The definition of "stormwater" includes "storm water runoff, snow melt runoff, and surface runoff and drainage." (40 C.F.R. § 122.26(b)(13).) (See Exhibit "5," hereto, which is a true and correct copy of the cited portion of the Intervenors' Opening Appellate Brief in the Arcadia Case; emphasis added.)

In sum, in light of the plain language of the federal regulation defining the term "stormwater" to include "urban runoff," i.e., "surface runoff" and "drainage" in addition to "storm water" and "snow melt," and given the findings of the Superior Court in the Arcadia Case, as well as the admissions by the State and Regional Boards and the Intervenors in that case, it is clear that the term "stormwater" as defined in the federal regulations, includes "dry weather" runoff.

In short, the definition of "stormwater" plainly includes dry-weather runoff, i.e., "surface runoff and drainage," and as such, there is no basis to treat "dry-weather runoff" any differently under the CWA, e.g., to apply numeric effluent limits rather than the MEP Standard to dry weather runoff, or to require that municipalities prohibit all non-point source "Landscape Irrigation," "Irrigation Waters," "Lawn Waters," and other similar discharges, from entering the MS4.

Response

Please see Regional Board Counsel Memorandum dated November 05, 2009, for discussion of the definition of and authority to regulate non-storm water discharges from MS4s. In addition, the commenter refers to the ruling in the Cities of Arcadia, et al., v. State Water Resources Control Board (Super. Ct. Orange County, 2007, No. 06CC02974) (Arcadia II) to support its interpretation that storm water under federal law includes all urban runoff. Further, the commenter claims that this interpretation has been agreed to by both the State and Los Angeles Regional Water Boards. The commenter fails to note that Arcadia II only considered the definition of storm water and urban runoff in the context of precipitation related surface runoff and drainage. The issues before the court did not include "non-storm water" discharges. Thus, the commenter's references are taken out of context and do not support any change in the Regional Board's interpretation of the definition of storm water as related to precipitation events.

Comment No.	405	Commenter No.	55	Comment Subject	unfunded mandate
--------------------	-----	----------------------	----	------------------------	------------------

Comment

Any requirements that goes beyond what is otherwise required under federal law, e.g., forcing the municipalities to strictly comply with numeric limits, as opposed to requiring compliance through the use of MEP-complaint BMPs, and any other accompanying mandates that go beyond the requirements of federal law, such as requiring municipalities to prohibit the discharge of Landscape Irrigation or other similar dry weather runoff from entering the MS4, or the new LID, SSMP, Retrofitting, and Hydromodification and related requirements, can only be imposed where adequate funds have first been provided to the municipalities to comply with such mandates. For example, Section F.3 of the Permit seeks to force the Permittees to "develop and implement a retrofitting program." Yet, this new mandated "restoration program" the Regional Board is attempting to force the Permittees to carry out, is not being funded by the State. Rather, the Draft Permit leaves it to the Municipal Permittees to fund this and many other new "programs" imposed by the Draft Permit."

Article XIII B, Section 6 of the California Constitution prohibits the Legislature or any State agency from shifting the financial responsibility of carrying out governmental functions to local governmental entities. Article XIII B, Section 6 provides, in relevant part, as follows:

Whenever the Legislature or any state agency mandates a new program or higher level of service on any local government, the state shall provide a subvention of funds to reimburse such local governments for the cost of such program or increased level of service

This reimbursement requirement provides permanent protection for taxpayers from excessive taxation and requires discipline in tax spending at both state and local levels. (County of Fresno v. State (1991) 53 Cal.3d 482, 487.) Enacted as a part of Proposition 4 in 1979, it "was intended to preclude the state/rom shifting financial responsibility to local entities that were ill equipped to handle the task." (Id.)

Accordingly, because the Regional Board is proposing to require strict compliance with numeric limits, a requirement that exceeds the MEP Standard set forth in federal law; is requiring municipalities to prohibit dry weather runoff including irrigation waters from entering their storm drain system, another requirement not found in the CWA; and is imposing new LID, SSMP, Retrofitting and Hydromodification requirements, none of which are required under the CW A; all such requirements are plainly new unfunded State mandates which may only be imposed where necessary funding has first been made available to the Permittees.

The incorporation of new permit requirements that are not mandated by federal law, and that go unfunded by the State, plainly violate Article XIII B, Section 6 of the California Constitution. (See County of Los Angeles v. Commission on State Mandates (2007) 150 Cal.App.4th 898, 914 ["We are not convinced that the obligations imposed by a permit issued by a Regional Water Board necessarily constitute federal mandates under all circumstances."].)

Response

The comment regarding unfunded mandates has been extensively considered in all previous response to comments. The comment does not raise any new issues from the previous comments.

The Fact Sheet and Response to comments Nos. 155 and 165 in the July 1, 2009, Response to Comments IV; Comment No. 5 in the July 6, 2007, Response to Comments I; Comment Nos. 1 and 9 in the December 12, 2007, Response to Comments II; Comment No. 1, 2, and 3; in the February 13, 2008 Response to Comments III; all provide discussions of these issues.

In summary, the State's water quality protection requirements within the Tentative Order are authorized by Federal Law, and are not unfunded mandates. No changes have been made in response to this comment.

Comment

Under Section C. of the Draft Permit imposing numeric effluent limitations for dry weather runoff, the municipalities are required to implement certain monitoring programs to assure compliance with the NELs. Also, under Section D. of the Draft Permit involving the SALs, again the Regional Board is proposing to impose various monitoring obligations on the municipalities as a means of requiring compliance with such SALs. Other portions of the Draft Permit, some of which were discussed in prior comments, similarly seek to impose monitoring and reporting obligations upon the permittees. Yet, under the Porter-Cologne Act, no monitoring and/or reporting requirements may be imposed upon local agencies, without the Boards first conducting a "cost benefit" analysis. To begin with, Water Code section 13225(c) provides as follows:

Each Regional Board, with respect to its region, shall, do all of the following:

(c) Require as necessary any state or local government to investigate and report on any technical factors involved in water quality control or to obtain and submit analyses of water; provided that the burden, including costs, of such reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained therefrom. (Water Code § 13225(c).)

Similarly, Water Code Section 13267(b) provides, in relevant part, as follows:

* * *

(b)(1). In conducting an investigation specified in subdivision (a), the regional board may require that any person who has discharged

... or who proposes to discharge, waste within its region ... shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the regional board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports. (Water Code § 13267(b).)

With the Draft Permit, although the Porter-Cologne Act expressly requires the Regional Board in this context to conduct a cost benefit analysis, and specifically requires that the Regional Board provide the Permittees with a "written explanation with regard to the need for the reports" and "identify the evidence that supports requiring the person to provide the reports," there are no purported findings anywhere in the Draft Permit showing that any such cost benefit analysis was conducted, or any finding that the burden, including costs, of such monitoring and reporting obligations bear a "reasonable relationship" to the need for the same.

In addition, there is no evidence that has been identified anywhere in the record, either in the findings or otherwise, to show that any such cost benefit analysis, as required under Water Code Sections 13267 and 13225, has ever been performed. Accordingly, no monitoring or reporting obligations associated with any NEL, SAL, or TMDL can be imposed upon the municipalities through the Draft Permit, until the requirements of Water Code sections 13225 and 13267 have first been met.

Response

Please note that an exceedance of a SAL does not mean a discharger is out of compliance. A SAL exceedance is required to be utilized in the iterative process.

In addition, monitoring and reporting requirements in an NPDES permit are authorized by Water Code section 13383, and a Finding has been added to the Tentative Order for clarification. Water Code section 13383 does not include a requirement that the Regional Board provide an explanation in writing of the need for the report or to identify evidence that supports requiring the reports. Water Code section 13267 does not require a cost-benefit analysis, but rather, the burden, including costs, must "bear a reasonable relationship to the need for the report and benefits to be obtained from the reports." The findings in the Order supporting the inclusion of NELs for non-storm water discharges, inclusion of SALs, and implementation of the EPA approved TMDL establish the basis (both the reason for and evidence to support) for requiring the reports based upon monitoring. Monitoring is necessary to determine compliance with the permit provisions intended to achieve compliance with water quality standards and protection of beneficial uses in the affected receiving waters. In addition, exceedances of both NELs and SALs, for example, require the permittees to take additional steps to determine the causes of the exceedances and/or steps that will result in better protection of water quality. Absent monitoring, some of the additional steps will not be required. The requirements are consistent with requirements at comparable sites in the San Diego Region. Please see Section T of the Fact Sheet / Technical Report for Order No. R9-2009-0002 for further discussion of monitoring and reporting.

Comment

The LID provisions in the Draft Permit, along with the accompanying new SSMPs requirements and the Retrofitting and new Hydromodification requirements for development and redevelopment within the jurisdictional boundaries of the various municipalities, are all provisions that conflict with the requirements of the California Environmental Quality Act ("CEQ A"). As such these provisions are contrary to law and cannot appropriately be included in the subject NPDES Permit. For example, the LID provisions require the municipalities to "require each Priority Development Project to implement LID BMPs which will collectively minimize directly connected impervious areas, limit loss of existing infiltration capacity, and protect areas that provide important water quality benefits necessary to maintain riparian and aquatic biota, and/or are particularly susceptible to erosion and sediment loss." (Draft Permit, F.1.d.(4).)

The Draft Permit goes on to require that LID BMPs be implemented unless the subject city makes a "finding of infeasibility for each Priority Development Project," and further requires that the municipality "incorporate formalized consideration, such as thorough checklists, ... into the plan review process for Priority Development Projects." (Draft Permit, F.1.d.(4)(a)(i) & (ii).) The Draft Permit also requires that LID BMPs be implemented at all such priority Development Projects "where technically feasible," and provides that if onsite retention LID BMPs are "technically infeasible that LID bio-filtration BMPs may be utilized." (Draft Permit, F.1.d.(4)(b) & (d).) Further "source control BMPs" are required to be implemented which must include BMPs to "eliminate irrigation runoff." (Draft Permit, F.1.d.(5)(c).)

The Draft Permit also includes a BMP waiver program allowing Priority Development Projects to substitute the implementation of LID BMPs in certain instances, with the implementation of treatment control BMPs and payment into an in lieu funding program and/or watershed equivalent BMPs. The waiver program requires, at a minimum, the net impact of Priority Development Projects from pollutant loadings to be above and beyond the impact caused by projects meeting the LID requirements, after considering "mitigation and in lieu payments." It further requires a cost benefit analysis to be developed as a part of the criteria for the technical feasibility analysis, along with various other mitigation measures for pollutant loads expected to be discharged as a result of not implementing LID BMPs. (Draft Permit, F.1.d.(7).) The LID waiver program goes so far as to allow for a "pollutant credit system," and requires a number of other conditions as a part of the waiver process. (Id) Section F.3.d of the Draft Permit requires the Permittees to "develop and implement a retrofitting program" with the goal of reducing "hydromodification," promoting "LID," and supporting "riparian and aquatic habitat restorations," among other purposes. Beyond these requirements, there are several provisions within the Draft Permit that go so far as to prevent "occupancy and/or the intended use of any portion" of the project, where the various LID and SSMP requirements are not being met. (See Draft Permit, F.1.d.(9).)

It is apparent from these Draft Permit terms that they are all designed to address potential adverse impacts on water quality or riparian or aquatic habitat etc., which may occur from the proposed development project in issue. Such an analysis, however, is already required to be conducted by municipalities under the requirements of California Environmental Quality Act ("CEQA" Public Resources Code Sections 21000 et. seq.). In fact, CEQA imposes numerous specific requirements on municipalities when considering development projects within their respective jurisdictions, and particularly requires that the municipalities consider and mitigate potentially significant adverse environmental impacts that may be expected from the project, specifically including impacts that may be expected on water quality.

CEQA is a comprehensive statute that requires governments to analyze projects to determine whether or not they may have significant adverse environmental impacts. If such significant adverse impacts are determined to be present by the lead governmental agency, then under CEQA, these impacts must be disclosed and reduced or mitigated to the extent feasible. CEQA expressly provides local entities the discretion to analyze and approve projects that are deemed appropriate for the local community, following the environmental analysis directed by the Statute, including an analysis of the impacts of the project on water quality. One example of this discretion is the ability of municipalities to adopt a Statement of Overriding Considerations if the public agency finds that "specific overriding economic, legal, social, technological, or other benefits of the project outweigh the significant effects on the environment." (Public Resources Code [PRC] Section 21081)

By removing the City's discretion under CEQA to approve local developments, the Permit is in conflict with existing State law. For example, the Draft Permit directly conflicts with CEQA by unlawfully attempting to direct how a local governmental agency is to approve a project. Under Public Resources Code Section 21 081.6(c), a responsible agency such as the Regional Board cannot direct how a lead agency - such as a Permittee - is to comply with CEQA's terms:

Any mitigation measures submitted to a lead agency by a responsible agency or an agency having jurisdiction over natural resources affected by the project shall be limited to measures which mitigate impacts to resources which are subject to the statutory authority of an definitions applicable to, that agency. Compliance or non-compliance by a

responsible agency or agency having jurisdiction over natural resources affected by a project with that requirement shall not limit ... the authority of the lead agency to approve, condition, or deny projects as provided by this division or any other provision of law. (Pub. Res. Code § 21081.6(e); emphasis added.)

In direct conflict with the terms of CEQA, the Regional Board, through the Draft Permit, unlawfully seeks to impose Permit terms that plainly seek to "limit the authority of the lead agency to approve, condition, or deny projects."

PRC Section 21081.1 also states that the lead agency's determination "shall be final and conclusive on all persons, including responsible agencies, unless challenged as provided in Section 21167." It similarly states that the lead agency "shall be responsible for determining whether an environmental impact report, a negative declaration, or mitigated negative declaration shall be required for any project which is subject to this division." (PRC Section 21080.1 (a).)

Further, no additional procedural or substantive requirements beyond those expressly set forth in CEQA may be imposed upon a local agency's CEQA review process:

It is the intent of the Legislature that courts, consistent with generally accepted rules of statutory interpretation, shall not interpret this division or the state guidelines adopted pursuant to Section 21083 in a manner which imposes procedural or substantive requirements beyond those explicitly stated in this division or in the state guidelines. (PRC § 21083.1.)

PRC section 21001 provides that local agencies "should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects." (PRC § 21001.) However, the conclusion in the Draft Permit appears to be that all runoff from a wide class of new development and redevelopment projects will result in significant adverse impacts on the environment, and that such impacts must be mitigated by those particular mitigation measures as mandated in the Draft Permit. Thus, the Draft Permit dictates the environmental review, without regard for CEQA's provisions, and eliminates a local governmental agency's discretion to consider and approve feasible alternatives or mitigation measures - even if alternative measures might have a lesser effect on the environment.

In addition, PRC section 21002 provides that, "the Legislature further finds and declares that in the event specific economic, social, or other conditions make infeasible such project alternatives or such mitigation measures, individual projects may be approved in spite of one or more significant effects thereof." PRC section 21081(b) then establishes a mechanism for local agencies to approve projects with unmitigated adverse impacts, if they adopt a Statement of Overriding Considerations. The Draft Permit's design standard requirements would eliminate a municipality's discretion to approve a project without the design standards being met, even if a municipality adopts a Statement of Overriding Considerations.

Under the Draft Permit, therefore, environmentally preferable alternatives and/or mitigation measures that would otherwise be required pursuant to CEQA, could not be pursued and required because of the arbitrary requirements set forth in the Draft Permit. The Draft Permit must be revised so as to avoid conflict with State law, and the referenced provisions in issue should be deleted.

Response Please see Comment no. 163 in the July 1, 2009, Response to Comments IV.

Comment

I am a homeowner in [insert name of community association] (Association) and [insert name of city](City). Although the Tentative Order applies directly to the County of Orange as Principal Permittee and the many south Orange County city Co-Permittees, I will be impacted as I will be required to pay for the cost of implementing measures to assure that the permittees remain in compliance. It is from this perspective that these comments are offered in response to the Tentative Order, No. R-2009-2002 NPDES No. CASO 108740.

1. Adoption of the Tentative Order will require my Association to incur added costs which may result in higher assessments charged to homeowners and trigger a chain-reaction of events that will have devastating consequences to the Association, our homeowners and the City as a whole.

Our community is reeling from the consequences of the current state of the economy, and an ever increasing number of the owners and members of my Association are facing financial collapse and the loss of their homes. Under the terms of the Tentative Order, as the City implements and enforces the mandatory requirements, the Association will be subject to fines and penalties and other administrative actions. In order to respond to these new mandates and to avoid penalties and fines, my Association will be required to implement new administrative procedures and make capital improvements and renovations to existing infrastructure. My Association will be forced to increase dues and assessments charged to the homeowners to provide for these new services and improvements. I will be required to pay more dues and assessments to my Association and may be required to pay for homeowner improvements to assure that the City remains in compliance. These added costs will pose extraordinary hardship upon me and my neighbors and there is an increasing likelihood that I cannot or will not be able to pay increased assessments or the costs of homeowner improvements. The financial burdens imposed by the Tentative Order could be the tipping point in my financial situation and my Association, leading to catastrophic consequences.

Faced with ever increasing debt obligations, I and my neighbors will be forced to prioritize the debts we pay, and when we pay them, and unfortunately, my situation requires that I consider delaying payment of assessments. I am already financially challenged by the amount of taxes, homeowner maintenance costs, monthly mortgage payments and existing levels of assessments I pay. If my obligations increase I may face expensive legal fees, foreclosure and bankruptcy. I cannot afford to pay all of the costs which may result from the adoption of the Tentative Order and all of the other costs I pay for my daily existence. I do not have the resources to pay fines or penalties imposed by the City or the Board.

If the Tentative Order is adopted, my property values will decline and I will be unable to sell my property for a fair price as buyers will be driven away from purchasing property in my city and my Association, choosing instead to purchase property elsewhere to avoid the threat of penalties and fines levied by the City and the Board and increased assessments charged by the Associations to cover the added costs. Homes will sit empty and fall into disrepair, thus decreasing property values and threatening the safety and welfare of our community associations and the homeowners they serve.

The costs of implementing and enforcing the Tentative Order will trigger a financial maelstrom such that I may have inadequate resources to continue to meet my obligations.

The primary objective the Tentative Order is designed to achieve will be frustrated and delayed by the financial collapse of the organizations and homeowners like me who are most capable of making a positive difference in enhancing water quality. There is no evidence that in crafting the Tentative Order, the negative economic consequences were considered and properly addressed.

The Tentative Order should be revised to address and overcome negative economic consequences of implementation. The Tentative Order should support and compliment, and not detract from, the financial stability of the City, my Association and the homeowners like me that they serve.

Response

The Tentative Order does not require Homeowner Associations to increase their homeowner assessments. The homeowner should address such concerns with their respective Homeowner Association. The Tentative Order ensures homeowner associations are held accountable to the same standard as any other resident within the Copermittee's jurisdiction, as such, the Tentative Order does not require any additional requirements on Homeowner Associations. The Tentative Order promotes water conservation and rainwater harvesting that can produce cost savings in the HOAs water bills. In addition, the Tentative Order promotes the use of Low Impact Development which has been shown to increase home values. More likely, home values and assessments are based on market values and economics where the Tentative Order plays a miniscule part.

Comment

2. Adoption of the Tentative Order will unnecessarily create adversity and barriers to the implementation of successful strategies and will divert resources needed to achieve the ultimate objectives of NPDES frustrating and delaying the implementation of successful programs.

The Tentative Order will require the City to adopt a much more strident enforcement posture. I am fearful that the City will be forced to implement strategies using its police powers, rather than achieving favorable outcomes based upon education, mutual cooperation and alignment of systems and processes based upon alliances with me, my Association and my neighbors. This new direction will drastically alter the climate of mutual cooperation and support homeowners and the Association and the City have worked so hard to achieve. This change will result in unnecessary adversity and controversy which will delay and generate resistance to the process of making real progress in achieving the prime objective of enhancement of water quality.

Equally alarming is the change in relations between me and my Association and my neighbors which will result from the adoption of the Tentative Order. The Association will be required to pass increased costs of compliance through to the homeowners. This will enhance the debt burden imposed upon the owners by my Association, and create unnecessary hardship and tension between the Association and homeowners. Increasing dues and assessments in the current economic environment will create significant controversy, paralysis in the implementation process, and dysfunction within the community. The Association and homeowners will be caught in the cycle of ever increasing legal involvement to assure funding for the added costs which will result from adoption of the Tentative Order.

To survive financially, the Association will be forced to more aggressively pursue foreclosure and other legal remedies against delinquent homeowner members to collect unpaid assessments for these added costs. Those homeowners not in default will be required to pay even more to subsidize the debt of their delinquent neighbors.

Adoption of the Tentative Order will sow the seeds of community unrest, pitting neighbor against neighbor and homeowners against the Association and the City against the Association, homeowners and other community interest groups. Instead of achieving compliance with the requirements of NPDES and the Clean Water Act by creating a strong foundation of mutual support and cooperation, compliance will be imposed upon resisting homeowners and other community stakeholders by pursuing costly legal and administrative enforcement, penalties and fines.

The Tentative Order should be revised to support cooperation among key community stakeholders including the City, community associations, homeowners and other interest groups.

Response

The Copermittees are to continue their programs of citizen outreach and education, as has been used for the past 20 years and resulted in the state of today's water quality. The Copermittees already have the authority to issue citations for violations of their ordinances. The Tentative Order does not significantly change the Copermittees legal authority to enforce their ordinances or their public education program. Therefore, the burden of responsibility lies with the Copermittees for adverse citizen reaction due to a Copermittee using "police powers." The Tentative Order is not requiring a Homeowner Association to treat their residents any differently. The Tentative Order has oversight of HOAs to ensure they are abiding by the same pollution prevention regulations as the general populace. Any financial burden should be addressed directly to your HOA. Residents should be especially mindful that the Tentative Order is not used as a scapegoat to otherwise increase HOA coffers. We fail to see how the Tentative Order, in improving water quality, will sow the seeds of community unrest as the commenter fails to provide any logical reasoning behind the conjecture other than broad platitudes and speculation.

Comment No.	410	Commenter No.	56	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment 3. The Tentative Order fails to acknowledge the successful efforts of homeowners to achieve compliance.

In spite of this record of accomplishment, the Tentative Order imposes new requirements without justification. Where is the evidence that the programs already in place in the City are not working?

Instead of encouraging the development of pilot programs and other management practices based upon the successful existing practices, systems and operations already implemented, the Tentative Order without justification and in an almost punitive fashion mandates new procedures and compliance to new standards which will be extremely costly to achieve and which will expose me, the City, my Association and my neighbors to civil liability and other administrative penalties.

The Tentative Order should be revised to support pilot programs before setting new standards. Revisions should be made to support existing programs until those programs are shown to be ineffective. New standards and requirements should not be adopted without justification. New requirements and standards should not be adopted until there is evidence that existing programs and systems implemented by the City, the Association and the homeowners are unsuccessful.

Response The Regional Board finds it difficult to respond directly to this comment, as the comment does not specify what new requirements and standards are being imposed without justification. Furthermore, the Tentative Order does not prevent the development of pilot programs and/or other management practices, and the Regional Board contends that many requirements within the Tentative Order are built upon existing pilot programs and management practices.

While many individual homeowners have likely implemented BMPs to protect water quality standards, the Draft 2008 303(d) Report has identified 33 waterbodies and 75 waterbody pollutant combinations within Southern Orange County that are recommended to be listed as impaired (see response to Comment No. 387).

Please also see response to Comment Nos. 408 and 409.

Comment No.	411	Commenter No.	56	Comment Subject	General
--------------------	-----	----------------------	----	------------------------	---------

Comment 4. Unequal Application of the permitting process and treatment under the law is not justified.

The requirements of the Tentative Order dramatically exceed those contained in all Orders adopted by the Board and all other regions of the California Water Quality Control Board and are inconsistent with the draft Order for North Orange County. There is no justification for the different and unequal application of the permitting process or the new draconian requirements included in the Tentative Order which if adopted will result in unfair and unequal treatment of me, the City and my Association. Why should owners living in community associations in North Orange County, San Diego County, or elsewhere in California benefit from demonstrably less restrictive standards and requirements in the Orders adopted for those regions than those imposed upon me and my neighbors living in the community associations within the City which will be subject to the Tentative Order if adopted? I strongly believe that homeowners like me, the City and my Association should not be singled out and forced to bear the cost and penalty of unequal treatment under the law. There is no justification for this unfair and unequal treatment.

The Tentative Order should be revised to be consistent with the Order adopted by the Board for San Diego County and with the draft Order of the California Water Quality Control Board, Santa Ana Region, North Orange County.

Response In regards to consistency between the San Diego and Santa Ana Regional Board, please see Comment no. 24 in the July 1, 2009, Response to Comments IV. Please also see response to Comment 373. The purpose of the NPDES Permit is to protect and maintain Water Quality Standards. The Tentative Order will move South Orange County closer to that goal.

Comment No.	412	Commenter No.	56	Comment Subject	General
Comment	<p>In conclusion, I would like to stress that revisions to the Tentative Order are required to assure fair and equal treatment under the law. Revisions are required to support existing programs which are working. New standards or requirements should not be adopted unless and until it has been shown that existing programs are ineffective. Revisions should be made to encourage use of pilot programs to develop and test new requirements and standards before implementation. Revisions are needed to support and encourage cooperation among community stakeholder groups and the City. The Tentative Order should be revised to address and overcome negative economic consequences of implementation. The Tentative Order should support and compliment, and not detract from, the financial stability of the City, the community associations and the homeowners they serve.</p> <p>I ask that you review the above-mentioned information and consider it when making final revisions to the Order. I look forward to your response and stand willing and ready to answer any questions you may have. Please contact me at [insert name and contact information] should you have any questions.</p>				
Response	<p>Please see response to Comment Nos. 387 and 410. It is also unclear what revisions are required and what existing programs, in the opinion of the commenter, are working.</p> <p>The Regional Board contends that the Tentative Order does encourage cooperation between community stakeholder groups and the Copermittees. For example, the WRMP section requires the Copermittees to have a public participation mechanism within each watershed.</p> <p>To the extent economic information was submitted, the Regional Board staff considered economic considerations in developing elements of the Tentative Order, but the Regional Board is not required to conduct a cost-benefit analysis. Please see the Fact Sheet; July 6, 2007, Response to Comments I, Response No. 5; December 12, 2007, Response to Comments II, Response Nos. 1 and 9; February 13, 2008, Response to Comments, Response No 3.</p> <p>In regards to consistency between the San Diego and Santa Ana Regional Board, please see Comment no. 24 in the July 1, 2009, Response to Comments IV. Please also see response to Comment No. 373.</p>				

ATTACHMENT 38

EXECUTIVE SUMMARY

The Orange County Stormwater Program (the Program) is a cooperative municipal regulatory compliance initiative focused on the management of urban and stormwater runoff for the protection and enhancement of Orange County's creeks, rivers, streams, and coastal waters. The main objective of the Program is to fulfill the commitment of Orange County's cities, the County of Orange and the Orange County Flood Control District to develop and implement a program that satisfies the requirements of area-wide municipal National Pollutant Discharge Elimination System (NPDES) permits (subsequently referred to as the Third Term Permits).

The purpose of this document is to comply with the requirement of the Third Term Permits, Regional Water Quality Control Board Orders R8-2002-0010 (Santa Ana Regional Board) and R9-2002-0001 (San Diego Regional Board) to submit a Report of Waste Discharge 180 days prior to permit expiration. This Report discusses the Permittees' Third Term Permit compliance activities and includes a description of accomplishments, an assessment of program effectiveness, and a proposed management program (a draft 2007 Drainage Area Management Plan) for the period 2007-2012.

The Program's accomplishments represent the culmination of the development and three years of implementation of a program that was substantially revised to meet the requirements of the Third Term NPDES Permits. Notable programmatic accomplishments include:

- Completion of the 2003 DAMP including 34 jurisdictional Local Implementation Plans (LIPs) (**DAMP Appendix A**), a formal training program (**DAMP Appendix B**) a program effectiveness assessment strategy (**DAMP Appendix C**), and 6 Watershed Action Plans (WAPs) (**DAMP Appendix D**) (**Section 2.0**);
- Establishment of 2 separate, but nonetheless similar and highly interdependent, planning processes targeting the control of pollutants in urban runoff and completion of studies to evaluate the effectiveness and applicability of various source control and treatment control Best Management Practices (**DAMP Appendix D**) (**Section 3.0**);
- Validation, through independent administrative and trial court review, of the robustness of the Permittees' local legal authority for DAMP implementation (**Section 4.0**);
- Development and implementation of (1) a Model Municipal Activities program at 2,302 municipal facilities, (2) Model Integrated Pest Management Guidelines which have reduced municipal fertilizer and pesticide use, and (3) an Established BMP performance reporting program that has indicated the increased effectiveness of street sweeping and trash and debris collection practices (**Section 5.0**);
- Development and implementation of a public education program that has created over 160,000,000 media impressions and produced measurable and positive changes in public awareness and behavior (**Section 6.0**);
- Development and implementation of a Model Water Quality Management Plan (WQMP) based program for new development, the approval of over 1,400 project WQMPs, and the creation and ongoing development of a web-based expert system to support coastal urban wetland management (**Section 7.0**);
- Development and implementation of a Model Construction Program under which 6,570 enforcement actions were taken within a pattern of increasing levels of compliance in the most recent annual reporting period (**Section 8.0**);
- Development and implementation of a Model Industrial/Commercial Program under which over 31,000 facilities have been subject to local regulatory review and 7,266

enforcement actions were taken within a pattern of increasing levels of compliance in the most recent annual reporting period (**Section 9.0**);

- The investigation of 8,866 complaints regarding illegal discharges or illicit connections, increased use of a telephone hotline for the reporting by the public of water quality concerns, and implementation of enhanced cooperative local agency procedures and practices for sewage spill response (**Section 10.0**);
- Development and approval of the Third Term Permit water quality monitoring program and development and implementation of a sophisticated environmental data management system (Labtrack) (**Section C-11.0**), and
- Implementation of the DAMP/Watershed Action Plans (WAPs) in the San Diego Regional Board area (**Section C-12.0**) and significant progress toward completion of WAPs for the Newport Bay and Santa Ana River watersheds.

In assessing the effectiveness of the Program, the Permittees evaluated a series of performance metrics termed Headline Measure, that are intended to confirm program implementation and validate achievement of outcomes. The basis of this approach draws on the hierarchical taxonomy of programmatic outcomes, being advocated by the California Stormwater Quality Association (CASQA), which creates a framework for defining the relationships between compliance actions and, ultimately, positive changes in water quality. In addition, the assessment has been informed by (1) the findings of the Countywide water quality monitoring programs, (2) a series of consultative workshops conducted with jurisdictional program coordinators, (3) reviews of audit reports and other Regional Water Quality Control Board (RWQCB) correspondence and meetings with RWQCB staff, and (4) the receiving water limitations provisions of the Permits.

In conducting the assessment, three major themes emerged during the review. These themes are:

Theme 1: Demonstrating the iterative management approach: Adapting the management program to more effectively address urban sources of pollutants that are causing or contributing to exceedances of water quality standards;

Theme 2: Enhancing Implementation: Improving program implementation through incorporation for auditable environmental management system concepts, and

Theme 3: Establishing watershed-based water quality planning: On a Countywide basis, creating 2 separate, but nonetheless highly inter-related, water quality planning processes, to address urban sources of pollutants.

The Program effectiveness assessment resulted in 2 types of programmatic recommendations, specifically (1) ROWD Commitments (New programmatic commitments to be developed and implemented over the period of the Fourth Term Permits) and (2) DAMP Modifications (Improvements to existing program commitments incorporated into the proposed 2007 DAMP). The ROWD Commitments comprise:

Iterative Management: Developing and implementing new BMP programs including Integrated Pest Management (IPM) approaches for pesticide toxicity, BMPs for the architectural use of copper and zinc in new development, and new BMPs and for municipal trash and debris

EXECUTIVE SUMMARY

control.

Enhancing implementation: Defining the expertise and competencies of staff with program implementation responsibilities and to develop staff skills and expertise through a strategic approach to training. Also, commitments to develop program guidance documentation and standards for source and treatment control BMPs.

Enhancing watershed-based water quality planning: Completing 11 Watershed Action Plans to establish countywide and watershed-based water quality planning processes across Orange County.

EXECUTIVE SUMMARY

The Orange County Stormwater Program (the Program) is a cooperative municipal regulatory compliance initiative focused on the management of urban and stormwater runoff for the protection and enhancement of Orange County's creeks, rivers, streams, and coastal waters. The main objective of the Program is to fulfill the commitment of Orange County's cities, the County of Orange and the Orange County Flood Control District to develop and implement a program that satisfies the requirements of area-wide municipal National Pollutant Discharge Elimination System (NPDES) permits (subsequently referred to as the Third Term Permits).

The purpose of this document is to comply with the requirement of the Third Term Permits, Regional Water Quality Control Board Orders R8-2002-0010 (Santa Ana Regional Board) and R9-2002-0001 (San Diego Regional Board) to submit a Report of Waste Discharge 180 days prior to permit expiration. This Report discusses the Permittees' Third Term Permit compliance activities and includes a description of accomplishments, an assessment of program effectiveness, and a proposed management program (a draft 2007 Drainage Area Management Plan) for the period 2007-2012.

The Program's accomplishments represent the culmination of the development and three years of implementation of a program that was substantially revised to meet the requirements of the Third Term NPDES Permits. Notable programmatic accomplishments include:

- Completion of the 2003 DAMP including 34 jurisdictional Local Implementation Plans (LIPs) (**DAMP Appendix A**), a formal training program (**DAMP Appendix B**) a program effectiveness assessment strategy (**DAMP Appendix C**), and 6 Watershed Action Plans (WAPs) (**DAMP Appendix D**) (**Section 2.0**);
- Establishment of 2 separate, but nonetheless similar and highly interdependent, planning processes targeting the control of pollutants in urban runoff and completion of studies to evaluate the effectiveness and applicability of various source control and treatment control Best Management Practices (**DAMP Appendix D**) (**Section 3.0**);
- Validation, through independent administrative and trial court review, of the robustness of the Permittees' local legal authority for DAMP implementation (**Section 4.0**);
- Development and implementation of (1) a Model Municipal Activities program at 2,302 municipal facilities, (2) Model Integrated Pest Management Guidelines which have reduced municipal fertilizer and pesticide use, and (3) an Established BMP performance reporting program that has indicated the increased effectiveness of street sweeping and trash and debris collection practices (**Section 5.0**);
- Development and implementation of a public education program that has created over 160,000,000 media impressions and produced measurable and positive changes in public awareness and behavior (**Section 6.0**);
- Development and implementation of a Model Water Quality Management Plan (WQMP) based program for new development, the approval of over 1,400 project WQMPs, and the creation and ongoing development of a web-based expert system to support coastal urban wetland management (**Section 7.0**);
- Development and implementation of a Model Construction Program under which 6,570 enforcement actions were taken within a pattern of increasing levels of compliance in the most recent annual reporting period (**Section 8.0**);
- Development and implementation of a Model Industrial/Commercial Program under which over 31,000 facilities have been subject to local regulatory review and 7,266

enforcement actions were taken within a pattern of increasing levels of compliance in the most recent annual reporting period (**Section 9.0**);

- The investigation of 8,866 complaints regarding illegal discharges or illicit connections, increased use of a telephone hotline for the reporting by the public of water quality concerns, and implementation of enhanced cooperative local agency procedures and practices for sewage spill response (**Section 10.0**);
- Development and approval of the Third Term Permit water quality monitoring program and development and implementation of a sophisticated environmental data management system (Labtrack) (**Section C-11.0**), and
- Implementation of the DAMP/Watershed Action Plans (WAPs) in the San Diego Regional Board area (**Section C-12.0**) and significant progress toward completion of WAPs for the Newport Bay and Santa Ana River watersheds.

In assessing the effectiveness of the Program, the Permittees evaluated a series of performance metrics termed Headline Measure, that are intended to confirm program implementation and validate achievement of outcomes. The basis of this approach draws on the hierarchical taxonomy of programmatic outcomes, being advocated by the California Stormwater Quality Association (CASQA), which creates a framework for defining the relationships between compliance actions and, ultimately, positive changes in water quality. In addition, the assessment has been informed by (1) the findings of the Countywide water quality monitoring programs, (2) a series of consultative workshops conducted with jurisdictional program coordinators, (3) reviews of audit reports and other Regional Water Quality Control Board (RWQCB) correspondence and meetings with RWQCB staff, and (4) the receiving water limitations provisions of the Permits.

In conducting the assessment, three major themes emerged during the review. These themes are:

Theme 1: Demonstrating the iterative management approach: Adapting the management program to more effectively address urban sources of pollutants that are causing or contributing to exceedances of water quality standards;

Theme 2: Enhancing Implementation: Improving program implementation through incorporation for auditable environmental management system concepts, and

Theme 3: Establishing watershed-based water quality planning: On a Countywide basis, creating 2 separate, but nonetheless highly inter-related, water quality planning processes, to address urban sources of pollutants.

The Program effectiveness assessment resulted in 2 types of programmatic recommendations, specifically (1) ROWD Commitments (New programmatic commitments to be developed and implemented over the period of the Fourth Term Permits) and (2) DAMP Modifications (Improvements to existing program commitments incorporated into the proposed 2007 DAMP). The ROWD Commitments comprise:

Iterative Management: Developing and implementing new BMP programs including Integrated Pest Management (IPM) approaches for pesticide toxicity, BMPs for the architectural use of copper and zinc in new development, and new BMPs and for municipal trash and debris

control.

Enhancing implementation: Defining the expertise and competencies of staff with program implementation responsibilities and to develop staff skills and expertise through a strategic approach to training. Also, commitments to develop program guidance documentation and standards for source and treatment control BMPs.

Enhancing watershed-based water quality planning: Completing 11 Watershed Action Plans to establish countywide and watershed-based water quality planning processes across Orange County.

1.0 INTRODUCTION

The cities of Anaheim, Brea, Buena Park, Costa Mesa, Cypress, Fountain Valley, Fullerton, Garden Grove, Huntington Beach, Irvine, La Habra, La Palma, Laguna Hills, Laguna Woods, Lake Forest, Los Alamitos, Newport Beach, Orange, Placentia, Santa Ana, Seal Beach, Stanton, Tustin, Villa Park, Westminster, and Yorba Linda (collectively the Santa Ana Region Permittees) and the cities of Aliso Viejo, Dana Point, Laguna Beach, Laguna Hills, Laguna Niguel, Laguna Woods, Lake Forest, Mission Viejo, Rancho Santa Margarita, San Clemente, and San Juan Capistrano (collectively the San Diego Region Permittees) operate municipal storm drain systems and discharge stormwater and urban runoff pursuant to National Pollutant Discharge Elimination System (NPDES) Permits.

These Permits require that the Permittees work together to:

- Effectively prohibit non-stormwater discharges to the stormdrain system, and
- Implement controls to reduce the discharge of pollutants in stormwater to the Maximum Extent Practicable (MEP).

The Permits were first adopted in 1990 and subsequently renewed in 1996 (Second Term) and 2002 (Third Term) (See **Table 1.1**). This **Report of Waste Discharge** has been prepared in anticipation of the expiration of the Third Term Permits in early 2007 and comprises:

- An evaluation of NPDES permit compliance over the period of the Third Term Permits;
- A proposed management program, the **2007 Drainage Area Management Plan (2007 DAMP)** (see **Appendix A**) for the Fourth Term Permits;
- A comparison of land use in Orange County in 2002 and 2005 (see **Appendix B**), and,
- A compendium of maps showing changes to the storm drain system infrastructure over the period of the Third Term Permits (see **Appendix C**).

1.1 Background

1.1.1 Drainage Area Management Plan

The **Drainage Area Management Plan (DAMP)** is the principal policy and program guidance document for the *Orange County Stormwater Program*, a cooperative municipal regulatory compliance initiative focused on the management and protection of Orange County's streams, rivers, creeks and coastal waters. The main objective of the DAMP is to fulfill the commitment of the Permittees to develop and implement a program that satisfies NPDES permit requirements.

SECTION 1.0, INTRODUCTION

The DAMP describes the agreements, structures and programs that:

- Provide the framework for the program management activities and plan development (**DAMP Section 2.0** and **Section 3.0**);
- Provide the legal authority for prohibiting unpermitted discharges into the storm drain system and for requiring BMPs in new development and significant redevelopment (**DAMP Section 4.0**);
- Improve existing municipal pollution prevention and removal best management practices (BMPs) to further reduce the amount of pollutants entering the storm drain system. (**DAMP Section 5.0**);
- Educate the public about the issues of urban stormwater and non-stormwater pollution and obtain their support in implementing pollution prevention BMPs (**DAMP Section 6.0**);
- Ensure that all new development and significant redevelopment incorporates appropriate Site Design, Source Control and Treatment Control BMPs to address specific water quality issues. (**DAMP Section 7.0**);
- Ensure that construction sites implement control practices that address control of construction related pollutants discharges including an effective combination of erosion and sediment controls and on-site hazardous materials and waste management (**DAMP Section 8.0**);
- Ensure that existing development addresses discharges from industrial facilities, selected commercial businesses, residential development and common interest areas/homeowner associations (note: the San Diego permit explicitly outlines a residential component, but the Santa Ana permit is more general about residential requirements). (**DAMP Section 9.0**);
- Detect and eliminate illegal discharges/illicit connections to the municipal storm drain system (**DAMP Section 10.0**);
- Identify urban impacts on receiving waters; produce environmental quality information to direct management activities, including prioritization of pollutants to support the development of specific controls to address these problems; and determine pollutant load reductions and changes in the quality of receiving waters (**DAMP Section 11.0**); and
- Assess watershed constituents of concern and manage urban runoff on a watershed basis (**DAMP Section 12.0**).

1.1.2 Runoff from Urban Areas

The Program is concerned with the imprint of urban development on the landscape.

SECTION 1.0, INTRODUCTION

Urbanization creates rooftops, driveways, roads and parking lots (Schueler and Holland, 2000,¹ use the term *Imperviousness* as the unifying theme for understanding the adverse hydrologic impacts of urbanization), which (1) increase the timing and volume of rainfall runoff (compared to pre-development conditions) and (2) provide a source of pollutants that are flushed or leached by rainfall runoff into aquatic systems. The environmental consequences of these impacts are loss or impairment of aquatic beneficial uses due to:

- Water quality degradation resulting from increased loadings of sediment nutrients, metals hydrocarbons, pesticides and bacteria;
- Stream channel instability and habitat loss resulting from increased severity and frequency of floods;
- Increased water temperatures resulting from solar energy absorption by urban surfaces and elimination of riparian shading; and
- Loss of groundwater recharge.

1.1.3 Regulatory History

The Orange County Stormwater Program was initiated in 1990 as a cooperative local government response to a 1987 amendment to the federal Clean Water Act (CWA). This amendment extended the provisions of CWA Section 402 (National Pollutant Discharge Eliminations System permitting) to municipal storm drain system operators thereby making local governments (and some industrial activities) responsible for the quality of their stormwater discharges. Permit application requirements were promulgated by US Environmental Protection Agency (EPA) in 1990 (40 CFR 122) and form the basis of the current program.

Orange County's first NPDES Permits were issued in 1990 with renewals in 1996 and 2002. There are separate NPDES Permits administered by the Santa Ana and San Diego Regional Water Quality Control Boards (RWQCBs). The Permits prescribe that surface water quality protection be addressed in local governments' oversight of construction and development, its regulation of industry and commerce, and in its construction, operation and maintenance of the public urban infrastructure.

Program managers maintain the compliance of their jurisdiction with the applicable permit (or permits) through implementation of a BMP-based environmental management system (i.e. the DAMP) that is subject to both annual self auditing and reporting and external regulatory compliance audits which, in the Santa Ana Regional Board are, is an enforceable part of the Third Term Permit.

¹ Thomas R. Schuler and Heather K. Holland. *The Practice of Watershed Protection: Techniques for protecting our nation's streams, lakes, rivers and estuaries* (Maryland: Center for Watershed Protection, 2000).

1.2 Approach to Preparing Report of Waste Discharge

1.2.1 Themes

The immediate objective of the ROWD is to fulfill the commitment of the Permittees to undertake a program assessment and propose revisions to the management program in response to the information learned. While compliance with the Third Term Permits is maintained by implementation of prescribed management actions, program assessment must be undertaken with regard to the Permits' receiving water limitations provisions which require adaptation of the Orange County Stormwater Program where urban sources are causing or contributing to exceedances of applicable water quality standards. The first of the major themes that has framed preparation of the ROWD is a focusing of management efforts on identified water quality constituents of concern identified by the environmental monitoring programs.

The Third Term Permits transformed the Orange County Stormwater Program developed under the First and Second Permit Terms. The major escalation in compliance obligations prescribed new requirements for local governments' oversight of construction and development, regulation of industry and commerce, and its construction, operation and maintenance of the public urban infrastructure. These new compliance obligations required a major realignment of the program implemented over two years with the consequence that program performance metrics are generally available for three years. Program effectiveness assessments over the limited period of full implementation have indicated positive programmatic impacts, as detailed in subsequent sections of this report. However, annual assessments have also indicated significant variability in performance reporting between jurisdictions. In addition, regulatory agency reviews have identified differences in regulatory agency and Permittee expectations in key areas of the Program, particularly with respect to regulation and oversight. The second major theme of the ROWD is therefore a focus on enhancing existing program implementation rather than the proposed development of major new program initiatives.

The third major theme is a focus on the watershed approach and specific water quality constituents of concern. The Third Term Permits required the Permittees under the jurisdiction of the San Diego RWQCB to develop Watershed Urban Runoff Management Plans (WURMPs) to address priority water quality constituents of concern, and similar plans are being developed for watersheds in the Santa Ana Region. The WURMPs, termed DAMP Watershed Action Plans, while continuing to evolve, provide a basis for both cooperative targeted actions that complement the countywide approach and optimizing management actions on a regional, sub-regional or jurisdictional basis.

Major Themes of the ROWD

- Demonstrating the Iterative Management Approach: Implementing policy shifts based upon the findings of the environmental monitoring programs.

- Enhancing Implementation: Focusing on program implementation through incorporation of environmental management system concepts.
- Emphasizing the Watershed Approach: Establishing and enhancing watershed-based water quality planning on a countywide basis.

1.2.2 Assessment

The DAMP incorporates three separate but nonetheless related water quality planning processes which are identified as “countywide,” “jurisdictional,” and “watershed-based” water quality management. Each process is iterative and incorporates annual phases of assessment focused on determining whether programmatic outcomes are being achieved (See **DAMP Appendix C - Program Effectiveness Assessment**). These annual assessments have previously been reported (see Unified and jurisdictional Annual Progress Reports).

DAMP Appendix C also recognizes the additional phase of assessment required in the ROWD every five years. While the longer term perspective of the ROWD allows a focus on environmental outcomes, both the annual and ROWD assessments necessarily consider the same performance metrics, both programmatic and environmental. In addition to considering these metrics, preparation of effectiveness assessments in the ROWD were additionally informed by:

- A longer term (rather than annual) review of the findings of the countywide water quality monitoring programs;
- Review of audit reports and other regulatory correspondence regarding the Program and meetings with RWQCB staff;
- A series of facilitated consultation meetings with jurisdictional program coordinators, including in-depth interviews on key program areas; and
- Input from the public at workshops.

The assessment has produced two types of programmatic recommendations:

1. ROWD Commitments, and
2. DAMP Modifications.

ROWD commitments represent shifts in programs that will be implemented upon completion of a development process with the Permittees, and are identified at the end of each program section of the ROWD. DAMP Modifications are characterized as programmatic modifications for improving program implementation and have been incorporated into the proposed 2007 DAMP.

SECTION 1.0, INTRODUCTION

Program Effectiveness

An activity, program element, or overall program is effective if it is producing a desired outcome. **Figure 1.1** shows that outcomes can be construed in terms of six levels and illustrates the progression of each successive level toward the ultimate goal of environmental improvement. In general, Levels 1 to 3 can be considered *Implementation Outcomes*, Levels 5 and 6 *Water Quality Outcomes* and Level 4 a combination of the two. Each level has value in informing the management process. However, it bears emphasis that not all are necessary or possible in every instance (CASQA, 2005).²

Assessment measures may be variously categorized. In this ROWD, two categories are recognized, related to (1) the shorter term confirmation of BMP implementation (Implementation or Process Measures, also termed Programmatic Indicators), corresponding to Levels 1-3 in **Figure 1.1**, and (2) the longer term verification of environmental improvement (Validation or Results Measures, typically actual indicators of environmental change). In essence, the categorization of measures reflects two basic assessment questions:

- Are program elements being implemented correctly?
- Are environmental improvements being realized?

Headline Indicators are intended to be a sub-set of measures that reflect in simple terms how a stormwater program is progressing towards its goals and are easily understandable. The Orange County Stormwater Program Headline Indicators that have been reported over the Third Term Permits are presented in **Table 1.2**.

Effectiveness assessment requires the establishment of a set of baseline conditions. Thereafter effectiveness can be determined by comparisons of successive years of indicator information against the baseline data. Where the period of evaluation is characterized by the implementation of new program requirements, determinations of program effectiveness will be limited to confirmation of program implementation. Indeed, it must be recognized that evidence of positive environmental outcomes can be elusive because:

- Water quality changes in response to program implementation are likely to be very slow; and
- Establishing a link between receiving water condition and program activities is difficult at the watershed scale when programs are being implemented incrementally.

While program effectiveness assessment is a key step in the iterative process of program

² California Stormwater Quality Association (CASQA). 2005. "An Introduction to Stormwater Program Effectiveness Assessment." Available at: http://www.scvurppp-w2k.com/pdfs/0405/CASQA%20White%20Paper_An%20Introduction%20to%20Stormwater%20Program%20Effectiveness%20Assessment4.pdf.

SECTION 1.0, INTRODUCTION

implementation, it should be realized that effectiveness assessment tools are still evolving. Assessing program effectiveness is recognized as a challenge for program managers across California, and the Orange County Stormwater Program is supporting the effort of the California Stormwater Quality Association (CASQA) to develop guidance in this area at a statewide level.

Environmental Assessment

A summary of the major findings of the water quality monitoring program is presented in **Section 11**. This summary has identified a number of water quality constituents of concern, specifically, metals (copper and zinc) and pesticides, based upon frequent exceedances of water quality standards and the occurrence of toxicity, respectively. In addition, Total Maximum Daily Loads (TMDL) and 13225 and 13267 Directives (see **Section 12**) for pathogen indicator bacteria and regulatory interventions regarding trash and debris require that these constituents also be considered water quality constituents of concern that will be the focus of targeted management efforts over the period of the Fourth Term Permits.

Regulatory Assessment

Over the period of the Third Term Permits, most of the municipal entities have been the subject of compliance audits which have served to highlight the successes (national recognition by USEPA) and shortcomings (three instances of administrative civil liabilities) of the Program. Since the primary objective of the DAMP is to fulfill the commitment of the Permittees to develop and implement a program that satisfies NPDES permit requirements, regulatory agency findings regarding permit compliance and the performance of the Orange County Stormwater Program must be considered in effectiveness assessments. Indeed, many of the commitments made in the subsequent sections follow from regulatory findings. In addition, current Total Maximum Daily Load (TMDL) development in the South County area and a regulatory intervention regarding trash and debris in the north County area, elevate fecal indicator bacteria and trash and debris to the status of Orange County Stormwater Program water quality constituents of concern.

Permittee Assessment

The Permittees have undertaken a comprehensive review of the current programs, identifying areas that are ineffective and require modification, and ones requiring additional emphasis. This assessment, coupled with the environmental and regulatory assessments, are the foundational underpinnings for this ROWD.

Figure 1.1: General Classification of Outcome Types

2.0 PROGRAM MANAGEMENT

2.1 Introduction

The key elements of program management comprise the Principal Permittee and Permittee relationship, the Implementation Agreement, the structure and hierarchy of committees (termed Management Framework), and policy and program documentation (i.e. the DAMP). At the inception of the Orange County Stormwater Program, the Permittees in both Regional Board areas agreed that the County of Orange would be the Principal Permittee and the cities and the Orange County Flood Control District would be Co-Permittees on the permit (all parties are now collectively referred to as Permittees). Principal Permittee and Permittee responsibilities are specified in the Permits and reiterated in the NPDES Stormwater Permit Implementation Agreement (referred to as Implementation Agreement) which also provides a funding mechanism for the shared costs (administration, program development, public education, and environmental monitoring) of the Orange County Stormwater Program. To further support the development and implementation of a coordinated countywide program, a management framework was created during the First Permit Term. With the Third Term Permits this framework has evolved into a four tier structure (Permittees, City Managers' Water Quality Committee, Technical Advisory Committee (TAC) and Program Committees/Task Forces). Concurrently, the DAMP was substantially revised to address the significant escalation in compliance requirements prescribed in the Third Term Permits.

2.2 Accomplishments

2.2.1 Implementation Agreement

The Implementation Agreement, originally entered into in December of 1990, was amended in October of 1993 to include two additional Permittees (Laguna Hills and Lake Forest) and formally establish the TAC.

- Implementation Agreement: On June 25, 2002, the Implementation Agreement was amended again and fully restated to include three additional Permittees (Aliso Viejo, Laguna Woods and Rancho Santa Margarita).

2.2.2 Management Framework

The Permittees established (in early 2002) and maintained a tiered management framework consisting of committees, task forces, sub-committees and ad hoc work groups to direct the development and implementation of the Orange County Stormwater Program (**Figure 2.1**). A greater level of participation in all aspects of the program has been evident by high Permittee participation in the management framework. This framework is composed of:

- City Manager's Water Quality Committee
-

SECTION 2.0, PROGRAM MANAGEMENT

The City Manager's Water Quality Committee meets as needed to provide budget and overall program review and governance direction.

- City Engineer's Technical Advisory Committee (TAC)

The TAC serves in a program advisory role and provides policy direction on program budget and program development and implementation. It is comprised of one Public Works Director/City Engineer, or selected representative, from each of the County Supervisor Districts and a representative from the County of Orange. It meets 4-6 times annually.

- General Permittee Committee

The General Permittee Committee is the principal forum for disseminating information for program coordinators. The Committee meets monthly (except November).

In 2004-05, thirty four (34) out of thirty five (35) Permittees reported 80% or higher participation in the General Permittee Committee.

- Task Forces/ Sub-Committees

The *Task Forces/ Sub-Committees* provide for the continued development of the program in a specified area of program responsibility and oversight. The Task Forces/ Sub-Committees which were active in 2004-05, are:

- Trash and Debris Task Force
 - Purpose: To foster and sustain partnership approaches to dealing with trash and debris in stormwater and urban runoff (quarterly meeting schedule). Recent products include a strategic assessment of Orange County's trash and debris control efforts.
 - Legal/Regulatory Authority Task Force
 - Purpose: To review the legal authorities that the Permittees have in complying with the permit requirements and recommend changes as needed and to track stormwater related litigation that may affect the Orange County Stormwater Program (quarterly meeting schedule).
 - Water Use Efficiency Task force
 - Purpose: To study and support a comprehensive effort to curb urban runoff through efficient water usage in Orange County (quarterly meeting schedule).
-

SECTION 2.0, PROGRAM MANAGEMENT

- Data and Information Management Sub-Committee
 - Purpose: To oversee the development and implementation of information technology solutions to program data management and reporting requirements (monthly meeting schedule). Recent products include an internet-based system for preparation of the annual reports/Program Effectiveness Assessments (PEAs).
 - LIP/PEA Sub-Committee
 - Purpose: To provide oversight and technical direction to the management of core DAMP/Local Implementation Plan (LIP) programs (bi-monthly meeting schedule).
 - Public Education Sub-Committee
 - Purpose: To provide regional consistency and oversight for the stormwater public education program efforts (monthly meeting schedule). The sub-committee directs development and dissemination of all education and outreach materials.
 - Inspection Sub-Committee
 - Purpose: To provide a forum for the coordination, investigation, enforcement and training aspects of the existing development inspection program and Illegal Discharges/Illicit Connections (ID/IC) programs (bi-monthly meeting schedule). Recent products include the Investigative Guidance Manual and self-audit checklist.
 - Water Quality Sub-Committee
 - Purpose: To provide oversight and technical input for the revision of the water quality monitoring programs, ongoing water quality data evaluation, and special water quality investigations and BMP effectiveness studies (quarterly meeting schedule).
 - Ad-Hoc Group – Wastewater Disposal
 - Purpose: To develop a list of BMPs for the disposal of washwater/wastewater generated by mobile businesses. The Group was convened specifically to address wastewater disposal issues and worked cooperatively with the sewerage agencies to produce best management practice guidance (BMP Fact Sheet IC24). This ad-hoc group has now sunsetted.
-

SECTION 2.0, PROGRAM MANAGEMENT

- Watershed Committees
 - Seven Watershed Committees (Newport Bay, Laguna Coastal streams, Aliso Creek, Dana Point Coastal Streams, San Juan Creek, San Clemente Coastal Streams, and San Mateo Creek) were established and have met regularly since their inception.
 - Other Watershed Committees/Work Groups

The Permittees have also participated in the Newport Bay Executive and Management Committees (the latter held jointly for a period with the Army Corp of Engineers (ACOE) Study Management Team), the Huntington Harbour Water Quality Task Force, the Dana Point Harbor Water Quality Task Force, the Coastal Coalition, and the Aliso Creek Tier I and Tier II stakeholder meetings. These watershed groups focus their activities and discussions on broader watershed issues of concern, such as habitat restoration and flood control in addition to water quality issues resulting from Total Maximum Daily Loads (TMDLs) and special directives.

- Other Representation/Participation

The Principal Permittee actively represents the Permittees on various advisory stormwater fora, including, California Stormwater Quality Association (CASQA), Southern California Coastal Water Research Project (SCCWRP) (the County, representing the Orange County Stormwater Program, joined SCCWRP in 2005-06), Plastic Debris - Rivers to Sea Project, Nitrogen and Selenium Management Program, and Waste Discharge Requirements (WDR) for Fats, Oils and Grease (FOG) Program.

2.2.3 Program Documentation

The completion of the 2003 DAMP marked the culmination of a major program documentation overhaul and revision that was initiated by the preparation of the Report of Waste Discharge submitted on September 1, 2000. In addition to the revised policy commitments and model programs, the DAMP was expanded through the addition of appendices to include 34 individual jurisdictional LIPs (the Permittees formally identified which departments have responsibility for implementation of each program element), an extensive compendium of training materials, regional and jurisdictional program effectiveness assessment and reporting, and six watershed management plans.

2.2.4 Watershed Mapping

To support the development of the DAMP/Watershed Chapters, GIS-based mapping was undertaken for the S. County area initially to define watershed boundaries. It will be completed for the entire County area by the end of 2006 and will, for the first time, establish definitive watershed and sub-watershed boundaries for Orange County.

SECTION 2.0, PROGRAM MANAGEMENT

Orange County Watersheds (See **Figure 12.1**)

Orange County – Santa Ana Region	South Orange – San Diego Region
San Gabriel / Coyote Creek Watershed (within Orange County)	Laguna Coastal Streams Watershed
Anaheim Bay/Huntington Harbour Watershed	Aliso Creek Watershed
Santa Ana River Watershed (within Orange County)	Dana Point Coastal Streams Watershed
Newport Bay Watershed	San Juan Creek Watershed
Newport Coastal Streams Watershed	San Clemente Coastal Streams Watershed
	San Mateo Creek Watershed (within Orange County)

2.2.5 Fiscal Analyses

Annual fiscal analyses have been conducted since the inception of the Program. Each analysis identifies *shared costs* and *individual costs*. Shared costs are those that fund activities performed by the Principal Permittee. These activities include administration, program development, public education, and environmental monitoring. The projected-shared cost expenditures for the 2005-06 fiscal year, as approved by the Permittees, were \$5,941,160.

Individual Costs are those incurred by each Permittee arising from its jurisdictional program implementation as documented in the LIPs and comprise capital and operation and maintenance costs. Capital Costs refers to expenditures for land, large equipment, and structures and Operations and Maintenance Costs refer to normal costs of operation including the cost of keeping equipment and facilities in working order. The total individual Permittee costs for the 2005-06 fiscal year were projected to be \$91,868,883.

The fiscal analysis also requires the identification of funding sources. The funding sources used by the Permittees include: General Fund, Utility Tax, Separate Utility, Gas Tax, and Special District Fund, Others (Sanitation Fee, Fleet Maintenance, Community Services District, Water Fund, Sewer & Storm Drain Fee, Grants, and Used Oil Recycling Grants). **Figure 2.2** shows that general funds continue to support over half the cost of program implementation across Orange County.

2.3 **Assessment**

2.3.1 Implementation Agreement

Since the inception of the Program the Implementation Agreement has been amended to provide for the incorporation of new cities and to formally recognize the role of the TAC. The structure of the Agreement has accommodated the expansion of the program and the significant escalation of shared costs with the adoption of the Third Term Permits. More recently, the Agreement has served as a model for cost sharing collaboration related to the Newport Bay TMDL compliance effort (including the Nitrogen Selenium Management Program), Regional Harbor Monitoring Program, and

SECTION 2.0, PROGRAM MANAGEMENT

Aliso Creek 13255 Directive. Consequently, it is considered to be an effective basis for cooperation of the Program.

2.3.2 Management Framework

USEPA defines a management framework *“as a lasting process for partners working together. It's a support structure making it easier to coordinate efforts--a structure made of agreed upon standard operating procedures, timelines, and forums for communicating with each other”*. On the basis of this definition, the current framework continues to effectively serve the Permittees. The Management Framework has enabled 36 local government entities to develop, implement and sustain coordinated regional and watershed-based approaches to water quality protection and management. The Framework provides a basis for all parties, including staff, management, executive management and elected officials to be informed and involved in the planning processes.

In addition to the established framework, an alternate management framework was conceived during the Third Permit Term by County senior management and the City Managers Association Water Quality Committee in the context of developing a countywide strategic approach to water quality protection based upon three watershed management areas. Conceptually endorsed by the County of Orange Board of Supervisors, this alternate structure will continue to be developed over the course of the Fourth Term Permits.

Headline Indicator - Participation in General Permittee Committee: In 2004-05, thirty four (34) out of thirty five (35) Permittees reported 80% or higher participation in the General Permittee Committee compared to thirty two (32) Permittees reporting 80% or higher participation in 2003-04.

The management framework is reviewed annually to ensure it meets program needs. All the committees/task forces have been effective in bringing forward initiatives to meet the requirements of the Third Term Permits and to address program needs under a consensus building production process.

While these outcomes point to the value and robustness of the current Framework, there has been significant turnover of staff in jurisdictional program manager positions. This has led to a regulatory agency perception that program managers lack the training and expertise necessary to effectively implement the “stormwater mandate.”

ROWD Commitment:

- Prepare a training schedule and define expertise and competencies for jurisdictional program manager positions.
-

SECTION 2.0, PROGRAM MANAGEMENT

2.3.3 Program Documentation

International Organization for Standardization (ISO) 14000 provides criteria for evaluating the efficacy of management system documentation. The DAMP expresses the commitment of the Permittees to NPDES permit compliance and to addressing the adverse impacts of urban runoff on Orange County's creeks, rivers, streams and coastal waters. It establishes objectives, guides the participating organizations toward the development and implementation of BMPs, and commits the Permittees to an iterative process of improvement. It requires the designation of a program manager and assigns responsibilities (through the LIPs) for program implementation. Based upon these considerations, the DAMP meets formal environmental management system expectations for policy documentation. Moreover, the DAMP clearly identifies management procedures and provides for the internal and external communication of both policy and performance. The DAMP is also widely available to interested parties through its posting to www.ocwatersheds.com.

While the comprehensive nature of the current documentation supports the implementation of the Program, it can be perceived as overwhelming in its complexity to both jurisdictional program coordinators who lack a long period of program association and outside constituencies seeking insights into the program. Moreover, the active consideration being given by regulators (e.g. the SWRCB's Blue Ribbon Panel) to possible future inclusion in NPDES permits of quantitative measures, including effluent limitations, underscores regulatory agency and environmental advocate perception of there being undue complexity and challenge with respect to establishing discharger accountability. It is possibly a perception which is being reinforced by overly comprehensive and complex program documentation. The Permittees started to address this issue of accessibility with the publication of the "popular format" *Orange County Stormwater Program Progress in 2002-2003* report and this document's subsequent acclaim points to the need for the more regular use of "popular" format reports. However, to address both the need for the DAMP to be more "accessible" and the Permittees' interest in validating a regulatory framework for stormwater predicated upon an auditable management system, the DAMP must more succinctly demonstrate to all constituencies that policies, objectives, and targets are properly identified and are being met, that regulatory compliance is being achieved, and that the planning processes provide for iterative improvement.

DAMP Modification:

- Revise the DAMP for greater consistency with established Environmental Management System (EMS) principles and improved accessibility to different constituencies and levels or readership.

2.3.4 Fiscal Analyses

SECTION 2.0, PROGRAM MANAGEMENT

The significant year-to-year variability in reported program costs (**Figure 2.3**), which cannot be attributed to changes in program management, point to the clear need for an assessment of the fiscal reporting process.

ROWD Commitment:

- Prepare a fiscal reporting strategy based upon a review of the fiscal analysis reporting section of the PEA, to better define the expenditure and budget line items included in the fiscal report.
-

Figure 2.1: Orange County Municipal NPDES Management Framework

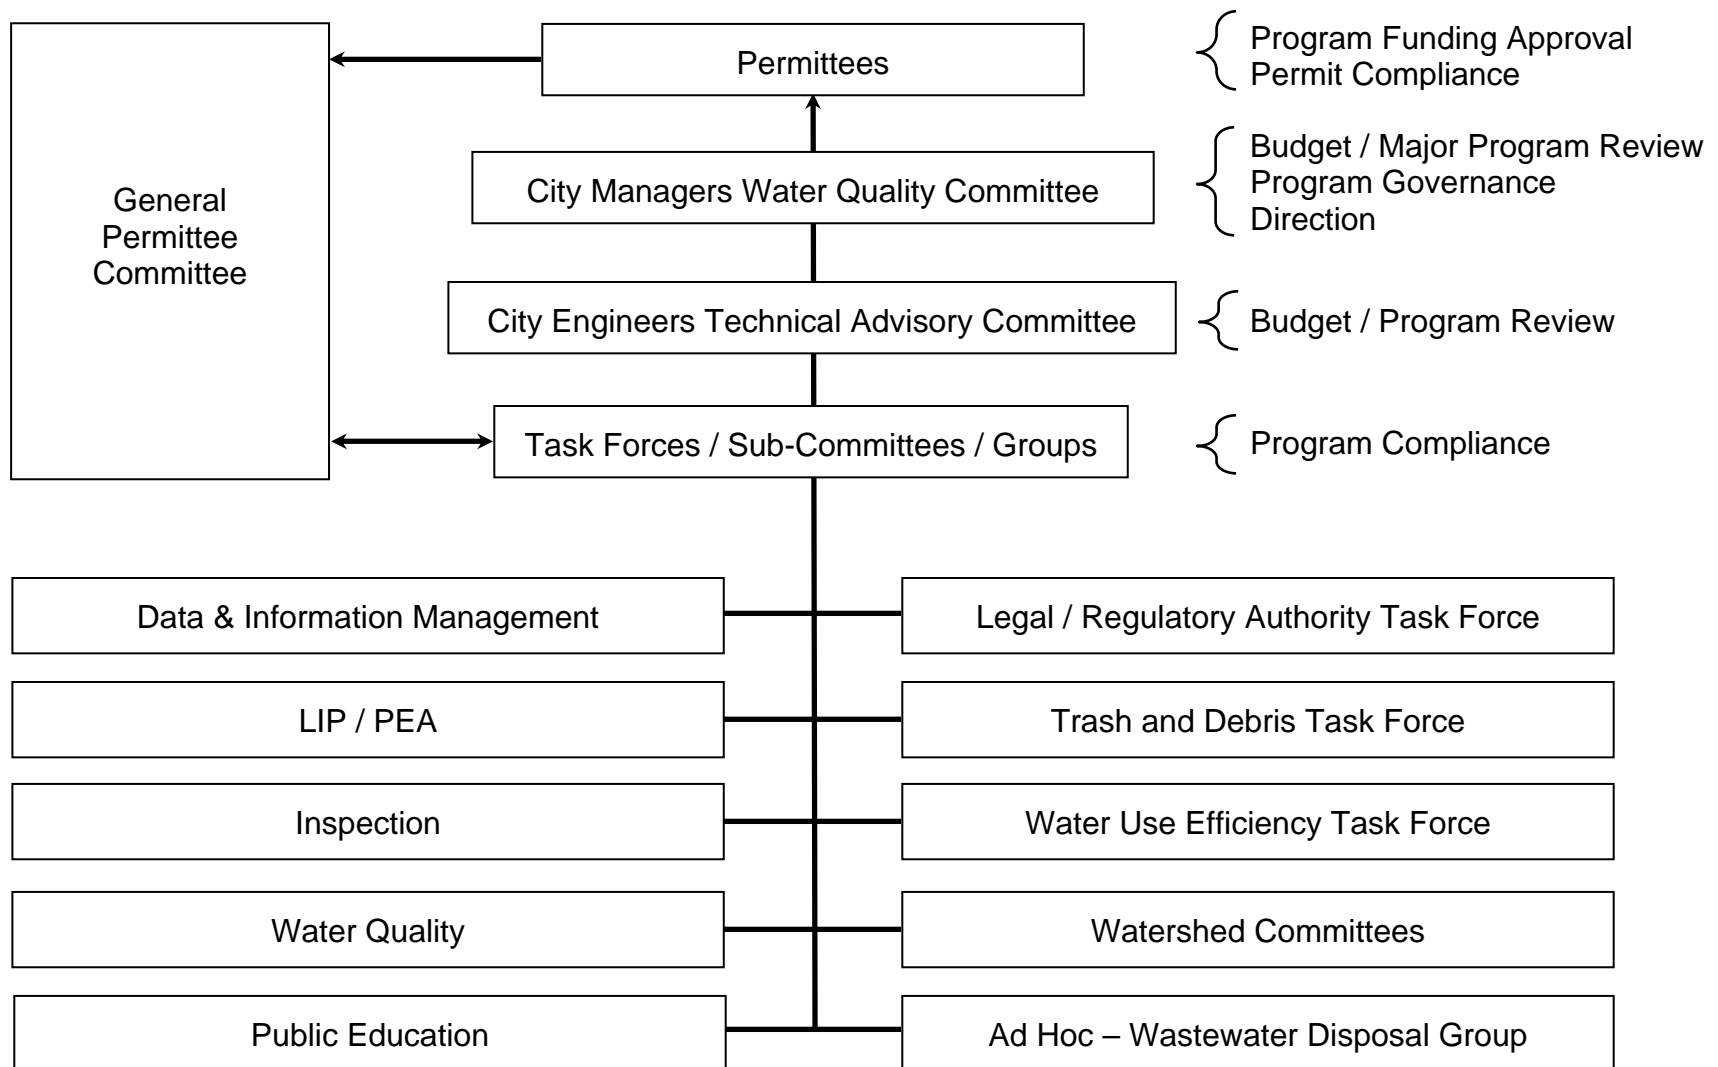

Figure 2.2: 2004-05 Funding Sources

Figure 2.3: Historical Review of Total Individual Permittee Costs

3.0 PLAN DEVELOPMENT

3.1 Introduction

The DAMP sets forth a countywide approach for urban stormwater management by:

- Establishing a baseline set of BMPs that are applicable to all areas and that are proven and cost-effective;
- Monitoring water quality to assess progress and identify urban impacts on receiving water;
- Prioritizing waterbodies for corrective action, with those listed as impaired having a higher priority; and
- Focusing on enhanced BMPs for constituents of concern at a watershed or jurisdictional level, as appropriate.

The purpose of **DAMP Section 3.0** is to describe an iterative planning process, informed by programmatic BMP assessments and environmental monitoring, which support the progressive evolution attainment of water quality standards, as required by the NPDES Permits.

3.2 Accomplishments

3.2.1 Enhancements to DAMP: Iterative Planning Processes

A defining feature of the iterative planning process is the continual analysis, measurement and improvement through the quality loop which is illustrated in a simplified form in **Figure 3.1**:

Assessing: Assessing environmental conditions and programmatic performance, establishing the goals and targets to be achieved, and determining the route to be taken and the measurements to track success;

Planning: Designing activities to achieve the goal, identifying the needed skills and expertise, and designating responsibility for achieving desired outcomes;

Implementing: Striving to bring the process into effect in an efficient and effective manner, and

Monitoring: Evaluating the effectiveness of the *Implementing* stage.

With the adoption of the Third Term Permits, the DAMP which previously had presented policy and programmatic guidance, was revised to incorporate greater individual accountability through jurisdictional Local Implementation Plans (LIPs) (see **DAMP Appendix B**). The LIPs provide a flexible jurisdiction-specific plan within the broader policy and model program framework of the DAMP.

With additional permit mandates to institute watershed-based planning, water quality

planning in the context of the DAMP is now evident as two separate, but nonetheless similar and highly interdependent, processes targeting the control of pollutants in urban runoff. These processes (**Table 3.1; Figure 3.1**) are now recognized in the DAMP as:

- DAMP/LIP – Directed by jurisdictional assessments completed individually by each Permittee and a countywide assessment through a Unified Annual Progress Report.; and
- DAMP/Watershed Action Plan (WAD) (See **DAMP Appendix D**) – Directed by watershed scale assessments in Watershed Annual Reports.

3.2.2 Enhancements to DAMP: Programs and BMPs

Assessment is the part of the planning cycle that involves either initial investigation of the environmental conditions that are being addressed by the management program or, in subsequent iterations of the planning cycle, re-assessment to determine program effectiveness (i.e. if the actions being implemented are contributing to programmatic goals). It encompasses programmatic (including technology evaluations) and environmental enhancements and is itself an evolving area of stormwater management.

Programmatic Enhancements

To assist the Permittees with reporting the status of LIP implementation and the performance of the individual jurisdictional stormwater quality management programs, a Program Effectiveness Assessment (PEA) reporting framework (**DAMP Appendix C**) was developed in 2002-03. The PEA:

- Facilitates the collection and compilation of specific stormwater program implementation data and progress validation indicators;
 - A PEA template was created in 2003 and has been the basis of the 2002-03, 2003-04, and 2004-05 Annual Reports. In 2005, the template was converted into an internet-based reporting system.
- Provides for program effectiveness assessment by the individual Permittees and the Principal Permittee on a jurisdictional, watershed and/or countywide basis;
 - The PEA identifies specific programmatic and environmental performance metrics including specified validation indicators titled, “Headline Indicators.” (See Section 1.2.2)
- Ensures that an evaluation and improvement process is applied on a jurisdictional, watershed and/or countywide level to determine where modifications within the DAMP, LIP or WAP may be necessary; and
- Provides a mechanism for the Permittee to identify and report modifications that have or will be made to their LIP.

Enhancements in BMP Knowledge

A number of BMP evaluations, with countywide application, have been undertaken. These studies include the *BMP Effectiveness and Applicability for Orange County* (see **DAMP Appendix E1**); *Trash and Debris BMP Evaluation* (see **DAMP Appendix E2**); *Erosion Control BMP Effectiveness Study* (see **DAMP Appendix E3**); *Septic System Inventory and Assessment* (see **DAMP Appendix E4**); *Portable Toilet Pollution Prevention Program* (see **DAMP Appendix E5**), *Dry Weather Diversion Study* (see **DAMP Appendix E6**), *BMP Retrofit Opportunity Study* (see **DAMP Appendix E7**), and *Tustin Area Spill Containment Project* (see **DAMP Appendix E8**).

- *BMP Effectiveness and Applicability for Orange County*

This study was commissioned to review existing information on available structural BMPs and to organize and present specific information to facilitate the selection, siting, design, construction and maintenance of the most appropriate and cost-effective BMPs for a particular site in Orange County. The study recommended consideration be given to using extended detention basins, vegetated swales, vegetated buffer strips, bioretention, sand and organic filters, infiltration basins and infiltration trenches. In 2005, the study report was updated to include flow reduction BMPs developed in conjunction with the Nitrogen and Selenium Management Program.

- *Trash and Debris BMP Evaluation*

The objectives of the study were to review characterization information on trash and debris in Orange County and to identify candidate structural BMPs. The study concluded that site characteristics such as hydraulic head or footprint may be the principal determinants of BMP selection. During the reporting period the findings of this study were developed into a BMP selection guide for retrofit applications to modify an existing facility to provide a water quality (trash/debris removal) function. This guide will be finalized in 2006-07 and incorporated into **DAMP Appendix E**.

- *Erosion Control BMP Effectiveness Study*

The study was conducted to evaluate selected erosion methodologies for graded building pads with the goal of providing information on (1) the effect of time and weathering on product condition; (2) the frequency a product must be applied to be effective; (3) the maximum slope on which a product will perform effectively; and (4) how product performance is affected by soil types. The study comprised an evaluation of two types of hydraulic mulch (paper and wood based), two types of polyacrylimide (low and high molecular weights), and wood mulch (without a binding agent). The findings of the evaluation, which will be reported in the **2005-06 Unified Report** and incorporated into **DAMP Appendix E**, will be used to form the basis of a program recommendation on county pre-approved

BMPs.

- *Septic System Inventory and Assessment*

The objectives of this study were to develop an inventory/database of the septic systems in Orange County and to estimate the potential impact of septic systems on the quality of selected receiving waters. The final inventory/database compilation resulted in a list of over 2776 active septic systems which are widely dispersed throughout the County but are found in the highest concentrations in the Santa Ana River watershed. In the course of conducting eighty field surveys, one failed system was noted, representing a failure rate of 1.25% which was consistent with a similar finding in the literature. The study concluded that septic systems do not represent a significant source of constituents of concern (particularly fecal indicator bacteria and nutrients) for Orange County receiving waters.

- *Portable Toilet Pollution Prevention Program*

The objectives of the evaluation were to: (1) determine the nature of existing operational practices and regulatory oversight structure; (2) assess the extent to which the present practices associated with their use and maintenance were adversely impacting surface water quality; and (3) recommend appropriate revisions to current operational practices or regulatory oversight as warranted. The study determined that current standard industry practices for use, maintenance, transport and storage of portable toilets within Orange County are generally found to be sufficiently responsible to prevent impacts to receiving waters.

- *Dry Weather Diversion Study*

The dry weather diversion study was prepared to evaluate the diversions to the sanitary sewer that are in place or proposed within Orange County and to identify decision-making criteria to be used in selecting diversions as a preferred BMP. A recommended procedure for prioritizing implementation of diversion facilities was developed for the area of Orange County served by the Orange County Sanitation District.

- *BMP Retrofit Opportunities Study*

In 1997-98, the feasibility of incorporating BMP retrofits to optimize beneficial use attainment began to be addressed in the context of the long-term water quality planning initiatives being conducted within Orange County, a number of which were in cooperation with the Army Corps of Engineers. To supplement these earlier efforts, during 2003-04, a countywide evaluation was initiated using a GIS-based model to identify opportunities within the existing storm drain infrastructure for configuring/reconfiguring storm drains or channel segments in order to improve water quality and maintain the designated beneficial uses

SECTION 3.0, PLAN DEVELOPMENT

(see **DAMP Appendix E**). This effort was continued in 2005-06 with further use of the GIS-based model.

- *Tustin Area Spill Control (TASC) Demonstration Project*

To address the various regulatory, technical and coordination issues associated with preventing and planning for sanitary sewer overflows (SSOs), the County, as Principal Permittee, and the Orange County Sanitation District (OCSD) initiated a pilot project titled Tustin Area Spill Control (TASC) Demonstration Project. The project's accomplishments to date include:

- Development of SSO response procedures;
- Selection of primary and backup sewage spill response contractors for containment and recovery of sanitary sewer overflows;
- Conducting SSO desktop and hands-on field response training with the contractors; and,
- Development of a Memorandum of Understanding for delineating jurisdictional and financial responsibilities within the TASC project.

Enhancements in Technologies and Methodologies

A number of important initiatives are being supported by the Permittees aimed at the development of assessment techniques and methodologies to support more informed and consistent decision making across Southern California and statewide, including projects being undertaken with the Southern California Stormwater Monitoring Coalition, University of California, Irvine (UCI) for the development of the California Sustainable Watershed/Wetland Information Manager (CalSWIM) - prototype database, and the California Stormwater Quality Association (CASQA) initiative on program effectiveness assessment.

Findings of the extensive water quality monitoring program during the reporting period are discussed in **Section 11.0**. However, concurrent with this data collection effort are a number of important initiatives, being supported by the Permittees, that are aimed at the development of assessment techniques and methodologies to support more informed and consistent decision making across Southern California. Notable amongst these initiatives are the Regional Research Monitoring Program (Stormwater Monitoring Coalition) and the Development of the California Sustainable Watershed/Wetland Information Manager (CalSWIM) - prototype Database.

- *Regional Research Monitoring Program (Stormwater Monitoring Coalition)*

The goal of the Southern California Stormwater Monitoring Coalition (SMC) is to identify region-specific research needs to better understand stormwater mechanisms and impacts, and to collectively sponsor the development of assessment techniques and methodologies that will enable more informed and consistent stormwater management decision-making across the region.

The SMC has initiated several of the 15 research projects identified in the research needs agenda, including: microbial source tracking method comparison,

development of standardized sampling and analysis protocols, implementation of a laboratory intercalibration program, peak flow impact assessment, and the development of a regional integrated freshwater stream bioassessment monitoring program.

- *Development of California Sustainable Watershed/Wetland Information Manager (CalSWIM) – Prototype Database*

In response to a commitment to develop a prototype watershed database for cumulative impact assessment, the County of Orange as Principal Permittee has worked with UCI in developing and implementing a prototype database called the California Sustainable Watershed/Wetland Information Manager (CalSWIM). CalSWIM is a web-based expert system and database focused, initially, on Newport Bay and the Newport Bay watershed and can be viewed at www.calswim.org. The technical objective of CalSWIM is to provide an interactive platform for coastal wetland and watershed managers, planners, and engineers to explore alternative wetland and watershed management strategies.

- *CASQA Program Effectiveness Assessment White Paper*

The preliminary *White Paper* introduced and discussed key concepts and provided a standardized terminology related to the development of a comprehensive framework for assessing the effectiveness of stormwater management programs. It briefly defined and categorized potential outcomes, measures, and methods to be used in conducting assessments, and provided examples of how several programs are already utilizing these tools to assess their effectiveness. It also discussed the current needs of stormwater program managers with respect to program assessment. The issues addressed in this paper will form the basis for more detailed guidance on effectiveness assessment that is being developed by the CASQA Effectiveness Assessment Subcommittee during 2006.

3.3 Assessment

The Permittees recognize that knowledge in the field of stormwater quality is rapidly evolving and that the BMPs within the DAMP/LIP must be revised, deleted or added to in order for the program to stay current. In addition, water quality problems caused by urban stormwater that are identified either through environmental monitoring or regulatory interventions will elevate the need for additional or new BMPs to be implemented.

3.3.1 Iterative Planning Processes

While the ROWD itself serves to identify new programmatic commitments (see **Sections 5.0 through 10.0**), and is thereby evidence of the iterative approach, the DAMP has not, to date, detailed a process for programmatic change in response to improved knowledge of water quality controls and best management practices.

DAMP Modification:

- Revise **DAMP Section 3.0** plan improvement process to detail the plan improvement process.

3.3.2 Programmatic Assessment

The PEA template created in 2003, and used as the basis of the 2002-03, 2003-04, and 2004-05 Annual Reports, has been helpful in establishing a series of metrics for spatial (i.e. jurisdictional comparisons) and temporal (i.e. year-to-year comparisons) assessments of program effectiveness. However, the reporting has highlighted significant inconsistencies in metric interpretation across the jurisdictions of the Orange County Stormwater Program that require further standardization.

ROWD Commitment:

- Prepare metric definitions and guidance to improve efficacy of the assessment process.

3.3.3 BMP Assessment

Over the course of the Third term Permits a number of BMP evaluations have been undertaken. The recommendations arising from these studies are presented as ROWD commitments or DAMP Modifications in the subsequent sections of this ROWD as appropriate.

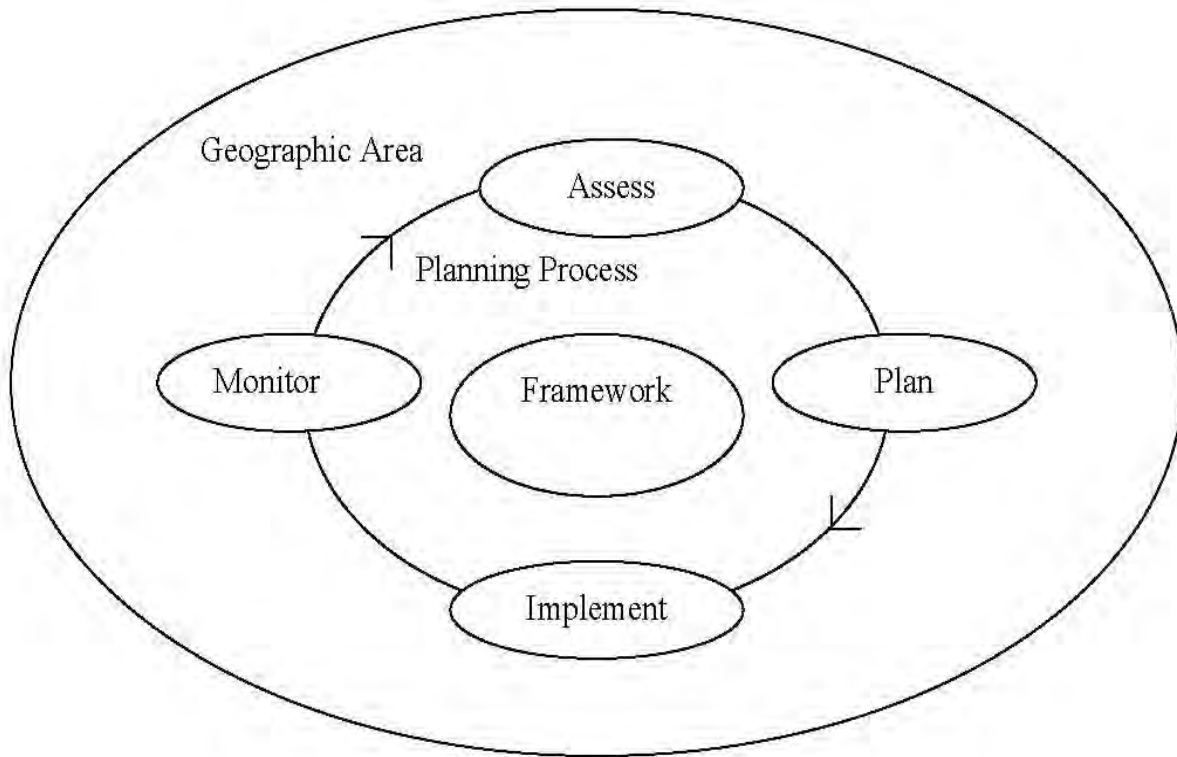

3.4 Summary

The Permittees consider **DAMP Section 3.0** to define the iterative planning processes, informed by programmatic and BMP assessments, that are the basis of the DAMP. Based upon this evaluation of the process, the principal finding is that the language of the DAMP can be revised to better define these processes at separate, but interrelated, jurisdictional, watershed and countywide levels. The Permittees have also identified a need to standardized annual reporting data further in order to enhance effectiveness assessment.

Table 3.1: Comparison of Water Quality Planning Processes

	DAMP/LIP	Watershed Action Plan
<i>Geographic Area Covered by Plan</i>	Defined by political (city/County) boundaries.	Defined by hydrologic boundaries.
<i>Planning Process</i>	Focused on reducing discharges of pollutants in urban runoff and stormwater pollution on a uniform countywide basis. Directed by DAMP/LIP in conformance with NPDES permits requirements.	Focused on improving local receiving water quality where it is adversely impacted by urban runoff and stormwater pollution. Directed by NPDES permits and 303(d) list.
<i>Framework</i>	Directed by Stormwater Program committee structure and Regional Board review. Public consultation principally through CEQA process/Regional Board review.	Directed by municipal and public agency stakeholders. Characterized by public participation.
<i>Assessment</i>	Based on countywide municipal and regional cooperative investigations of stormwater and receiving water quality. Assessments are undertaken annually (LIP) and every 5 year (DAMP).	Based on information from watershed specific investigations. Assessments are undertaken on an annual basis.
<i>Planning</i>	Broad based approach with emphasis on well established pollution prevention and source control measures.	Pollutant specific approach with emphasis on treatment controls and consideration of innovative regional solutions.
<i>Implementation</i>	Individually by Permittees.	Individually and collaboratively by Watershed Permittees and other agencies.
<i>Monitoring</i>	Considers pollutant load reduction.	Considers beneficial use attainment.

Figure 3.1: Water Quality Planning Process

4.0 LEGAL AUTHORITY

4.1 Introduction

The ability of the Permittees to comply with the requirements of the Third Term Permits is contingent upon the establishment, by each Permittee, of adequate legal authority to support control program implementation. **DAMP Section 4.0** discusses the development, starting in 1993, of a Model Water Quality Ordinance that was used by the Permittees as the basis of their local ordinances that were adopted by 1997. It also commits the Permittees to reviewing their ordinances to determine if any modifications are necessary in order to comply with new NPDES Permit requirements.

4.2 Accomplishments

With the adoption of the Third Term Permits in early 2002, the Permittees reviewed and verified the adequacy of their legal authority as the legal basis for the activities required for Third Term Permit compliance, primarily **DAMP Sections 7.0, 8.0, 9.0, and 10.0**. Following this initial review and verification, the responsibility for maintaining the efficacy of this key program element has rested with the Legal and Regulatory Task Force (see **Section 2.3.1**). During the reporting period, this Task Force has focused on a number of key areas including:

- Review and revision of legal authority as necessary regarding the stipulation of mandatory minimum BMPs in the San Diego Region;
- Review of inspection authority and “right of entry” at industrial/commercial facilities;
- Identification and resolution of overlap in legal authority within requirements of the WDR FOG program;
- Examination of the various Total Maximum Daily Load (TMDL) initiatives and their relationship to NPDES permits; and
- Perpetuation of BMP upkeep and maintenance in Water Quality Management Plans (WQMPs) for New Development/Significant Redevelopment.

Arising from the work of the Task Force have been continued findings of legal authority adequacy and the development of a model approach to WQMP recordation.

4.3 Assessment

The program effectiveness assessment outcome level for the **DAMP Section 4.0** is presented in **Table 4.1**. However, beyond confirming compliance with the Permits, the Permittees’ legal authority can also be assessed in the context of the sections of the DAMP that it primarily supports.

4.3.1 Legal Authority to Implement Existing Development and ID/IC Programs

In 2005, an action taken under the Ordinance requiring a property owner to effect the removal of manure from a creek under the authority of the jurisdiction’s water quality

ordinance was formerly challenged under the ordinance's appeal provisions. The jurisdiction prevailed in the third party adjudicated appeal hearing and again at a subsequent trial in an action brought by the Orange County District Attorney. These results, in addition to the numerous successful administrative actions and citations detailed in **Sections 8.0, 9.0 and 10.0** of this report, validate the robustness of the Permittees' legal basis for implementing **DAMP Sections 9.0 and 10.0**.

4.3.2 Legal Authority to Implement New Development Program

The New Development/Significant Redevelopment component of the Program ends with permit close-out and the BMPs implemented in conformance with DAMP Section 7.0 transition to the Existing Development component. As noted in **Section 7.3.1**, the Permittees believe that the BMP approach to stormwater management could be more effectively sustained by ensuring the longevity and enforcement of the approved WQMP against subsequent property owners for ongoing responsibility for BMP maintenance. The ROWD Commitment in **Section 7** to develop guidance on the recordation process and appropriate documentation to enable such enforcement will be fulfilled under the aegis of the Legal and Regulatory Task Force.

4.4 Summary

The Permittees validated the legal basis for implementing the DAMP in early 2002 and over the balance of the period of the Third term Permit continued to review aspects their legal authority under the aegis of the Legal and Regulatory Task Force. This review and the formal legal challenge to this authority in late 2005 and early 2006 have served to affirm the basic robustness of the Permittees' water quality ordinances.

SECTION 4.0, LEGAL AUTHORITY

5.0 MUNICIPAL ACTIVITIES

5.1 Introduction

The Permittees own and operate facilities and build and maintain much of the transportation, drainage and recreational infrastructure of the urban environment. The primary purpose of **DAMP Section 5.0** is to ensure that, through a systematic process of evaluation, BMPs are incorporated into these activities. **DAMP Section 5.0** also requires a commitment to implement Integrated Pest Management (IPM) approaches. In addition, **DAMP Appendix C** requires performance reporting related to a number of Established BMPs that have been recognized, since the inception of the Program, as significant contributors to pollutant load reduction.

5.2 Accomplishments

5.2.1 Model Municipal Activities Program

The Model Municipal Activities Program was developed and implemented in 2002-03 and replaced the environmental performance reporting program of the Second Term Permits. It establishes a framework for conducting a systematic program of evaluation and BMP implementation targeting fixed facilities, field programs and drainage facilities. The Model Municipal Activities Program requires the Permittees to:

- Compile facility and program inventories:

2,302 facilities have been reported as inventoried (2004-05 reporting period) and are subject to the program (**Table 5.2; Figure 5.1**).

- Prioritize facilities and programs based upon water quality threat and receiving water sensitivity:

There are a reported 1,070 high priority, 126 medium priority, and 1,106 low priority municipal facilities (**Table 5.2; Figure 5.1**)

- Establish model maintenance procedures:

Sets of BMP factsheets were produced for Fixed Facilities (13 factsheets), Field Programs (7 fact sheets) and Drainage Facilities (1 fact sheet). The factsheets are available at

http://www.ocwatersheds.com/StormWater/documents_damp_lip.asp

(Section 5 of the County of Orange/Orange County Flood Control District 2005-06 Local Implementation Plan).

- Conduct inspections:

Standard general and activity specific inspection forms have been developed for Fixed Facilities, Field Programs and Drainage Facilities. In addition, by the end

SECTION 5.0, MUNICIPAL ACTIVITIES

of 2006, 2,326 municipal facilities were reported as having been inspected for stormwater issues (**Table 5.3**).

- Implement BMPs:

At the end of the 2004-05 reporting period, 1,968 municipal facilities were determined to have full BMP implementation (**Table 5.3**).

- Undertake training:

Three training modules have been developed, specifically, Municipal Activities program Training, Fixed Facility Model Maintenance Procedure Training and Field Program Model Maintenance Procedure Training.

5.2.2 Model Integrated Pest Management, Pesticide and Fertilizer Guidelines

Landscaping is best managed using an integrated system of tactics that include biological, mechanical, physical, cultural, and chemical control. This system, known as IPM, relies on careful monitoring of the plants to identify when a chemical or other control action should be taken. In June 2001, the Principal Permittee entered into a five-year agreement with the University of California Cooperative Extension (UCCE) to conduct water quality monitoring studies and implement water quality improvement programs in areas where the University has special expertise, particularly related to fertilizer and pesticide applications (Note: On May 10, 2005, the agreement was revised and extended for up to six additional years). In close cooperation with the UCCE, Model IPM, Pesticide and Fertilizer Guidelines were completed in 2002-03. The Guidelines require the Permittees to:

- Conduct IPM self-audits:

With oversight and assistance from UCCE, the Permittees have completed self-audits of the Model IPM, Pesticide and Fertilizer Management Guidelines implementation. Audits have been conducted annually as part of annual progress reporting.

- Implement the Model IPM, Pesticide and Fertilizer Management Guidelines based upon IPM principles:

Fifty-seven percent (57%) of the Permittees are able to report that they operate under a formal written IPM policy.

Thirty-five (35) Permittees reported that approximately 363,146 pounds of nitrogen were applied to 6,862 acres of public land during the 2004-05 reporting period representing a third consecutive year of reduction (the 2005-06 figure represents a 2% decrease from the pounds per acre of nitrogen usage in 2003-04; a decrease of 27% from 2002-03; and a 12% decrease from 2001-02) (**Table 5.4**).

SECTION 5.0, MUNICIPAL ACTIVITIES

During the 2004-05 reporting period, approximately 19,227 pounds of active ingredients (AI) of pesticides were applied by the Permittees representing a 30% reduction in use since the inception of the program (**Table 5.3**).

- Undertake Training:

Training has been provided annually.

5.2.3 Established BMPs

Performance indicators for certain Established BMPs have been tracked since the inception of the Model Municipal Activities Program. These BMPs are street sweeping, solid waste collection, catch basin stenciling, drainage facility maintenance, trash & debris Control (formerly litter control), household hazardous waste collection, and used oil grant participation.

- Street Sweeping:

All Permittees maintain street sweeping programs in residential, commercial and/or industrial areas. In 1993 the Permittees compiled information regarding their existing street sweeping schedules and practices and have subsequently changed elements of their programs such as the types of sweepers purchased, the frequency of sweeping, and the use of parking restrictions in order for the street sweeping program to aid in water quality improvements.

85,516 tons of material was removed from the streets and gutters during the 2004-05 reporting period. This effort appears to represent a 12% increase for weight of material collected over the previous reporting period and a 25% increase over the tons of material reported in 2002-03. This amount represents a 87% increase in the weight of material collected over the 2001-02 total, indicating a marked increase in effort in this area of infrastructure maintenance in the Third Term Permit cycle. (**Table 5.5; Figure 5.2**).

- Solid Waste Collection:

The Permittees have solid waste collection programs for public, residential, commercial and industrial areas.

3,959,590 tons of solid waste was collected during the 2004-05 reporting period. This effort appears to represent a 9.1% increase in the amount of solid waste collected over the previous reporting period, an 8.8% increase over the reported total in 2002-03, and a 7.0% increase over the reported total in 2001-02 (**Table 5.6; Figure 5.3**).

SECTION 5.0, MUNICIPAL ACTIVITIES

- Catchbasin Stenciling:

Over 37,000 stormdrain inlets have been stenciled. Each year 6,000 – 9,000 inlets are re-stenciled.

- Drainage Facility Maintenance:

The Permittees inspect the drainage system within their jurisdictions annually and clean out accumulated debris on an as needed basis. Removal of accumulated debris and sediment is carried out either manually or by mechanical methods using flushing – in emergency situations only – in accordance with established maintenance procedures (Model Maintenance Procedure DF-1). By removing this material from the catch basin inlets and stormdrain system, the Permittees make a significant contribution in preventing the passage of these materials in downstream receiving waters.

5,612 tons of debris was removed from drainage facilities in 2004-05. This amount represents a 43% decrease in the amount of debris collected from drainage facilities when compared to the previous reporting period, a 77% decrease in the amount collected in 2002-03 and a 6.5% decrease in the amount collected in 2001-02 (The 2002-03 reported total suggests inconsistent reporting of this Indicator or other environmental factors such as Santa Ana winds) (**Table 5.7; Figure 5.2; Figure 5.3**).

- Trash & Debris Control:

Trash and debris control is an important element in the diversion of litter and other solid materials from the storm drain system. Although most Permittees historically viewed litter control as a public service program (i.e., preventing visual blight, etc.), rather than as a pollution control problem, it is now considered important as a visual indicator of water quality and an aspect of the recreational use of a waterbody.

Eleven (11) trash and debris booms have been installed in flood control channels and harbors to recover floatable material.

Inner-Coastal and Watershed Cleanup Day, which engages the public directly in the cleanup of trash and debris, has been heavily promoted by the Orange County Stormwater Program. In 2002, 1,722 volunteers joined in and collected 29,503 pounds of trash and 5,350 pounds of recyclables. In 2003, 2,473 volunteers collected 52,474 pounds of trash and 5,447 pounds of recyclables at 37 sites. In 2004, 6,001 volunteers collected 78,390 pounds of trash and 9,563 pounds of recyclables at 38 sites. In 2005 the number of clean-up sites increased to 43.

The Permittees have participated in the preparation of a number of strategic assessments of litter control efforts including *A Review Of Current Trash Pollution and Mitigation Efforts in Orange County: Final Report January 2006* prepared under

SECTION 5.0, MUNICIPAL ACTIVITIES

the auspices of the Trash & Debris Task Force and the Algalita Marine Foundation/California Coastal Commission *Plastic Debris: Rivers To Sea* initiative in which the Principal Permittee was represented on the advisory board.

- Household Hazardous Waste Collection:

Orange County has a household hazardous waste collection program administered by the Integrated Waste Management Department (IWMD). The program comprises four sites (Anaheim, Huntington Beach, San Juan Capistrano, and Irvine).

A total of 6,303,938 pounds of household hazardous waste was collected in the 2004-05 reporting period representing a 9.8% increase from the previous reporting period, a 48.7% increase from the 2002-03 reporting period, and 68.7% increase from the 2001-02 reporting period (**Table 5.8; Figure 5.6**).

- Used Oil Grant Participation:

Most of the Permittees, as well as the County's Health Care Agency, currently implement used oil recycling programs. These programs involve comprehensive public outreach including television and newspaper advertising, displays at community events, and the distribution of used oil containers at no cost to residents.

Twenty seven (27) Permittees reported having a Used Oil Grant participation program for 2004-05, 28 Permittees in 2003-04 and 27 Permittees in 2002-03 (**Table 5.9; Figure 5.7**).

5.3 Assessment

The current and potential program effectiveness assessment outcome levels for the Municipal Activities Program are presented in **Table 5.1a** (Model Municipal Activities Program) and **Table 5.1b** (Model IPM and Fertilizer Guidelines).

5.3.1 Model Municipal Activities Program

The Model Municipal Activities Program superceded the Environmental Performance Reporting (EPR) program of the Second Term Permits. Nonetheless, elements of the EPR program were carried over into the **2003 DAMP**. The **ROWD** is therefore recognized by the Permittees as an opportunity to eliminate the redundant vestiges of the prior inspection and oversight program.

The fixed facility inventory has fluctuated significantly over the reporting period (see **Table 5.2**) pointing to the need for the better definition of key program terms.

SECTION 5.0, MUNICIPAL ACTIVITIES

Indicator – Prioritization of Facilities: For 2004-05, 2,302 industrial facilities were prioritized, 46% of which were ranked as high priority; for 2003-04, 2,418 industrial facilities were prioritized, 49% of which were ranked as high priority; and for 2002-03, 2,380 industrial facilities were prioritized, 46% of which were ranked as high priority (**Table 5.2**).

Level 1: Implement Program

Level 3: Behavior Change

In addition, the number of designated “high priority” facilities has remained at approximately 1,100 annually (**Table 5.2**) despite the initial intention for the program to be risk-based and the significant level of BMP implementation (i.e. risk mitigation) that has occurred over the period of the Third Term Permits. It is also apparent that the application of a “high priority” designation has varied significantly between the Permittees, reflecting both different SAR and SDR Permit requirements and individual Permittee interpretations of the prioritization process.

DAMP Modification:

- Eliminate Environmental Performance Reporting (EPR) program (which is duplicative of Model Municipal Activities Program).
- Define “fixed facilities,” “field programs,” and “drainage facility sites.”

ROWD Commitment:

- Standardize SDR and SAR definitions of “high priority” and develop prioritization process that is better predicated on the threat (diminished by BMP implementation) posed by the facility, and considers the presence of “constituents of concern.”

5.3.2 Model Integrated Pest Management, Pesticide and Fertilizer Guidelines

The majority of fertilizers are applied to turfgrass with a smaller amount utilized on landscape material (trees, shrubs, groundcovers, and vines). Countywide, municipal fertilizer use has declined. However, other indicators of a shift toward more of an IPM-

SECTION 5.0, MUNICIPAL ACTIVITIES

oriented approach show little change; e.g. utilization of slow-release fertilizers, timing of fertilizer applications, and use of soil analyses.

Headline Indicator - Reduction in Total Fertilizer Usage (Nitrogen): Thirty-five Permittees (35) reported that approximately 363,146 pounds of nitrogen were applied to 6,862 acres of public land during the 2004-05 reporting period (53 lbs/acre). This figure represents a 2% decrease from the pounds per acre of nitrogen usage in 2003-04; a decrease of 27% from 2002-03; and a 12% decrease from 2001-05.

Level 3: Behavior Change

Headline Indicator - Reduction in Total Fertilizer Application (Phosphorus): Thirty-five Permittees reported that 81,600 pounds of phosphorus were applied to 6,862 acres of public land during the 2004-05 reporting period (12 lbs/acre). This figure represents a 20% decrease from the pounds per acre of phosphorus applied in 2003-04; a decrease of 33% from 2002-03; and an 8% decrease from 2001-05.

Level 3: Behavior Change

There also appears to have been an overall reduction in pesticide use. However, as with fertilizer use, other indicators (e.g. equipment calibration, clean-up of overspray, use of non-chemical pest control methods) show little change. The absence of a trend in these indicators shows that factors other than the adoption of IPM approaches (e.g. budgetary constraints) may be the more significant in explaining the overall reduction in pesticide use. Indeed, toward the end of the current Permit term, only fifty-seven percent (57%) of the Permittees are able to report that they operate under a formal written IPM policy.

Headline Indicator - Reduction in Pesticide Application: During the 2004-05 reporting period, approximately 19,227 pounds of active ingredient of pesticides was applied by Permittees. This represents an approximately 30% decrease in pounds of pesticide applied compared to 25,022 pounds of active ingredient pesticides applied in 2003-04, and 24,750 pounds of active ingredient applied in 2002-03.

Level 3: Behavior Change

ROWD Commitment:

- Develop Model Integrated Pest Management, Pesticide and Fertilizer Guidelines into a Model Program (rather than guidelines) with implementation goals and including model contract language.
 - Redefine IPM (pesticide use) indicators.
-

SECTION 5.0, MUNICIPAL ACTIVITIES

5.3.3 Established BMPs

An annual evaluation of the routine preventive maintenance activities is conducted and, where appropriate, improvements or new practices are implemented to further reduce the amount of pollutants discharged into the storm drain system. An important component of this evaluation process is the documentation and collection of data related to these selected activities.

Trash and Debris Controls (formerly Litter Control)

There are currently three aspects to trash and debris control that have been reported over the period of the Third Term Permits, specifically, the deployment of trash and debris booms, public participation in Inner-Coastal and Watershed Cleanup Day, and an enhanced program of catchbasin cleaning.

Currently, eleven (11) trash and debris booms have been installed in flood control channels and harbors to recover floatable material. However, the Permittees recognize that the stormdrain infrastructure provides for retrofit opportunities in other areas. Indeed, a number of recent technical reports prepared by the Permittees and Coastal Commission examining technologies for trash and debris control, as well as extensive independent jurisdictional experience with inlet devices, establish a basis for the development of policy recommendations in this area.

ROWD Commitment:

- Develop recommendations for the selection and installation of drain inlet screens.

Every year the California Coastal Commission and Trails-4-All sponsor the Inner-Coastal and Watershed Cleanup Day to help cleanup the trash and debris that accumulates along the coastline, fouling the beaches and tidal zone. This event has been sponsored and heavily promoted by the Orange County Stormwater Program. In 2002, 1,722 volunteers joined in and collected 29,503 pounds of trash and 5,350 pounds of recyclables. In 2003, 2,473 volunteers collected 52,474 pounds of trash and 5,447 pounds of recyclables. In 2004, 6,001 volunteers collected 78,390 pounds of trash and 9,563 pounds of recyclables. In 2005, the number of clean-up sites increased to 43. The sustained year-to-year increases in public participation and material recovery point to the effectiveness of the Permittees' efforts in promoting this event.

Catchbasins are inspected annually and cleaned as appropriate. In the 2004-05 reporting period 86% of the catchbasin inventory in Orange County was cleaned, the highest level in the first three years of the Third Term Permits.

SECTION 5.0, MUNICIPAL ACTIVITIES

Solid Waste Collection

During the last reporting period, 35 Permittees reported the collection of nearly 4.0 million tons of solid waste. This effort compares to the total of 3.62 million tons of solid waste reported by 30 Permittees in 2003-04, 3.64 million tons of solid waste reported by 26 Permittees in 2002-03, and 3.70 million tons of solid waste reported by 33 Permittees in 2001-05. While the Permittees encourage the public, through education and outreach, to properly dispose of their trash, and this encouragement may be contributing to the increased level of collection in the most recent reporting period, there are significant discrepancies in the year-to-year reporting of individual jurisdictions.

Headline Indicator - Solid Waste Collection: 3,959,590 tons of solid waste was collected during the 2004-05 reporting period. This effort appears to represent a 9.1% increase in the amount of solid waste collected over the previous reporting period, an 8.8% increase over the reported total in 2002-03, and a 7.0% increase over the reported total in 2001-05.

In addition to education, the Permittees have considered the extent to which the cradle-to-grave management of solid waste can be improved to increase the effectiveness of collection efforts. This consideration has identified municipal oversight of contract solid waste collection and disposal as another area for possible improvements in service effectiveness.

ROWD Commitment:

- Develop model language for municipal trash collection and haulage contracts that addresses water quality protection issues.

Drainage Facility Maintenance

Drainage facilities are an integral component of the Model Municipal Activities Program and, as high priority facilities, subject to annual inspection. While the reported total length of drainage facilities has increased over successive years, the amount of material recovered has decreased. This reduction may reflect the increasing effectiveness of source controls and the impact of changing management practices such as street sweeping on concrete channels. However, both inconsistent year-to-year reporting and the profound influence of environmental variables (e.g. prevalence of Santa Ana wind conditions and severity of the wet season) may also be explanatory factors.

SECTION 5.0, MUNICIPAL ACTIVITIES

Headline Indicator - Drainage Facility Maintenance: 5,612 tons of debris was removed from drainage facilities during the 2004-05 reporting period. This amount represents a 43% decrease in the amount of debris collected from drainage facilities when compared to the previous reporting period, a 77% decrease in the amount collected in 2002-03 and a 6.5% decrease in the amount collected in 2001-02.

Street Sweeping

The year-to-year increases in the amount of material recovered from the urban environment by street sweeping suggest success regarding the Permittees' efforts to continue to improve the effectiveness (e.g. increasing use of drain inlet screens, regenerative air sweepers, parking controls etc.) of this maintenance practice.

Headline Indicator - Street Sweeping: 85,516 tons of material was removed from the streets and gutters during the 2004-05 reporting period. This effort appears to represent a 12% increase for weight of material collected over the previous reporting period and a 25% increase over the tons of material reported in 2002-03. This amount represents an 87% increase in the weight of material collected over the 2001-02 total, indicating increasing effectiveness in this area of infrastructure maintenance in the Third Term Permit cycle.

* The number of gallons of used oil collected dropped in 2003-04 and then dramatically increased for 2004-05 due to CIWMB regulations in 2003-04 when the CIWMB stated that only the used oil turned in by do-it-yourselfers could be counted. However, for the 2004-05 reporting year, the CIWMB reversed their decision and allowed all used oil to be counted, including oil from HHCs and certified collectors (Jiffy Lube, etc.).

6.0 PUBLIC EDUCATION

6.1 Introduction

In 2002, the Permittees created a public and business outreach strategy - "Orange County Stormwater Public Education Program Recommendations." This strategy, which was updated in 2004, established a long-term, cost-effective approach to educate the public and targeted business groups about the effects of stormwater pollution and encourages their participation in the protection of surface waters. Key aspects of the strategy included conducting a survey to define the level of general knowledge held by people in Orange County, utilizing the survey results to develop campaign goals, determining the key messages, defining specific community outreach activities and approaches, preparing a master timeline, and creating a "brand" name for the Orange County Stormwater Program ("Project Pollution Prevention").

6.2 Accomplishments

The primary elements of the Third Term Permits public education program were a series of "Plans" that guided the program implementation, specifically:

- A "Materials Plan" that prioritized the educational materials necessary for revision/development and defined the common look and theme;
- A "Media Plan" that identified advertisement purchases in major publications, on Orange County Transit Authority buses and shelters, in movie theaters, on radio, and on cable television;
- A "Non-media Plan" which included the develop of a tool box for local outreach and building relationships with businesses, trade associations, chambers of commerce, utilities, and organizations that provided key opportunities for outreach;
- A "School Education Plan" to reach K-12 students in Orange County with pollution prevention messages; and
- An outreach plan for the approximate 10,000 food service facilities in Orange County.

Additional elements of the program include:

- An initial and follow-up public opinion/education survey (completed in 2003 and late 2005 respectively);
- Assistance with governmental and regulatory agency relations;
- Translation of all materials into Spanish and the creation of a Spanish webpage;
- Translation of key materials into Vietnamese;
- A "tool box" of materials for Permittee program coordinators to conduct local outreach efforts, based upon a quarterly "Quad Approach" including press releases, newsletter articles, fact sheets and billing inserts; and
- An employee-training program ("Stormwater 101") to educate all municipal employees about general stormwater principals.

SECTION 6.0, PUBLIC EDUCATION

6.2.1 Countywide Public and Business Education Materials Plan

A Materials Plan was developed that prioritizes the outreach materials necessary for revision/development and defined a common look and theme. Pursuant to this plan, the following materials were produced:

- Forty-three brochures; 22 in English, 18 in Spanish and four in Vietnamese.
- Sixteen print advertisements; eight in English, seven in Spanish and one in Vietnamese.
- Ten radio public service announcements; five in English and five in Spanish.
- Four movie/cable PSAs; three in English and one in Spanish.
- Three bus advertisements.
- Six quad outreach kits including a newsletter, press release, billing insert and fact sheet.
- Outreach kit for food service establishments including a BMP poster, four stickers, a PowerPoint presentation, fact sheet and CD-ROM.
- Stormwater 101 training kit including a pre/post training evaluation, fact sheet, PowerPoint presentation and 7-½ minute video.
- A municipal vehicle magnet.
- A door hanger notice for residential pollution problem correction.

6.2.2 Media Outreach Plan

A strategic media relations campaign was developed and implemented that included advertisements in major publications, on Orange County Transit Authority buses and shelters, in movie theaters, on radio, on cable television and online. The Permittees collectively purchased the following media during 2002-06:

Newspaper advertisements generated 46.5 million impressions

- Seven full-color ads in the Sunday *Orange County Register*
- Three full-color ads in the Sunday *Los Angeles Times* (Orange County Edition)
- Twenty-two full-page ads in 17 of the *Register's* community papers
- Fourteen full-page ads in four of the *Register's* community papers
- Eleven ¾-page ads in the *Los Angeles Times'* three Orange County community papers: the *Daily Pilot*, *Huntington Beach Independent* and *Laguna Beach Coastline Pilot*
- Nine full-page ads in the *News-Enterprise*
- Fourteen full-page ads in *OC Metro*
- Eleven full-page ads in *OC Weekly*
- Seventeen full-page ads in *Miniondas* (Spanish language)
- Fifteen full-page ads in *Excelsior* (Spanish language)

Radio advertising generated 27.6 million impressions

- Twenty 60-second spots on KLAC AM 570. The spots generated more than 120,000 impressions.
- One hundred and twenty- 60-second spots ran on JACK FM 93.1 generating 25 million impressions.

SECTION 6.0, PUBLIC EDUCATION

- One hundred and sixty 60-second spots ran on Sonido (Spanish language radio station) generating 2.5 million impressions.

OCTA bus advertising generated 71.5 million impressions

- Fifty-seven bus sides
- Fifty bus backs
- Fifty outdoor bus shelters

Movie theater advertising generated 11 million impressions

- The 30-second public service announcement ran on screen and in lobby kiosks for twenty weeks at 22 Edwards/Regal Cinemas, San Clemente's Krikorian Theater, twelve weeks at the Long Beach Town Center Theater and twelve weeks at AMC theaters.
- The sad fish poster was displayed at all 24 Orange County theaters.

Cable television advertising generated 1.4 million impressions on four cable stations (Adelphia, AT&T/Comcast, Time Warner and Cox Communications)

On-line banner advertising generated 2.35 million impressions

- Banner display on www.931jackfm.com for three months.
- Banner display on www.ocregister.com for two months.

Headline Indicator - Number of Media Impressions: The public education program generated over 160,000,000 media impressions over the period 2002-06.

ROWD Commitment

- Continue to "fine tune" the multi-media approach.
- Re-evaluate audiences & key messages for targeted behaviors.
- Pursue opportunities for regional collaboration.

6.2.3 Non-Media Outreach Plan

A Non-Media Outreach Plan was developed and implemented to complement the paid advertising media campaign. The plan utilized existing resources and partnerships to produce free or low-cost exposure for the program.

Outreach to Permittees

SECTION 6.0, PUBLIC EDUCATION

The plan included the development of a “tool box” of materials to enable the Permittees to conduct local outreach both directly and indirectly through businesses, trade associations, chambers of commerce, utilities, restaurants and other organizations.

Specifically, the “tool box” included:

- Outreach Materials - Artwork was created for use on outdoor locations such as bus shelters, streetlight banners, mouse pads and beach towels.
- The Quad - A series of newsletters, press releases, fact sheets and billing inserts were created that focused on seasonal stormwater themes. Six seasonal quads were created.
 - Spring Into Cleaning – Household Hazardous Waste
 - What’s Summer Without The Beach
 - When It Rains It Pours Pollutants Into Our Storm drains
 - A Pollution Fix for 2006
 - Green Thumb Blue Ocean
 - Keeping Your Car and the Environment Sparkling Clean
- An Events Listing - Lists of upcoming utility, restaurant, city and organization sponsored events were developed where stormwater information could be provided to event participants.
- Employee Training Materials - Stormwater training materials were developed to educate all municipal employees about general stormwater pollution prevention principles.

Outreach to Businesses

The plan’s proposed implementation of programs is based on relationships and partnerships that had been developed with groups who may have been receptive to partnering with the program..

- A list of key Orange County businesses that the Stormwater Program could potentially foster relationships with was developed. The list included top businesses and major Orange County employers. These businesses were contacted and the following is a list of the business partnerships developed:
- Point of Purchase - Partnerships with stores that sell auto supplies, hardware, pet supplies and gardening supplies were developed. The program has fostered relationships with:
 - PetsMart Inc.
 - Home Depot, Inc.,
 - Orchard Supply Hardware (OSH)
 - Wal-Mart,

SECTION 6.0, PUBLIC EDUCATION

- The Pet Pantry
 - Huntington Garden Center
 - Flowerdale
 - De Nault's Hardware
- A list of major Orange County events such as the Orange County Auto Show and Southern California Home & Garden Show was created. Event coordinators were contacted with a letter introducing the program and asking for the opportunity to participate and/or distribute Orange County Stormwater Program materials.

Outreach to Utilities

Major non-city utilities providing water, electricity, cable and refuse services were contacted and provided sample newsletters for use in their publications. Several utilities printed stormwater education materials in their newsletters and billing inserts and posted information on their websites including:

- Rainbow Disposal
- Waste Management
- Southern California Edison
- Sempra Energy/The Gas Company
- Orange County Water District
- Orange County Fire Authority

The four major refuse companies in Orange County agreed to place a 12" x 24" Stormwater magnet on their trucks. More than 500 refuse trucks displayed the magnet during the 2002-06 reporting period.

Outreach to Organizations

A list of key Orange County organizations that the Stormwater Program could foster relationships with was developed. The list included organizations such as chambers of commerce, rotary clubs, and environmental groups.

- Chambers of Commerce - Several chambers provided Stormwater information to their members including the Brea Chamber of Commerce, Fountain Valley Chamber of Commerce, the Black Chamber of Commerce and the South Orange County Chambers of Commerce.
- Welcome Express - Welcome Express provides welcome packets to new homeowners in various communities throughout Orange County. Welcome Express provides the Household Tips brochure within their new homeowner's packet.

Media Relations Campaign

SECTION 6.0, PUBLIC EDUCATION

The media relations campaign centered on fostering relationships with reporters. Local newspapers are considered one of the most credible sources of information for Orange County residents and reach a large audience. Therefore, media relations were an invaluable component of the public education campaign.

The media relations campaign utilized the seasonal stormwater press releases created as part of "the Quad" to contact the media on a quarterly basis. The program also updated its media distribution lists quarterly.

Indicator - Number of Non-Media Impressions: The public education program generated 25 million non-media impressions during 2002-06.

Outreach to Restaurants

A specific outreach plan for the approximate 10,000 food service facilities in Orange County was developed and implemented. The outreach plan included the following efforts:

- The inspection and distribution of educational materials to the approximately 10,000 existing food facilities (the inventory is updated annually) countywide. Over 36,000 inspections for NPDES stormwater related issues were conducted.
- A focused public education outreach component was developed and implemented. This effort included:
 - A mass mailing to all corporate and food service facilities within Orange County. Over 9,000 letters were mailed.
 - Distribution of focused educational brochures, posters, stickers and CD-ROMs were distributed during inspections.
 - Presentation was given to the Food Sanitation Advisory Council.

Indicator - Number of Food Facility Outreach Impressions: The public education program generated over 45,000 food facility outreach impressions during the 2002-06.

ROWD Commitment

- Continue to foster new relationships and partnerships.

6.2.4 School Education Outreach Program

During the 2002-03, reporting period extensive meetings took place with representatives from

SECTION 6.0, PUBLIC EDUCATION

various educational programs and agencies throughout Orange County. A school education outreach plan was developed and implemented that included the following partnerships:

Orange County Department of Education (OCDE)

Inside the Outdoors is an environmental education program administered by the OCDE. There are three types of programs within *Inside the Outdoors* which are the:

- Outdoor Science School - This program includes information on sources of water for southern California, pollution prevention, and watershed information. 14,000 students participated in this program.
- School Program - A traveling scientist visits school sites providing the "Drip Drop" program - a 60-minute presentation about water quality. 3,000 students participated in this program.
- Field Program - Fifth grade students move into the real world of science and social science. During the "Where Do I Flow" program students learn about water pollution and prevention. 12,803 students participated in this program.

Approximately 30,000 students participated in the *Inside the Outdoors* Science Programs.

Municipal Water District of Orange County (MWDOC)/Discovery Science Center (DSC)

The partnership with MWDOC/DSC is focused on the Elementary Water Science Education Program, a water education course for teachers, and a public program for general visitors.

- Elementary Water Science Education Program – This program presents grade-specific science lessons, which incorporate water sources, water conservation, and water/trash pollution themes complementary to the science content standards.

5th Grade Student Assemblies: This element of the program presents lessons to elementary school students in an assembly format. 17,200 fifth grade students and 500 fifth grade teachers participated in this program.

5th Grade Students Attending the DSC Field Trip Program - For 5th grade students attending the DSC, field trip instructors screen the Project Pollution Prevention video entitled "Go With the Flow" and distribute the Project Pollution Prevention water education-based booklet. 25,827 fifth grade students and 2,000 fifth grade teachers participated in this program.

- Water Education Course for Middle and High School Teachers - The Water Education Course provides fifth through twelfth grade teachers Professional Development classes complete with curriculum and a kit of scientific equipment to conduct water-focused and pollution awareness activities in their classrooms. The Water Education Course was provided to 24 teachers reaching approximately 792

SECTION 6.0, PUBLIC EDUCATION

students.

- Public Program for General Visitors to the DSC - A demonstration and learning station for the general public visitors and students on field trips to the DSC was developed to further communicate the importance of water, water conservation, urban pollutants, and stormwater/urban runoff pollution. An estimated 76,000 visitors saw the station annually.

Project WET (Water Education for Teachers)

The Project WET (<http://www.projectwet.org/index.html>) is a water science and education program for teachers that provide classroom ready teaching aids including the Project WET Curriculum and Activity Guide. The guide is a collection of hands-on, innovative, interdisciplinary activities. Project WET developed curriculum specifically for the stormwater program.

Nearly two hundred teachers have participated in Stormwater Program sponsored workshops reaching 7,000 students per year.

California Regional Environmental Educational Community (CREEC) Network

The California Regional Environmental Education Community (CREEC) Network is an educational project whose mission is "to develop a communication network which provides educators with access to "high quality" environmental education resources to enhance the environmental literacy of California Students." It is an educational project supported by the California Department of Education, Environmental Education Program, in collaboration with state, regional and local partners. The CREEC Network provides information on all Orange County environmental school education outreach programs. To further publicize this information, links between the Permittees' website and CREEC were established.

<p>Indicator - Number of School Outreach Impressions: The public education program generated 188,846 school outreach impressions during the 2002-06.</p>

SECTION 6.0, PUBLIC EDUCATION

6.2.5 Other Countywide Initiatives

The Principal Permittee conducted a number of countywide public education initiatives on behalf of the Permittees. These initiatives included:

- Provision of brochures, magnets, bookmarks, manual, and posters to the Permittees, general public, businesses, schools, and other agencies. During 2002-06 over 450,000 educational materials were distributed.
- Management of the countywide 24-hr bilingual water pollution reporting hotline number, (714) 567-6363. During the 2002-06 the hotline received 927 water pollution calls. Water pollution complaints are also received through the County website.
- Advertisement of the 24-hour water pollution hotline number and web address, www.ocwatersheds.com, in all SBC Regional Phone Directories.
- Management of the County website, www.ocwatersheds.com. During 2002-06 the website received over 10,000,000 hits.

Indicator - Number of Other Countywide Initiative Impressions: The public education program generated 10,450,927 other impressions during the 2002-06.

Headline Indicator - Public Education Program Impressions: The public education program created over 195,684,773 impressions during the 2002-06 permit cycle. One of the goals of the public education program is to target 100% of the residents of Orange County. Orange County has a population of approximately 3 million people. Therefore, it can be deduced that every resident of Orange County received thousands of impressions during the reporting period. This achievement also far exceeds a Third Term Permit requirement to deliver a minimum of 10 million impressions per year within the Santa Ana Regional Board Area.

6.3 **Assessment**

In an effort to better understand the public's awareness regarding water quality issues, several surveys have been conducted. The surveys have incorporated a number of questions relating to pesticide, herbicide and fertilizer use, the sewer and storm drain system and the public's overall awareness of the County's public outreach campaign. Surveys conducted since the inception of the Orange County Stormwater Program include:

- 1994 Stormwater Pollution Prevention and Flood Awareness Survey
- 2000 County of Orange Fair Survey

SECTION 6.0, PUBLIC EDUCATION

- 2000 Orange County Sanitation District Fair Survey
- LA Times In Education Survey
- 2001 Public Awareness Survey
- 2003 Public Awareness Survey
- 2005 Public Awareness Survey

6.3.1 Public Awareness Surveys

In May 2003, the Permittees conducted a large sample (1,500 respondents) public awareness survey to measure the current level of knowledge held by residents of Orange County. In November 2005, after 30 months of the public education campaign, a follow-up to the baseline survey was conducted. The purpose of the second survey was to assess the extent to which public opinion and knowledge about urban runoff issues have changed and whether Orange County residents have made any behavioral changes as a result of the public education campaign.

The findings indicate that the public information campaign on stormwater and urban runoff has made initial inroads towards increasing awareness. In the majority of questions, awareness of the program and or its elements increased one to three percentage points.

Effectiveness of Educating on the Environmental Issue

Consistent with findings from 2003, education, traffic congestion, safety and employment continue to rank higher than pollution as top issues of concern with Orange County residents. In the last 30 months, residents concern regarding pollution of the ocean, rivers, creeks and bays increased 1%. When asked specifically about ocean, bay and harbor pollution, concern remained consistent with the baseline data with 85% to 87% concerned. However, the intensity of concern regarding pollution of creeks and rivers increased 6% (from 39% very concerned in 2003 to 45% in 2005).

During the 30-month stormwater outreach campaign, information never focused on the actual quality of Orange County water or the severity of the issues. Most elements of the program focused on particular activities that would “protect our creeks, rivers, bays and ocean.” The result of the survey is consistent with the amount of prominence placed on this subject. If a greater emphasis was placed on this subject in the campaign, the numbers could have been higher.

Effectiveness of Educating on the Storm Drain System

Knowledge about urban runoff and storm drains has increased. In fact, 90% of residents know that water flowing in the street enters a storm drain and goes directly to a waterway. This is up six percentage points from 2003. However, there still is a lack of understanding regarding the storm drain system. When asked if water in the storm drains is tested and filtered, 4% more answered the question correctly in 2005, however, it was still less than half (46%) of the respondents. Similarly, when asked if sewer water and storm drain water

SECTION 6.0, PUBLIC EDUCATION

enter the same system, 3% more answered the question correctly, however, it was still less than half (44%) of the respondents.

During the education campaign, nearly all materials created mentioned that objects in the street flow through storm drains directly to the nearest waterway. However, only the brochures, fact sheets and newsletter articles went into depth regarding the difference between the sewer and storm drain system. The use of this information in all the materials shows in the increased level of awareness. Had the differences between the sewer system and storm drain system been illustrated in every piece, these numbers may have been higher.

Also, men tend to be very knowledgeable regarding the storm drain system while women were less knowledgeable according to the 2005 survey; therefore, materials targeted at women may be considered.

Effectiveness of Educating on Key Pollutants

The survey asked respondents if the following items contributed to polluting urban runoff: oil, toxic waste, Styrofoam cups, gardening products, cigarette butts, paint, dirty water/detergent, cleaning products, trash, pet waste, water from hoses, lawn clippings/dirt/leaves and pool water. In every case, respondents were very likely to say these items contributed to polluted runoff with nine of them increasing beyond the margin of error (oil, Styrofoam cups, cigarette butts, paint, cleaning products, trash, pet waste, lawn clippings/dirt/leaves and pool water).

The increased knowledge held regarding these 13 pollutants shows a strong upward trend and indicates that education materials are reaching the residents. For all but two pollutants (toxic waste and Styrofoam cups) a brochure has been created to educate the public. Also, seven of the pollutants (oil, gardening products, cigarette butts, dirty water/detergent, pet waste, hose water and lawn clippings/dirt/leaves) were covered in the print advertising campaign. The fact that public knowledge has increased regarding all 13 pollutants demonstrates that the education campaign is effective.

Effectiveness of Educating on Key Behaviors

Consistent with the first survey, roughly two thirds say that changing their personal behaviors would make a difference in cleaning up pollution (65%). This represents an increase of 2%. The survey revealed the following: 97% of people were either willing or did dispose of chemicals properly, 89% were willing to or did use fertilizers properly, 92% were either willing to or did keep yard clippings out of the street, 90% were willing to or currently adjust sprinklers to avoid overwatering; 79% were willing to or did pick up after their pet, 90% were willing to or currently use a broom to clean driveways, and 73% were willing to or eliminated washing cars at home.

When comparing seven actions that residents were already participating in, they were 4% more likely to dispose of chemicals properly and 3% more likely to pick up after a pet in 2005. However, less respondents were keeping yard clippings out of the street (-5%),

adjusting sprinklers (-1%), using a broom instead of a hose (-5%), properly using fertilizer (-1%) and eliminating car washing (-9%). Although participation in some of the seven actions decreased, roughly half of Orange County residents report taking part in all seven of the activities – making a significant increase over the 30 months (+37%) of the campaign (**Figure 6.1**).

During the course of the education campaign, the materials focused on what can be done to prevent urban runoff. All seven activities mentioned in the survey were addressed in brochures, newsletter articles, fact sheets, press releases and billing inserts.

The survey results indicate that the education campaign has penetrated the residents of Orange County and caused significant awareness of the activities that can reduce urban runoff. In all cases (except home car washing) at least eight in ten residents were either participating, or willing to participate in, activities that limit runoff. Despite a successful start to the campaign, residents appear to be obstinate when it comes to one behavior – eliminating home car washing.

Effectiveness of the School Outreach Program

A significant portion of parents of children under 19, roughly 25%, report that their children learned about urban runoff issues in school and came home and talked about it. It is safe to assume that the number of students who received the information, but did not share it with their parents is even higher.

Based on the significant number of students who have reported to a parent about having heard urban runoff prevention messages, it appears that the school outreach program has been effective.

Effectiveness of the Media Outreach Program

According to the 2005 survey, the most effective (most recognized by residents) form of advertising are the “No dumping, drains to ocean” stencils (81%) and newspaper articles (65%). Although part of the overall stormwater program, stencils were not an integral element of the education campaign. Their success can be attributed to a couple of factors. First, the stencils are on a large percentage of storm drains throughout the County. Nearly every resident has a stencil in his or her neighborhood. Also, the stencil program has been active in Orange County for many years. While other education programs were introduced in the last 30 months, residents have seen the stencils for more than a decade. The other very effective program has been newspaper articles. Similar to the stencils, articles on water pollution have been available to the public for decades and have had time to resonate.

Other effective aspects of the program (recognized by residents) were the PSAs on radio (39%), PSAs on cable (38%), newspaper advertising (35%), brochures (28%) and community events (20%). All five of these programs were initiated 30 months ago through the outreach campaign and have significantly resonated with residents. While most of these campaign elements were specific to Orange County, a few had the additional assistance from other regional campaigns such as “Don’t Trash California” and the “Used

Oil" program.

Less effective aspects of the program (least recognized by residents) were movie theater advertising (14%), workplace information (14%), bus advertising (13%) door hangers (12%), and Spanish radio PSAs (6%). While Spanish radio was the least recognized program by all respondents to the survey, among Spanish speaking respondents it was substantially higher (18%). All of these specific campaign elements were created and implemented during the 30-month outreach campaign (**Figure 6.2**).

When determining whether an element should be eliminated from the campaign, it is important to evaluate the number of sources people received information from. According to the 2005 survey, 29% of people received stormwater information from one or two sources. If the majority of these people received information from a source that is eliminated, the campaign would be less effective. However, in this circumstance, only 2% of people who received information from one or two sources received information from theater ads or bus backs. In regarding to theater advertising, it is possible that residents confused cable PSAs with theater advertising because both played the same spot. Since cable advertising was highly recognized by residents, the campaign could have been less effective if it were removed. In the case of bus back advertising, the program would still have been effective without this element.

Another aspect of the program that was evaluated was the print advertising. While, 35% of people recalled seeing print advertising, it is important to note what papers residents are reading. While the largest percentage of advertising was in the Orange County Register, the program did advertise in the Los Angeles Times a half dozen times a year. According to the survey, the percentage of people who get most of their information on urban run-off from the Times dropped from 12% to 9% (Orange County Register is 28%). Also, only 5% of people who received information from one or two sources received the information from print advertising. Therefore, advertising in the Times could likely have been less frequent without affecting the effectiveness of the campaign (**Figure 6.3 Effectiveness of Print Advertising**).

According to the 2005 survey, the percentage of voters saying there is enough information has increased (+1% and +5% from a split question). However, residents continue to believe that there is not enough information provided about how to stop urban runoff and ocean pollution in Orange County. So while some of the elements of the campaign could have been eliminated, the survey demonstrated that people need to receive information from a variety of sources. The Internet appears to be an emerging source of information, increasing 6% to 10% (third highest source of information).

6.4 Summary

Since the inception of the Orange County Stormwater Program outreach campaign, information on stormwater and urban runoff has made initial inroads in increasing awareness. This increase is seen in nearly every element of the program and demonstrates a great beginning to a program that was implemented in a short period of time.

SECTION 6.0, PUBLIC EDUCATION

Although all of the elements of the program contributed to the success of the campaign, the program could have considered eliminating bus back advertising. Print ads in the Los Angeles Times could have been reduced and ads in the full-run Orange County Register could have been increased. Another element that could have been added is online marketing. Overall the program demonstrated an effective start to the education campaign.

Figure 6.1: Resident Participation in Pollution Prevention Activities

Figure 6.2: Effectiveness of Media Outreach Program

Figure 6.3: Effectiveness of Print Advertising

7.0 NEW DEVELOPMENT/SIGNIFICANT REDEVELOPMENT

7.1 Introduction

One of the most important responsibilities of local government is to provide a decision making and approval processing framework for new development and re-development. This framework ensures that (1) development occurs in an orderly and organized fashion in a manner that reflects the vision and needs of the community, (2) environmental issues associated with development are assessed, and (3) provides a regulatory framework to ensure that standards set by the jurisdiction are implemented.

Since the inception of the Program, it has been recognized that the incorporation of BMPs into a development project in its planning stages offers a unique opportunity to limit increases in pollutant loads. **DAMP Section 7.0** links new development BMP design, construction and operation to the earlier phases of new development project planning, encompassed by the jurisdictional General Plans environmental review and development permit approval processes.

7.2 Accomplishments

7.2.1 New Development/Significant Redevelopment Program

In 1993, the New Development/Construction Task Force, comprised of representatives from the Principal Permittee, Building Industry Association (BIA), Association of General Contractors (AGC) and Civil Engineers & Land Surveyors of California (CELSOC), completed a report - *Best Management Practices For New Development Including Nonresidential Construction Projects (1-5 acres)* - that provided the basis for requiring the incorporation of structural and non-structural BMPs into development. This report was the basis of the New Development component of the DAMP during the First and Second Term Permits.

The requirements of the Third Term permits significantly increased the complexity of the new development provisions of the DAMP. These provisions provide a framework and a process for integrating watershed protection/stormwater quality management principles into the Permittees' General Plans, environmental review processes, and development permit approval processes. The new development provisions also cover initial project planning and project design, construction and completion, including requirements for the selection, design and long-term maintenance of permanent BMPs. Specifically, the new development provisions require the Permittees to:

- Assess the need to revise and update General Plans to include watershed and stormwater quality and quantity management considerations.
- Review CEQA processes for potential stormwater quality impacts and mitigation.
- Review development planning/permit approval process for stormwater protection principles.

- Develop and implement a model Water Quality Management Plan (WQMP) (also referred to as a Standard Urban Stormwater Mitigation Plan – SUSMP) to address impact from new development and significant redevelopment.

For the area of Orange County within the San Diego Regional Water Quality Control Board jurisdiction of Orange County (area south of El Toro Rd.), each municipality was required by the Permit to develop a Local WQMP, based on the model WQMP, to oversee new development and significant redevelopment within their local jurisdiction. These Local WQMPs were finalized for implementation on August 13, 2003.

For the area of Orange County within the Santa Ana Regional Water Quality Control Board jurisdiction of Orange County (area north of El Toro Rd.), the Model WQMP explains the requirements placed upon all new development and significant redevelopment projects. The Model WQMP underwent a lengthy public review process and was approved for implementation by the Executive Officer of the Santa Ana Regional Water Quality Control Board on September 30, 2003.

During the 2004-05 reporting period, 551 Project WQMPs were processed for 3,227 acres of development. Since 1997, a total of 3,193 Project WQMPs have been approved, covering 27,287 acres which represents approximately 6% of the area within Orange County subject to the Third Term Permits.

- Conduct education or training.

Five training modules have been developed and have been given:

1. General Plan Issues;
2. New Development/Significant Program Management;
3. Project Planning and Design: Environmental Review, Planning and Permitting and WQMP Development;
4. Stormwater BMP Effectiveness and Applicability for Orange County, and
5. Stormwater Treatment: How it Works (Or Does It?).

7.2.2 California Sustainable Watershed/Wetland Information Manager (CalSWIM)

CalSWIM (<http://calswim.org/>) is an Orange County Storm Water Program and University of California, Irvine (Departments of Engineering and Informatics) initiative to develop a web-based expert system and prototype database designed to support cost-effective and scientifically justifiable decisions regarding the monitoring, management, and alteration of coastal urban wetlands and their associated watersheds. Initiated in 2004, CalSWIM currently delivers:

- Forecasting and now-casting of nutrient levels, sediment supply, indicator bacteria, and pathogens in the Newport Bay Watershed, and

- Targeted evaluation of management decisions that affect the habitat quality and ecological function of coastal wetlands, and/or that directly bear on pollutants of concern.

7.2.3 Hydromodification

Hydromodification arises from changes in the volume, magnitude and duration of flows that can occur coincident with urbanization and is evident in the landscape as channel incision and bank erosion in the upper and middle portions of a watershed and as aggradation and increased channel meandering in the downstream areas of the watershed. In 2005, the Permittees supported, through the Stormwater Monitoring Coalition (SMC) and California Stormwater Quality Association (CASQA), a workshop that was convened to provide an overview of the key technical and managerial issues associated with hydromodification in S. California (see Stein and Zaleski, 2005¹).

7.3 **Assessment**

The current and potential program effectiveness assessment outcome levels for the New Development / Significant Redevelopment Program are presented in **Table 7.1**.

7.3.1 New Development/Significant Redevelopment Program

CEQA review processes were reviewed for adequacy early in the period of the Third Term Permits. However, in preparing the ROWD, a number of Permittees commented that the overall planning approval process for projects needs to more effectively ensure that water quality protection is considered in the earliest phases of project consideration through further elaboration of the preliminary or conceptual WQMP concept in the DAMP.

ROWD Commitment:

- Prepare guidance documentation and clarify requirements for the preliminary or conceptual Project WQMP.

The Model WQMP identifies BMPs for new development and significant redevelopment projects that are subject to WQMP requirements pursuant to **DAMP Section 7**. Depending upon the project size and characteristics, these BMPs include Site Design BMPs, applicable Source Control BMPs and Project-based Treatment Control BMPs (and/or participation in an approved regional or watershed management program).

¹ Managing Runoff to Protect Natural streams: The Latest Developments on Investigation and Management of Hydromodification in California; Stein and Zaleski, SCCWRP Technical Report 475, December 2000.

The requirement for new developments/significant redevelopment projects to prepare a WQMP has been an established part of the planning approval process (See **Table 7.2**) since the **1993 DAMP** and all Permittees certified they were implementing this part of the Program in 1997. While there is considerable variation in the level of activity between the Permittees, this variability can be attributed to the availability of land for development/redevelopment within a particular jurisdiction. Indeed, the County of Orange and the cities of Irvine and Anaheim, with large swathes of undeveloped land, show the highest numbers of WQMPs processed.

Headline Indicator - Number of WQMPs processed and the area (acreage) to which BMPs have been applied: During the 2004-05 reporting period, 551 WQMPs were processed for 3,227 acres of development compared to 461 WQMPs processed for 1,595 acres of development in 2003-04, and 391 WQMPs processed for 2,836 acres of development in 2002-03 (**Table 7.2; Figure 7.1**).

Level 1: Implement Program

Headline Indicator - Number of BMPs Implemented: A total of 5,061 BMPs were implemented in the 2004-05 reporting period. This total represents a 129% increase in the total number of BMPs implemented in 2003-04 (2,201) and a 112% increase from the total number of BMPs implemented in 2002-03 (2,389) (**Figure 7.2**).

Level 3: Behavior Change

During the Third Term Permit term, the structural source controls used most often were: common area efficient irrigation systems and landscape design, filtration, storm drain stenciling, and trash storage area. The non-structural source controls used most often include: employee training, common area litter control, common area landscape management, street sweeping, education, BMP maintenance, and activity restrictions. The most common treatment control BMPs that have been implemented include catch basin screens, catch basin filters, and stormwater treatment units (hydro-dynamic separators).

In preparing the ROWD, a number of Permittees have commented that (1) the guidance for selecting BMPs needs to be updated and enhanced, particularly with regard to treatment control BMPs, (2) there is a possible inconsistency in provisions regarding site prioritization, and (3) adjacent municipal stormwater programs have more effective provisions regarding the consideration of Site Design BMPs.

DAMP Modification:

- Revise *Model WQMP Table 7.II.6* for latest information on BMPs and clarity.
- Evaluate and revise (as necessary) prioritization provisions for Countywide consistency.

ROWD Commitment:

- Develop recommendations (through cooperative Stormwater Monitoring Coalition project) for incorporation of LID techniques into resource and water quality protection requirements.
- Develop library of BMP performance reports.
- Develop standard design checklist/plans/details for selected Source Control and Treatment Control BMPs.
- Develop recommendations for enhanced Model WQMP language regarding Site Design BMPs.
- Develop and implement BMPs for architectural uses of copper and zinc.

In 2005 the Santa Ana Regional Board formally approved the Irvine Ranch Water District's Natural Treatment System as a regional treatment control BMP for a portion of the Newport Bay Watershed. The project is significant for it being the first expression in the area under the jurisdiction of the Santa Ana RWQCB of a regional approach to stormwater treatment.

ROWD Commitment:

- Evaluate the NTS approval process and develop recommendations for streamlining regulatory agency approval of regional Treatment Control BMPs.

The New Development/Significant Redevelopment component of the Program ends with permit close-out and the BMPs transition to the Existing Development component. The Permittees believe that the BMP approach to stormwater management is most effectively sustained by ensuring the longevity of the WQMP through successive ownerships. Additionally, the Permittees requested additional guidance on recording WQMPs in a manner that would enable them to enforce the approved WQMP against subsequent property owners and ensure ongoing

responsibility for BMP maintenance.

ROWD Commitment:

Prepare guidance and training as needed on the recordation process (timing and appropriate documents to use) and develop recommendations for appropriate methods to employ to enable the Permittees to enforce the approved WQMP against subsequent property owners.

Training: Both the Permittees and RWQCB staff has identified a need for updated and additional training regarding WQMP review and approval.

ROWD Commitment:

- Prepare a training schedule and curriculum including defined expertise and competencies for staff with WQMP review and approval responsibilities.
- Prepare a workshop schedule and curriculum for the private sector on WQMP preparation.

7.3.2 California Sustainable Watershed/Wetland Information Manager (CalSWIM)

This initial development and deployment of CalSWIM has focused on Newport Bay, the regionally important tidal saltwater marsh. However, CalSWIM will in the future be extended with an open and scalable architecture to facilitate its rapid redeployment at other coastal urban wetland sites in southern California and elsewhere.

7.3.3 Hydromodification

While the major development projects in Orange County have now been entitled, the Permittees recognize that hydromodification is an emerging issue of concern as the future regulation and management of runoff from urban areas is increasingly considered with respect to the overarching objective of the CWA i.e. maintenance of the chemical, physical and biological integrity of the nation's waters.

DAMP Modification:

- Revise *Model WQMP Section 7.II -3.2.4 Identify Hydrologic Conditions of Concern* to incorporate additional information from hydromodification study.

7.4 Summary

The Third Term Permits have required the Permittees to develop and implement a significantly revised SUSMP- equivalent program for new development/significant redevelopment. This effort was completed Countywide by the end of 2003 and has resulted in an enhanced a WQMP program that, since 1997, has resulted in a total of 3,193 approved Project WQMPs. While the WQMP program is long-established, the review points to a possible continuing emphasis on pollution prevention BMPs and less progress regarding Site Design BMPs using LID approaches. Consequently, the development of additional training and technical support documentation on these approaches is being proposed as an area for further development. In addition, the Permittees have provisionally identified an opportunity, possibly through a Notice of Transfer of Responsibility, recordation, or other means, to enhance efficacy of the WQMP. This opportunity will be the future subject of a formal recommendation to the Permittees.

8.0 CONSTRUCTION

8.1 Introduction

The Permittees regulate construction activities and have responsibility for the construction and reconstruction of municipal facilities and infrastructure. Concern over construction sites as a major source of sediment and other pollutants has meant that construction activity has been a focus of the Permittees' compliance program since the First Term Permits.

8.2 Accomplishments

8.2.1 Model Construction Program

This Model Construction Program was developed and implemented in 2002-03. It requires all construction projects regardless of size to implement an effective combination of erosion and sediment controls and waste and materials management BMPs. It also establishes inspection obligations on the Permittees. Previously, the Permittees' oversight of construction activities was based upon ensuring conformance of public works projects with the *Greenbook Standard Specifications for Public Works Construction*. Specifically, the Model Construction Program requires the Permittees to:

- Inventory construction sites

In May 2002, a construction site inventory spreadsheet was finalized and distributed to the Permittees so that each municipality could develop their inventories by October 15, 2002, as required by Section VIII.1 of the 2002 Santa Ana Permit.

- Prioritize construction sites based upon water quality threat

During 2004-05, thirty-four (34) Permittees reported conducting 15,067 construction site inspections comprising 5,504 high priority site inspections, 1,542 medium priority site inspections and 8,021 low priority site inspections.

- Prepare BMP Guidance

The Permittees produced and distributed the *Construction Runoff Guidance Manual*.

- Conduct Inspections of construction sites

During the Third Term Permits 25,831, 25,549 and 15,067 site inspections were conducted in the 2002-03, 2003-04 and 2004-05 reporting periods respectively.

SECTION 8.0, CONSTRUCTION

- Undertake Enforcement

As a result of the 2004-05 inspections, thirty-three (33) Permittees reported the issuance of 445 Educational Letters, 1,052 Notices of Non-compliance, 74 Administrative Compliance Orders, 81 Cease and Desist Orders, and 47 Misdemeanor/Infractions.

- Conduct Training

To assist responsible municipal and contract/lease staff in understanding the Construction Program, two training modules have been developed:

- 1) Construction Program Management.
- 2) Inspecting Construction Site BMPs.

In the 2004-05 reporting period Construction Inspection training was provided in two sessions to 167 inspectors.

8.3 Assessment

The current and potential Program effectiveness Assessment Outcome Levels for the current program are summarized in **Table 8.1**.

8.3.1 Model Construction Program

Inventories

The year-to-year status of the Permittees' inventories are not tracked at a Countywide level and consequently this aspect of the model program cannot be assessed.

Prioritization

The Permittees prioritize construction sites based upon a consideration of the size and type of construction, time of construction, location, and site topography. While the numbers of sites of each priority are not tracked at a Countywide level, the year-to-year changes in the level of inspection activity (**Table 8.2**) shows inconsistent reporting between the Permittees.

DAMP Modification:

- Provide definitive construction site prioritization and reporting guidance.

SECTION 8.0, CONSTRUCTION

Inspection

The Permittees inspect construction sites to verify that the requirements of the DAMP are being implemented. The inspection frequency is determined by the season (“Wet” or “Dry”) and a site’s prioritization. The need for follow-up inspections also contributes significantly to the overall level of activity within a reporting period.

Headline Indicator - Inspection Activity: In 2004-05 thirty-four (34) Permittees completed 5,504 high priority, 1,542 medium priority, and 8,021 low priority construction site inspections. In 2003-04, 8,445 high priority, 5,731 medium priority, and 11,363 low priority construction site inspections were completed; and in 2002-03, 4,060 high priority, 15,937 medium priority, and 5,834 low priority construction site inspections were completed (**Table 8.2; Figure 8.1**).

Level 1: Implement Program

While the level of inspection activity is significant (15,000 inspections in the last reporting period) there are disparities between the Permittees which indicates inconsistent reporting. A major component of this activity is re-inspection following a finding of non-compliance. The Permittees believe that the re-inspection obligation is not sufficiently sensitive to the severity of the non-compliance, and RWQCB staff is concerned that the mandated level of follow-up activity may be discouraging findings of non-compliance.

DAMP Modification:

- Clarify inspection frequencies, violation definitions and re-inspection requirements.

Enforcement

Inspectors enforce compliance with the Model Construction Program, grading or building permit, sediment and erosion control plan, and the Water Quality Ordinance. Enforcement steps that may be taken by inspectors include but are not limited to verbal warnings, administrative actions under the Water Quality Ordinance (notice of violation, administrative compliance order, etc.) and written actions under Building/Grading Ordinances (corrective action notice, stop work order, etc.).

Headline Indicator – Extent of Compliance: As a result of the 2004-05 inspections, thirty-three (33) Permittees reported 1,514 construction requiring 1,521 re-inspections compared to 1,066 construction sites requiring 1,072 re-inspections in 2003-04; and 408 construction requiring 542 re-inspections in 2002-03 (**Table 8.3; Figure 8.2**).

Level 1: Implement Program

Level 3: Behavior Change

Headline Indicator – Number and Level of Enforcement Actions: As a result of the 2004-05 inspections, thirty-three (33) Permittees reported taking a total of 1,699 enforcement actions. This compares to 3,475 enforcement actions taken in 2003-04, and 1,395 enforcement actions taken in 2002-03 (**Table 8.4; Figure 8.3**).

Level 1: Implement Program

Level 3: Behavior Change

The significant disparities in enforcement activity between the Permittees clearly indicate inconsistent reporting. However, the consistent pattern of a peak of activity in 2003-04 and a subsequent reduction in the 2004-05 reporting period in construction and other stormwater program areas (Existing Development and Illegal Discharges/Illicit Connections) suggests an increased level of compliance within the regulated community.

Training

The Permits require that staff is adequately trained. In response, the Permittees developed two training modules and a guidance manual. However, the training modules need to be updated frequently enough to keep pace with the developments in the field of construction site sediment and erosion control management, and to provide inspectors with a technical understanding of BMPs. In addition, the training of inspectors regarding construction site inspection and oversight has been identified as a particular area of concern for Regional Board staff.

ROWD Commitment:

- Prepare a training schedule including curriculum content and defined expertise and competencies for construction inspectors.

8.4 Summary

The Third Term Permits have required the Permittees to develop and implement a formal inspection program commencing with an initial prioritized inventory of construction sites. Over the first three years of this effort, there has been a clear trend in the level of inspection and enforcement activity that, despite some uncertainties with respect to reporting, suggests increased BMP implementation and compliance with local water quality and grading/building ordinances by the regulated community. Based upon perceived positive outcomes of the Construction elements of the DAMP, the Permittees are proposing minor program modifications based upon the need for the continued training of inspectors and the sensitizing of the prioritization and inspection process toward a more risk-based approach.

9.0 EXISTING DEVELOPMENT

9.1 Introduction

Stormwater discharges from commercial and industrial facilities can become contaminated when material management practices allow exposure to stormwater and/or there is commingling of runoff with wastes. The purpose of **DAMP Section 9.0** is to provide a programmatic framework for the regulatory oversight of activities in commercial and industrial areas. Through inspections, outreach and requiring compliance with water quality ordinances, the Permittees are able to pro-actively address the quality of urban and stormwater runoff from industrial and commercial facilities. In addition, **DAMP Section 9.0** also provides a programmatic framework, based upon education and outreach approaches, for addressing activities in residential areas. Both the industrial/commercial and residential elements were added to the Program by the Third Term Permits.

9.2 Accomplishments

9.2.1 Model Industrial/Commercial Program

The Model Industrial/Commercial Program was developed and implemented in 2002-03. It transformed the Permittees oversight of commercial and industrial facilities/activities by establishing a formal inspection program where previously there had been a series of notifications and inspections initiated by complaints. The Model Industrial/Commercial Program requires the Permittees to:

- Identify and inventory facilities/activities with the potential to discharge pollutants:

Initially, 8,546 industrial facilities (**Table 9.1; Figure 9.1**) and 22,789 commercial facilities were identified and inventoried (**Table 9.2; Figure 9.2**).

- Prioritize facilities based upon water quality threat and receiving water sensitivity:

The Permittees prioritized 8,546, 8,604 and 2,821 industrial facilities in 2002-03, 2003-04 and 2004-05 respectively. Concurrently, 22,789, 23,778, and 25,411 commercial facilities were similarly evaluated and prioritized over the same respective periods.

- Establish Model Maintenance Procedures:

Twenty-two (22) model BMP fact sheets have been prepared which include a description of specific minimum source control BMPs for common industrial and commercial activities that may discharge pollutants. Specific BMPs may be adjusted on a jurisdictional basis as necessary. Where applicable, optional controls have been identified that should be considered for implementation at high priority facilities.

Typically each fact sheet contains the following sections:

- Pollution Prevention

SECTION 9.0, EXISTING DEVELOPMENT

- Suggested Best Management Practices
 - Training
 - References and Resources
- Conduct inspections and monitoring to ensure that commercial and industrial facilities are minimizing their impacts on the environment:

In the 2002-03, 2003-04 and 2004-05 reporting periods the Permittees completed 1,017, 4,029 and 2,706 inspections, respectively.

- Conduct inspections of food facilities:

The Orange County Permittees developed and submitted a food facility inspection program to the Santa Ana Regional Board on July 1, 2002. This program, which also meets the inspection requirements of the San Diego Regional Board, involves inspections and the distribution of educational materials at the approximately 10,000 existing restaurants countywide. The implementation of the Program is an addition to the environmental health inspections conducted by the County of Orange Health Care Agency (HCA). The HCA inspectors identify NPDES issues during these inspections, and they are forwarded to the respective Permittees and addressed by Permittee staff.

For the 2004-05 reporting period, 25,078 food facility inspections were conducted and 1,416 were reported to have NPDES issues (**Table 9.3**).

- Undertake Non-compliance Notification and Enforcement:

Enforcement for the industrial and commercial component of the Existing Development Program is the responsibility of individual Permittees. Each Permittee has several different levels of enforcement to choose from for different types of situations. This includes - from least severe to most severe - issuance of an educational letter, a notice of non-compliance, an administrative compliance order, a cease and desist order, or a misdemeanor/infraction.

The Permittees reported a total of 371 enforcement actions against industrial facilities during the 2004-05 reporting period

- Participate in Training:

To assist municipal staff in implementing the Existing Development Program for industrial and commercial facilities, five training modules were developed:

1. Existing Development Program Management Module (targeting jurisdictional program coordinators and providing guidance regarding management of an inspection program);
2. Field Implementation of Existing Development Program Module (targeting inspectors and providing guidance on conducting inspections);

SECTION 9.0, EXISTING DEVELOPMENT

3. Existing Development Program Training – Automobile Mechanical Repair, Maintenance, Fueling and Cleaning Businesses Module;
 4. Existing Development Program Training – Landscape Maintenance Businesses Module, and
 5. Existing Development Program Training – Industrial Stormwater Monitoring Module.
- Conduct Education and Outreach:

A number of education and outreach efforts, conducted under the overall public education element of the Program (see **DAMP Section 6.0**), directly supported implementation of the Model Industrial Commercial Program, specifically:

Mailings – During 2003-05 there was one mass mailing of an outreach letter for corporate environmental managers of food service establishments (FSE) and one mass mailing of education materials to all Orange County FSEs.

Outreach Materials –The following materials were developed by the Public Education Committee supportive of **Section 9.0**:

Brochures

- *Mobile Detailing and the Water Quality Act*
- *Water Quality Guidelines for Exterior Restaurant Cleaning Operations*
- *Water Quality Guidelines for Carpet Cleaning Activities*
- *Help Prevent Ocean Pollution: Tips for Hardscape and Landscape Drains*
- *Help Prevent Ocean Pollution: Tips for Home Improvement*

Posters

- Food/Restaurant Industry
- *“Help Prevent Ocean Pollution”* Food Facility BMPs Poster
- Auto Repair Industry
- Good Gas Station Operating Practices

“The Quad” - “The Quad” was developed as a tool to communicate with Cities, Businesses, Utilities and Organizations. Each Quad contains a newsletter, press release, fact sheet and billing insert focusing on a seasonal stormwater theme. Four seasonal quads were created during this reporting period, two of which were distributed in this reporting period. The following were the 2004-05 Quad themes:

- *“Spring Into Cleaning – Disposal of Household Hazardous Waste”*
- *“Summer: Yard Care”*
- *“Fall: Prepare for the Rainy Season”*
- *“Winter: New Years Resolution – Green in the New Year”*

FSE Outreach – The following materials were developed specifically for FSEs.

SECTION 9.0, EXISTING DEVELOPMENT

- *“Help Prevent Ocean Pollution”: A Guide for Food Service Establishments*
- *“Help Prevent Ocean Pollution” Food Facility BMPs Poster*
- *“Help Prevent Ocean Pollution” Food Facility BMPs Stickers*
- Bilingual CD-Rom illustrating appropriate Food Facility BMPs
- Food Facility BMP PowerPoint Presentation
- Food Facility BMP Fact Sheet

Other: Developed an urban nutrient outreach program targeting independent gardeners operating in the San Diego Creek/Newport Bay Watershed with Proposition 13 funding awarded to the County to investigate the sources of nutrients from the urban environment and test the effectiveness of structural and non-structural BMPs.

9.2.2 Model Residential Program

The Model Residential Program was developed and implemented in 2002-03 to further reduce pollutants potentially released into the environment from residential activities, including efforts to reduce over-watering. The main thrust of the residential program is to advocate pollution prevention practices as the most effective method to protect receiving water quality. The Model Residential Program requires the Permittees under the jurisdiction of the San Diego Regional Board to:

- Develop a source identification procedure and prioritize residential areas based on proximity to Environmentally Sensitive Areas (ESAs) within the Permittee’s jurisdiction.
- Identify Best Management Practices (BMPs) most appropriate for each area, based on residential activities:

See discussion of Outreach Materials (below).

- Conduct public outreach and education:

A number of education and outreach efforts, conducted under the overall public education element of the Program (see **DAMP Section 6.0**), directly supported implementation of the Model Residential Program, specifically:

Outreach Materials -The following materials were developed by the Public Education Committee supportive of **Section 9.0**:

Brochures

- *Help Prevent Ocean Pollution: Tips for Hardscape and Landscape Drains*
- *Help Prevent Ocean Pollution: Tips for Horse Care*
- *Help Prevent Ocean Pollution: Tips for Using Paint*
- *Help Prevent Ocean Pollution: Tips for Home Improvement*

“The Quad” - “The Quad” was developed as a tool to communicate with

SECTION 9.0, EXISTING DEVELOPMENT

cities, businesses, utilities and organizations such as home owner associations. Each Quad contains a newsletter, press release, fact sheet and billing insert focusing on a seasonal stormwater theme. Four seasonal quads were created during this reporting period, two of which were distributed in this reporting period. The following were the 2004-05 Quad themes:

- “Spring Into Cleaning - Disposal of Household Hazardous Waste”
- “Summer: Yard Care”
- “Fall: Prepare for the Rainy Season”
- “Winter: New Years Resolution - Green in the New Year”

9.2.3 Other Programs

During the reporting period, the Principal Permittee developed an urban nutrient outreach program targeting residential gardeners operating in the San Diego Creek/Newport Bay Watershed. The outreach program was one element of a Proposition 13 funded investigation of nutrient sources in an urban environment and structural and non-structural BMP effectiveness.

9.3 Assessment

The current and potential Program Effectiveness Assessment Outcome Levels that could be assessed within the current program are summarized in **Table 9-4** (Industrial/Commercial) and **Table 9.5** (Residential).

9.3.1 Model Industrial/Commercial Program

Inventories: Completing the inventory of industrial and commercial facilities has been problematic for some jurisdictions since the Standard Industrial Classification (SIC) codes on the business licenses (the primary source of this information for those jurisdictions with a business license program) have been incorrectly provided by businesses.¹ In addition, inventorying commercial facilities is extremely difficult because they are numerous, often transitory, and can only be identified through site visits. Mobile businesses are particularly problematic because they typically do not have a permanent facility location.

The Unified Annual Progress Reports include tables reporting the total number of commercial and industrial facilities and their respective prioritizations, organized by

¹ The Notice of Intent (NOI) form attached to the Draft Industrial General Permit (February 2005) and the SWRCB’s NOI processing system have been modified to accept both Standard Industrial Classification (SIC) codes and North American Industrial Classification System (NAICS) codes. The USEPA has indicated it intends to incorporate the NAICS codes into the storm water regulations but has not yet done so. The Proposed 2006 Multi-Sector General Permits for Stormwater Discharges Associated with Industrial Activity (MSGP) contains a note that “a complete list of SIC Codes (and conversions from the newer North American Industry Classification System [NAICS]) can be obtained from the Internet at www.census.gov/epcd/www/naics.html or in paper form from various locations in the document titled Handbook of Standard Industrial Classifications, Office of Management and Budget, 1987.”

SECTION 9.0, EXISTING DEVELOPMENT

Permittee. However, since the structure and content of the jurisdictional databases can differ between the Permittees, analysis of data on a regional or countywide basis is challenging. Indeed, there appears to be a persistent disparity between the number of industrial and commercial facilities inventoried and the number of industrial and commercial facilities that were prioritized over the reporting period (see **Tables 9.1** through **9.3** and **Figures 9.1** through **9.2**). This disparity points to the need to augment facility descriptions beyond SIC codes.

DAMP Modification:

- Provide more detailed industrial and commercial facility descriptions to assist in inventory standardization.

Prioritization: Commercial and industrial facilities must be classified as high, medium, or low priority to determine the frequency of inspection. The DAMP details a risk and receiving water sensitivity based point system for classification, the result of which is a total score indicating the facility priority. A change in facility prioritization can be indicative of programmatic success, since a finding that BMPs are being implemented (a behavior change) reduces the risk of pollutants being discharged which can result in a change in prioritization. However, both Permits specify mandatory high-priority commercial and industrial facilities. In addition, the San Diego Region Permittees are required to inventory only high-priority commercial facilities i.e. there are no designation of medium and low priority commercial facilities.

Headline Indicator - Prioritization of Facilities (Industrial Facilities): For 2004-05, 2,821 industrial facilities were prioritized, 27% of which were ranked as high priority; for 2003-04, 8,604 industrial facilities were prioritized, 13% of which were ranked as high priority; and for 2002-03, 8,546 industrial facilities were prioritized, 15% of which were ranked as high priority (**Table 9.1; Figure 9.1**).

- Level 1: Implement Program
- Level 3: Behavior Change

Headline Indicator - Prioritization of Facilities (Commercial Facilities): For 2004-05, 25,411 commercial facilities were prioritized, 20% of which were ranked as high priority; for 2003-04, 23,778 commercial facilities were prioritized, 24% of which were ranked as high priority; and for 2002-03, 22,789 commercial facilities were prioritized, 22% of which were ranked as high priority (**Table 9.2; Figure 9.2**).

- Level 1: Implement Program
- Level 3: Behavior Change

The year-to-year comparisons suggest some inconsistent reporting of this indicator. Part of this inconsistency arises from the interpretation of the extent to which a facility “tributary to” a sensitive receiving water, which is a key determinant in prioritization. From the Annual Progress Reports (See **DAMP Appendix C**), it is evident that “tributary to” is variously being interpreted as more than “next to” but “less than the whole watershed.” Also, although the point system is used by many of the Permittees, some perceive it as time-consuming and too subjective, and, as a result, may rely primarily on professional judgment. In addition, the ability of the prioritization process to meaningfully provide for a risk-based approach is also dampened by the requirements for mandatory high priority sites. Despite these reservations, it is possible that the decreased numbers of high priority sites in the most recent annual reporting period may also reflect increased findings of no stormwater exposures and diminished site risk.

ROWD Commitment:

- Develop a more detailed prioritization process to improve standardized reporting and to support re-direction of inspection resources to significant sources of priority constituents of concern

Inspection: The Permittees generally conduct two types of inspections: compliance inspections and follow-up inspections. Should an inspected site demonstrate non-compliance, inspection frequency must be increased as specified in the Permits until compliance is achieved. Although these inspections are generally viewed as beneficial, there is a regulatory agency perception (highlighted in meetings with Regional Board staff) that the inspections may be missing key items of concern and discouraging findings of non-compliance which add to the inspection burden by requiring additional follow-up activity.

Headline Indicator - Number of BMPs Implemented (Industrial Facilities): For 2004-05, 2,706 industrial facilities were reported to have BMP implementation, 68% of which have full BMP implementation; for 2003-04, 4,029 industrial facilities were reported to have BMP implementation, 59% of which have full BMP implementation; and for 2002-03, 1,026 industrial facilities were reported to have BMP implementation, 53% of which have full BMP implementation (**Table 9.6; Figure 9.3**).

Level 1: Implement Program

Level 3: Behavior Change

Headline Indicator - Number of BMPs Implemented (Commercial Facilities): For 2004-05, 5,566 commercial facilities were reported to have BMP implementation, 59% of which have full BMP implementation; for 2003-04, 8,484 commercial facilities were reported to have BMP implementation, 77% of which have full BMP implementation; and for 2002-03, 1,389 commercial facilities were reported to have BMP implementation, 63% of which have full BMP implementation (**Table 9.7; Figure 9.4**).

Level 1: Implement Program

Level 3: Behavior Change

It is also proving difficult for the inspectors to categorize BMP implementation at commercial and industrial sites along a three-point scale (fully, partially, or not implemented) because such a scale requires overly subjective determinations. Lastly, the requirement for follow-up inspections of all non-compliant sites every month is perceived to be excessive due to the already large number of sites in many cities' inventories.

ROWD Commitment:

- Develop effective alternative to re-inspection such as self-certification.

Headline Indicator – Food Facility Inspections: For the 2004-05 reporting period, 25,078 food facility inspections were conducted and 1,416 were reported to have NPDES issues (**Table 9.3**). For the 2003-04 reporting period, 12,635 food facility inspections were conducted and 1,298 were reported to have NPDES issues in the six month period of program implementation.

Level 1: Implement Program

Level 3: Behavior Change

The 2003-04 comparison suggests that food facility inspections and the associated education and outreach efforts are having a positive impact since the incidence of NPDES issues decreases from 1 in 10 inspections to 1 in 17 inspections .

Enforcement: Permittees are required to use a progressive enforcement approach and initiate enforcement actions where commercial and industrial facilities are found to be out of compliance. In general, specific facilities that are repeat offenders are identified through active database inventories and, in most cases, progressive enforcement is used to bring repeat offenders into compliance.

Headline Indicator – Number and Level of Enforcement Actions (Industrial Facilities): The Permittees reported a total of 371 enforcement actions against industrial facilities during the 2004-05 reporting period, 3,146 during the 2003-04 reporting period, and 533 during the 2002-03 reporting period (**Table 9.8**). The 2004-05 figure represents an 89% decrease from the total reported in 2003-04.

Level 1: Implement Program

Level 3: Behavior Change

Headline Indicator – Number and Level of Enforcement Actions (Commercial Facilities): The Permittees reported a total of 1,192 enforcement actions against commercial facilities during the 2004-05 reporting period, 1,534 during the 2003-04 reporting period, and 490 during the 2002-03 reporting period (**Table 9.9**). The 2004-05 figure represents a 22% decrease from the total reported in 2003-04.

Level 1: Implement Program

Level 3: Behavior Change

SECTION 9.0, EXISTING DEVELOPMENT

The 2003-04 comparison suggests some inconsistent reporting (e.g. Newport Beach, which compiled enforcement activity data in 2004-05 Unified Report, Section 2.10.0). However, the consistent pattern of reduced enforcement activity in the most recent reporting period across the Construction, Existing Development, and Illegal Discharges/Illicit Connections areas of the Program also suggests an increased level of compliance, also viewed as behavior change, by the regulated community.

Training: The Permits require that staff is adequately trained. In response, the Permittees developed several training modules, which are provided annually throughout the year. The training that has taken place has been deemed helpful. However, the training modules need to be updated frequently enough to keep pace with the developments in the field of stormwater management, maintain staff interest, and to provide inspectors with a technical understanding of a broad array of BMPs that can be shared with facility owner/operators.

ROWD Commitment:

- Prepare defined expertise and competencies for authorized inspector positions and develop a training schedule to meet these requirements

9.3.2 Model Residential Program

The Residential Model Program was developed to fulfill the residential activity and related commitments and requirements of Section F.3.d of the SDR Permit. The Common Interest Areas/Homeowners Associations (CIA/HOA) Activities Program was developed to fulfill the existing CIA/HOA activity commitments and requirements of Section F.6 of the SDR Permit.

Identification and Inventory: The SDR Permittees are required to identify high priority areas and activities as defined in the Permit. CIAs are considered to include high-priority areas and activities.

BMP Implementation: The SDR Permittees are required to identify minimum BMPs for high-priority areas and activities and, as necessary, additional controls. Some Permittees use a baseline BMP implementation approach for Residential areas and CIAs/HOAs unless inspectors notice a specific concern.

Enforcement and Reporting: SDR Permittees are required to enforce their stormwater ordinances for all residential areas and activities as necessary to maintain Permit compliance. The primary issue with residential areas and CIAs/HOAs concerns over irrigation. Enforcement actions taken against CIAs/HOAs include letters or notices, which generally leads to resolution of the issues. Some Permittees have reported some limited success using self certifications as a tool for effective implementation of the program within residential and CIA/HOA areas.

9.4 Summary

The Third Term Permits have required the Permittees to develop and implement a formal inspection program commencing with an initial inventory of potentially 30,000 facilities being subject to municipal oversight for stormwater and urban runoff issues. Over the first three years of this effort, there has been a clear trend in the level of inspection and enforcement activity that, despite some uncertainties with respect to reporting, suggests increased BMP implementation and compliance with local water quality ordinances by the existing industrial and commercial sector in Orange County. Based upon perceived positive outcomes of the Existing Development elements of the DAMP, the Permittees are proposing minor program modifications based upon the need for the continued training of inspectors and the sensitizing of the prioritization and inspection process toward a more effective risk-based approach.

10.0 ILLEGAL DISCHARGES/ILLICIT CONNECTIONS

10.1 Introduction

Illegal discharges/illicit connections (ID/IC) are potential sources of pollutants within municipal storm drain systems. The purpose of **DAMP Section 10.0** is to ensure that the Permittees have a programmatic framework for detecting and quickly responding to non-stormwater discharges to their storm drain systems. Since **DAMP Section 10.0** directly addresses one of the basic objectives of the NPDES Permits, it is a long-established part of the Program. With the Third Term Permits, the key elements of ID/IC have been significantly enhanced. In addition, a model sewage spill response program has been developed and has begun to be implemented in conjunction with OCSD.

10.2 Accomplishments

10.2.1 Illegal Discharges/Illicit Connections Program

The ID/IC Program provides guidance for Permittees when identifying, responding to and mitigating the effects of non-stormwater discharges and enforcing the ID/IC component of the Program for the protection of the environment. **DAMP Section 10.0** requires the Permittees to:

- Detect illegal discharges and illicit connections

A innovative Dry Weather Reconnaissance Program, based upon statistically derived benchmarks, was developed and implemented in both permit regions specifically to identify illegal discharges and illicit connections during the typically dry summer months of May through September using a suite of water quality analyses conducted in the field at designated random and targeted drains. The 2004-05 reporting period marked the third season of dry weather monitoring in the San Diego Region. With the approval of the Santa Ana Monitoring Program in July of 2005 by the Executive Officer of the Santa Ana Regional Board, dry weather monitoring in the Santa Ana Region commenced in May of 2006.

- Facilitate Public Reporting

Telephone and web-based reporting systems for the general public have been established and are advertised in the Stormwater Program's public education materials, Orange County "White Pages" telephone directories, and Permittee websites. A total of 3,408 complaints were received during the 2004-05 reporting period.

- Investigate

Each Permittee has designated Authorized Inspectors to investigate compliance with, detect violations of, and take actions pursuant to their Water Quality

SECTION 10.0, ILLEGAL DISCHARGES/ILLICIT CONNECTIONS

Ordinance. During the 2004-05 reporting period, the Permittees encountered and sought to mitigate discharges involving hydrocarbons (296 incidents), inorganic materials (264 incidents), metals (6 incidents), nutrients (43 incidents), 73 organic materials (73 incidents), discharge exceptions (133 incidents), pathogens (156 incidents), wastewater (624 incidents), pesticides (2 incidents), sediment (680 incidents), trash and debris (376 incidents), and 716 incidents involving miscellaneous types of materials for a total 3,369 incidents.

- Enforce

Enforcement actions are undertaken according to the adopted Water Quality Ordinances and accompanying Enforcement Consistency Guide. The Permittees reported a total of 3,528 enforcement actions, associated with ID/IC investigations during the 2004-05 reporting period.

- Undertake Training

To assist responsible municipal staff in understanding the Illegal Discharges/Illicit Connections Program, 10 training modules have been developed:

- 1) Program Management Training - Introductory
- 2) Program Management Training - Experienced
- 3) Authorized Inspector Training¹
- 4) Authorized Inspector Training - Introductory
- 5) Authorized Inspector - Field Implementation
- 6) Sewage Spill Response Training
- 7) Sewage Spill Response Training - Introductory
- 8) "Hands-On" Sewage Spill Response Training - Experienced
- 9) Fire Department Activities Training
- 10) Investigative Guidance Manual Training

In addition to the training modules, the Inspection Sub-Committee also provided training on various subjects relevant to the ID/IC program. This sub-committee meets bi-monthly to provide training to municipal inspectors and Authorized Inspectors in issues related to spill response, inspection and enforcement. In addition, this meeting serves as a forum for the coordination and discussion of ongoing difficult or new enforcement, investigation, or enforcement issues and to profile cases or incidents.

10.2.2 Model Sewage Spill Response Procedures

During the Third Permit term, the County and OCS D developed and implemented a coordinated sewage spill prevention and response demonstration project (The "Tustin

¹ This module was modified in the 2004-05 reporting period and divided into two modules, 1) Introductory and 2) Field Implementation.

Area Spill Control (TASC) Demonstration Project”). The TASC includes: 1) Development of sanitary sewer overflow (SSO) response procedures; 2) Selection of primary and backup sewage spill response contractors for containment and recovery of SSOs; and 3) SSO hands-on field response training for Permittee staff and municipal sewerage agency staff.

The TASC model program is currently in use in a limited portion of the County, however; one of the goals for TASC is to gradually phase the implementation of the project throughout the County so that the proactive interagency planning and coordination for sewage spill response can be implemented and/or improved in other watersheds

10.3 Assessment

The current and potential Program Effectiveness Assessment Outcome Levels that could be assessed within the current program are summarized in **Table 10-1**.

10.3.1 Illegal Discharges/Illicit Connections Program

Detection: The San Diego Dry Weather Monitoring Program has been conducted over 3 summers. Over this period there have been 585 site visits to 67 locations comprising 3 visits to the random sites and five visits to the targeted sites each season. Investigations, prompted by findings of elevated contaminant concentrations, were triggered on 18 occasions. These results show that approximately 25% of the 67 monitoring sites have exhibited evidence of contamination in dry weather flow at levels significantly above background levels.

The approval of the Santa Ana Monitoring Program (including the Dry Weather Reconnaissance Program) in July of 2005 by the Executive Officer of the Santa Ana Regional Board meant that the dry weather monitoring in the Santa Ana Region commenced in May of 2006. The 2006-07 Unified Report will present the first opportunity to review the effectiveness of this monitoring effort through comparison of the North and South County efforts.

Reporting: RWQCB staff have acknowledged that the Permittees’ field inspectors are trained to detect illegal discharges as part of their daily activities and, indeed, the majority of illegal discharges are detected by Permittee staff. The RWQCB staff also has noted that most Permittees have hotline numbers to receive water pollution complaints and incident information from the public and use database software to document the reported incidents which assists with the tracking of water pollution complaints by source. These RWQCB staff findings point to the overall robustness of the Permittees’ efforts to facilitate reporting.

Headline Indicator - Number of Complaints: The Permittees reported a total of 3,408 complaints/incidents during the 2004-05 reporting period. This total represents an 11% decrease from 2003-04 (3,837 complaints), and a 110% increase from 2002-03 (1,621 complaints) (**Table 10.2; Figure 10.1**).

Level 1: Implement Program

Level 3: Behavior Change

While the year-to-year comparison suggests some inconsistent reporting of this indicator, the overall pattern of a peak in the 2003-4 period (which is reproduced across other metrics) tends to suggest the positive impact of the Program (i.e. that there has been an overall reduction in the number of incidents and thereby a commensurate decline in the number of complaints). The increasing use of the “hotline” appears to indicate increasing awareness regarding this reporting mechanism.

Enforcement: Enforcement actions are undertaken according to the adopted Water Quality Ordinance and accompanying Enforcement Consistency Guide. In instances of noncompliance, the Permittee may adopt one of four types of remedies, including educational letters, administrative remedies, criminal remedies, or other civil or criminal remedies, as appropriate.

Headline Indicator - Number and Level of Enforcement Actions: The Permittees reported a total of 3,528 enforcement actions during the 2004-05 reporting period (**Table 10.3; Figure 10.2**). This represents an 18.9% decrease from the total reported in 2003-04 (4,351 enforcement actions), and an increase of 63% from the total reported 2002-03 (2,167 enforcement actions).

Level 1: Implement Program

Level 3: Behavior Change

The pattern in the number of enforcement arising from ID/IC investigations follows the pattern observed in other metrics of a peak of activity in the 2003-04 reporting period. An increase in the use of citations over the Third Term permit term is one feature of the changing approach to enforcement representing a shift from the prior educational emphasis.

Training: The Permits require that staff be adequately trained. In response, the Permittees developed a number of training modules (as outlined in 10.2.1) that are offered by the County throughout the year. Although the Permittees stated that the training has been helpful, they noted that the modules need to be updated and that new training topics and more advanced training are desired.

ROWD Commitment:

- Prepare a defined expertise and competencies for Authorized Inspector positions and develop a training program to meet these requirements.

10.3.2 Model Sewage Spill Response Procedures

The 2006-07 Unified Report will present the first opportunity to review the effectiveness of initial implementation of the TASC model program. Based on field experience on actual spills, the intent is to expand the geographical implementation of the program, initially with the area coincident with the boundaries of OCSD.

10.4 Summary

The Permittees' program for responding to complaints regarding ID/IC is a long established element of the Program. The major efforts regarding this element over the period of the Third Term Permits relate to the Dry Weather Reconnaissance Program, the continued facilitation of public reporting of complaints, the designation and training of designated Authorized Inspectors, and the development of TASC.

The incidence of complaints appears to have peaked in the 2003-04 reporting period and subsequently declined, which suggest a positive overall Program impact. Based primarily upon the interest of the Permittees and of RWQCB staff, the sole commitment arising out of the effectiveness assessment is for the development of defined experience and competencies for Authorized Inspector positions and development of a training program to meet these requirements.

SECTION 10.0, ILLEGAL DISCHARGES/ILLICIT CONNECTIONS

Table 10.1: Current Outcome Levels and Suggested Actions or Outcomes to Achieve Potential Outcome Levels

ID/IC Program Component	Effectiveness Assessment Outcome Levels					
	Level 1	Level 2	Level 3	Level 4	Level 5	Level 6

11.0 WATER QUALITY MONITORING SUMMARY AND ANALYSES

11.1 Introduction

The goal of environmental monitoring is to support the management process. In 2002 and 2003, the Program completed development of the *San Diego Region Receiving Waters Monitoring and Reporting Program* and the *San Diego Region Dry-Weather Monitoring Program* for wet and dry weather, respectively.

“monitoring is most useful when it results in more effective management decisions, specifically management decisions that protect or rehabilitate the environment.”
(NAS, 1991¹)

The *San Diego Region Receiving Waters Monitoring and Reporting Program* is comprised of four program elements. They are briefly described below.

- Urban Stream Bioassessment uses a “triad” of indicators (bioassessment, chemistry, toxicity) to describe impacts on stream communities and the relationship of any impacts to runoff, based on comparisons with reference locations on a year-to-year time frame.
- Long-term Mass Loading using measurements of key pollutants to assess loads over a time frame of years to decades to compared with past and present levels.
- Coastal Stormdrain Outfall Monitoring uses a suite of bacterial indicators at high priority drain outfalls to track compliance with regulatory standards and any improvements due to BMP implementation.
- Ambient Coastal Receiving Waters Monitoring uses measurements of runoff plume characteristics and extent, as well as measures of a suite of physical, chemical, and biological indicators to improve understanding of the impacts of runoff plumes on near-shore ecosystems.

The *San Diego Region Dry-Weather Monitoring Program* comprises a single program element. This element is:

- Dry Weather Reconnaissance consists of gathering data from both random and targeted sites, to define region-wide background dry weather conditions to serve as a basis for identifying candidate sites for further focused source identification work.

Compared to prior monitoring efforts (pre NPDES, First and Second Permit Term Programs), the Third Permit Term monitoring program is characterized by a broader range of locations and a wider array of methods for measuring impacts. For example, the receiving waters monitoring program more completely examines storm drains that

¹ Managing Troubled Waters, National Academy of Sciences, 1991

discharge directly to the coast and pose a potential health risk to swimmers and bathers. Also, there is investigation component to assess the effects of stormwater plumes on the nearshore marine environment. Inland, the monitoring program includes bioassessment studies and consistent use of toxicity testing. Combined with the established measurement of chemical parameters, this "triad" approach describes impacts more fully, more accurately identifies their sources, and more effectively identifies follow-up studies and BMPs.

This section will summarize the progress toward implementation of the Receiving Waters and Dry-weather Monitoring Programs during the Third Term Permit, the findings, and the proposal for future monitoring.

11.2 Accomplishments

11.2.1 Implementation of the Receiving Waters Monitoring Program

On August 13, 2002, a Receiving Water Monitoring Program was submitted to and subsequently approved by the San Diego Regional Water Quality Control Board. Relative to the monitoring program for the second term permit (99-04 Plan) the new program included many new monitoring locations and several new methods for evaluating the impacts of urban runoff including urban stream bioassessment and toxicity testing.

The initial phase of implementation involved:

- Procurement of specialized automatic sampling equipment for the collection of composite samples for pesticide analyses and toxicity testing.
- Establishment of price agreements for consultant services to conduct urban stream bioassessments and toxicity testing.
- Establishment of a Memorandum of Understanding (MOU) with the Orange County Health Care Agency's Public Health Laboratory to conduct bacteriological analyses of samples collected from coastal stormdrains and the surfzone receiving waters.

Subsequently the following monitoring was initiated:

- Urban Stream Bioassessment (USB) monitoring - The program includes semi-annual assessment each spring and fall at 12 urban channels and 3 reference sites. The fall 2002 monitoring began in November with assessments of physical habitat, benthic macroinvertebrate (BMI) taxonomy, and water chemistry at each site. Toxicity testing at bioassessment sites began in the spring of 2003.
- Composite sampling for water chemistry and toxicity of stormwater runoff at Mass Emissions sites began in December 2002.
- Sampling of stormdrain discharges for water chemistry and toxicity began at Ambient Coastal Receiving Waters (ACRW) sites in December 2002.
- Weekly sampling of Coastal Stormdrain Outfalls (CSDO) and their respective surfzone receiving waters began in January 2003.

Urban Stream Bioassessment

The urban stream bioassessment component of the water quality monitoring program is intended to assess the condition of biological communities in freshwater creeks and streams. This is accomplished through a triad of indicators monitored at 15 sites (12 urban channels and 3 reference locations) throughout the San Diego region of the County in the spring (usually May) and fall (usually October) of each year. The triad includes measures of the status of the benthic invertebrate community, aquatic chemistry, and aquatic toxicity.

Data on the species composition of the biological community is converted to an Index of Biotic Integrity (IBI) score and a similar score is computed for the physical habitat. A wide range of physical and chemical water quality measurements are made at each site including basic water quality indicators (temperature, specific conductance, pH, and dissolved oxygen concentration) and concentrations of urban pollutants such as pesticides and metals. Values for five dissolved metals are compared for guidance purposes, to acute toxicity criteria (adjusted for water hardness) established in the California Toxics Rule (CTR). The numbers and percentages of CTR exceedances are tabulated. Aqueous toxicity tests using three freshwater test organisms is conducted on samples from each site to provide a measure of the potential toxicity due to different categories of pollutants.

The analysis and evaluation of this triad of data types focuses on describing spatial patterns and temporal trends in community condition and in relating these to the aquatic concentrations of pollutants as well as to various aspects of physical habitat.

Data from all three years of monitoring demonstrates an overall pattern of lower IBIs in urbanized portions of watersheds, although this is not apparently related to aquatic chemistry or toxicity. **Figures 11.1** and **11.2** show the qualitative ratings of the average seasonal scores of the four metrics (CTR exceedances, aquatic toxicity, physical habitat score, and IBI score) used to assess stream health at each monitoring site. The color scheme for the figures is shown in the table below.

Qualitative Rating	Color	Average of All Data Collected between 2002 - 2005			
		Chemistry	Toxicity	PHAB Score	IBI Score*
Poor	Red	76-100% exceed CTR	67-100% effect@	0-50	0-26
Fair	Yellow	41-75% exceed CTR	34-66% effect	51-100	26-40
Good	Blue	15-40% exceed CTR	6-33% effect	101-150	41-55
Very Good	Green	0-14% exceed CTR	0-5% effect	151-200	56-70
Insuff. Data	White				

* The qualitative rating scale for IBI scores was established by the CA DF&G. A score of 0-13 is considered Very Poor.

@ In undiluted samples, effect relative to control sample = mortality in Ceriodaphnia and Hyallella survival tests, or inhibition of growth in Selenastrum growth test.

Figures 11.1 and 11.2 show that there is no readily apparent relationship across the region between the relative conditions of the biological community on the one hand and levels of toxicity and pollutants on the other.

In general, there is a clear biological pattern associated with the gradient of high to low IBI scores. A cluster analysis (**Figure 11.3**) shows that reference sites group together (i.e., have similar biological communities), characterized by species with relatively restricted habitat ranges. In contrast, sites with lower IBI scores have tolerant species with much wider habitat ranges. The presence of more tolerant species at sites with low IBI scores is a common finding in environmental studies in a wide range of marine, estuarine, and freshwater habitats. The cluster analysis also demonstrates a clear and persistent seasonal difference in biological community structure between spring and fall surveys. While there is some variability over time in the IBI and physical habitat scores at each site, the overall patterns described above are relatively persistent.

The spatial overview of the monitoring results (**Figures 11.1 and 11.2**) strongly suggests that there is no consistent relationship between the patterns in the biological stream communities and aquatic chemistry and toxicity. This conclusion is strongly supported by the very low incidence of both CTR exceedances and toxicity. In addition, a comparison of the station groupings in the cluster analysis in **Figure 11.3** to the actual levels of pollutants and of toxicity showed that there was no relationship between the biological pattern and measures of contamination and/or toxicity.

In contrast, there is a much stronger relationship between patterns in the biological community and various aspects of physical habitat. Overall, there is a positive relationship between IBI scores and physical habitat scores (**Figure 11.4**), although there is some noise around this relationship. This stems from the fact that not all the components of the physical habitat score are equally correlated with biological condition (**Figures 11.5a and 11.5b**). For example, low values for Instream Cover and Vegetation Protection are highly associated with poor community condition but intermediate values of these habitat components do not seem to be strongly correlated with community condition. On the other hand, Sediment Deposition is highly correlated with community condition only at high and low extremes, but not for intermediate values. In contrast to both these types of correlation, Channel Alteration is correlated with community condition at all levels of this component.

There is a need to further investigate the nature of the relationship between biological community patterns and physical habitat condition. This analysis should take advantage of the fact that both IBI and physical habitat scores are made up of multiple components that reflect different aspects of biological communities and physical habitat. It is likely that different IBI components, which reflect the status of different types of organisms, respond to different features of the physical habitat. The management benefit of such an analysis would be an improved ability to focus on those habitat features that matter the most to biological condition. This could lead to new stream or riparian zone management policies and procedures.

There are some apparent anomalies to the overall pattern just described, i.e., that biological condition is primarily determined by physical habitat characteristics. These situations may be appropriate for special studies that could identify site-specific contamination problems and/or provide additional insights into the relationship between physical habitat and biological condition. For example, station Christianitos Creek at Christianitos Road (station CC-CR) has IBI scores in the fair range but physical habitat scores more typical of sites with IBI scores in the poor to very poor range. However, CC-CR has high values for Riparian Vegetation Zone, Vegetation Protection, and Channel Alteration. Of these three, Riparian Vegetation Zone and Channel Alteration are very highly correlated with biological pattern in both the spring and the fall (**Figure 11.5**), and the high values for these components might explain this anomaly.

In contrast, reference station San Juan Creek at Cold Spring (REF-CS) has high physical habitat scores but anomalously low IBI scores. There is no readily apparent explanation for this in the physical habitat data, which suggests there may be some sort of pollution problem that was not detected by the monitoring program. Finally station WC-WCT also has high physical habitat scores but low IBI scores. This is a unique station in that it is within a wilderness area surrounded by pockets of residential areas. A special study will be conducted to determine if intermittent discharges of toxicants from the urban areas are impacting instream fauna.

Long-term Mass Loading

The long-term mass loading component of the monitoring program is intended to evaluate changes in pollutant loadings over a number of permit terms. This is accomplished through wet weather monitoring at six locations. Three storms are monitored at each location and for each storm the water chemistry is monitored with a series of 3 to 4 composite samples collectively spanning approximately 96-hours. This time period provides for comparison of the data to 96-hour guidance criteria for chronic aquatic toxicity from the California Toxics Rule (CTR). The concentrations of dissolved heavy metals in the composite samples are also compared to acute toxicity criteria from the CTR for guidance. The concentrations of organophosphate pesticides are compared to literature values of LC_{50s} for toxicity testing organisms.

Monitoring of at least three storms per site is attempted each year. Continuous water level records from streamgages at each site are used to determine stormwater discharge rates. The streamgages on Aliso Creek, Trabuco Creek, and San Juan Creek have produced acceptable records to calculate stormwater loads. The streamgage on Laguna Canyon Wash has experienced many operational problems and new monitoring equipment was installed during the 2005-06 monitoring year to overcome these problems. The Segunda Deshecha Channel was under construction during the first two years of the program during which time the streamgage was decommissioned. The high-flow stage-discharge relationships for this site and for the Prima Deshecha Channel have not been adequately defined to calculate accurate stormwater loads. When adequate channel ratings are established the flowrates and loads can be calculated for all prior years where accurate water level records are available.

Coastal Stormdrain Outfall Monitoring

The coastal stormdrain outfall component of the water quality monitoring program is intended to identify those sections of coastline where nearshore receiving waters most consistently exceed state AB411 standards for bacterial indicators, as well as the stormdrains that appear to be contributing the most to these exceedances. Three bacterial indicators (fecal coliforms, total coliforms, Enterococcus) are monitored weekly at 29 stormdrains along the coastline.

At each sampling event, concentrations of bacterial indicators are measured in the discharge of each stormdrain, as well as in the surfzone 25 yards upcoast and downcoast of the stormdrain. The flow from each drain is also estimated and categorized as high, medium, or low. Analyses of these data included calculation of an exceedance rate for each drain and linear regression of indicator concentrations in each drain's discharge against indicator concentrations in the nearby surfzone. The goal of these analyses was to identify the subset of drains that appeared most closely linked to a high rate of exceedance of the AB411 standards.

Coastal Stormdrain Outfall Monitoring was initiated during the final week of January 2003 and, except during periods of constant stormwater runoff, weekly monitoring at each site since that time. When the discharge from a stormdrain is diverted to the local sewage treatment plant, the stormdrain is not sampled. While diverted, only sampling of the downcoast location in the surfzone is conducted. Monitoring data are available through the Orange County Health Care Agency's website at ocbeachinfo.com.

The three years of monitoring data show that exceedances in the receiving water (i.e., the surfzone) tend to occur at the same subset of stations over time, although the rate of exceedances is higher during the winter than during the summer AB411 season (**Figures 11.6 and 11.7**). The five stations with exceedance rates of approximately 10% or higher are: POCHE, DSB-4, DSB-5, SJC1, and SCM1, which are concentrated along one section of the coast. There has been no observable discharge from DSB-4 during the three years of CSDO dry-weather monitoring. The exceedances of the AB-411 standards were most likely caused by the discharges of the other drains in the area (DSB-5 and SJC1). The highest exceedance rate during the AB411 season is 0.288 at station SCM1 and yearround 0.493 at station DSB5 (**Table 11.1**).

The exceedance rates alone do not necessarily indicate a problematic drain because the elevated bacterial indicator levels could stem from sources other than the nearby drain. Establishing a link between a particular drain and the receiving water exceedances depends on the relationship between indicator levels in the drain's discharge and in the receiving water. For example, the combination of elevated indicators in the receiving water with low levels in a drain's discharge would suggest that the exceedances could be due to longshore transport from another location. Conversely, elevated indicator levels in a drain's discharge combined with persistently low surfzone levels would suggest mixing and dilution by nearshore currents.

Linear regressions were performed for each indicator / drain combination and the results used to rank drains in terms of the strength of their relationship to receiving water conditions. The approximated yearly volume of flow from each drain was then used to qualitatively identify those drains with the highest loading of bacteria to the receiving water. Taken together, these evaluations resulted in the identification of five drains with a combination of high loadings of bacterial indicators and a statistically significant relationship between indicator levels in the drain and the surfzone:

- Aliso Creek (ACM-1)
- Salt Creek (SCM-1)
- Doheny Beach - North Creek Mouth (DSB-5)
- San Juan Creek (SJC1)
- Poche Beach (POCHE).

Table 11.2 summarizes conditions at these drains. Note that this list of drains is similar to, but not identical to, the list of drains with the highest exceedance rates.

These five stormdrains present opportunities for further upstream source identification studies to determine whether persistent receiving water contamination is due to sources near their mouths, to sources higher up in their respective drainage areas, and/or to longshore ocean currents transporting contamination from other nearby drains or creek mouths.

The following projects have been initiated in response to analysis of data from shoreline microbiology monitoring conducted for the Third Term Permit, the South Orange County Water Association (SOCWA) NPDES permit, and the Orange County Health Care Agency beach water quality program.

- The County has funded a \$200,000 microbial source tracking study in the Prima Deshecha Channel watershed. The report will be submitted by the consultant, Weston Solutions, Inc. to the County at the end of August 2006.
- The City of Dana Point has funded the construction, operation and maintenance of the ozone disinfection system for the dry-weather discharges from the Salt Creek Channel. Recent data from the surfzone has shown that the bacterial indicator concentrations are now consistently meeting the AB-411 standards.
- The City of Dana Point has procured grant funding and will provide matching funds for an epidemiological study by SCCWRP on the health effects of ocean water contact near the mouths of the Doheny Beach drains and San Juan Creek.

Ambient Coastal Receiving Water Monitoring

The ambient coastal receiving water component of the water quality monitoring program is intended to assess the impact of urban runoff to ecologically sensitive coastal areas by analyzing the water chemistry, aqueous toxicity, and magnitude of plumes of stormwater discharges to these areas. With this information the Permittees would then

prioritize these sites for further study in terms of their relative degree of potential threat to water quality and ecological resources. Monitoring at these 17 sites focuses primarily on aquatic chemistry and aquatic toxicity during both dry and wet (storm) weather conditions. Aerial photographs of stormwater plumes provide a basis for estimating the relative magnitudes of the impact zones.

Values for five metals are compared to acute toxicity criteria established in the California Toxics Rule (CTR) for guidance and the numbers and percentages of CTR exceedances tabulated. Toxicity tests with marine test organisms provide a measure of the potential toxicity due to different categories of pollutants. Because of the relatively high incidence of toxicity at some stations, the observed level of toxicity (in toxic units) was compared to the predicted toxicity expected from the observed aquatic chemistry results. Predicted toxicity was estimated by first calculating the average LC₅₀ for key chemicals from literature values. This average value was then used to calculate the amount of toxicity (in toxic units) to expect from the concentrations of these chemicals in aquatic chemistry samples. Summing the estimated toxicity from all chemicals resulted in an estimate of the toxicity that theoretically should be present.

For the coastal areas Ambient Coastal Receiving Waters monitoring was designed as an adaptive program whereby the initial monitoring would consist of sampling the discharges from selected coastal stormdrains for water chemistry and toxicity. The data from these samplings would be supplemented by aerial photographs of stormwater plumes in order to determine the drain which showed the greatest impact on its receiving waters. The receiving water for this drain would be selected for an offshore assessment of water quality and toxicity during the fifth year of the program. Water quality and toxicity monitoring of the stormdrains was initiated during a stormwater runoff event in December 2002 and has continued for three years. Aerial photography of stormwater plumes was carried out once in 2004 and once in 2005. Because of limited visibility due to cloud cover the plume photography for the first storm was conducted nearly two days after rainfall had ceased. For the second storm, the altitude of the flight was decreased to a level below the cloud cover which enabled photography at a time closer to the end of the storm.

Table 11.3 summarizes the frequency and pattern of exceedances of the acute saltwater CTR criteria at the ambient coastal receiving water stations during the period from 2002 – 2005. It should be noted that this analysis involved comparison of the freshwater discharges from these stormdrains to saltwater criteria. For each site, the potential impact to the receiving water assumes no dilution of the stormdrain discharge.

The data from this analysis show that exceedances are predominantly due to copper, with a lesser number due to nickel and zinc. The frequency of exceedance of the acute saltwater CTR criterion for copper remained fairly consistent during dry-weather sampling. The percentage of exceedances of the CTR criteria for stormwater samples in the third year appeared to drop dramatically from the prior two years. This observation may be the result of the higher than normal annual rainfall during year, as shown below:

Permit year	Total Samples	Exceeded Cu Criterion #(%)			
		Stormwater Samples	Dry Weather	Stormwater	Rainfall (inches)
1	32	6	14(54%)	4(67%)	14.57
2	39	5	14(41%)	4(80%)	8.41
3	59	39	10(50%)	15(38%)	28.44

Table 11.3 shows that the Doheny Beach stations most frequently exceed CTR values for multiple metals.

The toxicity results from these stations present another perspective on water quality conditions. **Table 11.4** summarizes the average degree of toxicity, averaged over all toxicity tests, at each station over the 2002-05 period. **Figures 11.8** and **11.9** visually present the regional pattern of toxicity, showing that toxicity is primarily concentrated at a subset of the stations, as are the CTR exceedances. The Doheny Beach stations (DSB -1, DSB-3, DSB-4, DSB-5) have consistently high average toxicities; these are generally the same stations with the highest frequencies of CTR exceedances. In addition, several other stations, distributed across a number of watersheds, had high average levels of toxicity. In general, the same stations exhibited elevated toxicity in both dry and wet weather.

There is a general correspondence between the overall patterns of CTR exceedances and toxicity, as exhibited by the Doheny Beach stations. However, other stations with elevated toxicity (e.g., LB-3) do not have higher than average numbers of CTR exceedances. Based on their combined patterns of CTR exceedances and toxicity, the following stations would be the highest priority for special studies to investigate the sources of contamination and/or toxicity:

- Doheny Beach (DSB-1, DSB-3, DSB-4, DSB-5)
- LB-4
- Salt Creek (SCM-1).

Stations DSB-5 and SCM-1 were also two of the five coastal stormdrain stations with persistent exceedances of AB411 standards for indicator bacteria. The differential sensitivity of toxicity test organisms can help provide a starting point for such source identification studies. Urchins and abalone are more sensitive to dissolved metals, while mysids are most sensitive to ammonia and organic compounds, particularly pesticides. Further guidance can be obtained from a comparison of the observed toxicity to that predicted from laboratory studies, as illustrated in **Figure 11.10**. An examination of this comparison for all the toxicity tests from this program component shows that predicted toxicity from zinc is often higher than the observed toxicity, strongly suggesting that zinc may not be as bio-available as other pollutants.

Much of the toxicity in the sea urchin fertilization test can be explained by elevated levels of dissolved metals, particularly copper. The predicted toxicity (from comparison of water chemistry to literature values of LC₅₀s) was higher than the observed toxicity.

This was due primarily to high concentrations of dissolved zinc, suggesting that zinc may be bound to organic ligands and is not completely bio-available.

The observed toxicity in the mysid survival tests is harder to explain because ammonia is very low and organophosphate pesticides were almost never found in the water samples (mysids are especially sensitive to Chlorpyrifos). The predicted toxicity was typically equal to or less than observed, which suggests that there are unknown toxicants affecting the system. Phase I TIEs have been conducted on a limited basis and have thus far proven inconclusive. For most of these TIEs the initial toxicity was only observed in the undiluted sample of the multiple dilution test. The baseline test of the TIE produced no response. The toxicity testing laboratory has hypothesized that the toxicant that caused the initial toxicity was most likely a volatile compound that dissipated over time.

Dana Point Harbor

The Ambient Coastal Receiving Water (ACRW) monitoring program also includes Dana Point Harbor. The monitoring of Dana Point Harbor was initiated in June of 2003 and consists of sampling for water chemistry and aqueous toxicity. Semiannual dry-weather analyses of sediment chemistry, sediment toxicity, and benthic infaunal analyses were added during the 2003-04 monitoring year.

As an enclosed embayment with several stormdrain inputs, Dana Point Harbor is a focus of particular attention within the region. **Figure 11.11** shows that average BRI (Benthic Response Index) scores for station DAPTDC (Dana Cove) were within the reference range, while BRI scores for all other stations fell within Response Level 2, indicating a change in species composition of between 25% and 50% compared to reference. DAPTDC also had relatively low levels of pollutants in the sediments and the lowest level of sediment toxicity (**Figure 11.12**). The bottom at this site consists mostly of rock and large gravel, with very little of the fine sediment which is typically associated with associated with elevated levels of particle-bound pollutants.

The overview presented in **Figure 11.12** shows that, with the exception of station DAPTDC, sediment monitoring data for Dana Point Harbor show a moderate level of impact to the benthic community and a moderate to substantial level of toxicity. The sediment chemistry picture is less clear because data are only available from two samplings (Spring and Fall 2005).

Impacts to the benthic community can stem from both toxicity due to chemical contamination and from physical disturbance. **Figure 11.13** shows that the relationship between BRI score and toxicity, while statistically significant, is not strong. Much of the relationship is driven by the handful of samples with the lowest BRI scores, which are all from station DAPTDC, which is somewhat anomalous. Since the sampling location for DAPTDC does not have a typical muddy bottom its benthic infaunal community is depauperate. Without this station, the regression would not be statistically significant. This finding is similar to results being generated as part of the technical work for the

State Water Resources Control Board's Sediment Quality Objectives project. Using data from embayments throughout California, this project has found that relationships among sediment chemistry, sediment toxicity, and benthic community changes are highly variable. Significant relationships can typically only be documented with large numbers of samples.

The cumulative frequency distribution of sediment toxicity from embayments in the Southern California Bight (**Figure 11.14**), based on data from the Bight '03 regional survey, provides a larger regional context to the toxicity results from Dana Point Harbor. The median mortality in sediment toxicity tests in the Bight '03 data is about 20%, which is lower than the average toxicity of all tests from Dana Point Harbor. **Figure 11.13** shows that the bulk of toxicity results fall between about 20% and 45% mortality relative to test controls.

Region-Wide CTR Exceedance Patterns

The CTR is a convenient benchmark for assessing region-wide patterns. For the purposes of this analysis it is not being used for compliance purposes but merely for guidance as to where the levels of constituents of concern may be persistently elevated.

Aquatic chemistry samples from several components of the water quality monitoring program (urban stream bioassessment, long-term mass loading, ambient coastal receiving water monitoring) were evaluated with respect to criteria for dissolved metals established in the CTR. While such CTR criteria are available for only a portion of the constituents measured in the program's samples, the combination of CTR exceedances from all available program components provides an overview of contamination patterns across the region. In addition to tabulating the number of exceedances at each station, the overall percentage of exceedances at each station (out of all samples collected at each station) was used to place stations into one of four categories representing relative frequency of exceedances.

Table 11.5 summarizes exceedances of acute CTR criteria for dissolved metals at all water quality monitoring stations in the San Diego region with more than one sampling event. For purposes of this assessment, all program components (bioassessment, mass loading, ambient coastal) were combined into one dataset, in order to better represent the spatial pattern of exceedances across the region.

Exceedances overall are predominantly due to copper, with a much smaller percentage due to nickel and zinc. Exceedances of the CTR for cadmium, lead, and silver were extremely rare and thus not included in **Table 11.5**. Most exceedances occur at a subset of the stations along the coast. There is year-to-year variability within this larger pattern, although this appears to be somewhat related to the amount of annual rainfall. **Figures 11.15** and **11.16** visually summarize these regional patterns, using the data presented in **Table 11.5**.

Within these larger patterns, the CTR exceedance data help identify locations where targeted special studies to identify upstream sources should be implemented. These are stations with more than a handful of samples where both the exceedance rate and/or the number of pollutants showing exceedances are among the highest:

- ACJ01
- SCM-1
- PDCM01
- SDCM02
- SJNL01
- DSB-5

Stations DSB-5 and SCM-1 were also two of the five coastal stormdrain stations with persistent exceedances of AB411 standards for indicator bacteria. It should be noted that stations ACJ01 and SJNL01 are a significant distance upstream of their respective coastal receiving waters and that their respective Ambient Coastal Receiving Waters monitoring locations ACM1 and SJC1 show much less of an impact with respect to the acute saltwater criteria from the CTR. These findings suggest that sampling of a mass emissions site and its corresponding ACRW discharge point be monitored concurrently during storms to more accurately evaluate the potential impacts of urban runoff.

Region-wide Toxicity Patterns

Aquatic toxicity test results from several components of the water quality monitoring program (urban stream bioassessment, long-term mass loading, ambient coastal receiving water monitoring) were combined to present a picture of how toxicity is distributed throughout the region. The average mortality rate of test organisms at each station was used to place each station into one of four categories representing relative intensity of toxicity. **Figures 11.17** and **11.18** show the distribution of relative toxicity across the region. In both dry and wet weather, toxicity is concentrated along the coast, although toxicity is detected somewhat further inland during wet weather.

11.2.2 Implementation of the Dry-weather Monitoring Program

The proposal for the Dry-weather Monitoring Program to detect illegal discharges and illicit connections (ID/ICs) to the stormdrain system was submitted to and subsequently approved by the Regional Board in February 2003. Monitoring was initiated in May 2003 and has continued each dry-weather season (May 1 - September 30).

The program includes monitoring 3 times annually at approximately 30 randomly selected stormdrains (random sites) to determine regional mean concentrations of constituents of concern. Each Permittee selected several stormdrains (targeted sites) within their respective jurisdiction, which were suspected to contain ID/ICs. These targeted sites were sampled monthly (5 times annually) for the same constituents. Triggers for source investigations were established using two statistical methods:

- If on consecutive sampling dates, the value of a monitored constituent exceeds the upper bound (lower bound for dissolved oxygen) of the tolerance interval around the estimated 90th percentile of random site data for that constituent, or
- The value of a monitored constituent exceeds the control limits for that constituent at that site. The control limits are set at 3.9 standard deviations above (below for dissolved oxygen) the mean for that site.

The Permittees are provided an updated spreadsheet of the monitoring data on a monthly basis throughout the dry-weather season. The tolerance intervals are updated periodically as more data are compiled. Extreme values of physical properties or chemical constituents measured in the field triggers immediate notification of the authorized inspector(s) of the city or cities which have jurisdiction within the watershed of the offending stormdrain. In many instances (e.g. high surfactant or TSS discharges) the responsible party has been identified quickly by the authorized inspector.

11.2.3 Establishment of a New Water Quality Database

In 2004, a new computer program was developed for managing NPDES monitoring data. The intent of this program which has been called Labtrack, is to provide a single repository for all current NPDES data, to reduce the number of systematic errors in monitoring and laboratory analyses, and to increase the efficiency in processing invoices for the payment of analytical services. Some of the features of Labtrack include the ability to:

- Produce customized periodic data summaries
- Print labels for sampling containers
- Print and maintain chain-of-custody documentation
- Check laboratory results against quality assurance criteria
- Check invoice pricing against price agreements
- Integrate discharge rate information from Hydstra (hydrologic database) to calculate load information for Performance Evaluation Assessment (PEA) and TMDL reports

11.2.4 Participation in Regional Monitoring Programs

Since 1997, the Permittees have been an active participant in the Regional Monitoring Program for the Southern California Bight. A Permittee representative has served on the steering committees for the 1998 Regional Assessment (Bight 98) and the 2003 Assessment (Bight 03). A representative has also served on several of the monitoring subcommittees on Bight 03.

The Permittees have also provided representation to the southern California Stormwater Monitoring Coalition. A Permittee representative was instrumental in the development of the Model Stormwater Monitoring Program guidance document which has incorporated many of the same methods used in this program. A Permittee representative is currently on the working group with SCCWRP and the California

Department of Fish and Game to improve the California Stream Bioassessment Procedure.

The Permittees are also participating in the Regional Harbor Monitoring Program (RHMP), which was designed and implemented in response to a 13267 letter from the San Diego Regional Water Quality Control Board. The RHMP is intended to help answer fundamental questions about the status of and trends in beneficial uses in the coastal harbors along this region of the coast. Dana Point Harbor, in southern Orange County, is included in the RHMP.

The RHMP uses a stratified random design modeled on the Bight Program approach and intended to ensure that the RHMP data are compatible with data from the periodic Bight Program. While the Bight Program uses a single stratum for harbors, the RHMP has identified multiple strata within harbors in order to provide for more detailed assessments of conditions. These strata are based on both structural (e.g., depth) and use (e.g., industrial, marina) features of harbors. Within each stratum, a broad range of indicators are sampled, including water quality, sediment quality and characteristics, toxicity, and fish tissue contamination. The RHMP is being implemented in two phases. The first phase focuses on using a more limited sampling protocol to validate design assumptions and gather the information needed for full implementation in the second, permanent, phase. The first phase will include 3 years of data collection and evaluation to validate design assumptions and sampling protocols. The first year of data collection was completed in 2005.

The knowledge gained from participation in these regional programs has enabled the Permittees to improve the monitoring program in many ways. The newly established price agreements for analytical services for the stormwater program required that the vendor had participated in the rigorous laboratory inter-calibration exercises for the Bight Regional Monitoring Program. These exercises, coordinated by SCCWRP, ensured that the accuracy and precision by each of the participating laboratories were maintained at a high standard.

11.2.5 Involvement in Research Level Investigations

The Permittees also contributed monitoring equipment and funding to UCI to conduct bacteriological investigations in the Santa Ana River and Huntington Beach surfzone. As a result of the study findings, the dry-weather discharges of several channels which drain to that area have been diverted to the Orange County Sanitation District. Since the diversions have been implemented there has been an improvement in scores for the surfzone in that area on Heal the Bay's Beach Water Quality Report Card.

On behalf of the Aliso Creek Watershed Permittees, the County worked with UC Irvine researchers Dr. Sunny Jiang and Dr. Betty Olson to investigate sources of bacteria in the J03P02 sub-watershed of Sulphur Creek. The UCI researchers used three Microbial Source Tracking (MST) methods to identify the sources of bacteria from samples collected in the sub-watershed from May through August 2002. These MST methods included: (1) analysis for human enteric viruses, (2) analysis for genetic biomarkers

indicative of human, cow, pig/cat, rabbit, and bird sources, and (3) Antibiotic Resistance Analysis (ARA). The analysis of samples for biomarkers of human and animal sources showed no samples with biomarkers of human origin, and showed that all or almost all samples had biomarkers of bird, rabbit, and cow origin. Findings from the human virus and ARA studies suggest that sewage was an unlikely source of fecal coliform in the drainage system, and that bacteria from wild animal feces were the dominant source of *Enterococci* in the watershed. Further details can be found in the eighth quarterly progress report for the Aliso Creek Directive, dated April 30, 2003, and ninth quarterly progress report, dated July 31, 2003.

11.3 Assessment

The monitoring results described in the preceding section have led to conclusions about patterns of impact and the potential sources of these impacts. These conclusions, summarized below, provide the basis for the summary recommendations in **Section 11.4**.

The current Urban Bioassessment monitoring program in South Orange County utilizes the triad approach from the SMC's model stormwater monitoring program. The results from the first three years of monitoring have shown that there is a clear pattern of lower IBIs in the more urbanized portions of watersheds, and this pattern appears to primarily reflect habitat degradation rather than aquatic toxicity due to chemical contamination. This is a typical result of bioassessment monitoring programs elsewhere in the country. These findings suggest further investigation of the relationship between the physical habitat and biological communities.

The current method of triad monitoring consists of a synoptic evaluation of the chemistry, toxicity, and bioassessment (physical habitat assessment and IBI score). IBI score may not be reflective of the water chemistry or toxicity testing results if the water quality is not consistent. If intermittent discharges of toxicants affect the study area they may not be measured during the synoptic sampling. If low IBI scores cannot be attributed to physical habitat degradation a more comprehensive water quality study should be conducted.

The Mass Emission monitoring program evaluates long-term trends in pollutant loading. Although the current mass emissions monitoring program has not yet generated enough data over time to fully accomplish this goal, it has identified two channels (Prima and Segunda Deshecha) with stormwater discharges that have shown persistent toxicity to marine test organisms.

The Coastal Stormdrain Outfall monitoring program provides a weekly indicator of the impacts to the coastal zone from bacteria in urban runoff. The program has enabled the Permittees to identify surfzone areas near the outlets of stormdrains that have shown the highest frequency of exceeding AB411 single-sample ocean water sports contact standards.

The first four years of the Ambient Coastal Receiving Waters program involved monitoring the chemistry and aquatic toxicity of dry weather and stormwater discharges to ecologically sensitive areas along the southern Orange County coastline. During two storms aerial photographs were taken of the stormwater plumes to estimate the spatial extent of the impact of urban runoff. While the impacts of urban runoff to the coastline were monitored indirectly, it did enable the Permittees to identify the stormdrains that had the highest concentrations of urban pollutants and showed the greatest potential for toxic effects to nearshore areas. In Dana Point Harbor the impacts to the receiving waters were monitored directly. Monitoring was conducted in the harbor near the outlets of the stormdrains with measurements of water chemistry and aqueous toxicity, sediment chemistry, sediment toxicity, and benthic infaunal analyses.

11.4 Summary

The data analysis results form the basis for the following recommendations for further investigations and modifications to the monitoring design itself. The proposed further studies are focused on improving our understanding of the sources and causes of the observed impacts. The suggested modifications to the program are intended to improve the cost effectiveness of the program by focusing on those areas where impacts are most persistent or where substantial knowledge gaps remain.

11.4.1 Receiving Water Monitoring Program

Urban Stream Bioassessment

The past three years of bioassessment data suggest that physical habitat rather than water chemistry has a greater influence on IBI scores. The Permittees will conduct statistical analyses of the relationship between the components of the IBI and physical habitat (PHAB) scores to provide more detailed insight into the specific aspects of physical habitat most important to maintaining biological communities. If the specific aspect(s) of physical habitat causing the impairment can be identified, the Permittees will investigate BMPs and/or management measures to improve the physical habitat and reduce the impairment. The Permittees will also continue to participate in the SMC's working group to improve the current DF&G California Stream Bioassessment Procedure.

There are two sites (REF-CS and WC-WCT) that exhibited higher than system-wide average physical habitat scores but low IBI scores. These sites will be the focus of targeted special studies which would include:

- Reconnaissance of the immediate upstream watershed to locate all natural and manmade inputs to the channel. The discharges from these inputs will be field screened (using Dry-weather Reconnaissance tools) to identify candidates for more comprehensive monitoring.
- Sampling for intermittent discharges of low concentrations of toxicants (e.g. pesticides and dissolved metals) which may be affecting the intolerant species at the bioassessment locations. Using automatic sampling equipment, 24-hour composite samples will be collected at the bioassessment site, one day each week for the four weeks prior to bioassessment monitoring. the composite samples will be analyzed for nutrients, trace metals, pesticides (organophosphates, carbamates, pyrethroids), and water toxicity (Ceriodaphnia and Hyallella survival in undiluted samples).

Mass Emissions Monitoring

Two of the sites (PDCM01 and SDCM02) showed persistent toxicity in the mysid survival/growth tests. The OP pesticide data could not account for this toxicity. During the upcoming storm season the suite of pesticide analyses will be expanded to include carbamates and pyrethroids.

More high-flow instantaneous discharge measurements will be made at the streamgaging locations operated by the Permittees in order to improve the accuracy of the channel stage-discharge relationships (ratings). Equipment utilizing state-of-the-art acoustic Doppler current profiling technology has been recently purchased to enable rapid measurements of discharge rates.

Coastal Stormdrain Outfall Monitoring

Three years of monitoring data show that there is a small subset of coastal drains that display persistent exceedances of AB411 standards and for which there is a statistically significant relationship between bacterial indicator levels in the drain discharge and the surfzone.

The consistency of this overall pattern supports a recommendation to consider reducing monitoring effort at those stormdrains that rarely if ever have exceedances and reprogramming that effort toward more intensive investigations of the problematic drains. The actual amount of any such reduction would be determined only after an evaluation of the statistical consequences of a reduction in monitoring frequency and in consultation with the Permittees and Regional Board staff.

Ambient Coastal Receiving Water Monitoring

The ACRW monitoring results highlight the following questions and/or issues that will be addressed either through targeted special studies or modifications of the scope of on-going monitoring.

Source Identification and Determining Causes of Toxicity

Examination of the water chemistry results provided insight into the causes of toxicity in the sea urchin fertilization tests. The toxicity in the mysid /survival growth tests however could not be explained either with water chemistry or phase I TIEs. To aid in identifying the unknown causes of toxicity in the mysid tests, the water chemistry analyses of the stormdrain discharges will be expanded to include carbamate and pyrethroid pesticides. If found, the concentrations of these pesticides will be compared to their respective literature values for the LC₅₀ in the mysid survival test. If a carbamate and/or pyrethroid pesticide is consistently found and their LC₅₀s for the mysid survival test have not been determined, the program would propose that the SMC conduct toxicity tests to determine those LC₅₀s.

There is a subset of six stations that provide targets for special studies to identify upstream sources of contamination and toxicity, based on the number of pollutants showing exceedances to CTR criteria, the high percentage of the time these exceedances occurred, and the level of toxicity observed. These sites include the Doheny Beach stormdrains (DSB-1, DSB-3, DSB-4, and DSB-5), a 48-inch stormdrain south of Main Beach in Laguna Beach (LB-4), and Salt Creek Mouth (SCM1).

A start on these efforts was made during the 2005-06 monitoring year, when the discharge from the DSB-5 stormdrain (North Beach Creek) was monitored extensively during a storm in March 2006. An automatic sampler was used to collect samples representative of the first flush and a 24-hour period after the first flush. In addition to the usual stormwater analyses for nutrients, metals, OP pesticides, and aquatic toxicity the Permittees also analyzed these samples for dissolved organic carbon, pyrethroid pesticides, organochlorine pesticides, PCBs, polynuclear aromatic hydrocarbons, and oil and grease. The results of this monitoring will be presented in the 2005-06 PEA report and will be used as guidance for special investigations of the drains described in the preceding paragraph.

Measuring Direct Impacts to the ACRWs

The toxicity testing results and the aerial photographs of stormwater plumes were used to select two coastal receiving waters (off of North Beach Creek and Salt Creek) for nearshore monitoring during a significant stormwater runoff event in the upcoming year.

The discharge from North Beach Creek in Doheny has shown significant amounts of metals and toxicity during both dry weather and stormwater runoff conditions. The

spatial extent of the stormwater plume from this drain appears to be limited to the jetty immediately west of the mouth of the creek.

The discharge from Salt Creek has also shown significant amounts of toxicity in the mysid survival/growth tests. Although the watershed area and consequently the stormwater discharge volume are much smaller than those of San Juan or Aliso Creeks, the impact of Salt Creek on the nearshore habitat may be greater.

Because the Permittees do not currently possess an ocean-worthy vessel for offshore monitoring during storm conditions, a price agreement with a consultant will be established to perform the monitoring off the mouth of Salt Creek. The monitoring will be consistent with those used in the assessment of stormwater plumes conducted as part of the Bight '03 Regional Monitoring Program. Monitoring of the physical characteristics of the plume and sample collection will be conducted by the consultant. Sample analyses will be performed by the Permittees' analytical services and toxicity testing providers. The localized monitoring of the impacts from North Beach Creek near the Dana Point Harbor jetty will be conducted by Permittee staff.

Dana Point Harbor

The monitoring data indicate that at least one area is significantly impacted by urban runoff. To determine the type of contaminant causing the high toxicity in the benthic sediment near the outlet of East Basin stormdrain (DAPTEB), a sediment TIE will be conducted. In addition to the routine analyses for sediment chemistry these samples will also be analyzed for polynuclear aromatic hydrocarbons, mercury, and tributyl tin. If the cause of the toxicity is identified, a source identification study will be initiated in the watershed of the Golden Lantern stormdrain.

11.4.2 Database Improvements

A module will be created for the Labtrack database which will enable the Permittees to produce data files consistent with the SMC's Standardized Data Transfer Format (SDTF). The SDTF is a Microsoft Access based format that will allow data transfer between Southern California Stormwater agencies.

12.0 WATERSHED ACTION PLANS

12.1 Introduction

The Third Term Permits have, with varying degrees of specificity, required the Permittees to develop and implement a watershed-based approach to urban stormwater management to complement the established jurisdictional-based approaches. In the area of the County under the jurisdiction of the San Diego Regional Board, Watershed Urban Runoff Management Plans (WURMPs) termed DAMP/Watershed Action Plans¹ (WAPs), have been prepared for each of the six principal watersheds. In the Santa Ana Regional Board area of the County, which has a long history of watershed planning focused on the Newport Bay Watershed, the Permittees were required to update Appendix N of the DAMP to reflect the implementation measures and schedules related to the fecal coliform TMDL.

Watershed management is the term used for the approach to water quality planning that places an emphasis on the watershed (the area draining into a river system, ocean or other body of water through a single outlet) as the planning area and looks to solutions to problems that cut across programs and jurisdictions. In Orange County, these efforts focus additional effort on the highest priority water quality constituents of concern in each watershed.

The approach taken to develop the DAMP/WAPs establishes the jurisdictional DAMP/LIPs and the DAMP/WAPs as the principal policy and program documents for two separate, but nonetheless similar and highly interdependent, water quality planning processes targeting the control of pollutants in urban runoff (see **Section 3.0, 2007 DAMP**). In a number of watersheds these efforts are supportive of a third planning process that is focused on achieving broader objectives such as watershed habitat restoration and connectivity rather than specific water quality outcomes.

Six distinct watersheds (See **Figure 12.1**) were recognized in the Third Term Permits within the San Diego Regional Board area which are identified below:

Region 9	Watershed Planning Area	Major Watercourses
San Diego	Laguna Coastal Streams	Laguna Canyon Creek
	Aliso Creek	Aliso Creek
	Dana Point Coastal Streams	Salt Creek
	San Juan Creek	San Juan Creek, Oso Creek, Trabuco Creek, Bell canyon, Verdugo Canyon
	San Clemente Coastal Streams	Prima Deshecha, Segunda Deshecha
	San Mateo Creek	San Mateo Creek

¹ Previously termed DAMP/Watershed Chapters

12.2 Accomplishments

Through the current Permit term, the six south Orange County watersheds have been the focus of watershed-based water quality planning and a number of environmental restoration planning initiatives.

12.2.1 Watershed-Based Water Quality Planning Efforts

In August 2003, DAMP/WAPs, including new GIS-based watershed delineations (and sub-watershed delineations in the Aliso Creek Watershed), were completed for each of the six watersheds. The documents present a watershed-based planning process for each watershed to focus activities on priority water quality constituents of concern. Concurrently, DAMP/WAP committees were established which have met at least bi-annually (excepting the San Mateo DAMP/WAP).

DAMP/WAP Objectives:

- To meet the requirements for a Watershed Urban Runoff Management Plan (WURMP) contained in the municipal National Pollution Discharge Elimination System (NPDES) stormwater permit (Order R9-2002-0001, Section J).
- To identify the most significant water quality issues and constituents of concern on a watershed scale and relate these to urban sources.
- To focus the pollution prevention and source control programs implemented at an individual jurisdiction level on the identified constituents of concern and to identify any jurisdiction-specific treatment control opportunities.
- To identify the water quality issues that are most appropriately addressed through a multi-jurisdictional watershed-scale approach.
- To incorporate information obtained from prior planning studies.
- To develop an integrated plan of action that results in meaningful water quality improvement at a watershed scale that balances economic, social, and environmental constraints.
- To identify indicators to track progress.

At the time of their preparation it was assumed that the DAMP/WAPs would ultimately evolve into TMDL implementation plans. Indeed, the anticipated development of the Beaches and Creeks Pathogen Indicator Bacteria TMDL established pathogen indicator bacteria as the priority constituent of concern in each watershed

The DAMP/LIP and DAMP/WAP planning processes essentially result in *Baseline BMPs* and *Enhanced BMPs*, respectively. *Baseline BMPs* are based upon the model programs identified in the DAMP and are implemented on a countywide basis to contribute to the control of all pollutants. *Enhanced BMPs* generally target watershed priority constituents of concern (currently pathogen indicator bacteria). The DAMP/WAP planning process also incorporates actions to comply with California Water Code (CWC) directives and

SECTION 12, WATERSHED ACTION PLANS

abatement orders. Progress on DAMP/WAP implementation has been reported in the FY2003-04 and FY2004-05 Annual Progress Reports.

The subsequent sections identify the Enhanced BMPs, compiled by watershed, that have been implemented by the Permittees. The information in parentheses uniquely identifies each Enhanced BMP with respect to the Action Plans included in the FY2004-05 WAP Annual Progress Reports, specifically:

XX-Y#z

Where XX - Jurisdictional identifier e.g. LB = Laguna Beach
Y - Long term (L) or Short term (S) Strategy
- Objective
z - Management action

These reports should be referred to for more detailed information regarding the Enhanced BMP and its implementation schedule.

- **Laguna Coastal Streams:**

Examples of Enhanced BMP implementation efforts in the watershed targeting pathogen indicator bacteria include:

- Construction of diversion systems with hydrodynamic separator units to control runoff pollution (LB-L3b), and
- Provision of public education materials that address pet and horse care (AV-S3a, LB-S3a, LW-S3f, LW-S3d).

- **Aliso Creek:**

Monitoring Program

On March 2, 2001, the San Diego Regional Board issued a directive pursuant to California Water Code Section 13225 ("Directive") to the Principal Permittee and the cities within the Aliso Creek Watershed ("Watershed Permittees") for an investigation of urban runoff in the watershed. The Directive found that the Watershed Permittees may be discharging waste with high bacteria levels from municipal storm drain outfalls into Aliso Creek and its tributaries. To meet requirements of the Directive, the Watershed Permittees implemented a watershed-wide regional bacteriological monitoring program in April of 2001.

Monitoring data was collected weekly at 37 locations throughout the watershed. The monitoring of each site included collection of bacteriological samples from the storm drain discharge and within the receiving water body and estimates of flowrates. Data was analyzed for trends and patterns in bacteria levels and reported quarterly through November 2005.

A revised regional monitoring program that more efficiently allocates efforts to source identification and reduction was approved in [GET] and began implementation in June 2006. The revised program focuses monitoring efforts on “status sites” and “trends sites” in the lower watershed and on a “BMP evaluation sites” at high-priority drains throughout the watershed.

The monitoring of status and trend sites addresses two questions:

1. Are conditions in receiving waters protective of beneficial uses? (status)
 2. Are conditions in receiving waters getting better or worse over time? (trends)
- Status and trends monitoring takes place at five core stations in the lower portion of the watershed, which past studies indicate is the area of highest recreation use and related concern about potential human health impacts. Despite some variability among them, the stations as a group provide a picture of conditions in the lower portion of the Creek. These five stations will be monitored during August and September, at a frequency of 10 samples per month. This period represents the most conservative sampling period because it captures the annual peak of bacteria levels in the watershed and the time of year that body contact recreation is most likely.

The BMP evaluation monitoring focuses on answering three questions:

1. Have bacteria loads from the high-priority drains decreased?
2. Are BMPs having their intended effects on concentrations in and/or loads from the drains?
3. Have impacts from high-priority drains on the receiving waters decreased?

Data from the BMP evaluation sites will also be compared to the results of the status and trends monitoring in the lower sections of Aliso Creek. This will help to assess whether a reduction in loads at the high-priority drains is associated with improving conditions in the lower Creek. Data and results of the revised monitoring program will be submitted on an annual basis on November 15th of each year.

In the spring of 2003, on behalf of the Watershed Permittees, the Principal Permittee worked with UC Irvine researchers Dr. Sunny Jiang and Dr. Betty Olson to investigate sources of bacteria in the J03P02 sub-watershed. The UCI researchers used three Microbial Source Tracking (MST) methods to identify the sources of bacteria from samples collected in the sub-watershed from May through August 2002. These MST methods included: (1) analysis for human enteric viruses, (2) analysis for genetic biomarkers indicative of human, cow, pig/cat, rabbit, and bird sources, and (3) Antibiotic Resistance Analysis (ARA). The analysis of samples for biomarkers of human and animal sources showed no samples with biomarkers of human origin, and showed that all or almost all samples had biomarkers of bird, rabbit, and cow origin. Findings from the human virus and ARA studies suggest that sewage was an unlikely source of fecal coliform in the drainage system, and that bacteria from wild animal feces were the dominant source of *Enterococci* in the

watershed.

In addition to field research and monitoring activities, the Principal Permittee, Watershed Permittees and Regional Board staff meet on a quarterly basis to discuss the data reports, investigation and bacteria pollution prevention and control activities undertaken by the Permittees, and advances in bacteria monitoring and control techniques.

The revised program also contains important adaptive components that will ensure the monitoring program maintains its focus on key management questions, responds appropriately to monitoring findings, initiates new activities only when they are supported by the monitoring data, and reduces monitoring effort when it no longer provides useful information. Data and results of the revised monitoring program will be submitted on an annual basis on November 15th of each year.

Enhanced BMPs

Examples of Enhanced BMP implementation efforts in the watershed targeting pathogen indicator bacteria include:

- Provision of pet waste disposal bags in parks and on trails (LN-L3f);
- Installation of municipal facility drain inlet debris screens (OC-L3a);
- Installation of drain inlet debris screens (LH-L3b, LN-L3b, MV-L4b);
- Installation of drain inlet filters (LF-L3a, MV-L3a);
- Installation of bactericidal in-line storm drain filters (MV-L3c);
- Installation of a hydro-dynamic separator along El Toro Road (LF-L3a);
- Installation of a stormwater treatment vault (MV-L4b);
- Operation of a UV disinfection water treatment system on drain JO1P28 (OC-L3b);
- Installation of Munger storm drain sand filter (LF-L3c);
- Wood Canyon Emergent Wetland Project with detention basins (AV-L3g);
- Landscape irrigation control (LN-L3e);
- Operation of a constructed wetland treatment system (Wet CAT) in drain JO3PO2 (LN-L2c). The Wet CAT system consists of three constructed multipurpose wetlands designed to capture and treat low-flow urban runoff from a suburban residential neighborhood. The wetlands were constructed in 2001-03 in response to the Clean-up and Abatement Order issued to the City of Laguna Niguel and the County of Orange in December 1999;
- Implementation of a trash enclosure retrofit program (MV-L3e);
- Implementation of bio-retention devices (MV-L3f), and
- Hosting Fats, Oils and Greases (FOG) seminars (LF-L3f).

- **San Juan Creek:**

Examples of Enhanced BMP implementation efforts in the watershed targeting pathogen indicator bacteria include:

- Provision of pet waste disposal bags in parks and on trails (DP-L3d, LH-L3d, LNL3e, RSM-L3c, SJC-L3g);
- Installation of drain inlet debris screens (DP-L3c, MV-L4b, SJC-L3a, SJC-L4c);
- Installation of drain inlet filters (DP-L3c, DP-L3f, DP-S2a, MV-L3a, SJC-L3a);
- Installation of bactericidal in-line storm drain filters (LH-L3e, LN-L3b);
- Installation of a hydro-dynamic separator for locations along coastline (SC-L3c);
- Installation of a stormwater treatment vault at drain JO1P03(MV-L4b);
- Operate and maintain dry weather nuisance water diversions (DP-L3g);
- Employ debris nets at natural drainages to ocean (SC-L3c);
- Plastic bag recycling (SC-S4c, SJC-S4b);
- Provision of public education materials that address pet and horse care (DP-S3b, DP-S3c, LH-S3a, SC-S3a, SJC-S3a, OC-S3a, OC-S3b);
- Landscape irrigation control (DP-L3a, LH-L3c, LN-L3c, LN-S2c, RSM-L3a, SCL2d, SJC-L2c, OC-L2a);
- Employ structural treatment units at North Beach (SC-L3c);
- Sewage spill prevention and retrofit of food service facilities (SJC-L3d);
- Identify potential drainage system retrofit opportunities (SJC-L3f);
- Hosting tours for the public of BMP infrastructure (LN-S3b, MV-S3b);
- Outreach to HOA's on BMPs (MV-S2e, RSM-S2d);
- Implementation of a trash enclosure retrofit program (MV-L3d, SJC-L3b);
- Installation of catch basin filters in new developments (MV-L3a);
- Focus on trash enclosure area maintenance (MV-L3d, SC-L3c, SC-L4a, SJC-L3e);
- Hosting Fats, Oils and Greases (FOG) seminars (DP-L3e, SJC-S3e);
- Video inspection of sanitary sewers (DP-L3h), and
- Field investigation and bacteria source identification (LN-L2c, SC-L2b, SC-L2e, SC-L3d, OC-L3a).

- **Dana Point Coastal Streams:**

Monitoring Program

The Permittees participate in the Regional Harbor Monitoring Program (RHMP), which was designed and implemented in response to a 13267 letter from the San Diego Regional Water Quality Control Board. The RHMP is intended to help answer fundamental questions about the status of and trends in beneficial uses in the coastal harbors along this region of the coast. Dana Point Harbor is included in the RHMP.

Enhanced BMPs

Examples of Enhanced BMP implementation efforts in the watershed targeting pathogen indicator bacteria include:

- Provision of pet waste disposal bags in parks and on trails (DP-L3d, LN-L3e);
- Installation of drain inlet debris screens (DP-L3c);
- Installation of drain inlet filters (DP-L3c, DP-L3f, DP-S2a, OC-L2b);
- Installation of bactericidal in-line storm drain filters (LN-L3b);
- Installation of vinyl coated chain link fence under Baby Beach Pier (OC-2Le);
- Installation of sanitary sewer diversion at Baby Beach (OC-L2d);
- Operate and maintain dry weather nuisance water diversions (DP-L3g);
- Organization of beach/creek clean-up events (DP-S3a, DP-S3d, LB-S2b, LN-S2b, OC-S2a);
- Landscape irrigation control (DP-L3a, LN-L3a, LN-L3c, OC-L2a);
- Restoration of circulation at Dana Point Harbor (DP-L4c);
- Parking area infiltrative swale with a suspended solids separator (OC-L2c);
- Catch basin retrofit program (LN-L3b);
- Provision of public education materials that address pet and horse care (DP-S3b, DP-S3c, DP-S3e, LB-S3a, LN-S3a, OC-S3a, OC-S3b);
- Hosting tours for the public of BMP infrastructure (LN-S3b);
- Hosting Fats, Oils and Greases (FOG) seminars (DP-L3e);
- Video inspection of sanitary sewers (DP-L3h), and
- Field investigation and bacteria source identification (DP-L2a, DP-L6b, DP-L7a, LB-L2a, LN-L2a, LN-L2c).

- **San Clemente Coastal Streams:**

Examples of Enhanced BMP implementation efforts in the watershed targeting pathogen indicator bacteria include:

- Plastic bag recycling program (SC-S4c, SJC-S4b);
- Provision of pet waste disposal bags in parks and on trails (DP-L3d, SJC-L3c);
- Installation of drain inlet debris screens (DP-L3c, OC-L2c, SJC-L4c);
- Installation of drain inlet filters (DP-L3c, DP-L3f, DP-S2a, OC-L2c);
- Installation of debris nets at natural drainages to ocean (SC-L3c)

- Installation of a phase II storm drain Capistrano Beach Nuisance water diversion & hydrodynamic separator. (DP-L3b);
 - Installation of a hydro-dynamic separator for locations along coastline (SC-L3c);
 - Operation of a UV disinfection water treatment system at drain MO1 (OC-L2a); a
 - Operation and maintenance of dry weather nuisance water diversions (DP-L3g)
 - Provision of public education materials that address pet and horse care (DP-S3b, DP-S3c, OC-L2b, OC-S3a, SC-S3a, SJC-S3a);
 - Implementation of a trash enclosure retrofit program (SC-L3c, SC-L4a, SJC-L3b);
 - Video inspection of sanitary sewers (DP-L3h);
 - Focus on trash enclosure area maintenance (SC-L3c, SC-L4a, SJC-L3e);
 - Hosting Fats, Oils and Greases (FOG) seminars (DP-L3e, SJC-S3d), and
 - Field investigation and bacteria source identification (SC-L2b, SC-L3d, SC-L2e).
- **San Mateo Creek:**

The portion of the San Mateo Creek watershed within Orange County is currently not urbanized. With the development of the Rancho Mission Viejo project, water quality protection will be addressed in the planning approval process for the project. Watershed-based water quality planning will occur in collaboration with San Diego County at such time that conditions warrant a watershed-based approach.

12.2.2 Environmental Restoration Projects and Planning Efforts

The term “Restoration” is applied to projects and planning efforts that contribute to the re-establishment of a more natural watershed hydrologic regime and which are focused on achieving broader objectives such as watershed habitat restoration and connectivity rather than specific water quality outcomes.

- **Laguna Coastal Streams**

Examples of restoration projects in the watershed include:

- Restoration projects along the full length of Laguna Creek (LB-L3b).

- **Aliso Creek**

Examples of restoration projects in the watershed include:

- Urban stream channel restoration (LN-L3c, LN-L5a), and
- Urban landscape renewal initiative (LH-L3a, LH-S2c, LN-L3a, LN-S2c).

Watershed Management Plan and Feasibility Study

The Army Corps of Engineers has completed a comprehensive study of the creek and its watershed in order to develop a management plan that will accomplish stream stability, habitat restoration, flood and embankment protection, and

improved water quality. A concurrent study was initiated for San Juan Creek. \$45 million in Section 219 funds is being sought to support the Aliso Creek Water Quality SUPER project.

- **San Juan Creek**

Examples of restoration projects in the watershed include:

- Urban landscape renewal initiative (DP-L3a, LH-L3a, LH-S2c, LN-L3a, SJC-L2c, SJC-L4b, OC-L2a);
- Urban stream channel restoration at the San Clemente Municipal Golf Course (SC-L3c), and
- Arundo eradication (SJC-S1b).

Watershed Management Plan and Feasibility Study

The County of Orange has entered into a \$3.2 million Federal Cost Share Agreement with the Corps for the San Juan Creek Watershed Spin-Off Feasibility Study. The Permittees and water/wastewater agencies have developed a locally preferred plan (LPP) for the lower watershed which they plan to represent to the Corps. The LPP includes removal of the existing concrete slope panels and would result in the addition of a sand creek invert under the concrete sloped panels.

- **Dana Point Coastal Streams**

Examples of restoration projects in the watershed include:

- Urban landscape renewal initiative (DP-L3a, LN-L3a, LN-L3c, OC-L2a);

- **San Clemente Coastal Streams**

Examples of restoration projects in the watershed include:

- Urban landscape renewal initiative (DP-L3a, OC-L2a, SJC-L2c, SJC-L4b);
- Urban stream channel restoration at the San Clemente Municipal Golf Course (SC-L3c);
- Landscape irrigation control (DP-L3a, OC-L2a, SC-L2d, SJC-L2c);
- Employ structural treatment units at Poche Beach (SC-L3c);
- Identify potential drainage system retrofit opportunities (SJC-L3b); and
- Arundo eradication (SJC-S1b).

- **San Mateo**

See discussion in 12.2.1 – San Mateo Creek.

12.2.3 Other Planning Efforts

- **Integrated Regional Water Management Plan (IRWMP)**

In August, 2005, the County facilitated forming the South Orange County Integrated Regional Water Management Group (Group). This Group is comprised of South Orange County cities, the County, and water/wastewater agencies. The Group prepared an IRWMP, which was adopted in May, 2006. The IRWMP integrates projects and management plans of the various agencies to foster coordination, collaboration and communication among those organizations in order to provide a reliable water supply, protect and improve water quality, and achieve other multiple objectives in an efficient manner.

12.3 Assessment

Three separate, but nonetheless highly interrelated, planning processes have continued to develop through the period of the Third Term Permits. These processes are (1) DAMP/LIP focused on Countywide implementation of Baseline BMPs, (2) DAMP/Watershed Action Plan focused on Enhanced BMPs targeting specific constituents of concern, and (3) a number of processes and initiatives that are focused on achieving broader objectives such as watershed habitat restoration and connectivity rather than specific water quality outcomes.

The first two processes align with the CWA's interim goal, which is to attain water quality sufficient to provide for the protection and propagation of fish, shellfish, and wildlife and for recreation in and on the water. The third process aligns with the overarching objective of the CWA which is to restore and maintain the chemical, physical and biological integrity of the nation's waters. While the interim goal is subordinate to the broader objective, it nonetheless continues to be the primary focus of the Permittees efforts since it is the basis of the long-established NPDES permitting framework to which the Permittees, as a consequence of Section 402(p) of the CWA, are subject.

12.3.1 Watershed-Based Water Quality Planning Efforts

In south Orange County the specific WURMP requirements of the Third Term Permits have preceded TMDL development and implementation and led to the creation of six DAMP/WAPs. The most DAMP/WAP progress reports show significant progress with respect to each of the short-term and long term objectives and the DAMP/WAPs are deemed to usefully provide:

- A holistic account of all water quality protection and management activities in the

watershed;

- A basis for developing establishing and communicating common goals for the watershed with an action plan to achieve them, and
- A framework for monitoring and assessing the progress of projects individually and cumulatively at the watershed scale.

At the time of their preparation it was assumed that the DAMP/WAPs would ultimately evolve into TMDL implementation plans. Indeed, the anticipated development of the Beaches and Creeks Pathogen Indicator Bacteria TMDL established pathogen indicator bacteria as the priority constituent of concern in each of the six south Orange County watersheds for which DAMP/WAPs were prepared. One consequence of this common focus was the convening of WAP committees to address the same constituent of concern. While this situation suggests a need for a regional consolidation of committees within the Orange County portion of San Juan Hydrologic Unit, it is recognized that the TMDL's separate load allocations will likely require coordinated action and cost sharing on a hydrologic area or hydrologic sub-area basis. In addition, it is expected that additional TMDLs will be developed over the next permit term for more localized water and sediment quality impairments which will also require watershed management-based planning approaches at the hydrologic sub-area level. While the Permittees strive to minimize the administrative burden of the various planning processes, realignment of the current watershed planning areas wholly within Orange County and the San Juan Hydrologic Unit is considered premature prior to TMDL promulgation.

The exception in the foregoing assessment is the San Mateo DAMP/WAP. The San Juan Hydrologic Area encompasses south Orange County and an area of San Diego County comprising a portion of the San Mateo Canyon Hydrologic Area and the San Onofre Hydrologic Areas. While a DAMP/WAP was prepared for the portion of San Mateo Canyon within Orange County, it is an area of Orange County that is yet to undergo urbanization. It is anticipated that no further action will be taken by the Permittees relating to the San Mateo DAMP/WAP pending until such time as there is a need to address urbanization impacts on a watershed scale and in collaboration with San Diego County.

ROWD Commitment

- Complete development of the **DAMP/Watershed Action Plans** into bacteria TMDL implementation plans (excepting the San Mateo DAMP/WAP).

12.3.2 Environmental Restoration Planning Efforts

The Permittees' environmental restoration efforts focused on ecological outcomes are generally broad stakeholder initiatives rather than permit compliance driven planning

processes. Further, the major restoration planning efforts are predominantly grant funded cooperative projects. Consequently, federal funding of ACOE watershed management and restoration initiatives and the future success of the IRWMP and other grant funding initiatives will continue to be a major determinant of progress with respect to these planning efforts.

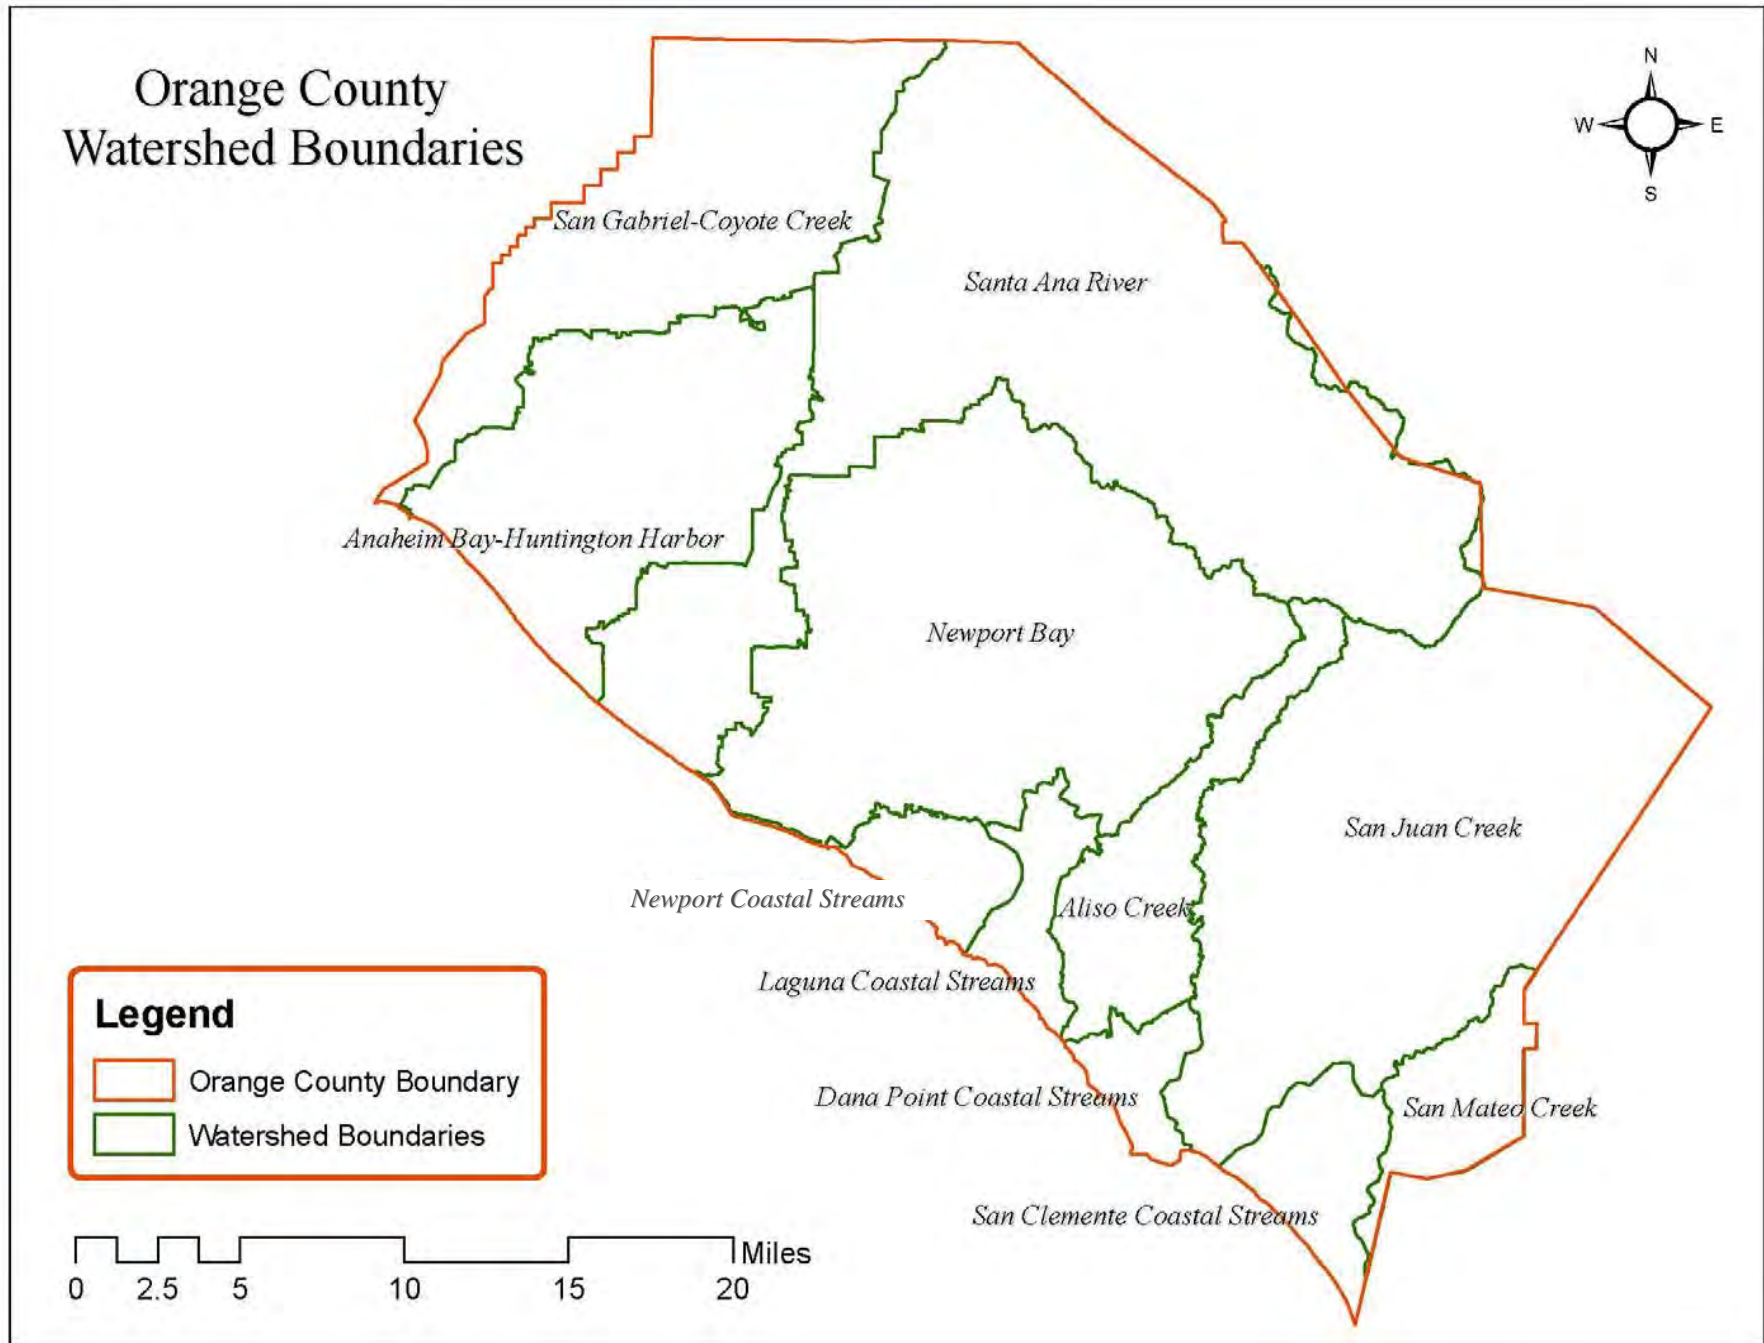

12.3 Summary

The most DAMP/WAP progress reports show significant progress with respect to each of the WURMP short-term and long term objectives established in the Third Term Permits. Based upon this progress the DAMP/WAPs are deemed to usefully provide:

- A holistic account of all water quality protection and management activities in the watershed;
- A basis for developing establishing and communicating common goals for the watershed with an action plan to achieve them, and
- A framework for monitoring and assessing the progress of projects individually and cumulatively at the watershed scale.

With the increased emphasis on TMDL implementation in the Fourth Term Permits, the Permittees will focus on the five watershed areas of San Juan Hydrologic Area within Orange County and continue to develop the DAMP/WAPs into TMDL implementation plans. This development, while likely maintaining the San Juan Creek and Aliso Creek DAMP/WAPs, may lead to a consolidation of effort related to the coastal streams watersheds. In addition, the San Mateo Creek Watershed which is largely outside Orange County, and not currently subject to urbanization (in the Orange County portion), will not be further developed pending the need for inter-county collaboration on a watershed basis in the future.

Figure 12.1

13.0 SUMMARY

13.1 Introduction

From the various sources of information that were used to evaluate program effectiveness, three themes have emerged that frame the Permittees approach to developing the proposed 2007 DAMP. These themes are:

Demonstrating the iterative management approach: Adapting the management program to more effectively address urban sources of pollutants that are causing or contributing to exceedances of water quality standards;

Enhancing Implementation: Improving program implementation through incorporation of auditable environmental management system concepts; and,

Establishing watershed-based water quality planning: On a Countywide basis, creating two separate, but nonetheless highly inter-related, water quality planning processes to address urban sources of pollutants.

Each of these themes is the basis for two types of programmatic recommendations, specifically (1) ROWD Commitments (new programmatic commitments to be developed and implemented over the period of the Fourth Term Permits) and (2) DAMP Modifications (improvements to existing program commitments incorporated into the proposed 2007 DAMP).

13.2 Demonstrating Iterative Management

ROWD Commitments:

- Develop Model Integrated Pest Management, Pesticide and Fertilizer Guidelines into a Model Program (rather than guidelines) with implementation goals and including model contract language (see **Section 5.3.2**).
- Develop recommendations for the selection and installation of drain inlet screens (see **Section 5.3.3**).
- Develop model language for municipal trash collection and haulage contracts that address water quality protection issues (see **Section 5.3.3**).
- Develop and implement BMPs for architectural uses of copper and zinc (see **Section 7.3.1**).

13.3 Enhancing Implementation

ROWD Commitments:

- Prepare a training schedule and define expertise and competencies for
-

SECTION 13.0, SUMMARY

- jurisdictional program manager positions (see **Section 2.3.2**).
- Prepare a fiscal reporting strategy based upon an audit of the fiscal analysis reporting section of the PEA, to better define the expenditure and budget line items included in the fiscal report (see **Section 2.3.4**).
 - Prepare metric definitions and guidance to improve efficacy of the assessment process.
 - Standardize SDR and SAR definitions of “High” priority and develop prioritization process that is better predicated on the threat (diminished by BMP implementation) posed by the facility, and consider the presence of “constituents of concern” (see **Section 5.3.1**).
 - Redefine IPM (pesticide use) indicators (see **Section 5.3.1**).
 - Prepare guidance documentation and clarify requirements or conceptual Project WQMP (see **Section 7.3.1**).
 - Prepare guidance and training as needed on the recordation process (timing and appropriate documents to use) and develop recommendations for appropriate methods to employ to enable the Permittees to enforce the approved WQMP against subsequent property owners (see **Section 7.3.1**).
 - Develop library of BMP performance reports (see **Section 7.3.1**).
 - Develop standard design checklist/plans/details for source and treatment control BMPs (see **Section 7.3.1**).
 - Develop recommendations/guidance for enhanced Model WQMP language regarding Site Design BMPs (see **Section 7.3.1**).
 -
 - Evaluate the NTS approval process and develop recommendations for streamlining regulatory agency approval of regional treatment control BMPs (see **Section 7.3.1**).
 - Prepare a training schedule including defined expertise and competencies for staff with WQMP review and approval responsibilities (see **Section 7.3.1**).
 - Prepare a training schedule including defined expertise and competencies for construction inspectors (see **Section 8.3.1**).
 - Develop a more detailed prioritization process to improve standardized reporting and to support re-direction of inspection resources to significant sources of priority constituents of concern (see **Section 9.3.1**).
-

SECTION 13.0, SUMMARY

- Develop effective alternative to re-inspection such as self-certification (see **Section 9.3.1**).
- Prepare defined expertise and competencies for authorized inspector positions and develop a training schedule to meet these requirements (see **Section 9.3.1**).

DAMP Modifications:

- Revised the DAMP for greater consistency with established Environmental Management System (EMS) principles and improved accessibility to different constituencies and levels or readership (see **Section 2.3.3**).
- Revised **DAMP Section 3.0 plan improvement process** to detail iterative process for DAMP improvement (see **Section 3.3.1**).
- Defined “fixed facilities,” “field programs,” and “drainage facility sites” (see **Section 5.3.1**).
- Eliminated Environmental Performance Reporting (EPR) program (which is duplicative of Model Municipal Activities Program) (see **Section 5.3.1**).
- Revised Model WQMP Table 7.II.6 for latest information on BMPs and clarity (see **Section 7.3.1**).
- Evaluated and revised (as necessary) prioritization provisions for Countywide consistency (see **Section 7.3.1**).
- Provided definitive construction site prioritization guidance (see **Section 8.3.1**).
- Clarified inspection frequencies; violation definitions and re-inspection (see **Section 9.3.1**).
- Provided definitive industrial and commercial facility descriptions (see **Section 9.3.1**).

13.4 Establishing Watershed-Based Water Quality Planning

ROWD Commitment:

- Complete DAMP/Watershed Action Plans for all 11 Orange County watersheds (see **Section 12.3.2**).
-

1.0 INTRODUCTION

The cities of Anaheim, Brea, Buena Park, Costa Mesa, Cypress, Fountain Valley, Fullerton, Garden Grove, Huntington Beach, Irvine, La Habra, La Palma, Laguna Hills, Laguna Woods, Lake Forest, Los Alamitos, Newport Beach, Orange, Placentia, Santa Ana, Seal Beach, Stanton, Tustin, Villa Park, Westminster, and Yorba Linda (collectively the Santa Ana Region Permittees) and the cities of Aliso Viejo, Dana Point, Laguna Beach, Laguna Hills, Laguna Niguel, Laguna Woods, Lake Forest, Mission Viejo, Rancho Santa Margarita, San Clemente, and San Juan Capistrano (collectively the San Diego Region Permittees) operate municipal storm drain systems and discharge stormwater and urban runoff pursuant to National Pollutant Discharge Elimination System (NPDES) Permits.

These Permits require that the Permittees work together to:

- Effectively prohibit non-stormwater discharges to the stormdrain system, and
- Implement controls to reduce the discharge of pollutants in stormwater to the Maximum Extent Practicable (MEP).

The Permits were first adopted in 1990 and subsequently renewed in 1996 (Second Term) and 2002 (Third Term) (See **Table 1.1**). This **Report of Waste Discharge** has been prepared in anticipation of the expiration of the Third Term Permits in early 2007 and comprises:

- An evaluation of NPDES permit compliance over the period of the Third Term Permits;
- A proposed management program, the **2007 Drainage Area Management Plan (2007 DAMP)** (see **Appendix A**) for the Fourth Term Permits;
- A comparison of land use in Orange County in 2002 and 2005 (see **Appendix B**), and,
- A compendium of maps showing changes to the storm drain system infrastructure over the period of the Third Term Permits (see **Appendix C**).

1.1 Background

1.1.1 Drainage Area Management Plan

The **Drainage Area Management Plan (DAMP)** is the principal policy and program guidance document for the *Orange County Stormwater Program*, a cooperative municipal regulatory compliance initiative focused on the management and protection of Orange County's streams, rivers, creeks and coastal waters. The main objective of the DAMP is to fulfill the commitment of the Permittees to develop and implement a program that satisfies NPDES permit requirements.

SECTION 1.0, INTRODUCTION

The DAMP describes the agreements, structures and programs that:

- Provide the framework for the program management activities and plan development (**DAMP Section 2.0** and **Section 3.0**);
- Provide the legal authority for prohibiting unpermitted discharges into the storm drain system and for requiring BMPs in new development and significant redevelopment (**DAMP Section 4.0**);
- Improve existing municipal pollution prevention and removal best management practices (BMPs) to further reduce the amount of pollutants entering the storm drain system. (**DAMP Section 5.0**);
- Educate the public about the issues of urban stormwater and non-stormwater pollution and obtain their support in implementing pollution prevention BMPs (**DAMP Section 6.0**);
- Ensure that all new development and significant redevelopment incorporates appropriate Site Design, Source Control and Treatment Control BMPs to address specific water quality issues. (**DAMP Section 7.0**);
- Ensure that construction sites implement control practices that address control of construction related pollutants discharges including an effective combination of erosion and sediment controls and on-site hazardous materials and waste management (**DAMP Section 8.0**);
- Ensure that existing development addresses discharges from industrial facilities, selected commercial businesses, residential development and common interest areas/homeowner associations (note: the San Diego permit explicitly outlines a residential component, but the Santa Ana permit is more general about residential requirements). (**DAMP Section 9.0**);
- Detect and eliminate illegal discharges/illicit connections to the municipal storm drain system (**DAMP Section 10.0**);
- Identify urban impacts on receiving waters; produce environmental quality information to direct management activities, including prioritization of pollutants to support the development of specific controls to address these problems; and determine pollutant load reductions and changes in the quality of receiving waters (**DAMP Section 11.0**); and
- Assess watershed constituents of concern and manage urban runoff on a watershed basis (**DAMP Section 12.0**).

1.1.2 Runoff from Urban Areas

The Program is concerned with the imprint of urban development on the landscape.

SECTION 1.0, INTRODUCTION

Urbanization creates rooftops, driveways, roads and parking lots (Schueler and Holland, 2000,¹ use the term *Imperviousness* as the unifying theme for understanding the adverse hydrologic impacts of urbanization), which (1) increase the timing and volume of rainfall runoff (compared to pre-development conditions) and (2) provide a source of pollutants that are flushed or leached by rainfall runoff into aquatic systems. The environmental consequences of these impacts are loss or impairment of aquatic beneficial uses due to:

- Water quality degradation resulting from increased loadings of sediment nutrients, metals hydrocarbons, pesticides and bacteria;
- Stream channel instability and habitat loss resulting from increased severity and frequency of floods;
- Increased water temperatures resulting from solar energy absorption by urban surfaces and elimination of riparian shading; and
- Loss of groundwater recharge.

1.1.3 Regulatory History

The Orange County Stormwater Program was initiated in 1990 as a cooperative local government response to a 1987 amendment to the federal Clean Water Act (CWA). This amendment extended the provisions of CWA Section 402 (National Pollutant Discharge Eliminations System permitting) to municipal storm drain system operators thereby making local governments (and some industrial activities) responsible for the quality of their stormwater discharges. Permit application requirements were promulgated by US Environmental Protection Agency (EPA) in 1990 (40 CFR 122) and form the basis of the current program.

Orange County's first NPDES Permits were issued in 1990 with renewals in 1996 and 2002. There are separate NPDES Permits administered by the Santa Ana and San Diego Regional Water Quality Control Boards (RWQCBs). The Permits prescribe that surface water quality protection be addressed in local governments' oversight of construction and development, its regulation of industry and commerce, and in its construction, operation and maintenance of the public urban infrastructure.

Program managers maintain the compliance of their jurisdiction with the applicable permit (or permits) through implementation of a BMP-based environmental management system (i.e. the DAMP) that is subject to both annual self auditing and reporting and external regulatory compliance audits which, in the Santa Ana Regional Board are, is an enforceable part of the Third Term Permit.

¹ Thomas R. Schuler and Heather K. Holland. *The Practice of Watershed Protection: Techniques for protecting our nation's streams, lakes, rivers and estuaries* (Maryland: Center for Watershed Protection, 2000).

1.2 Approach to Preparing Report of Waste Discharge

1.2.1 Themes

The immediate objective of the ROWD is to fulfill the commitment of the Permittees to undertake a program assessment and propose revisions to the management program in response to the information learned. While compliance with the Third Term Permits is maintained by implementation of prescribed management actions, program assessment must be undertaken with regard to the Permits' receiving water limitations provisions which require adaptation of the Orange County Stormwater Program where urban sources are causing or contributing to exceedances of applicable water quality standards. The first of the major themes that has framed preparation of the ROWD is a focusing of management efforts on identified water quality constituents of concern identified by the environmental monitoring programs.

The Third Term Permits transformed the Orange County Stormwater Program developed under the First and Second Permit Terms. The major escalation in compliance obligations prescribed new requirements for local governments' oversight of construction and development, regulation of industry and commerce, and its construction, operation and maintenance of the public urban infrastructure. These new compliance obligations required a major realignment of the program implemented over two years with the consequence that program performance metrics are generally available for three years. Program effectiveness assessments over the limited period of full implementation have indicated positive programmatic impacts, as detailed in subsequent sections of this report. However, annual assessments have also indicated significant variability in performance reporting between jurisdictions. In addition, regulatory agency reviews have identified differences in regulatory agency and Permittee expectations in key areas of the Program, particularly with respect to regulation and oversight. The second major theme of the ROWD is therefore a focus on enhancing existing program implementation rather than the proposed development of major new program initiatives.

The third major theme is a focus on the watershed approach and specific water quality constituents of concern. The Third Term Permits required the Permittees under the jurisdiction of the San Diego RWQCB to develop Watershed Urban Runoff Management Plans (WURMPs) to address priority water quality constituents of concern, and similar plans are being developed for watersheds in the Santa Ana Region. The WURMPs, termed DAMP Watershed Action Plans, while continuing to evolve, provide a basis for both cooperative targeted actions that complement the countywide approach and optimizing management actions on a regional, sub-regional or jurisdictional basis.

Major Themes of the ROWD

- Demonstrating the Iterative Management Approach: Implementing policy shifts based upon the findings of the environmental monitoring programs.

- Enhancing Implementation: Focusing on program implementation through incorporation of environmental management system concepts.
- Emphasizing the Watershed Approach: Establishing and enhancing watershed-based water quality planning on a countywide basis.

1.2.2 Assessment

The DAMP incorporates three separate but nonetheless related water quality planning processes which are identified as “countywide,” “jurisdictional,” and “watershed-based” water quality management. Each process is iterative and incorporates annual phases of assessment focused on determining whether programmatic outcomes are being achieved (See **DAMP Appendix C - Program Effectiveness Assessment**). These annual assessments have previously been reported (see Unified and jurisdictional Annual Progress Reports).

DAMP Appendix C also recognizes the additional phase of assessment required in the ROWD every five years. While the longer term perspective of the ROWD allows a focus on environmental outcomes, both the annual and ROWD assessments necessarily consider the same performance metrics, both programmatic and environmental. In addition to considering these metrics, preparation of effectiveness assessments in the ROWD were additionally informed by:

- A longer term (rather than annual) review of the findings of the countywide water quality monitoring programs;
- Review of audit reports and other regulatory correspondence regarding the Program and meetings with RWQCB staff;
- A series of facilitated consultation meetings with jurisdictional program coordinators, including in-depth interviews on key program areas; and
- Input from the public at workshops.

The assessment has produced two types of programmatic recommendations:

1. ROWD Commitments, and
2. DAMP Modifications.

ROWD commitments represent shifts in programs that will be implemented upon completion of a development process with the Permittees, and are identified at the end of each program section of the ROWD. DAMP Modifications are characterized as programmatic modifications for improving program implementation and have been incorporated into the proposed 2007 DAMP.

Program Effectiveness

An activity, program element, or overall program is effective if it is producing a desired outcome. **Figure 1.1** shows that outcomes can be construed in terms of six levels and illustrates the progression of each successive level toward the ultimate goal of environmental improvement. In general, Levels 1 to 3 can be considered *Implementation Outcomes*, Levels 5 and 6 *Water Quality Outcomes* and Level 4 a combination of the two. Each level has value in informing the management process. However, it bears emphasis that not all are necessary or possible in every instance (CASQA, 2005).²

Assessment measures may be variously categorized. In this ROWD, two categories are recognized, related to (1) the shorter term confirmation of BMP implementation (Implementation or Process Measures, also termed Programmatic Indicators), corresponding to Levels 1-3 in **Figure 1.1**, and (2) the longer term verification of environmental improvement (Validation or Results Measures, typically actual indicators of environmental change). In essence, the categorization of measures reflects two basic assessment questions:

- Are program elements being implemented correctly?
- Are environmental improvements being realized?

Headline Indicators are intended to be a sub-set of measures that reflect in simple terms how a stormwater program is progressing towards its goals and are easily understandable. The Orange County Stormwater Program Headline Indicators that have been reported over the Third Term Permits are presented in **Table 1.2**.

Effectiveness assessment requires the establishment of a set of baseline conditions. Thereafter effectiveness can be determined by comparisons of successive years of indicator information against the baseline data. Where the period of evaluation is characterized by the implementation of new program requirements, determinations of program effectiveness will be limited to confirmation of program implementation. Indeed, it must be recognized that evidence of positive environmental outcomes can be elusive because:

- Water quality changes in response to program implementation are likely to be very slow; and
- Establishing a link between receiving water condition and program activities is difficult at the watershed scale when programs are being implemented incrementally.

While program effectiveness assessment is a key step in the iterative process of program

² California Stormwater Quality Association (CASQA). 2005. "An Introduction to Stormwater Program Effectiveness Assessment." Available at: http://www.scvurppp-w2k.com/pdfs/0405/CASQA%20White%20Paper_An%20Introduction%20to%20Stormwater%20Program%20Effectiveness%20Assessment4.pdf.

SECTION 1.0, INTRODUCTION

implementation, it should be realized that effectiveness assessment tools are still evolving. Assessing program effectiveness is recognized as a challenge for program managers across California, and the Orange County Stormwater Program is supporting the effort of the California Stormwater Quality Association (CASQA) to develop guidance in this area at a statewide level.

Environmental Assessment

A summary of the major findings of the water quality monitoring program is presented in **Section 11**. This summary has identified a number of water quality constituents of concern, specifically, metals (copper and zinc) and pesticides, based upon frequent exceedances of water quality standards and the occurrence of toxicity, respectively. In addition, Total Maximum Daily Loads (TMDL) and 13225 and 13267 Directives (see **Section 12**) for pathogen indicator bacteria and regulatory interventions regarding trash and debris require that these constituents also be considered water quality constituents of concern that will be the focus of targeted management efforts over the period of the Fourth Term Permits.

Regulatory Assessment

Over the period of the Third Term Permits, most of the municipal entities have been the subject of compliance audits which have served to highlight the successes (national recognition by USEPA) and shortcomings (three instances of administrative civil liabilities) of the Program. Since the primary objective of the DAMP is to fulfill the commitment of the Permittees to develop and implement a program that satisfies NPDES permit requirements, regulatory agency findings regarding permit compliance and the performance of the Orange County Stormwater Program must be considered in effectiveness assessments. Indeed, many of the commitments made in the subsequent sections follow from regulatory findings. In addition, current Total Maximum Daily Load (TMDL) development in the South County area and a regulatory intervention regarding trash and debris in the north County area, elevate fecal indicator bacteria and trash and debris to the status of Orange County Stormwater Program water quality constituents of concern.

Permittee Assessment

The Permittees have undertaken a comprehensive review of the current programs, identifying areas that are ineffective and require modification, and ones requiring additional emphasis. This assessment, coupled with the environmental and regulatory assessments, are the foundational underpinnings for this ROWD.

Figure 1.1: General Classification of Outcome Types

2.0 PROGRAM MANAGEMENT

2.1 Introduction

The key elements of program management comprise the Principal Permittee and Permittee relationship, the Implementation Agreement, the structure and hierarchy of committees (termed Management Framework), and policy and program documentation (i.e. the DAMP). At the inception of the Orange County Stormwater Program, the Permittees in both Regional Board areas agreed that the County of Orange would be the Principal Permittee and the cities and the Orange County Flood Control District would be Co-Permittees on the permit (all parties are now collectively referred to as Permittees). Principal Permittee and Permittee responsibilities are specified in the Permits and reiterated in the NPDES Stormwater Permit Implementation Agreement (referred to as Implementation Agreement) which also provides a funding mechanism for the shared costs (administration, program development, public education, and environmental monitoring) of the Orange County Stormwater Program. To further support the development and implementation of a coordinated countywide program, a management framework was created during the First Permit Term. With the Third Term Permits this framework has evolved into a four tier structure (Permittees, City Managers' Water Quality Committee, Technical Advisory Committee (TAC) and Program Committees/Task Forces). Concurrently, the DAMP was substantially revised to address the significant escalation in compliance requirements prescribed in the Third Term Permits.

2.2 Accomplishments

2.2.1 Implementation Agreement

The Implementation Agreement, originally entered into in December of 1990, was amended in October of 1993 to include two additional Permittees (Laguna Hills and Lake Forest) and formally establish the TAC.

- Implementation Agreement: On June 25, 2002, the Implementation Agreement was amended again and fully restated to include three additional Permittees (Aliso Viejo, Laguna Woods and Rancho Santa Margarita).

2.2.2 Management Framework

The Permittees established (in early 2002) and maintained a tiered management framework consisting of committees, task forces, sub-committees and ad hoc work groups to direct the development and implementation of the Orange County Stormwater Program (**Figure 2.1**). A greater level of participation in all aspects of the program has been evident by high Permittee participation in the management framework. This framework is composed of:

- City Manager's Water Quality Committee
-

SECTION 2.0, PROGRAM MANAGEMENT

The City Manager's Water Quality Committee meets as needed to provide budget and overall program review and governance direction.

- City Engineer's Technical Advisory Committee (TAC)

The TAC serves in a program advisory role and provides policy direction on program budget and program development and implementation. It is comprised of one Public Works Director/City Engineer, or selected representative, from each of the County Supervisor Districts and a representative from the County of Orange. It meets 4-6 times annually.

- General Permittee Committee

The General Permittee Committee is the principal forum for disseminating information for program coordinators. The Committee meets monthly (except November).

In 2004-05, thirty four (34) out of thirty five (35) Permittees reported 80% or higher participation in the General Permittee Committee.

- Task Forces/ Sub-Committees

The *Task Forces/ Sub-Committees* provide for the continued development of the program in a specified area of program responsibility and oversight. The Task Forces/ Sub-Committees which were active in 2004-05, are:

- Trash and Debris Task Force
 - Purpose: To foster and sustain partnership approaches to dealing with trash and debris in stormwater and urban runoff (quarterly meeting schedule). Recent products include a strategic assessment of Orange County's trash and debris control efforts.
 - Legal/Regulatory Authority Task Force
 - Purpose: To review the legal authorities that the Permittees have in complying with the permit requirements and recommend changes as needed and to track stormwater related litigation that may affect the Orange County Stormwater Program (quarterly meeting schedule).
 - Water Use Efficiency Task force
 - Purpose: To study and support a comprehensive effort to curb urban runoff through efficient water usage in Orange County (quarterly meeting schedule).
-

SECTION 2.0, PROGRAM MANAGEMENT

- Data and Information Management Sub-Committee
 - Purpose: To oversee the development and implementation of information technology solutions to program data management and reporting requirements (monthly meeting schedule). Recent products include an internet-based system for preparation of the annual reports/Program Effectiveness Assessments (PEAs).
 - LIP/PEA Sub-Committee
 - Purpose: To provide oversight and technical direction to the management of core DAMP/Local Implementation Plan (LIP) programs (bi-monthly meeting schedule).
 - Public Education Sub-Committee
 - Purpose: To provide regional consistency and oversight for the stormwater public education program efforts (monthly meeting schedule). The sub-committee directs development and dissemination of all education and outreach materials.
 - Inspection Sub-Committee
 - Purpose: To provide a forum for the coordination, investigation, enforcement and training aspects of the existing development inspection program and Illegal Discharges/Illicit Connections (ID/IC) programs (bi-monthly meeting schedule). Recent products include the Investigative Guidance Manual and self-audit checklist.
 - Water Quality Sub-Committee
 - Purpose: To provide oversight and technical input for the revision of the water quality monitoring programs, ongoing water quality data evaluation, and special water quality investigations and BMP effectiveness studies (quarterly meeting schedule).
 - Ad-Hoc Group – Wastewater Disposal
 - Purpose: To develop a list of BMPs for the disposal of washwater/wastewater generated by mobile businesses. The Group was convened specifically to address wastewater disposal issues and worked cooperatively with the sewerage agencies to produce best management practice guidance (BMP Fact Sheet IC24). This ad-hoc group has now sunsetted.
-

SECTION 2.0, PROGRAM MANAGEMENT

- Watershed Committees
 - Seven Watershed Committees (Newport Bay, Laguna Coastal streams, Aliso Creek, Dana Point Coastal Streams, San Juan Creek, San Clemente Coastal Streams, and San Mateo Creek) were established and have met regularly since their inception.
 - Other Watershed Committees/Work Groups

The Permittees have also participated in the Newport Bay Executive and Management Committees (the latter held jointly for a period with the Army Corp of Engineers (ACOE) Study Management Team), the Huntington Harbour Water Quality Task Force, the Dana Point Harbor Water Quality Task Force, the Coastal Coalition, and the Aliso Creek Tier I and Tier II stakeholder meetings. These watershed groups focus their activities and discussions on broader watershed issues of concern, such as habitat restoration and flood control in addition to water quality issues resulting from Total Maximum Daily Loads (TMDLs) and special directives.

- Other Representation/Participation

The Principal Permittee actively represents the Permittees on various advisory stormwater fora, including, California Stormwater Quality Association (CASQA), Southern California Coastal Water Research Project (SCCWRP) (the County, representing the Orange County Stormwater Program, joined SCCWRP in 2005-06), Plastic Debris - Rivers to Sea Project, Nitrogen and Selenium Management Program, and Waste Discharge Requirements (WDR) for Fats, Oils and Grease (FOG) Program.

2.2.3 Program Documentation

The completion of the 2003 DAMP marked the culmination of a major program documentation overhaul and revision that was initiated by the preparation of the Report of Waste Discharge submitted on September 1, 2000. In addition to the revised policy commitments and model programs, the DAMP was expanded through the addition of appendices to include 34 individual jurisdictional LIPs (the Permittees formally identified which departments have responsibility for implementation of each program element), an extensive compendium of training materials, regional and jurisdictional program effectiveness assessment and reporting, and six watershed management plans.

2.2.4 Watershed Mapping

To support the development of the DAMP/Watershed Chapters, GIS-based mapping was undertaken for the S. County area initially to define watershed boundaries. It will be completed for the entire County area by the end of 2006 and will, for the first time, establish definitive watershed and sub-watershed boundaries for Orange County.

SECTION 2.0, PROGRAM MANAGEMENT

Orange County Watersheds (See **Figure 12.1**)

Orange County – Santa Ana Region	South Orange – San Diego Region
San Gabriel / Coyote Creek Watershed (within Orange County)	Laguna Coastal Streams Watershed
Anaheim Bay/Huntington Harbour Watershed	Aliso Creek Watershed
Santa Ana River Watershed (within Orange County)	Dana Point Coastal Streams Watershed
Newport Bay Watershed	San Juan Creek Watershed
Newport Coastal Streams Watershed	San Clemente Coastal Streams Watershed
	San Mateo Creek Watershed (within Orange County)

2.2.5 Fiscal Analyses

Annual fiscal analyses have been conducted since the inception of the Program. Each analysis identifies *shared costs* and *individual costs*. Shared costs are those that fund activities performed by the Principal Permittee. These activities include administration, program development, public education, and environmental monitoring. The projected-shared cost expenditures for the 2005-06 fiscal year, as approved by the Permittees, were \$5,941,160.

Individual Costs are those incurred by each Permittee arising from its jurisdictional program implementation as documented in the LIPs and comprise capital and operation and maintenance costs. Capital Costs refers to expenditures for land, large equipment, and structures and Operations and Maintenance Costs refer to normal costs of operation including the cost of keeping equipment and facilities in working order. The total individual Permittee costs for the 2005-06 fiscal year were projected to be \$91,868,883.

The fiscal analysis also requires the identification of funding sources. The funding sources used by the Permittees include: General Fund, Utility Tax, Separate Utility, Gas Tax, and Special District Fund, Others (Sanitation Fee, Fleet Maintenance, Community Services District, Water Fund, Sewer & Storm Drain Fee, Grants, and Used Oil Recycling Grants). **Figure 2.2** shows that general funds continue to support over half the cost of program implementation across Orange County.

2.3 **Assessment**

2.3.1 Implementation Agreement

Since the inception of the Program the Implementation Agreement has been amended to provide for the incorporation of new cities and to formally recognize the role of the TAC. The structure of the Agreement has accommodated the expansion of the program and the significant escalation of shared costs with the adoption of the Third Term Permits. More recently, the Agreement has served as a model for cost sharing collaboration related to the Newport Bay TMDL compliance effort (including the Nitrogen Selenium Management Program), Regional Harbor Monitoring Program, and

SECTION 2.0, PROGRAM MANAGEMENT

Aliso Creek 13255 Directive. Consequently, it is considered to be an effective basis for cooperation of the Program.

2.3.2 Management Framework

USEPA defines a management framework *“as a lasting process for partners working together. It's a support structure making it easier to coordinate efforts--a structure made of agreed upon standard operating procedures, timelines, and forums for communicating with each other”*. On the basis of this definition, the current framework continues to effectively serve the Permittees. The Management Framework has enabled 36 local government entities to develop, implement and sustain coordinated regional and watershed-based approaches to water quality protection and management. The Framework provides a basis for all parties, including staff, management, executive management and elected officials to be informed and involved in the planning processes.

In addition to the established framework, an alternate management framework was conceived during the Third Permit Term by County senior management and the City Managers Association Water Quality Committee in the context of developing a countywide strategic approach to water quality protection based upon three watershed management areas. Conceptually endorsed by the County of Orange Board of Supervisors, this alternate structure will continue to be developed over the course of the Fourth Term Permits.

Headline Indicator - Participation in General Permittee Committee: In 2004-05, thirty four (34) out of thirty five (35) Permittees reported 80% or higher participation in the General Permittee Committee compared to thirty two (32) Permittees reporting 80% or higher participation in 2003-04.

The management framework is reviewed annually to ensure it meets program needs. All the committees/task forces have been effective in bringing forward initiatives to meet the requirements of the Third Term Permits and to address program needs under a consensus building production process.

While these outcomes point to the value and robustness of the current Framework, there has been significant turnover of staff in jurisdictional program manager positions. This has led to a regulatory agency perception that program managers lack the training and expertise necessary to effectively implement the “stormwater mandate.”

ROWD Commitment:

- Prepare a training schedule and define expertise and competencies for jurisdictional program manager positions.
-

SECTION 2.0, PROGRAM MANAGEMENT

2.3.3 Program Documentation

International Organization for Standardization (ISO) 14000 provides criteria for evaluating the efficacy of management system documentation. The DAMP expresses the commitment of the Permittees to NPDES permit compliance and to addressing the adverse impacts of urban runoff on Orange County's creeks, rivers, streams and coastal waters. It establishes objectives, guides the participating organizations toward the development and implementation of BMPs, and commits the Permittees to an iterative process of improvement. It requires the designation of a program manager and assigns responsibilities (through the LIPs) for program implementation. Based upon these considerations, the DAMP meets formal environmental management system expectations for policy documentation. Moreover, the DAMP clearly identifies management procedures and provides for the internal and external communication of both policy and performance. The DAMP is also widely available to interested parties through its posting to www.ocwatersheds.com.

While the comprehensive nature of the current documentation supports the implementation of the Program, it can be perceived as overwhelming in its complexity to both jurisdictional program coordinators who lack a long period of program association and outside constituencies seeking insights into the program. Moreover, the active consideration being given by regulators (e.g. the SWRCB's Blue Ribbon Panel) to possible future inclusion in NPDES permits of quantitative measures, including effluent limitations, underscores regulatory agency and environmental advocate perception of there being undue complexity and challenge with respect to establishing discharger accountability. It is possibly a perception which is being reinforced by overly comprehensive and complex program documentation. The Permittees started to address this issue of accessibility with the publication of the "popular format" *Orange County Stormwater Program Progress in 2002-2003* report and this document's subsequent acclaim points to the need for the more regular use of "popular" format reports. However, to address both the need for the DAMP to be more "accessible" and the Permittees' interest in validating a regulatory framework for stormwater predicated upon an auditable management system, the DAMP must more succinctly demonstrate to all constituencies that policies, objectives, and targets are properly identified and are being met, that regulatory compliance is being achieved, and that the planning processes provide for iterative improvement.

DAMP Modification:

- Revise the DAMP for greater consistency with established Environmental Management System (EMS) principles and improved accessibility to different constituencies and levels or readership.

2.3.4 Fiscal Analyses

SECTION 2.0, PROGRAM MANAGEMENT

The significant year-to-year variability in reported program costs (**Figure 2.3**), which cannot be attributed to changes in program management, point to the clear need for an assessment of the fiscal reporting process.

ROWD Commitment:

- Prepare a fiscal reporting strategy based upon a review of the fiscal analysis reporting section of the PEA, to better define the expenditure and budget line items included in the fiscal report.

Figure 2.1: Orange County Municipal NPDES Management Framework

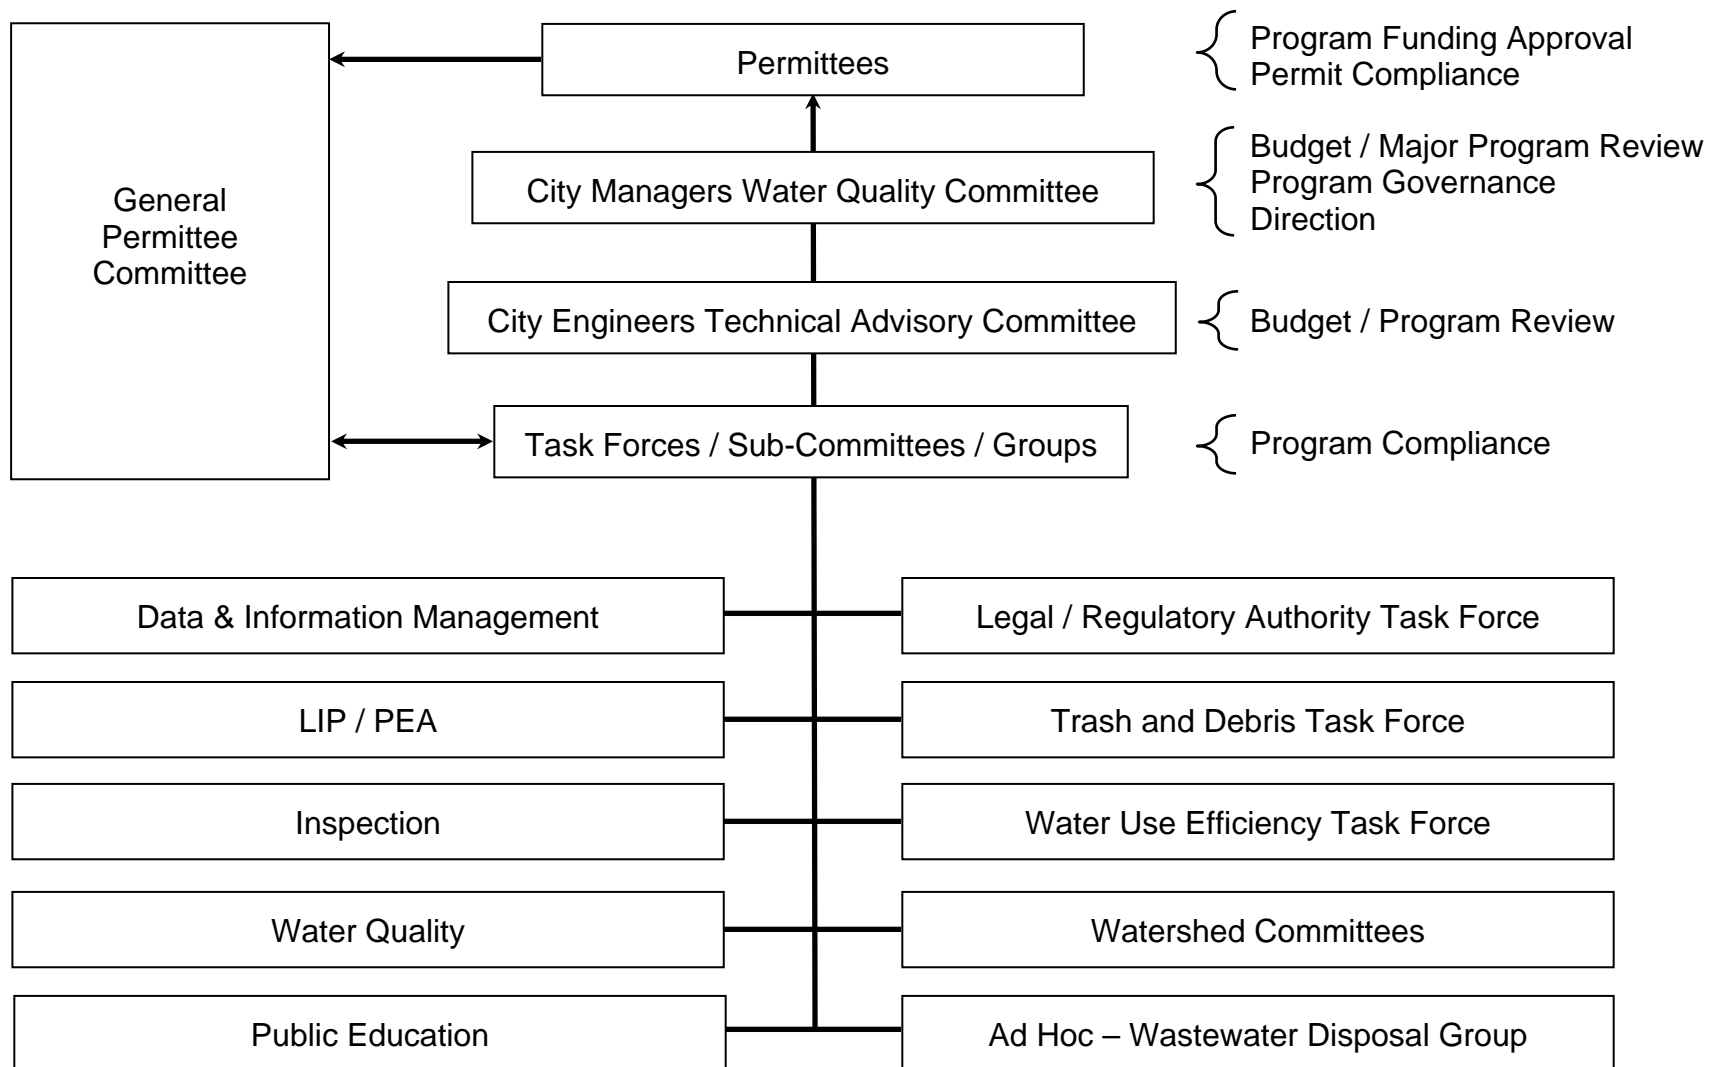

Figure 2.2: 2004-05 Funding Sources

Figure 2.3: Historical Review of Total Individual Permittee Costs

3.0 PLAN DEVELOPMENT

3.1 Introduction

The DAMP sets forth a countywide approach for urban stormwater management by:

- Establishing a baseline set of BMPs that are applicable to all areas and that are proven and cost-effective;
- Monitoring water quality to assess progress and identify urban impacts on receiving water;
- Prioritizing waterbodies for corrective action, with those listed as impaired having a higher priority; and
- Focusing on enhanced BMPs for constituents of concern at a watershed or jurisdictional level, as appropriate.

The purpose of **DAMP Section 3.0** is to describe an iterative planning process, informed by programmatic BMP assessments and environmental monitoring, which support the progressive evolution attainment of water quality standards, as required by the NPDES Permits.

3.2 Accomplishments

3.2.1 Enhancements to DAMP: Iterative Planning Processes

A defining feature of the iterative planning process is the continual analysis, measurement and improvement through the quality loop which is illustrated in a simplified form in **Figure 3.1**:

Assessing: Assessing environmental conditions and programmatic performance, establishing the goals and targets to be achieved, and determining the route to be taken and the measurements to track success;

Planning: Designing activities to achieve the goal, identifying the needed skills and expertise, and designating responsibility for achieving desired outcomes;

Implementing: Striving to bring the process into effect in an efficient and effective manner, and

Monitoring: Evaluating the effectiveness of the *Implementing* stage.

With the adoption of the Third Term Permits, the DAMP which previously had presented policy and programmatic guidance, was revised to incorporate greater individual accountability through jurisdictional Local Implementation Plans (LIPs) (see **DAMP Appendix B**). The LIPs provide a flexible jurisdiction-specific plan within the broader policy and model program framework of the DAMP.

With additional permit mandates to institute watershed-based planning, water quality

planning in the context of the DAMP is now evident as two separate, but nonetheless similar and highly interdependent, processes targeting the control of pollutants in urban runoff. These processes (**Table 3.1; Figure 3.1**) are now recognized in the DAMP as:

- DAMP/LIP – Directed by jurisdictional assessments completed individually by each Permittee and a countywide assessment through a Unified Annual Progress Report.; and
- DAMP/Watershed Action Plan (WAD) (See **DAMP Appendix D**) – Directed by watershed scale assessments in Watershed Annual Reports.

3.2.2 Enhancements to DAMP: Programs and BMPs

Assessment is the part of the planning cycle that involves either initial investigation of the environmental conditions that are being addressed by the management program or, in subsequent iterations of the planning cycle, re-assessment to determine program effectiveness (i.e. if the actions being implemented are contributing to programmatic goals). It encompasses programmatic (including technology evaluations) and environmental enhancements and is itself an evolving area of stormwater management.

Programmatic Enhancements

To assist the Permittees with reporting the status of LIP implementation and the performance of the individual jurisdictional stormwater quality management programs, a Program Effectiveness Assessment (PEA) reporting framework (**DAMP Appendix C**) was developed in 2002-03. The PEA:

- Facilitates the collection and compilation of specific stormwater program implementation data and progress validation indicators;
 - A PEA template was created in 2003 and has been the basis of the 2002-03, 2003-04, and 2004-05 Annual Reports. In 2005, the template was converted into an internet-based reporting system.
- Provides for program effectiveness assessment by the individual Permittees and the Principal Permittee on a jurisdictional, watershed and/or countywide basis;
 - The PEA identifies specific programmatic and environmental performance metrics including specified validation indicators titled, “Headline Indicators.” (See Section 1.2.2)
- Ensures that an evaluation and improvement process is applied on a jurisdictional, watershed and/or countywide level to determine where modifications within the DAMP, LIP or WAP may be necessary; and
- Provides a mechanism for the Permittee to identify and report modifications that have or will be made to their LIP.

Enhancements in BMP Knowledge

A number of BMP evaluations, with countywide application, have been undertaken. These studies include the *BMP Effectiveness and Applicability for Orange County* (see **DAMP Appendix E1**); *Trash and Debris BMP Evaluation* (see **DAMP Appendix E2**); *Erosion Control BMP Effectiveness Study* (see **DAMP Appendix E3**); *Septic System Inventory and Assessment* (see **DAMP Appendix E4**); *Portable Toilet Pollution Prevention Program* (see **DAMP Appendix E5**), *Dry Weather Diversion Study* (see **DAMP Appendix E6**), *BMP Retrofit Opportunity Study* (see **DAMP Appendix E7**), and *Tustin Area Spill Containment Project* (see **DAMP Appendix E8**).

- *BMP Effectiveness and Applicability for Orange County*

This study was commissioned to review existing information on available structural BMPs and to organize and present specific information to facilitate the selection, siting, design, construction and maintenance of the most appropriate and cost-effective BMPs for a particular site in Orange County. The study recommended consideration be given to using extended detention basins, vegetated swales, vegetated buffer strips, bioretention, sand and organic filters, infiltration basins and infiltration trenches. In 2005, the study report was updated to include flow reduction BMPs developed in conjunction with the Nitrogen and Selenium Management Program.

- *Trash and Debris BMP Evaluation*

The objectives of the study were to review characterization information on trash and debris in Orange County and to identify candidate structural BMPs. The study concluded that site characteristics such as hydraulic head or footprint may be the principal determinants of BMP selection. During the reporting period the findings of this study were developed into a BMP selection guide for retrofit applications to modify an existing facility to provide a water quality (trash/debris removal) function. This guide will be finalized in 2006-07 and incorporated into **DAMP Appendix E**.

- *Erosion Control BMP Effectiveness Study*

The study was conducted to evaluate selected erosion methodologies for graded building pads with the goal of providing information on (1) the effect of time and weathering on product condition; (2) the frequency a product must be applied to be effective; (3) the maximum slope on which a product will perform effectively; and (4) how product performance is affected by soil types. The study comprised an evaluation of two types of hydraulic mulch (paper and wood based), two types of polyacrylimide (low and high molecular weights), and wood mulch (without a binding agent). The findings of the evaluation, which will be reported in the **2005-06 Unified Report** and incorporated into **DAMP Appendix E**, will be used to form the basis of a program recommendation on county pre-approved

BMPs.

- *Septic System Inventory and Assessment*

The objectives of this study were to develop an inventory/database of the septic systems in Orange County and to estimate the potential impact of septic systems on the quality of selected receiving waters. The final inventory/database compilation resulted in a list of over 2776 active septic systems which are widely dispersed throughout the County but are found in the highest concentrations in the Santa Ana River watershed. In the course of conducting eighty field surveys, one failed system was noted, representing a failure rate of 1.25% which was consistent with a similar finding in the literature. The study concluded that septic systems do not represent a significant source of constituents of concern (particularly fecal indicator bacteria and nutrients) for Orange County receiving waters.

- *Portable Toilet Pollution Prevention Program*

The objectives of the evaluation were to: (1) determine the nature of existing operational practices and regulatory oversight structure; (2) assess the extent to which the present practices associated with their use and maintenance were adversely impacting surface water quality; and (3) recommend appropriate revisions to current operational practices or regulatory oversight as warranted. The study determined that current standard industry practices for use, maintenance, transport and storage of portable toilets within Orange County are generally found to be sufficiently responsible to prevent impacts to receiving waters.

- *Dry Weather Diversion Study*

The dry weather diversion study was prepared to evaluate the diversions to the sanitary sewer that are in place or proposed within Orange County and to identify decision-making criteria to be used in selecting diversions as a preferred BMP. A recommended procedure for prioritizing implementation of diversion facilities was developed for the area of Orange County served by the Orange County Sanitation District.

- *BMP Retrofit Opportunities Study*

In 1997-98, the feasibility of incorporating BMP retrofits to optimize beneficial use attainment began to be addressed in the context of the long-term water quality planning initiatives being conducted within Orange County, a number of which were in cooperation with the Army Corps of Engineers. To supplement these earlier efforts, during 2003-04, a countywide evaluation was initiated using a GIS-based model to identify opportunities within the existing storm drain infrastructure for configuring/reconfiguring storm drains or channel segments in order to improve water quality and maintain the designated beneficial uses

SECTION 3.0, PLAN DEVELOPMENT

(see **DAMP Appendix E**). This effort was continued in 2005-06 with further use of the GIS-based model.

- *Tustin Area Spill Control (TASC) Demonstration Project*

To address the various regulatory, technical and coordination issues associated with preventing and planning for sanitary sewer overflows (SSOs), the County, as Principal Permittee, and the Orange County Sanitation District (OCSD) initiated a pilot project titled Tustin Area Spill Control (TASC) Demonstration Project. The project's accomplishments to date include:

- Development of SSO response procedures;
- Selection of primary and backup sewage spill response contractors for containment and recovery of sanitary sewer overflows;
- Conducting SSO desktop and hands-on field response training with the contractors; and,
- Development of a Memorandum of Understanding for delineating jurisdictional and financial responsibilities within the TASC project.

Enhancements in Technologies and Methodologies

A number of important initiatives are being supported by the Permittees aimed at the development of assessment techniques and methodologies to support more informed and consistent decision making across Southern California and statewide, including projects being undertaken with the Southern California Stormwater Monitoring Coalition, University of California, Irvine (UCI) for the development of the California Sustainable Watershed/Wetland Information Manager (CalSWIM) - prototype database, and the California Stormwater Quality Association (CASQA) initiative on program effectiveness assessment.

Findings of the extensive water quality monitoring program during the reporting period are discussed in **Section 11.0**. However, concurrent with this data collection effort are a number of important initiatives, being supported by the Permittees, that are aimed at the development of assessment techniques and methodologies to support more informed and consistent decision making across Southern California. Notable amongst these initiatives are the Regional Research Monitoring Program (Stormwater Monitoring Coalition) and the Development of the California Sustainable Watershed/Wetland Information Manager (CalSWIM) - prototype Database.

- *Regional Research Monitoring Program (Stormwater Monitoring Coalition)*

The goal of the Southern California Stormwater Monitoring Coalition (SMC) is to identify region-specific research needs to better understand stormwater mechanisms and impacts, and to collectively sponsor the development of assessment techniques and methodologies that will enable more informed and consistent stormwater management decision-making across the region.

The SMC has initiated several of the 15 research projects identified in the research needs agenda, including: microbial source tracking method comparison,

development of standardized sampling and analysis protocols, implementation of a laboratory intercalibration program, peak flow impact assessment, and the development of a regional integrated freshwater stream bioassessment monitoring program.

- *Development of California Sustainable Watershed/Wetland Information Manager (CalSWIM) – Prototype Database*

In response to a commitment to develop a prototype watershed database for cumulative impact assessment, the County of Orange as Principal Permittee has worked with UCI in developing and implementing a prototype database called the California Sustainable Watershed/Wetland Information Manager (CalSWIM). CalSWIM is a web-based expert system and database focused, initially, on Newport Bay and the Newport Bay watershed and can be viewed at www.calswim.org. The technical objective of CalSWIM is to provide an interactive platform for coastal wetland and watershed managers, planners, and engineers to explore alternative wetland and watershed management strategies.

- *CASQA Program Effectiveness Assessment White Paper*

The preliminary *White Paper* introduced and discussed key concepts and provided a standardized terminology related to the development of a comprehensive framework for assessing the effectiveness of stormwater management programs. It briefly defined and categorized potential outcomes, measures, and methods to be used in conducting assessments, and provided examples of how several programs are already utilizing these tools to assess their effectiveness. It also discussed the current needs of stormwater program managers with respect to program assessment. The issues addressed in this paper will form the basis for more detailed guidance on effectiveness assessment that is being developed by the CASQA Effectiveness Assessment Subcommittee during 2006.

3.3 Assessment

The Permittees recognize that knowledge in the field of stormwater quality is rapidly evolving and that the BMPs within the DAMP/LIP must be revised, deleted or added to in order for the program to stay current. In addition, water quality problems caused by urban stormwater that are identified either through environmental monitoring or regulatory interventions will elevate the need for additional or new BMPs to be implemented.

3.3.1 Iterative Planning Processes

While the ROWD itself serves to identify new programmatic commitments (see **Sections 5.0 through 10.0**), and is thereby evidence of the iterative approach, the DAMP has not, to date, detailed a process for programmatic change in response to improved knowledge of water quality controls and best management practices.

DAMP Modification:

- Revise **DAMP Section 3.0** plan improvement process to detail the plan improvement process.

3.3.2 Programmatic Assessment

The PEA template created in 2003, and used as the basis of the 2002-03, 2003-04, and 2004-05 Annual Reports, has been helpful in establishing a series of metrics for spatial (i.e. jurisdictional comparisons) and temporal (i.e. year-to-year comparisons) assessments of program effectiveness. However, the reporting has highlighted significant inconsistencies in metric interpretation across the jurisdictions of the Orange County Stormwater Program that require further standardization.

ROWD Commitment:

- Prepare metric definitions and guidance to improve efficacy of the assessment process.

3.3.3 BMP Assessment

Over the course of the Third term Permits a number of BMP evaluations have been undertaken. The recommendations arising from these studies are presented as ROWD commitments or DAMP Modifications in the subsequent sections of this ROWD as appropriate.

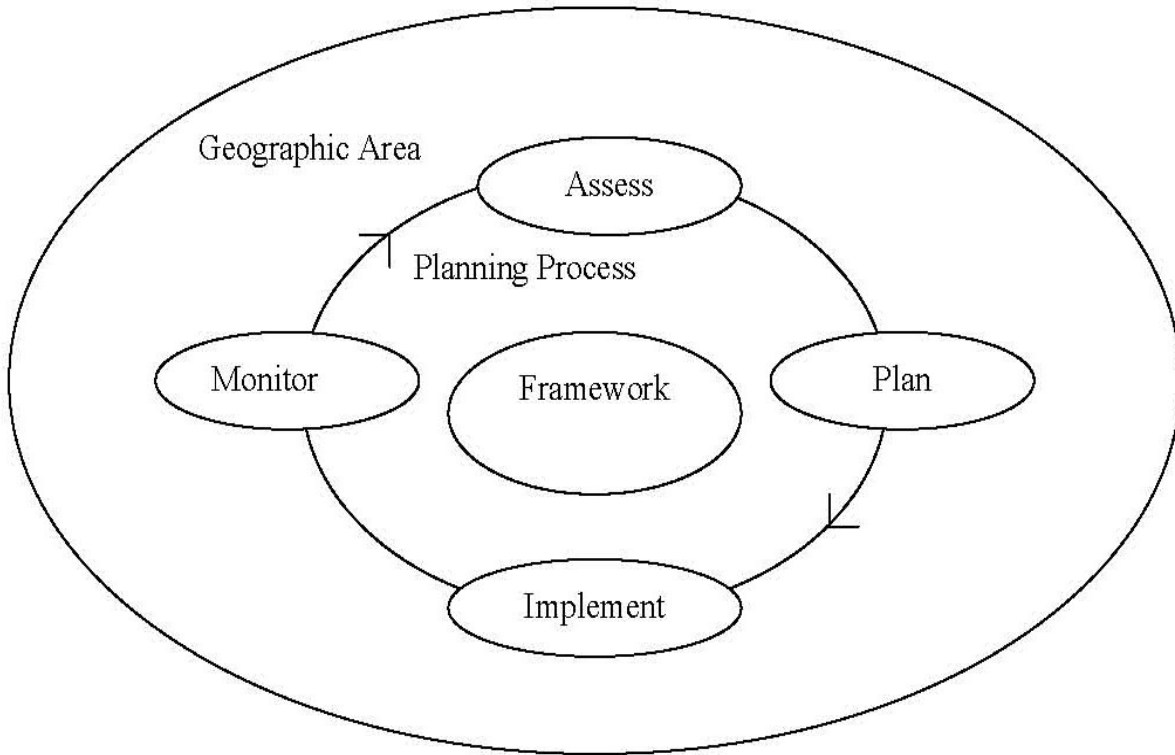

3.4 Summary

The Permittees consider **DAMP Section 3.0** to define the iterative planning processes, informed by programmatic and BMP assessments, that are the basis of the DAMP. Based upon this evaluation of the process, the principal finding is that the language of the DAMP can be revised to better define these processes at separate, but interrelated, jurisdictional, watershed and countywide levels. The Permittees have also identified a need to standardized annual reporting data further in order to enhance effectiveness assessment.

Table 3.1: Comparison of Water Quality Planning Processes

	DAMP/LIP	Watershed Action Plan
<i>Geographic Area Covered by Plan</i>	Defined by political (city/County) boundaries.	Defined by hydrologic boundaries.
<i>Planning Process</i>	Focused on reducing discharges of pollutants in urban runoff and stormwater pollution on a uniform countywide basis. Directed by DAMP/LIP in conformance with NPDES permits requirements.	Focused on improving local receiving water quality where it is adversely impacted by urban runoff and stormwater pollution. Directed by NPDES permits and 303(d) list.
<i>Framework</i>	Directed by Stormwater Program committee structure and Regional Board review. Public consultation principally through CEQA process/Regional Board review.	Directed by municipal and public agency stakeholders. Characterized by public participation.
<i>Assessment</i>	Based on countywide municipal and regional cooperative investigations of stormwater and receiving water quality. Assessments are undertaken annually (LIP) and every 5 year (DAMP).	Based on information from watershed specific investigations. Assessments are undertaken on an annual basis.
<i>Planning</i>	Broad based approach with emphasis on well established pollution prevention and source control measures.	Pollutant specific approach with emphasis on treatment controls and consideration of innovative regional solutions.
<i>Implementation</i>	Individually by Permittees.	Individually and collaboratively by Watershed Permittees and other agencies.
<i>Monitoring</i>	Considers pollutant load reduction.	Considers beneficial use attainment.

Figure 3.1: Water Quality Planning Process

4.0 LEGAL AUTHORITY

4.1 Introduction

The ability of the Permittees to comply with the requirements of the Third Term Permits is contingent upon the establishment, by each Permittee, of adequate legal authority to support control program implementation. **DAMP Section 4.0** discusses the development, starting in 1993, of a Model Water Quality Ordinance that was used by the Permittees as the basis of their local ordinances that were adopted by 1997. It also commits the Permittees to reviewing their ordinances to determine if any modifications are necessary in order to comply with new NPDES Permit requirements.

4.2 Accomplishments

With the adoption of the Third Term Permits in early 2002, the Permittees reviewed and verified the adequacy of their legal authority as the legal basis for the activities required for Third Term Permit compliance, primarily **DAMP Sections 7.0, 8.0, 9.0, and 10.0**. Following this initial review and verification, the responsibility for maintaining the efficacy of this key program element has rested with the Legal and Regulatory Task Force (see **Section 2.3.1**). During the reporting period, this Task Force has focused on a number of key areas including:

- Review and revision of legal authority as necessary regarding the stipulation of mandatory minimum BMPs in the San Diego Region;
- Review of inspection authority and “right of entry” at industrial/commercial facilities;
- Identification and resolution of overlap in legal authority within requirements of the WDR FOG program;
- Examination of the various Total Maximum Daily Load (TMDL) initiatives and their relationship to NPDES permits; and
- Perpetuation of BMP upkeep and maintenance in Water Quality Management Plans (WQMPs) for New Development/Significant Redevelopment.

Arising from the work of the Task Force have been continued findings of legal authority adequacy and the development of a model approach to WQMP recordation.

4.3 Assessment

The program effectiveness assessment outcome level for the **DAMP Section 4.0** is presented in **Table 4.1**. However, beyond confirming compliance with the Permits, the Permittees’ legal authority can also be assessed in the context of the sections of the DAMP that it primarily supports.

4.3.1 Legal Authority to Implement Existing Development and ID/IC Programs

In 2005, an action taken under the Ordinance requiring a property owner to effect the removal of manure from a creek under the authority of the jurisdiction’s water quality

ordinance was formerly challenged under the ordinance's appeal provisions. The jurisdiction prevailed in the third party adjudicated appeal hearing and again at a subsequent trial in an action brought by the Orange County District Attorney. These results, in addition to the numerous successful administrative actions and citations detailed in **Sections 8.0, 9.0 and 10.0** of this report, validate the robustness of the Permittees' legal basis for implementing **DAMP Sections 9.0 and 10.0**.

4.3.2 Legal Authority to Implement New Development Program

The New Development/Significant Redevelopment component of the Program ends with permit close-out and the BMPs implemented in conformance with DAMP Section 7.0 transition to the Existing Development component. As noted in **Section 7.3.1**, the Permittees believe that the BMP approach to stormwater management could be more effectively sustained by ensuring the longevity and enforcement of the approved WQMP against subsequent property owners for ongoing responsibility for BMP maintenance. The ROWD Commitment in **Section 7** to develop guidance on the recordation process and appropriate documentation to enable such enforcement will be fulfilled under the aegis of the Legal and Regulatory Task Force.

4.4 Summary

The Permittees validated the legal basis for implementing the DAMP in early 2002 and over the balance of the period of the Third term Permit continued to review aspects their legal authority under the aegis of the Legal and Regulatory Task Force. This review and the formal legal challenge to this authority in late 2005 and early 2006 have served to affirm the basic robustness of the Permittees' water quality ordinances.

SECTION 4.0, LEGAL AUTHORITY

5.0 MUNICIPAL ACTIVITIES

5.1 Introduction

The Permittees own and operate facilities and build and maintain much of the transportation, drainage and recreational infrastructure of the urban environment. The primary purpose of **DAMP Section 5.0** is to ensure that, through a systematic process of evaluation, BMPs are incorporated into these activities. **DAMP Section 5.0** also requires a commitment to implement Integrated Pest Management (IPM) approaches. In addition, **DAMP Appendix C** requires performance reporting related to a number of Established BMPs that have been recognized, since the inception of the Program, as significant contributors to pollutant load reduction.

5.2 Accomplishments

5.2.1 Model Municipal Activities Program

The Model Municipal Activities Program was developed and implemented in 2002-03 and replaced the environmental performance reporting program of the Second Term Permits. It establishes a framework for conducting a systematic program of evaluation and BMP implementation targeting fixed facilities, field programs and drainage facilities. The Model Municipal Activities Program requires the Permittees to:

- Compile facility and program inventories:

2,302 facilities have been reported as inventoried (2004-05 reporting period) and are subject to the program (**Table 5.2; Figure 5.1**).

- Prioritize facilities and programs based upon water quality threat and receiving water sensitivity:

There are a reported 1,070 high priority, 126 medium priority, and 1,106 low priority municipal facilities (**Table 5.2; Figure 5.1**)

- Establish model maintenance procedures:

Sets of BMP factsheets were produced for Fixed Facilities (13 factsheets), Field Programs (7 fact sheets) and Drainage Facilities (1 fact sheet). The factsheets are available at

http://www.ocwatersheds.com/StormWater/documents_damp_lip.asp

(Section 5 of the County of Orange/Orange County Flood Control District 2005-06 Local Implementation Plan).

- Conduct inspections:

Standard general and activity specific inspection forms have been developed for Fixed Facilities, Field Programs and Drainage Facilities. In addition, by the end

SECTION 5.0, MUNICIPAL ACTIVITIES

of 2006, 2,326 municipal facilities were reported as having been inspected for stormwater issues (**Table 5.3**).

- Implement BMPs:

At the end of the 2004-05 reporting period, 1,968 municipal facilities were determined to have full BMP implementation (**Table 5.3**).

- Undertake training:

Three training modules have been developed, specifically, Municipal Activities program Training, Fixed Facility Model Maintenance Procedure Training and Field Program Model Maintenance Procedure Training.

5.2.2 Model Integrated Pest Management, Pesticide and Fertilizer Guidelines

Landscaping is best managed using an integrated system of tactics that include biological, mechanical, physical, cultural, and chemical control. This system, known as IPM, relies on careful monitoring of the plants to identify when a chemical or other control action should be taken. In June 2001, the Principal Permittee entered into a five-year agreement with the University of California Cooperative Extension (UCCE) to conduct water quality monitoring studies and implement water quality improvement programs in areas where the University has special expertise, particularly related to fertilizer and pesticide applications (Note: On May 10, 2005, the agreement was revised and extended for up to six additional years). In close cooperation with the UCCE, Model IPM, Pesticide and Fertilizer Guidelines were completed in 2002-03. The Guidelines require the Permittees to:

- Conduct IPM self-audits:

With oversight and assistance from UCCE, the Permittees have completed self-audits of the Model IPM, Pesticide and Fertilizer Management Guidelines implementation. Audits have been conducted annually as part of annual progress reporting.

- Implement the Model IPM, Pesticide and Fertilizer Management Guidelines based upon IPM principles:

Fifty-seven percent (57%) of the Permittees are able to report that they operate under a formal written IPM policy.

Thirty-five (35) Permittees reported that approximately 363,146 pounds of nitrogen were applied to 6,862 acres of public land during the 2004-05 reporting period representing a third consecutive year of reduction (the 2005-06 figure represents a 2% decrease from the pounds per acre of nitrogen usage in 2003-04; a decrease of 27% from 2002-03; and a 12% decrease from 2001-02) (**Table 5.4**).

SECTION 5.0, MUNICIPAL ACTIVITIES

During the 2004-05 reporting period, approximately 19,227 pounds of active ingredients (AI) of pesticides were applied by the Permittees representing a 30% reduction in use since the inception of the program (**Table 5.3**).

- Undertake Training:

Training has been provided annually.

5.2.3 Established BMPs

Performance indicators for certain Established BMPs have been tracked since the inception of the Model Municipal Activities Program. These BMPs are street sweeping, solid waste collection, catch basin stenciling, drainage facility maintenance, trash & debris Control (formerly litter control), household hazardous waste collection, and used oil grant participation.

- Street Sweeping:

All Permittees maintain street sweeping programs in residential, commercial and/or industrial areas. In 1993 the Permittees compiled information regarding their existing street sweeping schedules and practices and have subsequently changed elements of their programs such as the types of sweepers purchased, the frequency of sweeping, and the use of parking restrictions in order for the street sweeping program to aid in water quality improvements.

85,516 tons of material was removed from the streets and gutters during the 2004-05 reporting period. This effort appears to represent a 12% increase for weight of material collected over the previous reporting period and a 25% increase over the tons of material reported in 2002-03. This amount represents a 87% increase in the weight of material collected over the 2001-02 total, indicating a marked increase in effort in this area of infrastructure maintenance in the Third Term Permit cycle. (**Table 5.5; Figure 5.2**).

- Solid Waste Collection:

The Permittees have solid waste collection programs for public, residential, commercial and industrial areas.

3,959,590 tons of solid waste was collected during the 2004-05 reporting period. This effort appears to represent a 9.1% increase in the amount of solid waste collected over the previous reporting period, an 8.8% increase over the reported total in 2002-03, and a 7.0% increase over the reported total in 2001-02 (**Table 5.6; Figure 5.3**).

SECTION 5.0, MUNICIPAL ACTIVITIES

- Catchbasin Stenciling:

Over 37,000 stormdrain inlets have been stenciled. Each year 6,000 – 9,000 inlets are re-stenciled.

- Drainage Facility Maintenance:

The Permittees inspect the drainage system within their jurisdictions annually and clean out accumulated debris on an as needed basis. Removal of accumulated debris and sediment is carried out either manually or by mechanical methods using flushing – in emergency situations only – in accordance with established maintenance procedures (Model Maintenance Procedure DF-1). By removing this material from the catch basin inlets and stormdrain system, the Permittees make a significant contribution in preventing the passage of these materials in downstream receiving waters.

5,612 tons of debris was removed from drainage facilities in 2004-05. This amount represents a 43% decrease in the amount of debris collected from drainage facilities when compared to the previous reporting period, a 77% decrease in the amount collected in 2002-03 and a 6.5% decrease in the amount collected in 2001-02 (The 2002-03 reported total suggests inconsistent reporting of this Indicator or other environmental factors such as Santa Ana winds) (**Table 5.7; Figure 5.2; Figure 5.3**).

- Trash & Debris Control:

Trash and debris control is an important element in the diversion of litter and other solid materials from the storm drain system. Although most Permittees historically viewed litter control as a public service program (i.e., preventing visual blight, etc.), rather than as a pollution control problem, it is now considered important as a visual indicator of water quality and an aspect of the recreational use of a waterbody.

Eleven (11) trash and debris booms have been installed in flood control channels and harbors to recover floatable material.

Inner-Coastal and Watershed Cleanup Day, which engages the public directly in the cleanup of trash and debris, has been heavily promoted by the Orange County Stormwater Program. In 2002, 1,722 volunteers joined in and collected 29,503 pounds of trash and 5,350 pounds of recyclables. In 2003, 2,473 volunteers collected 52,474 pounds of trash and 5,447 pounds of recyclables at 37 sites. In 2004, 6,001 volunteers collected 78,390 pounds of trash and 9,563 pounds of recyclables at 38 sites. In 2005 the number of clean-up sites increased to 43.

The Permittees have participated in the preparation of a number of strategic assessments of litter control efforts including *A Review Of Current Trash Pollution and Mitigation Efforts in Orange County: Final Report January 2006* prepared under

SECTION 5.0, MUNICIPAL ACTIVITIES

the auspices of the Trash & Debris Task Force and the Algalita Marine Foundation/California Coastal Commission *Plastic Debris: Rivers To Sea* initiative in which the Principal Permittee was represented on the advisory board.

- Household Hazardous Waste Collection:

Orange County has a household hazardous waste collection program administered by the Integrated Waste Management Department (IWMD). The program comprises four sites (Anaheim, Huntington Beach, San Juan Capistrano, and Irvine).

A total of 6,303,938 pounds of household hazardous waste was collected in the 2004-05 reporting period representing a 9.8% increase from the previous reporting period, a 48.7% increase from the 2002-03 reporting period, and 68.7% increase from the 2001-02 reporting period (**Table 5.8; Figure 5.6**).

- Used Oil Grant Participation:

Most of the Permittees, as well as the County's Health Care Agency, currently implement used oil recycling programs. These programs involve comprehensive public outreach including television and newspaper advertising, displays at community events, and the distribution of used oil containers at no cost to residents.

Twenty seven (27) Permittees reported having a Used Oil Grant participation program for 2004-05, 28 Permittees in 2003-04 and 27 Permittees in 2002-03 (**Table 5.9; Figure 5.7**).

5.3 Assessment

The current and potential program effectiveness assessment outcome levels for the Municipal Activities Program are presented in **Table 5.1a** (Model Municipal Activities Program) and **Table 5.1b** (Model IPM and Fertilizer Guidelines).

5.3.1 Model Municipal Activities Program

The Model Municipal Activities Program superceded the Environmental Performance Reporting (EPR) program of the Second Term Permits. Nonetheless, elements of the EPR program were carried over into the **2003 DAMP**. The **ROWD** is therefore recognized by the Permittees as an opportunity to eliminate the redundant vestiges of the prior inspection and oversight program.

The fixed facility inventory has fluctuated significantly over the reporting period (see **Table 5.2**) pointing to the need for the better definition of key program terms.

SECTION 5.0, MUNICIPAL ACTIVITIES

Indicator – Prioritization of Facilities: For 2004-05, 2,302 industrial facilities were prioritized, 46% of which were ranked as high priority; for 2003-04, 2,418 industrial facilities were prioritized, 49% of which were ranked as high priority; and for 2002-03, 2,380 industrial facilities were prioritized, 46% of which were ranked as high priority (**Table 5.2**).

Level 1: Implement Program

Level 3: Behavior Change

In addition, the number of designated “high priority” facilities has remained at approximately 1,100 annually (**Table 5.2**) despite the initial intention for the program to be risk-based and the significant level of BMP implementation (i.e. risk mitigation) that has occurred over the period of the Third Term Permits. It is also apparent that the application of a “high priority” designation has varied significantly between the Permittees, reflecting both different SAR and SDR Permit requirements and individual Permittee interpretations of the prioritization process.

DAMP Modification:

- Eliminate Environmental Performance Reporting (EPR) program (which is duplicative of Model Municipal Activities Program).
- Define “fixed facilities,” “field programs,” and “drainage facility sites.”

ROWD Commitment:

- Standardize SDR and SAR definitions of “high priority” and develop prioritization process that is better predicated on the threat (diminished by BMP implementation) posed by the facility, and considers the presence of “constituents of concern.”

5.3.2 Model Integrated Pest Management, Pesticide and Fertilizer Guidelines

The majority of fertilizers are applied to turfgrass with a smaller amount utilized on landscape material (trees, shrubs, groundcovers, and vines). Countywide, municipal fertilizer use has declined. However, other indicators of a shift toward more of an IPM-

SECTION 5.0, MUNICIPAL ACTIVITIES

oriented approach show little change; e.g. utilization of slow-release fertilizers, timing of fertilizer applications, and use of soil analyses.

Headline Indicator - Reduction in Total Fertilizer Usage (Nitrogen): Thirty-five Permittees (35) reported that approximately 363,146 pounds of nitrogen were applied to 6,862 acres of public land during the 2004-05 reporting period (53 lbs/acre). This figure represents a 2% decrease from the pounds per acre of nitrogen usage in 2003-04; a decrease of 27% from 2002-03; and a 12% decrease from 2001-05.

Level 3: Behavior Change

Headline Indicator - Reduction in Total Fertilizer Application (Phosphorus): Thirty-five Permittees reported that 81,600 pounds of phosphorus were applied to 6,862 acres of public land during the 2004-05 reporting period (12 lbs/acre). This figure represents a 20% decrease from the pounds per acre of phosphorus applied in 2003-04; a decrease of 33% from 2002-03; and an 8% decrease from 2001-05.

Level 3: Behavior Change

There also appears to have been an overall reduction in pesticide use. However, as with fertilizer use, other indicators (e.g. equipment calibration, clean-up of overspray, use of non-chemical pest control methods) show little change. The absence of a trend in these indicators shows that factors other than the adoption of IPM approaches (e.g. budgetary constraints) may be the more significant in explaining the overall reduction in pesticide use. Indeed, toward the end of the current Permit term, only fifty-seven percent (57%) of the Permittees are able to report that they operate under a formal written IPM policy.

Headline Indicator - Reduction in Pesticide Application: During the 2004-05 reporting period, approximately 19,227 pounds of active ingredient of pesticides was applied by Permittees. This represents an approximately 30% decrease in pounds of pesticide applied compared to 25,022 pounds of active ingredient pesticides applied in 2003-04, and 24,750 pounds of active ingredient applied in 2002-03.

Level 3: Behavior Change

ROWD Commitment:

- Develop Model Integrated Pest Management, Pesticide and Fertilizer Guidelines into a Model Program (rather than guidelines) with implementation goals and including model contract language.
 - Redefine IPM (pesticide use) indicators.
-

SECTION 5.0, MUNICIPAL ACTIVITIES

5.3.3 Established BMPs

An annual evaluation of the routine preventive maintenance activities is conducted and, where appropriate, improvements or new practices are implemented to further reduce the amount of pollutants discharged into the storm drain system. An important component of this evaluation process is the documentation and collection of data related to these selected activities.

Trash and Debris Controls (formerly Litter Control)

There are currently three aspects to trash and debris control that have been reported over the period of the Third Term Permits, specifically, the deployment of trash and debris booms, public participation in Inner-Coastal and Watershed Cleanup Day, and an enhanced program of catchbasin cleaning.

Currently, eleven (11) trash and debris booms have been installed in flood control channels and harbors to recover floatable material. However, the Permittees recognize that the stormdrain infrastructure provides for retrofit opportunities in other areas. Indeed, a number of recent technical reports prepared by the Permittees and Coastal Commission examining technologies for trash and debris control, as well as extensive independent jurisdictional experience with inlet devices, establish a basis for the development of policy recommendations in this area.

ROWD Commitment:

- Develop recommendations for the selection and installation of drain inlet screens.

Every year the California Coastal Commission and Trails-4-All sponsor the Inner-Coastal and Watershed Cleanup Day to help cleanup the trash and debris that accumulates along the coastline, fouling the beaches and tidal zone. This event has been sponsored and heavily promoted by the Orange County Stormwater Program. In 2002, 1,722 volunteers joined in and collected 29,503 pounds of trash and 5,350 pounds of recyclables. In 2003, 2,473 volunteers collected 52,474 pounds of trash and 5,447 pounds of recyclables. In 2004, 6,001 volunteers collected 78,390 pounds of trash and 9,563 pounds of recyclables. In 2005, the number of clean-up sites increased to 43. The sustained year-to-year increases in public participation and material recovery point to the effectiveness of the Permittees' efforts in promoting this event.

Catchbasins are inspected annually and cleaned as appropriate. In the 2004-05 reporting period 86% of the catchbasin inventory in Orange County was cleaned, the highest level in the first three years of the Third Term Permits.

SECTION 5.0, MUNICIPAL ACTIVITIES

Solid Waste Collection

During the last reporting period, 35 Permittees reported the collection of nearly 4.0 million tons of solid waste. This effort compares to the total of 3.62 million tons of solid waste reported by 30 Permittees in 2003-04, 3.64 million tons of solid waste reported by 26 Permittees in 2002-03, and 3.70 million tons of solid waste reported by 33 Permittees in 2001-05. While the Permittees encourage the public, through education and outreach, to properly dispose of their trash, and this encouragement may be contributing to the increased level of collection in the most recent reporting period, there are significant discrepancies in the year-to-year reporting of individual jurisdictions.

Headline Indicator - Solid Waste Collection: 3,959,590 tons of solid waste was collected during the 2004-05 reporting period. This effort appears to represent a 9.1% increase in the amount of solid waste collected over the previous reporting period, an 8.8% increase over the reported total in 2002-03, and a 7.0% increase over the reported total in 2001-05.

In addition to education, the Permittees have considered the extent to which the cradle-to-grave management of solid waste can be improved to increase the effectiveness of collection efforts. This consideration has identified municipal oversight of contract solid waste collection and disposal as another area for possible improvements in service effectiveness.

ROWD Commitment:

- Develop model language for municipal trash collection and haulage contracts that addresses water quality protection issues.

Drainage Facility Maintenance

Drainage facilities are an integral component of the Model Municipal Activities Program and, as high priority facilities, subject to annual inspection. While the reported total length of drainage facilities has increased over successive years, the amount of material recovered has decreased. This reduction may reflect the increasing effectiveness of source controls and the impact of changing management practices such as street sweeping on concrete channels. However, both inconsistent year-to-year reporting and the profound influence of environmental variables (e.g. prevalence of Santa Ana wind conditions and severity of the wet season) may also be explanatory factors.

SECTION 5.0, MUNICIPAL ACTIVITIES

Headline Indicator - Drainage Facility Maintenance: 5,612 tons of debris was removed from drainage facilities during the 2004-05 reporting period. This amount represents a 43% decrease in the amount of debris collected from drainage facilities when compared to the previous reporting period, a 77% decrease in the amount collected in 2002-03 and a 6.5% decrease in the amount collected in 2001-02.

Street Sweeping

The year-to-year increases in the amount of material recovered from the urban environment by street sweeping suggest success regarding the Permittees' efforts to continue to improve the effectiveness (e.g. increasing use of drain inlet screens, regenerative air sweepers, parking controls etc.) of this maintenance practice.

Headline Indicator - Street Sweeping: 85,516 tons of material was removed from the streets and gutters during the 2004-05 reporting period. This effort appears to represent a 12% increase for weight of material collected over the previous reporting period and a 25% increase over the tons of material reported in 2002-03. This amount represents an 87% increase in the weight of material collected over the 2001-02 total, indicating increasing effectiveness in this area of infrastructure maintenance in the Third Term Permit cycle.

* The number of gallons of used oil collected dropped in 2003-04 and then dramatically increased for 2004-05 due to CIWMB regulations in 2003-04 when the CIWMB stated that only the used oil turned in by do-it-yourselfers could be counted. However, for the 2004-05 reporting year, the CIWMB reversed their decision and allowed all used oil to be counted, including oil from HHCs and certified collectors (Jiffy Lube, etc.).

6.0 PUBLIC EDUCATION

6.1 Introduction

In 2002, the Permittees created a public and business outreach strategy - "Orange County Stormwater Public Education Program Recommendations." This strategy, which was updated in 2004, established a long-term, cost-effective approach to educate the public and targeted business groups about the effects of stormwater pollution and encourages their participation in the protection of surface waters. Key aspects of the strategy included conducting a survey to define the level of general knowledge held by people in Orange County, utilizing the survey results to develop campaign goals, determining the key messages, defining specific community outreach activities and approaches, preparing a master timeline, and creating a "brand" name for the Orange County Stormwater Program ("Project Pollution Prevention").

6.2 Accomplishments

The primary elements of the Third Term Permits public education program were a series of "Plans" that guided the program implementation, specifically:

- A "Materials Plan" that prioritized the educational materials necessary for revision/development and defined the common look and theme;
- A "Media Plan" that identified advertisement purchases in major publications, on Orange County Transit Authority buses and shelters, in movie theaters, on radio, and on cable television;
- A "Non-media Plan" which included the develop of a tool box for local outreach and building relationships with businesses, trade associations, chambers of commerce, utilities, and organizations that provided key opportunities for outreach;
- A "School Education Plan" to reach K-12 students in Orange County with pollution prevention messages; and
- An outreach plan for the approximate 10,000 food service facilities in Orange County.

Additional elements of the program include:

- An initial and follow-up public opinion/education survey (completed in 2003 and late 2005 respectively);
- Assistance with governmental and regulatory agency relations;
- Translation of all materials into Spanish and the creation of a Spanish webpage;
- Translation of key materials into Vietnamese;
- A "tool box" of materials for Permittee program coordinators to conduct local outreach efforts, based upon a quarterly "Quad Approach" including press releases, newsletter articles, fact sheets and billing inserts; and
- An employee-training program ("Stormwater 101") to educate all municipal employees about general stormwater principals.

SECTION 6.0, PUBLIC EDUCATION

6.2.1 Countywide Public and Business Education Materials Plan

A Materials Plan was developed that prioritizes the outreach materials necessary for revision/development and defined a common look and theme. Pursuant to this plan, the following materials were produced:

- Forty-three brochures; 22 in English, 18 in Spanish and four in Vietnamese.
- Sixteen print advertisements; eight in English, seven in Spanish and one in Vietnamese.
- Ten radio public service announcements; five in English and five in Spanish.
- Four movie/cable PSAs; three in English and one in Spanish.
- Three bus advertisements.
- Six quad outreach kits including a newsletter, press release, billing insert and fact sheet.
- Outreach kit for food service establishments including a BMP poster, four stickers, a PowerPoint presentation, fact sheet and CD-ROM.
- Stormwater 101 training kit including a pre/post training evaluation, fact sheet, PowerPoint presentation and 7-½ minute video.
- A municipal vehicle magnet.
- A door hanger notice for residential pollution problem correction.

6.2.2 Media Outreach Plan

A strategic media relations campaign was developed and implemented that included advertisements in major publications, on Orange County Transit Authority buses and shelters, in movie theaters, on radio, on cable television and online. The Permittees collectively purchased the following media during 2002-06:

Newspaper advertisements generated 46.5 million impressions

- Seven full-color ads in the Sunday *Orange County Register*
- Three full-color ads in the Sunday *Los Angeles Times* (Orange County Edition)
- Twenty-two full-page ads in 17 of the *Register's* community papers
- Fourteen full-page ads in four of the *Register's* community papers
- Eleven ¾-page ads in the *Los Angeles Times'* three Orange County community papers: the *Daily Pilot*, *Huntington Beach Independent* and *Laguna Beach Coastline Pilot*
- Nine full-page ads in the *News-Enterprise*
- Fourteen full-page ads in *OC Metro*
- Eleven full-page ads in *OC Weekly*
- Seventeen full-page ads in *Miniondas* (Spanish language)
- Fifteen full-page ads in *Excelsior* (Spanish language)

Radio advertising generated 27.6 million impressions

- Twenty 60-second spots on KLAC AM 570. The spots generated more than 120,000 impressions.
- One hundred and twenty- 60-second spots ran on JACK FM 93.1 generating 25 million impressions.

SECTION 6.0, PUBLIC EDUCATION

- One hundred and sixty 60-second spots ran on Sonido (Spanish language radio station) generating 2.5 million impressions.

OCTA bus advertising generated 71.5 million impressions

- Fifty-seven bus sides
- Fifty bus backs
- Fifty outdoor bus shelters

Movie theater advertising generated 11 million impressions

- The 30-second public service announcement ran on screen and in lobby kiosks for twenty weeks at 22 Edwards/Regal Cinemas, San Clemente's Krikorian Theater, twelve weeks at the Long Beach Town Center Theater and twelve weeks at AMC theaters.
- The sad fish poster was displayed at all 24 Orange County theaters.

Cable television advertising generated 1.4 million impressions on four cable stations (Adelphia, AT&T/Comcast, Time Warner and Cox Communications)

On-line banner advertising generated 2.35 million impressions

- Banner display on www.931jackfm.com for three months.
- Banner display on www.ocregister.com for two months.

Headline Indicator - Number of Media Impressions: The public education program generated over 160,000,000 media impressions over the period 2002-06.

ROWD Commitment

- Continue to "fine tune" the multi-media approach.
- Re-evaluate audiences & key messages for targeted behaviors.
- Pursue opportunities for regional collaboration.

6.2.3 Non-Media Outreach Plan

A Non-Media Outreach Plan was developed and implemented to complement the paid advertising media campaign. The plan utilized existing resources and partnerships to produce free or low-cost exposure for the program.

Outreach to Permittees

SECTION 6.0, PUBLIC EDUCATION

The plan included the development of a “tool box” of materials to enable the Permittees to conduct local outreach both directly and indirectly through businesses, trade associations, chambers of commerce, utilities, restaurants and other organizations.

Specifically, the “tool box” included:

- Outreach Materials - Artwork was created for use on outdoor locations such as bus shelters, streetlight banners, mouse pads and beach towels.
- The Quad - A series of newsletters, press releases, fact sheets and billing inserts were created that focused on seasonal stormwater themes. Six seasonal quads were created.
 - Spring Into Cleaning – Household Hazardous Waste
 - What’s Summer Without The Beach
 - When It Rains It Pours Pollutants Into Our Storm drains
 - A Pollution Fix for 2006
 - Green Thumb Blue Ocean
 - Keeping Your Car and the Environment Sparkling Clean
- An Events Listing - Lists of upcoming utility, restaurant, city and organization sponsored events were developed where stormwater information could be provided to event participants.
- Employee Training Materials - Stormwater training materials were developed to educate all municipal employees about general stormwater pollution prevention principles.

Outreach to Businesses

The plan’s proposed implementation of programs is based on relationships and partnerships that had been developed with groups who may have been receptive to partnering with the program..

- A list of key Orange County businesses that the Stormwater Program could potentially foster relationships with was developed. The list included top businesses and major Orange County employers. These businesses were contacted and the following is a list of the business partnerships developed:
- Point of Purchase - Partnerships with stores that sell auto supplies, hardware, pet supplies and gardening supplies were developed. The program has fostered relationships with:
 - PetsMart Inc.
 - Home Depot, Inc.,
 - Orchard Supply Hardware (OSH)
 - Wal-Mart,

SECTION 6.0, PUBLIC EDUCATION

- The Pet Pantry
 - Huntington Garden Center
 - Flowerdale
 - De Nault's Hardware
- A list of major Orange County events such as the Orange County Auto Show and Southern California Home & Garden Show was created. Event coordinators were contacted with a letter introducing the program and asking for the opportunity to participate and/or distribute Orange County Stormwater Program materials.

Outreach to Utilities

Major non-city utilities providing water, electricity, cable and refuse services were contacted and provided sample newsletters for use in their publications. Several utilities printed stormwater education materials in their newsletters and billing inserts and posted information on their websites including:

- Rainbow Disposal
- Waste Management
- Southern California Edison
- Sempra Energy/The Gas Company
- Orange County Water District
- Orange County Fire Authority

The four major refuse companies in Orange County agreed to place a 12" x 24" Stormwater magnet on their trucks. More than 500 refuse trucks displayed the magnet during the 2002-06 reporting period.

Outreach to Organizations

A list of key Orange County organizations that the Stormwater Program could foster relationships with was developed. The list included organizations such as chambers of commerce, rotary clubs, and environmental groups.

- Chambers of Commerce - Several chambers provided Stormwater information to their members including the Brea Chamber of Commerce, Fountain Valley Chamber of Commerce, the Black Chamber of Commerce and the South Orange County Chambers of Commerce.
- Welcome Express - Welcome Express provides welcome packets to new homeowners in various communities throughout Orange County. Welcome Express provides the Household Tips brochure within their new homeowner's packet.

Media Relations Campaign

SECTION 6.0, PUBLIC EDUCATION

The media relations campaign centered on fostering relationships with reporters. Local newspapers are considered one of the most credible sources of information for Orange County residents and reach a large audience. Therefore, media relations were an invaluable component of the public education campaign.

The media relations campaign utilized the seasonal stormwater press releases created as part of "the Quad" to contact the media on a quarterly basis. The program also updated its media distribution lists quarterly.

Indicator - Number of Non-Media Impressions: The public education program generated 25 million non-media impressions during 2002-06.

Outreach to Restaurants

A specific outreach plan for the approximate 10,000 food service facilities in Orange County was developed and implemented. The outreach plan included the following efforts:

- The inspection and distribution of educational materials to the approximately 10,000 existing food facilities (the inventory is updated annually) countywide. Over 36,000 inspections for NPDES stormwater related issues were conducted.
- A focused public education outreach component was developed and implemented. This effort included:
 - A mass mailing to all corporate and food service facilities within Orange County. Over 9,000 letters were mailed.
 - Distribution of focused educational brochures, posters, stickers and CD-ROMs were distributed during inspections.
 - Presentation was given to the Food Sanitation Advisory Council.

Indicator - Number of Food Facility Outreach Impressions: The public education program generated over 45,000 food facility outreach impressions during the 2002-06.

ROWD Commitment

- Continue to foster new relationships and partnerships.

6.2.4 School Education Outreach Program

During the 2002-03, reporting period extensive meetings took place with representatives from

SECTION 6.0, PUBLIC EDUCATION

various educational programs and agencies throughout Orange County. A school education outreach plan was developed and implemented that included the following partnerships:

Orange County Department of Education (OCDE)

Inside the Outdoors is an environmental education program administered by the OCDE. There are three types of programs within *Inside the Outdoors* which are the:

- Outdoor Science School - This program includes information on sources of water for southern California, pollution prevention, and watershed information. 14,000 students participated in this program.
- School Program - A traveling scientist visits school sites providing the "Drip Drop" program - a 60-minute presentation about water quality. 3,000 students participated in this program.
- Field Program - Fifth grade students move into the real world of science and social science. During the "Where Do I Flow" program students learn about water pollution and prevention. 12,803 students participated in this program.

Approximately 30,000 students participated in the *Inside the Outdoors* Science Programs.

Municipal Water District of Orange County (MWDOC)/Discovery Science Center (DSC)

The partnership with MWDOC/DSC is focused on the Elementary Water Science Education Program, a water education course for teachers, and a public program for general visitors.

- Elementary Water Science Education Program – This program presents grade-specific science lessons, which incorporate water sources, water conservation, and water/trash pollution themes complementary to the science content standards.

5th Grade Student Assemblies: This element of the program presents lessons to elementary school students in an assembly format. 17,200 fifth grade students and 500 fifth grade teachers participated in this program.

5th Grade Students Attending the DSC Field Trip Program - For 5th grade students attending the DSC, field trip instructors screen the Project Pollution Prevention video entitled "Go With the Flow" and distribute the Project Pollution Prevention water education-based booklet. 25,827 fifth grade students and 2,000 fifth grade teachers participated in this program.

- Water Education Course for Middle and High School Teachers - The Water Education Course provides fifth through twelfth grade teachers Professional Development classes complete with curriculum and a kit of scientific equipment to conduct water-focused and pollution awareness activities in their classrooms. The Water Education Course was provided to 24 teachers reaching approximately 792

SECTION 6.0, PUBLIC EDUCATION

students.

- Public Program for General Visitors to the DSC - A demonstration and learning station for the general public visitors and students on field trips to the DSC was developed to further communicate the importance of water, water conservation, urban pollutants, and stormwater/urban runoff pollution. An estimated 76,000 visitors saw the station annually.

Project WET (Water Education for Teachers)

The Project WET (<http://www.projectwet.org/index.html>) is a water science and education program for teachers that provide classroom ready teaching aids including the Project WET Curriculum and Activity Guide. The guide is a collection of hands-on, innovative, interdisciplinary activities. Project WET developed curriculum specifically for the stormwater program.

Nearly two hundred teachers have participated in Stormwater Program sponsored workshops reaching 7,000 students per year.

California Regional Environmental Educational Community (CREEC) Network

The California Regional Environmental Education Community (CREEC) Network is an educational project whose mission is "to develop a communication network which provides educators with access to "high quality" environmental education resources to enhance the environmental literacy of California Students." It is an educational project supported by the California Department of Education, Environmental Education Program, in collaboration with state, regional and local partners. The CREEC Network provides information on all Orange County environmental school education outreach programs. To further publicize this information, links between the Permittees' website and CREEC were established.

<p>Indicator - Number of School Outreach Impressions: The public education program generated 188,846 school outreach impressions during the 2002-06.</p>

SECTION 6.0, PUBLIC EDUCATION

6.2.5 Other Countywide Initiatives

The Principal Permittee conducted a number of countywide public education initiatives on behalf of the Permittees. These initiatives included:

- Provision of brochures, magnets, bookmarks, manual, and posters to the Permittees, general public, businesses, schools, and other agencies. During 2002-06 over 450,000 educational materials were distributed.
- Management of the countywide 24-hr bilingual water pollution reporting hotline number, (714) 567-6363. During the 2002-06 the hotline received 927 water pollution calls. Water pollution complaints are also received through the County website.
- Advertisement of the 24-hour water pollution hotline number and web address, www.ocwatersheds.com, in all SBC Regional Phone Directories.
- Management of the County website, www.ocwatersheds.com. During 2002-06 the website received over 10,000,000 hits.

Indicator - Number of Other Countywide Initiative Impressions: The public education program generated 10,450,927 other impressions during the 2002-06.

Headline Indicator - Public Education Program Impressions: The public education program created over 195,684,773 impressions during the 2002-06 permit cycle. One of the goals of the public education program is to target 100% of the residents of Orange County. Orange County has a population of approximately 3 million people. Therefore, it can be deduced that every resident of Orange County received thousands of impressions during the reporting period. This achievement also far exceeds a Third Term Permit requirement to deliver a minimum of 10 million impressions per year within the Santa Ana Regional Board Area.

6.3 **Assessment**

In an effort to better understand the public's awareness regarding water quality issues, several surveys have been conducted. The surveys have incorporated a number of questions relating to pesticide, herbicide and fertilizer use, the sewer and storm drain system and the public's overall awareness of the County's public outreach campaign. Surveys conducted since the inception of the Orange County Stormwater Program include:

- 1994 Stormwater Pollution Prevention and Flood Awareness Survey
- 2000 County of Orange Fair Survey

SECTION 6.0, PUBLIC EDUCATION

- 2000 Orange County Sanitation District Fair Survey
- LA Times In Education Survey
- 2001 Public Awareness Survey
- 2003 Public Awareness Survey
- 2005 Public Awareness Survey

6.3.1 Public Awareness Surveys

In May 2003, the Permittees conducted a large sample (1,500 respondents) public awareness survey to measure the current level of knowledge held by residents of Orange County. In November 2005, after 30 months of the public education campaign, a follow-up to the baseline survey was conducted. The purpose of the second survey was to assess the extent to which public opinion and knowledge about urban runoff issues have changed and whether Orange County residents have made any behavioral changes as a result of the public education campaign.

The findings indicate that the public information campaign on stormwater and urban runoff has made initial inroads towards increasing awareness. In the majority of questions, awareness of the program and or its elements increased one to three percentage points.

Effectiveness of Educating on the Environmental Issue

Consistent with findings from 2003, education, traffic congestion, safety and employment continue to rank higher than pollution as top issues of concern with Orange County residents. In the last 30 months, residents concern regarding pollution of the ocean, rivers, creeks and bays increased 1%. When asked specifically about ocean, bay and harbor pollution, concern remained consistent with the baseline data with 85% to 87% concerned. However, the intensity of concern regarding pollution of creeks and rivers increased 6% (from 39% very concerned in 2003 to 45% in 2005).

During the 30-month stormwater outreach campaign, information never focused on the actual quality of Orange County water or the severity of the issues. Most elements of the program focused on particular activities that would “protect our creeks, rivers, bays and ocean.” The result of the survey is consistent with the amount of prominence placed on this subject. If a greater emphasis was placed on this subject in the campaign, the numbers could have been higher.

Effectiveness of Educating on the Storm Drain System

Knowledge about urban runoff and storm drains has increased. In fact, 90% of residents know that water flowing in the street enters a storm drain and goes directly to a waterway. This is up six percentage points from 2003. However, there still is a lack of understanding regarding the storm drain system. When asked if water in the storm drains is tested and filtered, 4% more answered the question correctly in 2005, however, it was still less than half (46%) of the respondents. Similarly, when asked if sewer water and storm drain water

SECTION 6.0, PUBLIC EDUCATION

enter the same system, 3% more answered the question correctly, however, it was still less than half (44%) of the respondents.

During the education campaign, nearly all materials created mentioned that objects in the street flow through storm drains directly to the nearest waterway. However, only the brochures, fact sheets and newsletter articles went into depth regarding the difference between the sewer and storm drain system. The use of this information in all the materials shows in the increased level of awareness. Had the differences between the sewer system and storm drain system been illustrated in every piece, these numbers may have been higher.

Also, men tend to be very knowledgeable regarding the storm drain system while women were less knowledgeable according to the 2005 survey; therefore, materials targeted at women may be considered.

Effectiveness of Educating on Key Pollutants

The survey asked respondents if the following items contributed to polluting urban runoff: oil, toxic waste, Styrofoam cups, gardening products, cigarette butts, paint, dirty water/detergent, cleaning products, trash, pet waste, water from hoses, lawn clippings/dirt/leaves and pool water. In every case, respondents were very likely to say these items contributed to polluted runoff with nine of them increasing beyond the margin of error (oil, Styrofoam cups, cigarette butts, paint, cleaning products, trash, pet waste, lawn clippings/dirt/leaves and pool water).

The increased knowledge held regarding these 13 pollutants shows a strong upward trend and indicates that education materials are reaching the residents. For all but two pollutants (toxic waste and Styrofoam cups) a brochure has been created to educate the public. Also, seven of the pollutants (oil, gardening products, cigarette butts, dirty water/detergent, pet waste, hose water and lawn clippings/dirt/leaves) were covered in the print advertising campaign. The fact that public knowledge has increased regarding all 13 pollutants demonstrates that the education campaign is effective.

Effectiveness of Educating on Key Behaviors

Consistent with the first survey, roughly two thirds say that changing their personal behaviors would make a difference in cleaning up pollution (65%). This represents an increase of 2%. The survey revealed the following: 97% of people were either willing or did dispose of chemicals properly, 89% were willing to or did use fertilizers properly, 92% were either willing to or did keep yard clippings out of the street, 90% were willing to or currently adjust sprinklers to avoid overwatering; 79% were willing to or did pick up after their pet, 90% were willing to or currently use a broom to clean driveways, and 73% were willing to or eliminated washing cars at home.

When comparing seven actions that residents were already participating in, they were 4% more likely to dispose of chemicals properly and 3% more likely to pick up after a pet in 2005. However, less respondents were keeping yard clippings out of the street (-5%),

adjusting sprinklers (-1%), using a broom instead of a hose (-5%), properly using fertilizer (-1%) and eliminating car washing (-9%). Although participation in some of the seven actions decreased, roughly half of Orange County residents report taking part in all seven of the activities – making a significant increase over the 30 months (+37%) of the campaign (**Figure 6.1**).

During the course of the education campaign, the materials focused on what can be done to prevent urban runoff. All seven activities mentioned in the survey were addressed in brochures, newsletter articles, fact sheets, press releases and billing inserts.

The survey results indicate that the education campaign has penetrated the residents of Orange County and caused significant awareness of the activities that can reduce urban runoff. In all cases (except home car washing) at least eight in ten residents were either participating, or willing to participate in, activities that limit runoff. Despite a successful start to the campaign, residents appear to be obstinate when it comes to one behavior – eliminating home car washing.

Effectiveness of the School Outreach Program

A significant portion of parents of children under 19, roughly 25%, report that their children learned about urban runoff issues in school and came home and talked about it. It is safe to assume that the number of students who received the information, but did not share it with their parents is even higher.

Based on the significant number of students who have reported to a parent about having heard urban runoff prevention messages, it appears that the school outreach program has been effective.

Effectiveness of the Media Outreach Program

According to the 2005 survey, the most effective (most recognized by residents) form of advertising are the “No dumping, drains to ocean” stencils (81%) and newspaper articles (65%). Although part of the overall stormwater program, stencils were not an integral element of the education campaign. Their success can be attributed to a couple of factors. First, the stencils are on a large percentage of storm drains throughout the County. Nearly every resident has a stencil in his or her neighborhood. Also, the stencil program has been active in Orange County for many years. While other education programs were introduced in the last 30 months, residents have seen the stencils for more than a decade. The other very effective program has been newspaper articles. Similar to the stencils, articles on water pollution have been available to the public for decades and have had time to resonate.

Other effective aspects of the program (recognized by residents) were the PSAs on radio (39%), PSAs on cable (38%), newspaper advertising (35%), brochures (28%) and community events (20%). All five of these programs were initiated 30 months ago through the outreach campaign and have significantly resonated with residents. While most of these campaign elements were specific to Orange County, a few had the additional assistance from other regional campaigns such as “Don’t Trash California” and the “Used

Oil" program.

Less effective aspects of the program (least recognized by residents) were movie theater advertising (14%), workplace information (14%), bus advertising (13%) door hangers (12%), and Spanish radio PSAs (6%). While Spanish radio was the least recognized program by all respondents to the survey, among Spanish speaking respondents it was substantially higher (18%). All of these specific campaign elements were created and implemented during the 30-month outreach campaign (**Figure 6.2**).

When determining whether an element should be eliminated from the campaign, it is important to evaluate the number of sources people received information from. According to the 2005 survey, 29% of people received stormwater information from one or two sources. If the majority of these people received information from a source that is eliminated, the campaign would be less effective. However, in this circumstance, only 2% of people who received information from one or two sources received information from theater ads or bus backs. In regarding to theater advertising, it is possible that residents confused cable PSAs with theater advertising because both played the same spot. Since cable advertising was highly recognized by residents, the campaign could have been less effective if it were removed. In the case of bus back advertising, the program would still have been effective without this element.

Another aspect of the program that was evaluated was the print advertising. While, 35% of people recalled seeing print advertising, it is important to note what papers residents are reading. While the largest percentage of advertising was in the Orange County Register, the program did advertise in the Los Angeles Times a half dozen times a year. According to the survey, the percentage of people who get most of their information on urban run-off from the Times dropped from 12% to 9% (Orange County Register is 28%). Also, only 5% of people who received information from one or two sources received the information from print advertising. Therefore, advertising in the Times could likely have been less frequent without affecting the effectiveness of the campaign (**Figure 6.3 Effectiveness of Print Advertising**).

According to the 2005 survey, the percentage of voters saying there is enough information has increased (+1% and +5% from a split question). However, residents continue to believe that there is not enough information provided about how to stop urban runoff and ocean pollution in Orange County. So while some of the elements of the campaign could have been eliminated, the survey demonstrated that people need to receive information from a variety of sources. The Internet appears to be an emerging source of information, increasing 6% to 10% (third highest source of information).

6.4 Summary

Since the inception of the Orange County Stormwater Program outreach campaign, information on stormwater and urban runoff has made initial inroads in increasing awareness. This increase is seen in nearly every element of the program and demonstrates a great beginning to a program that was implemented in a short period of time.

SECTION 6.0, PUBLIC EDUCATION

Although all of the elements of the program contributed to the success of the campaign, the program could have considered eliminating bus back advertising. Print ads in the Los Angeles Times could have been reduced and ads in the full-run Orange County Register could have been increased. Another element that could have been added is online marketing. Overall the program demonstrated an effective start to the education campaign.

Figure 6.1: Resident Participation in Pollution Prevention Activities

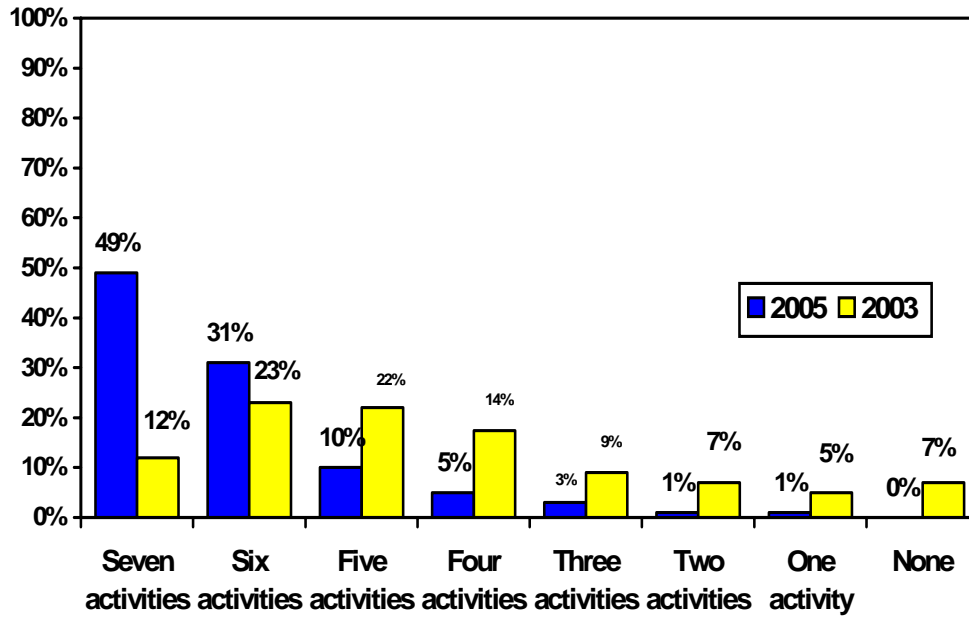

Figure 6.2: Effectiveness of Media Outreach Program

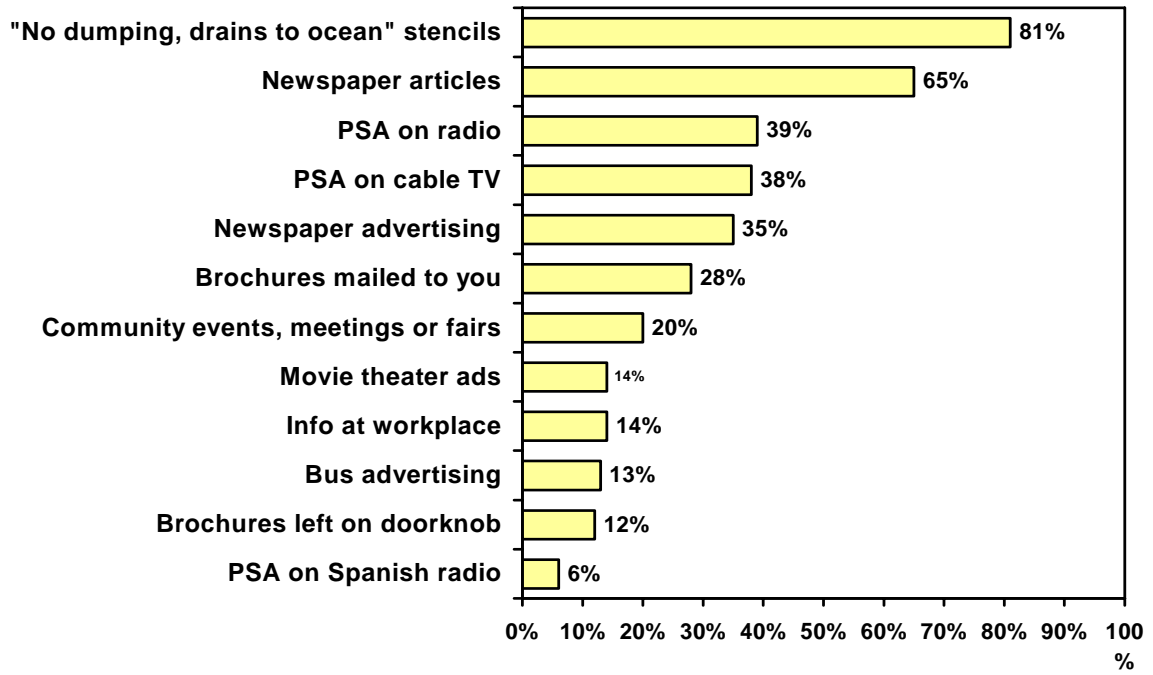

Figure 6.3: Effectiveness of Print Advertising

7.0 NEW DEVELOPMENT/SIGNIFICANT REDEVELOPMENT

7.1 Introduction

One of the most important responsibilities of local government is to provide a decision making and approval processing framework for new development and re-development. This framework ensures that (1) development occurs in an orderly and organized fashion in a manner that reflects the vision and needs of the community, (2) environmental issues associated with development are assessed, and (3) provides a regulatory framework to ensure that standards set by the jurisdiction are implemented.

Since the inception of the Program, it has been recognized that the incorporation of BMPs into a development project in its planning stages offers a unique opportunity to limit increases in pollutant loads. **DAMP Section 7.0** links new development BMP design, construction and operation to the earlier phases of new development project planning, encompassed by the jurisdictional General Plans environmental review and development permit approval processes.

7.2 Accomplishments

7.2.1 New Development/Significant Redevelopment Program

In 1993, the New Development/Construction Task Force, comprised of representatives from the Principal Permittee, Building Industry Association (BIA), Association of General Contractors (AGC) and Civil Engineers & Land Surveyors of California (CELSOC), completed a report - *Best Management Practices For New Development Including Nonresidential Construction Projects (1-5 acres)* - that provided the basis for requiring the incorporation of structural and non-structural BMPs into development. This report was the basis of the New Development component of the DAMP during the First and Second Term Permits.

The requirements of the Third Term permits significantly increased the complexity of the new development provisions of the DAMP. These provisions provide a framework and a process for integrating watershed protection/stormwater quality management principles into the Permittees' General Plans, environmental review processes, and development permit approval processes. The new development provisions also cover initial project planning and project design, construction and completion, including requirements for the selection, design and long-term maintenance of permanent BMPs. Specifically, the new development provisions require the Permittees to:

- Assess the need to revise and update General Plans to include watershed and stormwater quality and quantity management considerations.
- Review CEQA processes for potential stormwater quality impacts and mitigation.
- Review development planning/permit approval process for stormwater protection principles.

- Develop and implement a model Water Quality Management Plan (WQMP) (also referred to as a Standard Urban Stormwater Mitigation Plan – SUSMP) to address impact from new development and significant redevelopment.

For the area of Orange County within the San Diego Regional Water Quality Control Board jurisdiction of Orange County (area south of El Toro Rd.), each municipality was required by the Permit to develop a Local WQMP, based on the model WQMP, to oversee new development and significant redevelopment within their local jurisdiction. These Local WQMPs were finalized for implementation on August 13, 2003.

For the area of Orange County within the Santa Ana Regional Water Quality Control Board jurisdiction of Orange County (area north of El Toro Rd.), the Model WQMP explains the requirements placed upon all new development and significant redevelopment projects. The Model WQMP underwent a lengthy public review process and was approved for implementation by the Executive Officer of the Santa Ana Regional Water Quality Control Board on September 30, 2003.

During the 2004-05 reporting period, 551 Project WQMPs were processed for 3,227 acres of development. Since 1997, a total of 3,193 Project WQMPs have been approved, covering 27,287 acres which represents approximately 6% of the area within Orange County subject to the Third Term Permits.

- Conduct education or training.

Five training modules have been developed and have been given:

1. General Plan Issues;
2. New Development/Significant Program Management;
3. Project Planning and Design: Environmental Review, Planning and Permitting and WQMP Development;
4. Stormwater BMP Effectiveness and Applicability for Orange County, and
5. Stormwater Treatment: How it Works (Or Does It?).

7.2.2 California Sustainable Watershed/Wetland Information Manager (CalSWIM)

CalSWIM (<http://calswim.org/>) is an Orange County Storm Water Program and University of California, Irvine (Departments of Engineering and Informatics) initiative to develop a web-based expert system and prototype database designed to support cost-effective and scientifically justifiable decisions regarding the monitoring, management, and alteration of coastal urban wetlands and their associated watersheds. Initiated in 2004, CalSWIM currently delivers:

- Forecasting and now-casting of nutrient levels, sediment supply, indicator bacteria, and pathogens in the Newport Bay Watershed, and

- Targeted evaluation of management decisions that affect the habitat quality and ecological function of coastal wetlands, and/or that directly bear on pollutants of concern.

7.2.3 Hydromodification

Hydromodification arises from changes in the volume, magnitude and duration of flows that can occur coincident with urbanization and is evident in the landscape as channel incision and bank erosion in the upper and middle portions of a watershed and as aggradation and increased channel meandering in the downstream areas of the watershed. In 2005, the Permittees supported, through the Stormwater Monitoring Coalition (SMC) and California Stormwater Quality Association (CASQA), a workshop that was convened to provide an overview of the key technical and managerial issues associated with hydromodification in S. California (see Stein and Zaleski, 2005¹).

7.3 **Assessment**

The current and potential program effectiveness assessment outcome levels for the New Development / Significant Redevelopment Program are presented in **Table 7.1**.

7.3.1 New Development/Significant Redevelopment Program

CEQA review processes were reviewed for adequacy early in the period of the Third Term Permits. However, in preparing the ROWD, a number of Permittees commented that the overall planning approval process for projects needs to more effectively ensure that water quality protection is considered in the earliest phases of project consideration through further elaboration of the preliminary or conceptual WQMP concept in the DAMP.

ROWD Commitment:

- Prepare guidance documentation and clarify requirements for the preliminary or conceptual Project WQMP.

The Model WQMP identifies BMPs for new development and significant redevelopment projects that are subject to WQMP requirements pursuant to **DAMP Section 7**. Depending upon the project size and characteristics, these BMPs include Site Design BMPs, applicable Source Control BMPs and Project-based Treatment Control BMPs (and/or participation in an approved regional or watershed management program).

¹ Managing Runoff to Protect Natural streams: The Latest Developments on Investigation and Management of Hydromodification in California; Stein and Zaleski, SCCWRP Technical Report 475, December 2000.

The requirement for new developments/significant redevelopment projects to prepare a WQMP has been an established part of the planning approval process (See **Table 7.2**) since the **1993 DAMP** and all Permittees certified they were implementing this part of the Program in 1997. While there is considerable variation in the level of activity between the Permittees, this variability can be attributed to the availability of land for development/redevelopment within a particular jurisdiction. Indeed, the County of Orange and the cities of Irvine and Anaheim, with large swathes of undeveloped land, show the highest numbers of WQMPs processed.

Headline Indicator - Number of WQMPs processed and the area (acreage) to which BMPs have been applied: During the 2004-05 reporting period, 551 WQMPs were processed for 3,227 acres of development compared to 461 WQMPs processed for 1,595 acres of development in 2003-04, and 391 WQMPs processed for 2,836 acres of development in 2002-03 (**Table 7.2; Figure 7.1**).

Level 1: Implement Program

Headline Indicator - Number of BMPs Implemented: A total of 5,061 BMPs were implemented in the 2004-05 reporting period. This total represents a 129% increase in the total number of BMPs implemented in 2003-04 (2,201) and a 112% increase from the total number of BMPs implemented in 2002-03 (2,389) (**Figure 7.2**).

Level 3: Behavior Change

During the Third Term Permit term, the structural source controls used most often were: common area efficient irrigation systems and landscape design, filtration, storm drain stenciling, and trash storage area. The non-structural source controls used most often include: employee training, common area litter control, common area landscape management, street sweeping, education, BMP maintenance, and activity restrictions. The most common treatment control BMPs that have been implemented include catch basin screens, catch basin filters, and stormwater treatment units (hydro-dynamic separators).

In preparing the ROWD, a number of Permittees have commented that (1) the guidance for selecting BMPs needs to be updated and enhanced, particularly with regard to treatment control BMPs, (2) there is a possible inconsistency in provisions regarding site prioritization, and (3) adjacent municipal stormwater programs have more effective provisions regarding the consideration of Site Design BMPs.

DAMP Modification:

- Revise *Model WQMP Table 7.II.6* for latest information on BMPs and clarity.
- Evaluate and revise (as necessary) prioritization provisions for Countywide consistency.

ROWD Commitment:

- Develop recommendations (through cooperative Stormwater Monitoring Coalition project) for incorporation of LID techniques into resource and water quality protection requirements.
- Develop library of BMP performance reports.
- Develop standard design checklist/plans/details for selected Source Control and Treatment Control BMPs.
- Develop recommendations for enhanced Model WQMP language regarding Site Design BMPs.
- Develop and implement BMPs for architectural uses of copper and zinc.

In 2005 the Santa Ana Regional Board formally approved the Irvine Ranch Water District's Natural Treatment System as a regional treatment control BMP for a portion of the Newport Bay Watershed. The project is significant for it being the first expression in the area under the jurisdiction of the Santa Ana RWQCB of a regional approach to stormwater treatment.

ROWD Commitment:

- Evaluate the NTS approval process and develop recommendations for streamlining regulatory agency approval of regional Treatment Control BMPs.

The New Development/Significant Redevelopment component of the Program ends with permit close-out and the BMPs transition to the Existing Development component. The Permittees believe that the BMP approach to stormwater management is most effectively sustained by ensuring the longevity of the WQMP through successive ownerships. Additionally, the Permittees requested additional guidance on recording WQMPs in a manner that would enable them to enforce the approved WQMP against subsequent property owners and ensure ongoing

responsibility for BMP maintenance.

ROWD Commitment:

Prepare guidance and training as needed on the recordation process (timing and appropriate documents to use) and develop recommendations for appropriate methods to employ to enable the Permittees to enforce the approved WQMP against subsequent property owners.

Training: Both the Permittees and RWQCB staff has identified a need for updated and additional training regarding WQMP review and approval.

ROWD Commitment:

- Prepare a training schedule and curriculum including defined expertise and competencies for staff with WQMP review and approval responsibilities.
- Prepare a workshop schedule and curriculum for the private sector on WQMP preparation.

7.3.2 California Sustainable Watershed/Wetland Information Manager (CalSWIM)

This initial development and deployment of CalSWIM has focused on Newport Bay, the regionally important tidal saltwater marsh. However, CalSWIM will in the future be extended with an open and scalable architecture to facilitate its rapid redeployment at other coastal urban wetland sites in southern California and elsewhere.

7.3.3 Hydromodification

While the major development projects in Orange County have now been entitled, the Permittees recognize that hydromodification is an emerging issue of concern as the future regulation and management of runoff from urban areas is increasingly considered with respect to the overarching objective of the CWA i.e. maintenance of the chemical, physical and biological integrity of the nation's waters.

DAMP Modification:

- Revise *Model WQMP Section 7.II -3.2.4 Identify Hydrologic Conditions of Concern* to incorporate additional information from hydromodification study.

7.4 Summary

The Third Term Permits have required the Permittees to develop and implement a significantly revised SUSMP- equivalent program for new development/significant redevelopment. This effort was completed Countywide by the end of 2003 and has resulted in an enhanced a WQMP program that, since 1997, has resulted in a total of 3,193 approved Project WQMPs. While the WQMP program is long-established, the review points to a possible continuing emphasis on pollution prevention BMPs and less progress regarding Site Design BMPs using LID approaches. Consequently, the development of additional training and technical support documentation on these approaches is being proposed as an area for further development. In addition, the Permittees have provisionally identified an opportunity, possibly through a Notice of Transfer of Responsibility, recordation, or other means, to enhance efficacy of the WQMP. This opportunity will be the future subject of a formal recommendation to the Permittees.

8.0 CONSTRUCTION

8.1 Introduction

The Permittees regulate construction activities and have responsibility for the construction and reconstruction of municipal facilities and infrastructure. Concern over construction sites as a major source of sediment and other pollutants has meant that construction activity has been a focus of the Permittees' compliance program since the First Term Permits.

8.2 Accomplishments

8.2.1 Model Construction Program

This Model Construction Program was developed and implemented in 2002-03. It requires all construction projects regardless of size to implement an effective combination of erosion and sediment controls and waste and materials management BMPs. It also establishes inspection obligations on the Permittees. Previously, the Permittees' oversight of construction activities was based upon ensuring conformance of public works projects with the *Greenbook Standard Specifications for Public Works Construction*. Specifically, the Model Construction Program requires the Permittees to:

- Inventory construction sites

In May 2002, a construction site inventory spreadsheet was finalized and distributed to the Permittees so that each municipality could develop their inventories by October 15, 2002, as required by Section VIII.1 of the 2002 Santa Ana Permit.

- Prioritize construction sites based upon water quality threat

During 2004-05, thirty-four (34) Permittees reported conducting 15,067 construction site inspections comprising 5,504 high priority site inspections, 1,542 medium priority site inspections and 8,021 low priority site inspections.

- Prepare BMP Guidance

The Permittees produced and distributed the *Construction Runoff Guidance Manual*.

- Conduct Inspections of construction sites

During the Third Term Permits 25,831, 25,549 and 15,067 site inspections were conducted in the 2002-03, 2003-04 and 2004-05 reporting periods respectively.

SECTION 8.0, CONSTRUCTION

- Undertake Enforcement

As a result of the 2004-05 inspections, thirty-three (33) Permittees reported the issuance of 445 Educational Letters, 1,052 Notices of Non-compliance, 74 Administrative Compliance Orders, 81 Cease and Desist Orders, and 47 Misdemeanor/Infractions.

- Conduct Training

To assist responsible municipal and contract/lease staff in understanding the Construction Program, two training modules have been developed:

- 1) Construction Program Management.
- 2) Inspecting Construction Site BMPs.

In the 2004-05 reporting period Construction Inspection training was provided in two sessions to 167 inspectors.

8.3 Assessment

The current and potential Program effectiveness Assessment Outcome Levels for the current program are summarized in **Table 8.1**.

8.3.1 Model Construction Program

Inventories

The year-to-year status of the Permittees' inventories are not tracked at a Countywide level and consequently this aspect of the model program cannot be assessed.

Prioritization

The Permittees prioritize construction sites based upon a consideration of the size and type of construction, time of construction, location, and site topography. While the numbers of sites of each priority are not tracked at a Countywide level, the year-to-year changes in the level of inspection activity (**Table 8.2**) shows inconsistent reporting between the Permittees.

DAMP Modification:

- Provide definitive construction site prioritization and reporting guidance.

SECTION 8.0, CONSTRUCTION

Inspection

The Permittees inspect construction sites to verify that the requirements of the DAMP are being implemented. The inspection frequency is determined by the season (“Wet” or “Dry”) and a site’s prioritization. The need for follow-up inspections also contributes significantly to the overall level of activity within a reporting period.

Headline Indicator - Inspection Activity: In 2004-05 thirty-four (34) Permittees completed 5,504 high priority, 1,542 medium priority, and 8,021 low priority construction site inspections. In 2003-04, 8,445 high priority, 5,731 medium priority, and 11,363 low priority construction site inspections were completed; and in 2002-03, 4,060 high priority, 15,937 medium priority, and 5,834 low priority construction site inspections were completed (**Table 8.2; Figure 8.1**).

Level 1: Implement Program

While the level of inspection activity is significant (15,000 inspections in the last reporting period) there are disparities between the Permittees which indicates inconsistent reporting. A major component of this activity is re-inspection following a finding of non-compliance. The Permittees believe that the re-inspection obligation is not sufficiently sensitive to the severity of the non-compliance, and RWQCB staff is concerned that the mandated level of follow-up activity may be discouraging findings of non-compliance.

DAMP Modification:

- Clarify inspection frequencies, violation definitions and re-inspection requirements.

Enforcement

Inspectors enforce compliance with the Model Construction Program, grading or building permit, sediment and erosion control plan, and the Water Quality Ordinance. Enforcement steps that may be taken by inspectors include but are not limited to verbal warnings, administrative actions under the Water Quality Ordinance (notice of violation, administrative compliance order, etc.) and written actions under Building/Grading Ordinances (corrective action notice, stop work order, etc.).

Headline Indicator – Extent of Compliance: As a result of the 2004-05 inspections, thirty-three (33) Permittees reported 1,514 construction requiring 1,521 re-inspections compared to 1,066 construction sites requiring 1,072 re-inspections in 2003-04; and 408 construction requiring 542 re-inspections in 2002-03 (**Table 8.3; Figure 8.2**).

Level 1: Implement Program

Level 3: Behavior Change

Headline Indicator – Number and Level of Enforcement Actions: As a result of the 2004-05 inspections, thirty-three (33) Permittees reported taking a total of 1,699 enforcement actions. This compares to 3,475 enforcement actions taken in 2003-04, and 1,395 enforcement actions taken in 2002-03 (**Table 8.4; Figure 8.3**).

Level 1: Implement Program

Level 3: Behavior Change

The significant disparities in enforcement activity between the Permittees clearly indicate inconsistent reporting. However, the consistent pattern of a peak of activity in 2003-04 and a subsequent reduction in the 2004-05 reporting period in construction and other stormwater program areas (Existing Development and Illegal Discharges/Illicit Connections) suggests an increased level of compliance within the regulated community.

Training

The Permits require that staff is adequately trained. In response, the Permittees developed two training modules and a guidance manual. However, the training modules need to be updated frequently enough to keep pace with the developments in the field of construction site sediment and erosion control management, and to provide inspectors with a technical understanding of BMPs. In addition, the training of inspectors regarding construction site inspection and oversight has been identified as a particular area of concern for Regional Board staff.

ROWD Commitment:

- Prepare a training schedule including curriculum content and defined expertise and competencies for construction inspectors.

8.4 Summary

The Third Term Permits have required the Permittees to develop and implement a formal inspection program commencing with an initial prioritized inventory of construction sites. Over the first three years of this effort, there has been a clear trend in the level of inspection and enforcement activity that, despite some uncertainties with respect to reporting, suggests increased BMP implementation and compliance with local water quality and grading/building ordinances by the regulated community. Based upon perceived positive outcomes of the Construction elements of the DAMP, the Permittees are proposing minor program modifications based upon the need for the continued training of inspectors and the sensitizing of the prioritization and inspection process toward a more risk-based approach.

Figure 8.3: Enforcement Action Taken, Comparison of 2002-03, 2003-04 and 2004-05

9.0 EXISTING DEVELOPMENT

9.1 Introduction

Stormwater discharges from commercial and industrial facilities can become contaminated when material management practices allow exposure to stormwater and/or there is commingling of runoff with wastes. The purpose of **DAMP Section 9.0** is to provide a programmatic framework for the regulatory oversight of activities in commercial and industrial areas. Through inspections, outreach and requiring compliance with water quality ordinances, the Permittees are able to pro-actively address the quality of urban and stormwater runoff from industrial and commercial facilities. In addition, **DAMP Section 9.0** also provides a programmatic framework, based upon education and outreach approaches, for addressing activities in residential areas. Both the industrial/commercial and residential elements were added to the Program by the Third Term Permits.

9.2 Accomplishments

9.2.1 Model Industrial/Commercial Program

The Model Industrial/Commercial Program was developed and implemented in 2002-03. It transformed the Permittees oversight of commercial and industrial facilities/activities by establishing a formal inspection program where previously there had been a series of notifications and inspections initiated by complaints. The Model Industrial/Commercial Program requires the Permittees to:

- Identify and inventory facilities/activities with the potential to discharge pollutants:

Initially, 8,546 industrial facilities (**Table 9.1; Figure 9.1**) and 22,789 commercial facilities were identified and inventoried (**Table 9.2; Figure 9.2**).

- Prioritize facilities based upon water quality threat and receiving water sensitivity:

The Permittees prioritized 8,546, 8,604 and 2,821 industrial facilities in 2002-03, 2003-04 and 2004-05 respectively. Concurrently, 22,789, 23,778, and 25,411 commercial facilities were similarly evaluated and prioritized over the same respective periods.

- Establish Model Maintenance Procedures:

Twenty-two (22) model BMP fact sheets have been prepared which include a description of specific minimum source control BMPs for common industrial and commercial activities that may discharge pollutants. Specific BMPs may be adjusted on a jurisdictional basis as necessary. Where applicable, optional controls have been identified that should be considered for implementation at high priority facilities.

Typically each fact sheet contains the following sections:

- Pollution Prevention

SECTION 9.0, EXISTING DEVELOPMENT

- Suggested Best Management Practices
 - Training
 - References and Resources
- Conduct inspections and monitoring to ensure that commercial and industrial facilities are minimizing their impacts on the environment:

In the 2002-03, 2003-04 and 2004-05 reporting periods the Permittees completed 1,017, 4,029 and 2,706 inspections, respectively.

- Conduct inspections of food facilities:

The Orange County Permittees developed and submitted a food facility inspection program to the Santa Ana Regional Board on July 1, 2002. This program, which also meets the inspection requirements of the San Diego Regional Board, involves inspections and the distribution of educational materials at the approximately 10,000 existing restaurants countywide. The implementation of the Program is an addition to the environmental health inspections conducted by the County of Orange Health Care Agency (HCA). The HCA inspectors identify NPDES issues during these inspections, and they are forwarded to the respective Permittees and addressed by Permittee staff.

For the 2004-05 reporting period, 25,078 food facility inspections were conducted and 1,416 were reported to have NPDES issues (**Table 9.3**).

- Undertake Non-compliance Notification and Enforcement:

Enforcement for the industrial and commercial component of the Existing Development Program is the responsibility of individual Permittees. Each Permittee has several different levels of enforcement to choose from for different types of situations. This includes - from least severe to most severe - issuance of an educational letter, a notice of non-compliance, an administrative compliance order, a cease and desist order, or a misdemeanor/infracton.

The Permittees reported a total of 371 enforcement actions against industrial facilities during the 2004-05 reporting period

- Participate in Training:

To assist municipal staff in implementing the Existing Development Program for industrial and commercial facilities, five training modules were developed:

1. Existing Development Program Management Module (targeting jurisdictional program coordinators and providing guidance regarding management of an inspection program;
2. Field Implementation of Existing Development Program Module (targeting inspectors and providing guidance on conducting inspections);

SECTION 9.0, EXISTING DEVELOPMENT

3. Existing Development Program Training – Automobile Mechanical Repair, Maintenance, Fueling and Cleaning Businesses Module;
 4. Existing Development Program Training – Landscape Maintenance Businesses Module, and
 5. Existing Development Program Training – Industrial Stormwater Monitoring Module.
- Conduct Education and Outreach:

A number of education and outreach efforts, conducted under the overall public education element of the Program (see **DAMP Section 6.0**), directly supported implementation of the Model Industrial Commercial Program, specifically:

Mailings – During 2003-05 there was one mass mailing of an outreach letter for corporate environmental managers of food service establishments (FSE) and one mass mailing of education materials to all Orange County FSEs.

Outreach Materials –The following materials were developed by the Public Education Committee supportive of **Section 9.0**:

Brochures

- *Mobile Detailing and the Water Quality Act*
- *Water Quality Guidelines for Exterior Restaurant Cleaning Operations*
- *Water Quality Guidelines for Carpet Cleaning Activities*
- *Help Prevent Ocean Pollution: Tips for Hardscape and Landscape Drains*
- *Help Prevent Ocean Pollution: Tips for Home Improvement*

Posters

- Food/Restaurant Industry
- *“Help Prevent Ocean Pollution”* Food Facility BMPs Poster
- Auto Repair Industry
- Good Gas Station Operating Practices

“The Quad” - “The Quad” was developed as a tool to communicate with Cities, Businesses, Utilities and Organizations. Each Quad contains a newsletter, press release, fact sheet and billing insert focusing on a seasonal stormwater theme. Four seasonal quads were created during this reporting period, two of which were distributed in this reporting period. The following were the 2004-05 Quad themes:

- *“Spring Into Cleaning – Disposal of Household Hazardous Waste”*
- *“Summer: Yard Care”*
- *“Fall: Prepare for the Rainy Season”*
- *“Winter: New Years Resolution – Green in the New Year”*

FSE Outreach – The following materials were developed specifically for FSEs.

SECTION 9.0, EXISTING DEVELOPMENT

- *“Help Prevent Ocean Pollution”: A Guide for Food Service Establishments*
- *“Help Prevent Ocean Pollution” Food Facility BMPs Poster*
- *“Help Prevent Ocean Pollution” Food Facility BMPs Stickers*
- Bilingual CD-Rom illustrating appropriate Food Facility BMPs
- Food Facility BMP PowerPoint Presentation
- Food Facility BMP Fact Sheet

Other: Developed an urban nutrient outreach program targeting independent gardeners operating in the San Diego Creek/Newport Bay Watershed with Proposition 13 funding awarded to the County to investigate the sources of nutrients from the urban environment and test the effectiveness of structural and non-structural BMPs.

9.2.2 Model Residential Program

The Model Residential Program was developed and implemented in 2002-03 to further reduce pollutants potentially released into the environment from residential activities, including efforts to reduce over-watering. The main thrust of the residential program is to advocate pollution prevention practices as the most effective method to protect receiving water quality. The Model Residential Program requires the Permittees under the jurisdiction of the San Diego Regional Board to:

- Develop a source identification procedure and prioritize residential areas based on proximity to Environmentally Sensitive Areas (ESAs) within the Permittee’s jurisdiction.
- Identify Best Management Practices (BMPs) most appropriate for each area, based on residential activities:

See discussion of Outreach Materials (below).

- Conduct public outreach and education:

A number of education and outreach efforts, conducted under the overall public education element of the Program (see **DAMP Section 6.0**), directly supported implementation of the Model Residential Program, specifically:

Outreach Materials -The following materials were developed by the Public Education Committee supportive of **Section 9.0**:

Brochures

- *Help Prevent Ocean Pollution: Tips for Hardscape and Landscape Drains*
- *Help Prevent Ocean Pollution: Tips for Horse Care*
- *Help Prevent Ocean Pollution: Tips for Using Paint*
- *Help Prevent Ocean Pollution: Tips for Home Improvement*

“The Quad” - “The Quad” was developed as a tool to communicate with

SECTION 9.0, EXISTING DEVELOPMENT

cities, businesses, utilities and organizations such as home owner associations. Each Quad contains a newsletter, press release, fact sheet and billing insert focusing on a seasonal stormwater theme. Four seasonal quads were created during this reporting period, two of which were distributed in this reporting period. The following were the 2004-05 Quad themes:

- “Spring Into Cleaning - Disposal of Household Hazardous Waste”
- “Summer: Yard Care”
- “Fall: Prepare for the Rainy Season”
- “Winter: New Years Resolution - Green in the New Year”

9.2.3 Other Programs

During the reporting period, the Principal Permittee developed an urban nutrient outreach program targeting residential gardeners operating in the San Diego Creek/Newport Bay Watershed. The outreach program was one element of a Proposition 13 funded investigation of nutrient sources in an urban environment and structural and non-structural BMP effectiveness.

9.3 Assessment

The current and potential Program Effectiveness Assessment Outcome Levels that could be assessed within the current program are summarized in **Table 9-4** (Industrial/Commercial) and **Table 9.5** (Residential).

9.3.1 Model Industrial/Commercial Program

Inventories: Completing the inventory of industrial and commercial facilities has been problematic for some jurisdictions since the Standard Industrial Classification (SIC) codes on the business licenses (the primary source of this information for those jurisdictions with a business license program) have been incorrectly provided by businesses.¹ In addition, inventorying commercial facilities is extremely difficult because they are numerous, often transitory, and can only be identified through site visits. Mobile businesses are particularly problematic because they typically do not have a permanent facility location.

The Unified Annual Progress Reports include tables reporting the total number of commercial and industrial facilities and their respective prioritizations, organized by

¹ The Notice of Intent (NOI) form attached to the Draft Industrial General Permit (February 2005) and the SWRCB’s NOI processing system have been modified to accept both Standard Industrial Classification (SIC) codes and North American Industrial Classification System (NAICS) codes. The USEPA has indicated it intends to incorporate the NAICS codes into the storm water regulations but has not yet done so. The Proposed 2006 Multi-Sector General Permits for Stormwater Discharges Associated with Industrial Activity (MSGP) contains a note that “a complete list of SIC Codes (and conversions from the newer North American Industry Classification System [NAICS]) can be obtained from the Internet at www.census.gov/epcd/www/naics.html or in paper form from various locations in the document titled Handbook of Standard Industrial Classifications, Office of Management and Budget, 1987.”

SECTION 9.0, EXISTING DEVELOPMENT

Permittee. However, since the structure and content of the jurisdictional databases can differ between the Permittees, analysis of data on a regional or countywide basis is challenging. Indeed, there appears to be a persistent disparity between the number of industrial and commercial facilities inventoried and the number of industrial and commercial facilities that were prioritized over the reporting period (see **Tables 9.1** through **9.3** and **Figures 9.1** through **9.2**). This disparity points to the need to augment facility descriptions beyond SIC codes.

DAMP Modification:

- Provide more detailed industrial and commercial facility descriptions to assist in inventory standardization.

Prioritization: Commercial and industrial facilities must be classified as high, medium, or low priority to determine the frequency of inspection. The DAMP details a risk and receiving water sensitivity based point system for classification, the result of which is a total score indicating the facility priority. A change in facility prioritization can be indicative of programmatic success, since a finding that BMPs are being implemented (a behavior change) reduces the risk of pollutants being discharged which can result in a change in prioritization. However, both Permits specify mandatory high-priority commercial and industrial facilities. In addition, the San Diego Region Permittees are required to inventory only high-priority commercial facilities i.e. there are no designation of medium and low priority commercial facilities.

Headline Indicator - Prioritization of Facilities (Industrial Facilities): For 2004-05, 2,821 industrial facilities were prioritized, 27% of which were ranked as high priority; for 2003-04, 8,604 industrial facilities were prioritized, 13% of which were ranked as high priority; and for 2002-03, 8,546 industrial facilities were prioritized, 15% of which were ranked as high priority (**Table 9.1; Figure 9.1**).

- Level 1: Implement Program
- Level 3: Behavior Change

Headline Indicator - Prioritization of Facilities (Commercial Facilities): For 2004-05, 25,411 commercial facilities were prioritized, 20% of which were ranked as high priority; for 2003-04, 23,778 commercial facilities were prioritized, 24% of which were ranked as high priority; and for 2002-03, 22,789 commercial facilities were prioritized, 22% of which were ranked as high priority (**Table 9.2; Figure 9.2**).

- Level 1: Implement Program
- Level 3: Behavior Change

The year-to-year comparisons suggest some inconsistent reporting of this indicator. Part of this inconsistency arises from the interpretation of the extent to which a facility “tributary to” a sensitive receiving water, which is a key determinant in prioritization. From the Annual Progress Reports (See **DAMP Appendix C**), it is evident that “tributary to” is variously being interpreted as more than “next to” but “less than the whole watershed.” Also, although the point system is used by many of the Permittees, some perceive it as time-consuming and too subjective, and, as a result, may rely primarily on professional judgment. In addition, the ability of the prioritization process to meaningfully provide for a risk-based approach is also dampened by the requirements for mandatory high priority sites. Despite these reservations, it is possible that the decreased numbers of high priority sites in the most recent annual reporting period may also reflect increased findings of no stormwater exposures and diminished site risk.

ROWD Commitment:

- Develop a more detailed prioritization process to improve standardized reporting and to support re-direction of inspection resources to significant sources of priority constituents of concern

Inspection: The Permittees generally conduct two types of inspections: compliance inspections and follow-up inspections. Should an inspected site demonstrate non-compliance, inspection frequency must be increased as specified in the Permits until compliance is achieved. Although these inspections are generally viewed as beneficial, there is a regulatory agency perception (highlighted in meetings with Regional Board staff) that the inspections may be missing key items of concern and discouraging findings of non-compliance which add to the inspection burden by requiring additional follow-up activity.

Headline Indicator - Number of BMPs Implemented (Industrial Facilities): For 2004-05, 2,706 industrial facilities were reported to have BMP implementation, 68% of which have full BMP implementation; for 2003-04, 4,029 industrial facilities were reported to have BMP implementation, 59% of which have full BMP implementation; and for 2002-03, 1,026 industrial facilities were reported to have BMP implementation, 53% of which have full BMP implementation (**Table 9.6; Figure 9.3**).

Level 1: Implement Program

Level 3: Behavior Change

Headline Indicator - Number of BMPs Implemented (Commercial Facilities): For 2004-05, 5,566 commercial facilities were reported to have BMP implementation, 59% of which have full BMP implementation; for 2003-04, 8,484 commercial facilities were reported to have BMP implementation, 77% of which have full BMP implementation; and for 2002-03, 1,389 commercial facilities were reported to have BMP implementation, 63% of which have full BMP implementation (**Table 9.7; Figure 9.4**).

Level 1: Implement Program

Level 3: Behavior Change

It is also proving difficult for the inspectors to categorize BMP implementation at commercial and industrial sites along a three-point scale (fully, partially, or not implemented) because such a scale requires overly subjective determinations. Lastly, the requirement for follow-up inspections of all non-compliant sites every month is perceived to be excessive due to the already large number of sites in many cities' inventories.

ROWD Commitment:

- Develop effective alternative to re-inspection such as self-certification.

Headline Indicator – Food Facility Inspections: For the 2004-05 reporting period, 25,078 food facility inspections were conducted and 1,416 were reported to have NPDES issues (**Table 9.3**). For the 2003-04 reporting period, 12,635 food facility inspections were conducted and 1,298 were reported to have NPDES issues in the six month period of program implementation.

Level 1: Implement Program

Level 3: Behavior Change

The 2003-04 comparison suggests that food facility inspections and the associated education and outreach efforts are having a positive impact since the incidence of NPDES issues decreases from 1 in 10 inspections to 1 in 17 inspections .

Enforcement: Permittees are required to use a progressive enforcement approach and initiate enforcement actions where commercial and industrial facilities are found to be out of compliance. In general, specific facilities that are repeat offenders are identified through active database inventories and, in most cases, progressive enforcement is used to bring repeat offenders into compliance.

Headline Indicator – Number and Level of Enforcement Actions (Industrial Facilities): The Permittees reported a total of 371 enforcement actions against industrial facilities during the 2004-05 reporting period, 3,146 during the 2003-04 reporting period, and 533 during the 2002-03 reporting period (**Table 9.8**). The 2004-05 figure represents an 89% decrease from the total reported in 2003-04.

Level 1: Implement Program

Level 3: Behavior Change

Headline Indicator – Number and Level of Enforcement Actions (Commercial Facilities): The Permittees reported a total of 1,192 enforcement actions against commercial facilities during the 2004-05 reporting period, 1,534 during the 2003-04 reporting period, and 490 during the 2002-03 reporting period (**Table 9.9**). The 2004-05 figure represents a 22% decrease from the total reported in 2003-04.

Level 1: Implement Program

Level 3: Behavior Change

SECTION 9.0, EXISTING DEVELOPMENT

The 2003-04 comparison suggests some inconsistent reporting (e.g. Newport Beach, which compiled enforcement activity data in 2004-05 Unified Report, Section 2.10.0). However, the consistent pattern of reduced enforcement activity in the most recent reporting period across the Construction, Existing Development, and Illegal Discharges/Illicit Connections areas of the Program also suggests an increased level of compliance, also viewed as behavior change, by the regulated community.

Training: The Permits require that staff is adequately trained. In response, the Permittees developed several training modules, which are provided annually throughout the year. The training that has taken place has been deemed helpful. However, the training modules need to be updated frequently enough to keep pace with the developments in the field of stormwater management, maintain staff interest, and to provide inspectors with a technical understanding of a broad array of BMPs that can be shared with facility owner/operators.

ROWD Commitment:

- Prepare defined expertise and competencies for authorized inspector positions and develop a training schedule to meet these requirements

9.3.2 Model Residential Program

The Residential Model Program was developed to fulfill the residential activity and related commitments and requirements of Section F.3.d of the SDR Permit. The Common Interest Areas/Homeowners Associations (CIA/HOA) Activities Program was developed to fulfill the existing CIA/HOA activity commitments and requirements of Section F.6 of the SDR Permit.

Identification and Inventory: The SDR Permittees are required to identify high priority areas and activities as defined in the Permit. CIAs are considered to include high-priority areas and activities.

BMP Implementation: The SDR Permittees are required to identify minimum BMPs for high-priority areas and activities and, as necessary, additional controls. Some Permittees use a baseline BMP implementation approach for Residential areas and CIAs/HOAs unless inspectors notice a specific concern.

Enforcement and Reporting: SDR Permittees are required to enforce their stormwater ordinances for all residential areas and activities as necessary to maintain Permit compliance. The primary issue with residential areas and CIAs/HOAs concerns over irrigation. Enforcement actions taken against CIAs/HOAs include letters or notices, which generally leads to resolution of the issues. Some Permittees have reported some limited success using self certifications as a tool for effective implementation of the program within residential and CIA/HOA areas.

9.4 Summary

The Third Term Permits have required the Permittees to develop and implement a formal inspection program commencing with an initial inventory of potentially 30,000 facilities being subject to municipal oversight for stormwater and urban runoff issues. Over the first three years of this effort, there has been a clear trend in the level of inspection and enforcement activity that, despite some uncertainties with respect to reporting, suggests increased BMP implementation and compliance with local water quality ordinances by the existing industrial and commercial sector in Orange County. Based upon perceived positive outcomes of the Existing Development elements of the DAMP, the Permittees are proposing minor program modifications based upon the need for the continued training of inspectors and the sensitizing of the prioritization and inspection process toward a more effective risk-based approach.

10.0 ILLEGAL DISCHARGES/ILLICIT CONNECTIONS

10.1 Introduction

Illegal discharges/illicit connections (ID/IC) are potential sources of pollutants within municipal storm drain systems. The purpose of **DAMP Section 10.0** is to ensure that the Permittees have a programmatic framework for detecting and quickly responding to non-stormwater discharges to their storm drain systems. Since **DAMP Section 10.0** directly addresses one of the basic objectives of the NPDES Permits, it is a long-established part of the Program. With the Third Term Permits, the key elements of ID/IC have been significantly enhanced. In addition, a model sewage spill response program has been developed and has begun to be implemented in conjunction with OCSD.

10.2 Accomplishments

10.2.1 Illegal Discharges/Illicit Connections Program

The ID/IC Program provides guidance for Permittees when identifying, responding to and mitigating the effects of non-stormwater discharges and enforcing the ID/IC component of the Program for the protection of the environment. **DAMP Section 10.0** requires the Permittees to:

- Detect illegal discharges and illicit connections

A innovative Dry Weather Reconnaissance Program, based upon statistically derived benchmarks, was developed and implemented in both permit regions specifically to identify illegal discharges and illicit connections during the typically dry summer months of May through September using a suite of water quality analyses conducted in the field at designated random and targeted drains. The 2004-05 reporting period marked the third season of dry weather monitoring in the San Diego Region. With the approval of the Santa Ana Monitoring Program in July of 2005 by the Executive Officer of the Santa Ana Regional Board, dry weather monitoring in the Santa Ana Region commenced in May of 2006.

- Facilitate Public Reporting

Telephone and web-based reporting systems for the general public have been established and are advertised in the Stormwater Program's public education materials, Orange County "White Pages" telephone directories, and Permittee websites. A total of 3,408 complaints were received during the 2004-05 reporting period.

- Investigate

Each Permittee has designated Authorized Inspectors to investigate compliance with, detect violations of, and take actions pursuant to their Water Quality

SECTION 10.0, ILLEGAL DISCHARGES/ILLICIT CONNECTIONS

Ordinance. During the 2004-05 reporting period, the Permittees encountered and sought to mitigate discharges involving hydrocarbons (296 incidents), inorganic materials (264 incidents), metals (6 incidents), nutrients (43 incidents), 73 organic materials (73 incidents), discharge exceptions (133 incidents), pathogens (156 incidents), wastewater (624 incidents), pesticides (2 incidents), sediment (680 incidents), trash and debris (376 incidents), and 716 incidents involving miscellaneous types of materials for a total 3,369 incidents.

- Enforce

Enforcement actions are undertaken according to the adopted Water Quality Ordinances and accompanying Enforcement Consistency Guide. The Permittees reported a total of 3,528 enforcement actions, associated with ID/IC investigations during the 2004-05 reporting period.

- Undertake Training

To assist responsible municipal staff in understanding the Illegal Discharges/Illicit Connections Program, 10 training modules have been developed:

- 1) Program Management Training - Introductory
- 2) Program Management Training - Experienced
- 3) Authorized Inspector Training¹
- 4) Authorized Inspector Training - Introductory
- 5) Authorized Inspector - Field Implementation
- 6) Sewage Spill Response Training
- 7) Sewage Spill Response Training - Introductory
- 8) "Hands-On" Sewage Spill Response Training - Experienced
- 9) Fire Department Activities Training
- 10) Investigative Guidance Manual Training

In addition to the training modules, the Inspection Sub-Committee also provided training on various subjects relevant to the ID/IC program. This sub-committee meets bi-monthly to provide training to municipal inspectors and Authorized Inspectors in issues related to spill response, inspection and enforcement. In addition, this meeting serves as a forum for the coordination and discussion of ongoing difficult or new enforcement, investigation, or enforcement issues and to profile cases or incidents.

10.2.2 Model Sewage Spill Response Procedures

During the Third Permit term, the County and OCS D developed and implemented a coordinated sewage spill prevention and response demonstration project (The "Tustin

¹ This module was modified in the 2004-05 reporting period and divided into two modules, 1) Introductory and 2) Field Implementation.

Area Spill Control (TASC) Demonstration Project”). The TASC includes: 1) Development of sanitary sewer overflow (SSO) response procedures; 2) Selection of primary and backup sewage spill response contractors for containment and recovery of SSOs; and 3) SSO hands-on field response training for Permittee staff and municipal sewerage agency staff.

The TASC model program is currently in use in a limited portion of the County, however; one of the goals for TASC is to gradually phase the implementation of the project throughout the County so that the proactive interagency planning and coordination for sewage spill response can be implemented and/or improved in other watersheds

10.3 Assessment

The current and potential Program Effectiveness Assessment Outcome Levels that could be assessed within the current program are summarized in **Table 10-1**.

10.3.1 Illegal Discharges/Illicit Connections Program

Detection: The San Diego Dry Weather Monitoring Program has been conducted over 3 summers. Over this period there have been 585 site visits to 67 locations comprising 3 visits to the random sites and five visits to the targeted sites each season. Investigations, prompted by findings of elevated contaminant concentrations, were triggered on 18 occasions. These results show that approximately 25% of the 67 monitoring sites have exhibited evidence of contamination in dry weather flow at levels significantly above background levels.

The approval of the Santa Ana Monitoring Program (including the Dry Weather Reconnaissance Program) in July of 2005 by the Executive Officer of the Santa Ana Regional Board meant that the dry weather monitoring in the Santa Ana Region commenced in May of 2006. The 2006-07 Unified Report will present the first opportunity to review the effectiveness of this monitoring effort through comparison of the North and South County efforts.

Reporting: RWQCB staff have acknowledged that the Permittees’ field inspectors are trained to detect illegal discharges as part of their daily activities and, indeed, the majority of illegal discharges are detected by Permittee staff. The RWQCB staff also has noted that most Permittees have hotline numbers to receive water pollution complaints and incident information from the public and use database software to document the reported incidents which assists with the tracking of water pollution complaints by source. These RWQCB staff findings point to the overall robustness of the Permittees’ efforts to facilitate reporting.

Headline Indicator - Number of Complaints: The Permittees reported a total of 3,408 complaints/incidents during the 2004-05 reporting period. This total represents an 11% decrease from 2003-04 (3,837 complaints), and a 110% increase from 2002-03 (1,621 complaints) (**Table 10.2; Figure 10.1**).

Level 1: Implement Program

Level 3: Behavior Change

While the year-to-year comparison suggests some inconsistent reporting of this indicator, the overall pattern of a peak in the 2003-4 period (which is reproduced across other metrics) tends to suggest the positive impact of the Program (i.e. that there has been an overall reduction in the number of incidents and thereby a commensurate decline in the number of complaints). The increasing use of the “hotline” appears to indicate increasing awareness regarding this reporting mechanism.

Enforcement: Enforcement actions are undertaken according to the adopted Water Quality Ordinance and accompanying Enforcement Consistency Guide. In instances of noncompliance, the Permittee may adopt one of four types of remedies, including educational letters, administrative remedies, criminal remedies, or other civil or criminal remedies, as appropriate.

Headline Indicator - Number and Level of Enforcement Actions: The Permittees reported a total of 3,528 enforcement actions during the 2004-05 reporting period (**Table 10.3; Figure 10.2**). This represents an 18.9% decrease from the total reported in 2003-04 (4,351 enforcement actions), and an increase of 63% from the total reported 2002-03 (2,167 enforcement actions).

Level 1: Implement Program

Level 3: Behavior Change

The pattern in the number of enforcement arising from ID/IC investigations follows the pattern observed in other metrics of a peak of activity in the 2003-04 reporting period. An increase in the use of citations over the Third Term permit term is one feature of the changing approach to enforcement representing a shift from the prior educational emphasis.

Training: The Permits require that staff be adequately trained. In response, the Permittees developed a number of training modules (as outlined in 10.2.1) that are offered by the County throughout the year. Although the Permittees stated that the training has been helpful, they noted that the modules need to be updated and that new training topics and more advanced training are desired.

ROWD Commitment:

- Prepare a defined expertise and competencies for Authorized Inspector positions and develop a training program to meet these requirements.

10.3.2 Model Sewage Spill Response Procedures

The 2006-07 Unified Report will present the first opportunity to review the effectiveness of initial implementation of the TASC model program. Based on field experience on actual spills, the intent is to expand the geographical implementation of the program, initially with the area coincident with the boundaries of OCSD.

10.4 Summary

The Permittees' program for responding to complaints regarding ID/IC is a long established element of the Program. The major efforts regarding this element over the period of the Third Term Permits relate to the Dry Weather Reconnaissance Program, the continued facilitation of public reporting of complaints, the designation and training of designated Authorized Inspectors, and the development of TASC.

The incidence of complaints appears to have peaked in the 2003-04 reporting period and subsequently declined, which suggest a positive overall Program impact. Based primarily upon the interest of the Permittees and of RWQCB staff, the sole commitment arising out of the effectiveness assessment is for the development of defined experience and competencies for Authorized Inspector positions and development of a training program to meet these requirements.

11.0 WATER QUALITY MONITORING SUMMARY AND ANALYSES

11.1 Introduction

The goal of environmental monitoring is to support the management process. In 2002 and 2003, the Program completed development of the *San Diego Region Receiving Waters Monitoring and Reporting Program* and the *San Diego Region Dry-Weather Monitoring Program* for wet and dry weather, respectively.

“monitoring is most useful when it results in more effective management decisions, specifically management decisions that protect or rehabilitate the environment.”
(NAS, 1991¹)

The *San Diego Region Receiving Waters Monitoring and Reporting Program* is comprised of four program elements. They are briefly described below.

- Urban Stream Bioassessment uses a “triad” of indicators (bioassessment, chemistry, toxicity) to describe impacts on stream communities and the relationship of any impacts to runoff, based on comparisons with reference locations on a year-to-year time frame.
- Long-term Mass Loading using measurements of key pollutants to assess loads over a time frame of years to decades to compared with past and present levels.
- Coastal Stormdrain Outfall Monitoring uses a suite of bacterial indicators at high priority drain outfalls to track compliance with regulatory standards and any improvements due to BMP implementation.
- Ambient Coastal Receiving Waters Monitoring uses measurements of runoff plume characteristics and extent, as well as measures of a suite of physical, chemical, and biological indicators to improve understanding of the impacts of runoff plumes on near-shore ecosystems.

The *San Diego Region Dry-Weather Monitoring Program* comprises a single program element. This element is:

- Dry Weather Reconnaissance consists of gathering data from both random and targeted sites, to define region-wide background dry weather conditions to serve as a basis for identifying candidate sites for further focused source identification work.

Compared to prior monitoring efforts (pre NPDES, First and Second Permit Term Programs), the Third Permit Term monitoring program is characterized by a broader range of locations and a wider array of methods for measuring impacts. For example, the receiving waters monitoring program more completely examines storm drains that

¹ Managing Troubled Waters, National Academy of Sciences, 1991

discharge directly to the coast and pose a potential health risk to swimmers and bathers. Also, there is investigation component to assess the effects of stormwater plumes on the nearshore marine environment. Inland, the monitoring program includes bioassessment studies and consistent use of toxicity testing. Combined with the established measurement of chemical parameters, this "triad" approach describes impacts more fully, more accurately identifies their sources, and more effectively identifies follow-up studies and BMPs.

This section will summarize the progress toward implementation of the Receiving Waters and Dry-weather Monitoring Programs during the Third Term Permit, the findings, and the proposal for future monitoring.

11.2 Accomplishments

11.2.1 Implementation of the Receiving Waters Monitoring Program

On August 13, 2002, a Receiving Water Monitoring Program was submitted to and subsequently approved by the San Diego Regional Water Quality Control Board. Relative to the monitoring program for the second term permit (99-04 Plan) the new program included many new monitoring locations and several new methods for evaluating the impacts of urban runoff including urban stream bioassessment and toxicity testing.

The initial phase of implementation involved:

- Procurement of specialized automatic sampling equipment for the collection of composite samples for pesticide analyses and toxicity testing.
- Establishment of price agreements for consultant services to conduct urban stream bioassessments and toxicity testing.
- Establishment of a Memorandum of Understanding (MOU) with the Orange County Health Care Agency's Public Health Laboratory to conduct bacteriological analyses of samples collected from coastal stormdrains and the surfzone receiving waters.

Subsequently the following monitoring was initiated:

- Urban Stream Bioassessment (USB) monitoring - The program includes semi-annual assessment each spring and fall at 12 urban channels and 3 reference sites. The fall 2002 monitoring began in November with assessments of physical habitat, benthic macroinvertebrate (BMI) taxonomy, and water chemistry at each site. Toxicity testing at bioassessment sites began in the spring of 2003.
- Composite sampling for water chemistry and toxicity of stormwater runoff at Mass Emissions sites began in December 2002.
- Sampling of stormdrain discharges for water chemistry and toxicity began at Ambient Coastal Receiving Waters (ACRW) sites in December 2002.
- Weekly sampling of Coastal Stormdrain Outfalls (CSDO) and their respective surfzone receiving waters began in January 2003.

Urban Stream Bioassessment

The urban stream bioassessment component of the water quality monitoring program is intended to assess the condition of biological communities in freshwater creeks and streams. This is accomplished through a triad of indicators monitored at 15 sites (12 urban channels and 3 reference locations) throughout the San Diego region of the County in the spring (usually May) and fall (usually October) of each year. The triad includes measures of the status of the benthic invertebrate community, aquatic chemistry, and aquatic toxicity.

Data on the species composition of the biological community is converted to an Index of Biotic Integrity (IBI) score and a similar score is computed for the physical habitat. A wide range of physical and chemical water quality measurements are made at each site including basic water quality indicators (temperature, specific conductance, pH, and dissolved oxygen concentration) and concentrations of urban pollutants such as pesticides and metals. Values for five dissolved metals are compared for guidance purposes, to acute toxicity criteria (adjusted for water hardness) established in the California Toxics Rule (CTR). The numbers and percentages of CTR exceedances are tabulated. Aqueous toxicity tests using three freshwater test organisms is conducted on samples from each site to provide a measure of the potential toxicity due to different categories of pollutants.

The analysis and evaluation of this triad of data types focuses on describing spatial patterns and temporal trends in community condition and in relating these to the aquatic concentrations of pollutants as well as to various aspects of physical habitat.

Data from all three years of monitoring demonstrates an overall pattern of lower IBIs in urbanized portions of watersheds, although this is not apparently related to aquatic chemistry or toxicity. **Figures 11.1** and **11.2** show the qualitative ratings of the average seasonal scores of the four metrics (CTR exceedances, aquatic toxicity, physical habitat score, and IBI score) used to assess stream health at each monitoring site. The color scheme for the figures is shown in the table below.

Qualitative Rating	Color	Average of All Data Collected between 2002 - 2005			
		Chemistry	Toxicity	PHAB Score	IBI Score*
Poor	Red	76-100% exceed CTR	67-100% effect@	0-50	0-26
Fair	Yellow	41-75% exceed CTR	34-66% effect	51-100	26-40
Good	Blue	15-40% exceed CTR	6-33% effect	101-150	41-55
Very Good	Green	0-14% exceed CTR	0-5% effect	151-200	56-70
Insuff. Data	White				

* The qualitative rating scale for IBI scores was established by the CA DF&G. A score of 0-13 is considered Very Poor.

@ In undiluted samples, effect relative to control sample = mortality in Ceriodaphnia and Hyallemella survival tests, or inhibition of growth in Selenastrum growth test.

Figures 11.1 and 11.2 show that there is no readily apparent relationship across the region between the relative conditions of the biological community on the one hand and levels of toxicity and pollutants on the other.

In general, there is a clear biological pattern associated with the gradient of high to low IBI scores. A cluster analysis (**Figure 11.3**) shows that reference sites group together (i.e., have similar biological communities), characterized by species with relatively restricted habitat ranges. In contrast, sites with lower IBI scores have tolerant species with much wider habitat ranges. The presence of more tolerant species at sites with low IBI scores is a common finding in environmental studies in a wide range of marine, estuarine, and freshwater habitats. The cluster analysis also demonstrates a clear and persistent seasonal difference in biological community structure between spring and fall surveys. While there is some variability over time in the IBI and physical habitat scores at each site, the overall patterns described above are relatively persistent.

The spatial overview of the monitoring results (**Figures 11.1 and 11.2**) strongly suggests that there is no consistent relationship between the patterns in the biological stream communities and aquatic chemistry and toxicity. This conclusion is strongly supported by the very low incidence of both CTR exceedances and toxicity. In addition, a comparison of the station groupings in the cluster analysis in **Figure 11.3** to the actual levels of pollutants and of toxicity showed that there was no relationship between the biological pattern and measures of contamination and/or toxicity.

In contrast, there is a much stronger relationship between patterns in the biological community and various aspects of physical habitat. Overall, there is a positive relationship between IBI scores and physical habitat scores (**Figure 11.4**), although there is some noise around this relationship. This stems from the fact that not all the components of the physical habitat score are equally correlated with biological condition (**Figures 11.5a and 11.5b**). For example, low values for Instream Cover and Vegetation Protection are highly associated with poor community condition but intermediate values of these habitat components do not seem to be strongly correlated with community condition. On the other hand, Sediment Deposition is highly correlated with community condition only at high and low extremes, but not for intermediate values. In contrast to both these types of correlation, Channel Alteration is correlated with community condition at all levels of this component.

There is a need to further investigate the nature of the relationship between biological community patterns and physical habitat condition. This analysis should take advantage of the fact that both IBI and physical habitat scores are made up of multiple components that reflect different aspects of biological communities and physical habitat. It is likely that different IBI components, which reflect the status of different types of organisms, respond to different features of the physical habitat. The management benefit of such an analysis would be an improved ability to focus on those habitat features that matter the most to biological condition. This could lead to new stream or riparian zone management policies and procedures.

There are some apparent anomalies to the overall pattern just described, i.e., that biological condition is primarily determined by physical habitat characteristics. These situations may be appropriate for special studies that could identify site-specific contamination problems and/or provide additional insights into the relationship between physical habitat and biological condition. For example, station Christianitos Creek at Christianitos Road (station CC-CR) has IBI scores in the fair range but physical habitat scores more typical of sites with IBI scores in the poor to very poor range. However, CC-CR has high values for Riparian Vegetation Zone, Vegetation Protection, and Channel Alteration. Of these three, Riparian Vegetation Zone and Channel Alteration are very highly correlated with biological pattern in both the spring and the fall (**Figure 11.5**), and the high values for these components might explain this anomaly.

In contrast, reference station San Juan Creek at Cold Spring (REF-CS) has high physical habitat scores but anomalously low IBI scores. There is no readily apparent explanation for this in the physical habitat data, which suggests there may be some sort of pollution problem that was not detected by the monitoring program. Finally station WC-WCT also has high physical habitat scores but low IBI scores. This is a unique station in that it is within a wilderness area surrounded by pockets of residential areas. A special study will be conducted to determine if intermittent discharges of toxicants from the urban areas are impacting instream fauna.

Long-term Mass Loading

The long-term mass loading component of the monitoring program is intended to evaluate changes in pollutant loadings over a number of permit terms. This is accomplished through wet weather monitoring at six locations. Three storms are monitored at each location and for each storm the water chemistry is monitored with a series of 3 to 4 composite samples collectively spanning approximately 96-hours. This time period provides for comparison of the data to 96-hour guidance criteria for chronic aquatic toxicity from the California Toxics Rule (CTR). The concentrations of dissolved heavy metals in the composite samples are also compared to acute toxicity criteria from the CTR for guidance. The concentrations of organophosphate pesticides are compared to literature values of LC₅₀s for toxicity testing organisms.

Monitoring of at least three storms per site is attempted each year. Continuous water level records from streamgages at each site are used to determine stormwater discharge rates. The streamgages on Aliso Creek, Trabuco Creek, and San Juan Creek have produced acceptable records to calculate stormwater loads. The streamgage on Laguna Canyon Wash has experienced many operational problems and new monitoring equipment was installed during the 2005-06 monitoring year to overcome these problems. The Segunda Deshecha Channel was under construction during the first two years of the program during which time the streamgage was decommissioned. The high-flow stage-discharge relationships for this site and for the Prima Deshecha Channel have not been adequately defined to calculate accurate stormwater loads. When adequate channel ratings are established the flowrates and loads can be calculated for all prior years where accurate water level records are available.

Coastal Stormdrain Outfall Monitoring

The coastal stormdrain outfall component of the water quality monitoring program is intended to identify those sections of coastline where nearshore receiving waters most consistently exceed state AB411 standards for bacterial indicators, as well as the stormdrains that appear to be contributing the most to these exceedances. Three bacterial indicators (fecal coliforms, total coliforms, Enterococcus) are monitored weekly at 29 stormdrains along the coastline.

At each sampling event, concentrations of bacterial indicators are measured in the discharge of each stormdrain, as well as in the surfzone 25 yards upcoast and downcoast of the stormdrain. The flow from each drain is also estimated and categorized as high, medium, or low. Analyses of these data included calculation of an exceedance rate for each drain and linear regression of indicator concentrations in each drain's discharge against indicator concentrations in the nearby surfzone. The goal of these analyses was to identify the subset of drains that appeared most closely linked to a high rate of exceedance of the AB411 standards.

Coastal Stormdrain Outfall Monitoring was initiated during the final week of January 2003 and, except during periods of constant stormwater runoff, weekly monitoring at each site since that time. When the discharge from a stormdrain is diverted to the local sewage treatment plant, the stormdrain is not sampled. While diverted, only sampling of the downcoast location in the surfzone is conducted. Monitoring data are available through the Orange County Health Care Agency's website at ocbeachinfo.com.

The three years of monitoring data show that exceedances in the receiving water (i.e., the surfzone) tend to occur at the same subset of stations over time, although the rate of exceedances is higher during the winter than during the summer AB411 season (**Figures 11.6 and 11.7**). The five stations with exceedance rates of approximately 10% or higher are: POCHE, DSB-4, DSB-5, SJC1, and SCM1, which are concentrated along one section of the coast. There has been no observable discharge from DSB-4 during the three years of CSDO dry-weather monitoring. The exceedances of the AB-411 standards were most likely caused by the discharges of the other drains in the area (DSB-5 and SJC1). The highest exceedance rate during the AB411 season is 0.288 at station SCM1 and yearround 0.493 at station DSB5 (**Table 11.1**).

The exceedance rates alone do not necessarily indicate a problematic drain because the elevated bacterial indicator levels could stem from sources other than the nearby drain. Establishing a link between a particular drain and the receiving water exceedances depends on the relationship between indicator levels in the drain's discharge and in the receiving water. For example, the combination of elevated indicators in the receiving water with low levels in a drain's discharge would suggest that the exceedances could be due to longshore transport from another location. Conversely, elevated indicator levels in a drain's discharge combined with persistently low surfzone levels would suggest mixing and dilution by nearshore currents.

Linear regressions were performed for each indicator / drain combination and the results used to rank drains in terms of the strength of their relationship to receiving water conditions. The approximated yearly volume of flow from each drain was then used to qualitatively identify those drains with the highest loading of bacteria to the receiving water. Taken together, these evaluations resulted in the identification of five drains with a combination of high loadings of bacterial indicators and a statistically significant relationship between indicator levels in the drain and the surfzone:

- Aliso Creek (ACM-1)
- Salt Creek (SCM-1)
- Doheny Beach - North Creek Mouth (DSB-5)
- San Juan Creek (SJC1)
- Poche Beach (POCHE).

Table 11.2 summarizes conditions at these drains. Note that this list of drains is similar to, but not identical to, the list of drains with the highest exceedance rates.

These five stormdrains present opportunities for further upstream source identification studies to determine whether persistent receiving water contamination is due to sources near their mouths, to sources higher up in their respective drainage areas, and/or to longshore ocean currents transporting contamination from other nearby drains or creek mouths.

The following projects have been initiated in response to analysis of data from shoreline microbiology monitoring conducted for the Third Term Permit, the South Orange County Water Association (SOCWA) NPDES permit, and the Orange County Health Care Agency beach water quality program.

- The County has funded a \$200,000 microbial source tracking study in the Prima Deshecha Channel watershed. The report will be submitted by the consultant, Weston Solutions, Inc. to the County at the end of August 2006.
- The City of Dana Point has funded the construction, operation and maintenance of the ozone disinfection system for the dry-weather discharges from the Salt Creek Channel. Recent data from the surfzone has shown that the bacterial indicator concentrations are now consistently meeting the AB-411 standards.
- The City of Dana Point has procured grant funding and will provide matching funds for an epidemiological study by SCCWRP on the health effects of ocean water contact near the mouths of the Doheny Beach drains and San Juan Creek.

Ambient Coastal Receiving Water Monitoring

The ambient coastal receiving water component of the water quality monitoring program is intended to assess the impact of urban runoff to ecologically sensitive coastal areas by analyzing the water chemistry, aqueous toxicity, and magnitude of plumes of stormwater discharges to these areas. With this information the Permittees would then

prioritize these sites for further study in terms of their relative degree of potential threat to water quality and ecological resources. Monitoring at these 17 sites focuses primarily on aquatic chemistry and aquatic toxicity during both dry and wet (storm) weather conditions. Aerial photographs of stormwater plumes provide a basis for estimating the relative magnitudes of the impact zones.

Values for five metals are compared to acute toxicity criteria established in the California Toxics Rule (CTR) for guidance and the numbers and percentages of CTR exceedances tabulated. Toxicity tests with marine test organisms provide a measure of the potential toxicity due to different categories of pollutants. Because of the relatively high incidence of toxicity at some stations, the observed level of toxicity (in toxic units) was compared to the predicted toxicity expected from the observed aquatic chemistry results. Predicted toxicity was estimated by first calculating the average LC₅₀ for key chemicals from literature values. This average value was then used to calculate the amount of toxicity (in toxic units) to expect from the concentrations of these chemicals in aquatic chemistry samples. Summing the estimated toxicity from all chemicals resulted in an estimate of the toxicity that theoretically should be present.

For the coastal areas Ambient Coastal Receiving Waters monitoring was designed as an adaptive program whereby the initial monitoring would consist of sampling the discharges from selected coastal stormdrains for water chemistry and toxicity. The data from these samplings would be supplemented by aerial photographs of stormwater plumes in order to determine the drain which showed the greatest impact on its receiving waters. The receiving water for this drain would be selected for an offshore assessment of water quality and toxicity during the fifth year of the program. Water quality and toxicity monitoring of the stormdrains was initiated during a stormwater runoff event in December 2002 and has continued for three years. Aerial photography of stormwater plumes was carried out once in 2004 and once in 2005. Because of limited visibility due to cloud cover the plume photography for the first storm was conducted nearly two days after rainfall had ceased. For the second storm, the altitude of the flight was decreased to a level below the cloud cover which enabled photography at a time closer to the end of the storm.

Table 11.3 summarizes the frequency and pattern of exceedances of the acute saltwater CTR criteria at the ambient coastal receiving water stations during the period from 2002 – 2005. It should be noted that this analysis involved comparison of the freshwater discharges from these stormdrains to saltwater criteria. For each site, the potential impact to the receiving water assumes no dilution of the stormdrain discharge.

The data from this analysis show that exceedances are predominantly due to copper, with a lesser number due to nickel and zinc. The frequency of exceedance of the acute saltwater CTR criterion for copper remained fairly consistent during dry-weather sampling. The percentage of exceedances of the CTR criteria for stormwater samples in the third year appeared to drop dramatically from the prior two years. This observation may be the result of the higher than normal annual rainfall during year, as shown below:

Permit year	Total Samples	Exceeded Cu Criterion #(%)			
		Stormwater Samples	Dry Weather	Stormwater	Rainfall (inches)
1	32	6	14(54%)	4(67%)	14.57
2	39	5	14(41%)	4(80%)	8.41
3	59	39	10(50%)	15(38%)	28.44

Table 11.3 shows that the Doheny Beach stations most frequently exceed CTR values for multiple metals.

The toxicity results from these stations present another perspective on water quality conditions. **Table 11.4** summarizes the average degree of toxicity, averaged over all toxicity tests, at each station over the 2002-05 period. **Figures 11.8** and **11.9** visually present the regional pattern of toxicity, showing that toxicity is primarily concentrated at a subset of the stations, as are the CTR exceedances. The Doheny Beach stations (DSB -1, DSB-3, DSB-4, DSB-5) have consistently high average toxicities; these are generally the same stations with the highest frequencies of CTR exceedances. In addition, several other stations, distributed across a number of watersheds, had high average levels of toxicity. In general, the same stations exhibited elevated toxicity in both dry and wet weather.

There is a general correspondence between the overall patterns of CTR exceedances and toxicity, as exhibited by the Doheny Beach stations. However, other stations with elevated toxicity (e.g., LB-3) do not have higher than average numbers of CTR exceedances. Based on their combined patterns of CTR exceedances and toxicity, the following stations would be the highest priority for special studies to investigate the sources of contamination and/or toxicity:

- Doheny Beach (DSB-1, DSB-3, DSB-4, DSB-5)
- LB-4
- Salt Creek (SCM-1).

Stations DSB-5 and SCM-1 were also two of the five coastal stormdrain stations with persistent exceedances of AB411 standards for indicator bacteria. The differential sensitivity of toxicity test organisms can help provide a starting point for such source identification studies. Urchins and abalone are more sensitive to dissolved metals, while mysids are most sensitive to ammonia and organic compounds, particularly pesticides. Further guidance can be obtained from a comparison of the observed toxicity to that predicted from laboratory studies, as illustrated in **Figure 11.10**. An examination of this comparison for all the toxicity tests from this program component shows that predicted toxicity from zinc is often higher than the observed toxicity, strongly suggesting that zinc may not be as bio-available as other pollutants.

Much of the toxicity in the sea urchin fertilization test can be explained by elevated levels of dissolved metals, particularly copper. The predicted toxicity (from comparison of water chemistry to literature values of LC_{50s}) was higher than the observed toxicity.

This was due primarily to high concentrations of dissolved zinc, suggesting that zinc may be bound to organic ligands and is not completely bio-available.

The observed toxicity in the mysid survival tests is harder to explain because ammonia is very low and organophosphate pesticides were almost never found in the water samples (mysids are especially sensitive to Chlorpyrifos). The predicted toxicity was typically equal to or less than observed, which suggests that there are unknown toxicants affecting the system. Phase I TIEs have been conducted on a limited basis and have thus far proven inconclusive. For most of these TIEs the initial toxicity was only observed in the undiluted sample of the multiple dilution test. The baseline test of the TIE produced no response. The toxicity testing laboratory has hypothesized that the toxicant that caused the initial toxicity was most likely a volatile compound that dissipated over time.

Dana Point Harbor

The Ambient Coastal Receiving Water (ACRW) monitoring program also includes Dana Point Harbor. The monitoring of Dana Point Harbor was initiated in June of 2003 and consists of sampling for water chemistry and aqueous toxicity. Semiannual dry-weather analyses of sediment chemistry, sediment toxicity, and benthic infaunal analyses were added during the 2003-04 monitoring year.

As an enclosed embayment with several stormdrain inputs, Dana Point Harbor is a focus of particular attention within the region. **Figure 11.11** shows that average BRI (Benthic Response Index) scores for station DAPTDC (Dana Cove) were within the reference range, while BRI scores for all other stations fell within Response Level 2, indicating a change in species composition of between 25% and 50% compared to reference. DAPTDC also had relatively low levels of pollutants in the sediments and the lowest level of sediment toxicity (**Figure 11.12**). The bottom at this site consists mostly of rock and large gravel, with very little of the fine sediment which is typically associated with associated with elevated levels of particle-bound pollutants.

The overview presented in **Figure 11.12** shows that, with the exception of station DAPTDC, sediment monitoring data for Dana Point Harbor show a moderate level of impact to the benthic community and a moderate to substantial level of toxicity. The sediment chemistry picture is less clear because data are only available from two samplings (Spring and Fall 2005).

Impacts to the benthic community can stem from both toxicity due to chemical contamination and from physical disturbance. **Figure 11.13** shows that the relationship between BRI score and toxicity, while statistically significant, is not strong. Much of the relationship is driven by the handful of samples with the lowest BRI scores, which are all from station DAPTDC, which is somewhat anomalous. Since the sampling location for DAPTDC does not have a typical muddy bottom its benthic infaunal community is depauperate. Without this station, the regression would not be statistically significant. This finding is similar to results being generated as part of the technical work for the

State Water Resources Control Board's Sediment Quality Objectives project. Using data from embayments throughout California, this project has found that relationships among sediment chemistry, sediment toxicity, and benthic community changes are highly variable. Significant relationships can typically only be documented with large numbers of samples.

The cumulative frequency distribution of sediment toxicity from embayments in the Southern California Bight (**Figure 11.14**), based on data from the Bight '03 regional survey, provides a larger regional context to the toxicity results from Dana Point Harbor. The median mortality in sediment toxicity tests in the Bight '03 data is about 20%, which is lower than the average toxicity of all tests from Dana Point Harbor. **Figure 11.13** shows that the bulk of toxicity results fall between about 20% and 45% mortality relative to test controls.

Region-Wide CTR Exceedance Patterns

The CTR is a convenient benchmark for assessing region-wide patterns. For the purposes of this analysis it is not being used for compliance purposes but merely for guidance as to where the levels of constituents of concern may be persistently elevated.

Aquatic chemistry samples from several components of the water quality monitoring program (urban stream bioassessment, long-term mass loading, ambient coastal receiving water monitoring) were evaluated with respect to criteria for dissolved metals established in the CTR. While such CTR criteria are available for only a portion of the constituents measured in the program's samples, the combination of CTR exceedances from all available program components provides an overview of contamination patterns across the region. In addition to tabulating the number of exceedances at each station, the overall percentage of exceedances at each station (out of all samples collected at each station) was used to place stations into one of four categories representing relative frequency of exceedances.

Table 11.5 summarizes exceedances of acute CTR criteria for dissolved metals at all water quality monitoring stations in the San Diego region with more than one sampling event. For purposes of this assessment, all program components (bioassessment, mass loading, ambient coastal) were combined into one dataset, in order to better represent the spatial pattern of exceedances across the region.

Exceedances overall are predominantly due to copper, with a much smaller percentage due to nickel and zinc. Exceedances of the CTR for cadmium, lead, and silver were extremely rare and thus not included in **Table 11.5**. Most exceedances occur at a subset of the stations along the coast. There is year-to-year variability within this larger pattern, although this appears to be somewhat related to the amount of annual rainfall. **Figures 11.15** and **11.16** visually summarize these regional patterns, using the data presented in **Table 11.5**.

Within these larger patterns, the CTR exceedance data help identify locations where targeted special studies to identify upstream sources should be implemented. These are stations with more than a handful of samples where both the exceedance rate and/or the number of pollutants showing exceedances are among the highest:

- ACJ01
- SCM-1
- PDCM01
- SDCM02
- SJNL01
- DSB-5

Stations DSB-5 and SCM-1 were also two of the five coastal stormdrain stations with persistent exceedances of AB411 standards for indicator bacteria. It should be noted that stations ACJ01 and SJNL01 are a significant distance upstream of their respective coastal receiving waters and that their respective Ambient Coastal Receiving Waters monitoring locations ACM1 and SJC1 show much less of an impact with respect to the acute saltwater criteria from the CTR. These findings suggest that sampling of a mass emissions site and its corresponding ACRW discharge point be monitored concurrently during storms to more accurately evaluate the potential impacts of urban runoff.

Region-wide Toxicity Patterns

Aquatic toxicity test results from several components of the water quality monitoring program (urban stream bioassessment, long-term mass loading, ambient coastal receiving water monitoring) were combined to present a picture of how toxicity is distributed throughout the region. The average mortality rate of test organisms at each station was used to place each station into one of four categories representing relative intensity of toxicity. **Figures 11.17** and **11.18** show the distribution of relative toxicity across the region. In both dry and wet weather, toxicity is concentrated along the coast, although toxicity is detected somewhat further inland during wet weather.

11.2.2 Implementation of the Dry-weather Monitoring Program

The proposal for the Dry-weather Monitoring Program to detect illegal discharges and illicit connections (ID/ICs) to the stormdrain system was submitted to and subsequently approved by the Regional Board in February 2003. Monitoring was initiated in May 2003 and has continued each dry-weather season (May 1 - September 30).

The program includes monitoring 3 times annually at approximately 30 randomly selected stormdrains (random sites) to determine regional mean concentrations of constituents of concern. Each Permittee selected several stormdrains (targeted sites) within their respective jurisdiction, which were suspected to contain ID/ICs. These targeted sites were sampled monthly (5 times annually) for the same constituents. Triggers for source investigations were established using two statistical methods:

- If on consecutive sampling dates, the value of a monitored constituent exceeds the upper bound (lower bound for dissolved oxygen) of the tolerance interval around the estimated 90th percentile of random site data for that constituent, or
- The value of a monitored constituent exceeds the control limits for that constituent at that site. The control limits are set at 3.9 standard deviations above (below for dissolved oxygen) the mean for that site.

The Permittees are provided an updated spreadsheet of the monitoring data on a monthly basis throughout the dry-weather season. The tolerance intervals are updated periodically as more data are compiled. Extreme values of physical properties or chemical constituents measured in the field triggers immediate notification of the authorized inspector(s) of the city or cities which have jurisdiction within the watershed of the offending stormdrain. In many instances (e.g. high surfactant or TSS discharges) the responsible party has been identified quickly by the authorized inspector.

11.2.3 Establishment of a New Water Quality Database

In 2004, a new computer program was developed for managing NPDES monitoring data. The intent of this program which has been called Labtrack, is to provide a single repository for all current NPDES data, to reduce the number of systematic errors in monitoring and laboratory analyses, and to increase the efficiency in processing invoices for the payment of analytical services. Some of the features of Labtrack include the ability to:

- Produce customized periodic data summaries
- Print labels for sampling containers
- Print and maintain chain-of-custody documentation
- Check laboratory results against quality assurance criteria
- Check invoice pricing against price agreements
- Integrate discharge rate information from Hydstra (hydrologic database) to calculate load information for Performance Evaluation Assessment (PEA) and TMDL reports

11.2.4 Participation in Regional Monitoring Programs

Since 1997, the Permittees have been an active participant in the Regional Monitoring Program for the Southern California Bight. A Permittee representative has served on the steering committees for the 1998 Regional Assessment (Bight 98) and the 2003 Assessment (Bight 03). A representative has also served on several of the monitoring subcommittees on Bight 03.

The Permittees have also provided representation to the southern California Stormwater Monitoring Coalition. A Permittee representative was instrumental in the development of the Model Stormwater Monitoring Program guidance document which has incorporated many of the same methods used in this program. A Permittee representative is currently on the working group with SCCWRP and the California

Department of Fish and Game to improve the California Stream Bioassessment Procedure.

The Permittees are also participating in the Regional Harbor Monitoring Program (RHMP), which was designed and implemented in response to a 13267 letter from the San Diego Regional Water Quality Control Board. The RHMP is intended to help answer fundamental questions about the status of and trends in beneficial uses in the coastal harbors along this region of the coast. Dana Point Harbor, in southern Orange County, is included in the RHMP.

The RHMP uses a stratified random design modeled on the Bight Program approach and intended to ensure that the RHMP data are compatible with data from the periodic Bight Program. While the Bight Program uses a single stratum for harbors, the RHMP has identified multiple strata within harbors in order to provide for more detailed assessments of conditions. These strata are based on both structural (e.g., depth) and use (e.g., industrial, marina) features of harbors. Within each stratum, a broad range of indicators are sampled, including water quality, sediment quality and characteristics, toxicity, and fish tissue contamination. The RHMP is being implemented in two phases. The first phase focuses on using a more limited sampling protocol to validate design assumptions and gather the information needed for full implementation in the second, permanent, phase. The first phase will include 3 years of data collection and evaluation to validate design assumptions and sampling protocols. The first year of data collection was completed in 2005.

The knowledge gained from participation in these regional programs has enabled the Permittees to improve the monitoring program in many ways. The newly established price agreements for analytical services for the stormwater program required that the vendor had participated in the rigorous laboratory inter-calibration exercises for the Bight Regional Monitoring Program. These exercises, coordinated by SCCWRP, ensured that the accuracy and precision by each of the participating laboratories were maintained at a high standard.

11.2.5 Involvement in Research Level Investigations

The Permittees also contributed monitoring equipment and funding to UCI to conduct bacteriological investigations in the Santa Ana River and Huntington Beach surfzone. As a result of the study findings, the dry-weather discharges of several channels which drain to that area have been diverted to the Orange County Sanitation District. Since the diversions have been implemented there has been an improvement in scores for the surfzone in that area on Heal the Bay's Beach Water Quality Report Card.

On behalf of the Aliso Creek Watershed Permittees, the County worked with UC Irvine researchers Dr. Sunny Jiang and Dr. Betty Olson to investigate sources of bacteria in the J03P02 sub-watershed of Sulphur Creek. The UCI researchers used three Microbial Source Tracking (MST) methods to identify the sources of bacteria from samples collected in the sub-watershed from May through August 2002. These MST methods included: (1) analysis for human enteric viruses, (2) analysis for genetic biomarkers

indicative of human, cow, pig/cat, rabbit, and bird sources, and (3) Antibiotic Resistance Analysis (ARA). The analysis of samples for biomarkers of human and animal sources showed no samples with biomarkers of human origin, and showed that all or almost all samples had biomarkers of bird, rabbit, and cow origin. Findings from the human virus and ARA studies suggest that sewage was an unlikely source of fecal coliform in the drainage system, and that bacteria from wild animal feces were the dominant source of *Enterococci* in the watershed. Further details can be found in the eighth quarterly progress report for the Aliso Creek Directive, dated April 30, 2003, and ninth quarterly progress report, dated July 31, 2003.

11.3 Assessment

The monitoring results described in the preceding section have led to conclusions about patterns of impact and the potential sources of these impacts. These conclusions, summarized below, provide the basis for the summary recommendations in **Section 11.4**.

The current Urban Bioassessment monitoring program in South Orange County utilizes the triad approach from the SMC's model stormwater monitoring program. The results from the first three years of monitoring have shown that there is a clear pattern of lower IBIs in the more urbanized portions of watersheds, and this pattern appears to primarily reflect habitat degradation rather than aquatic toxicity due to chemical contamination. This is a typical result of bioassessment monitoring programs elsewhere in the country. These findings suggest further investigation of the relationship between the physical habitat and biological communities.

The current method of triad monitoring consists of a synoptic evaluation of the chemistry, toxicity, and bioassessment (physical habitat assessment and IBI score). IBI score may not be reflective of the water chemistry or toxicity testing results if the water quality is not consistent. If intermittent discharges of toxicants affect the study area they may not be measured during the synoptic sampling. If low IBI scores cannot be attributed to physical habitat degradation a more comprehensive water quality study should be conducted.

The Mass Emission monitoring program evaluates long-term trends in pollutant loading. Although the current mass emissions monitoring program has not yet generated enough data over time to fully accomplish this goal, it has identified two channels (Prima and Segunda Deshecha) with stormwater discharges that have shown persistent toxicity to marine test organisms.

The Coastal Stormdrain Outfall monitoring program provides a weekly indicator of the impacts to the coastal zone from bacteria in urban runoff. The program has enabled the Permittees to identify surfzone areas near the outlets of stormdrains that have shown the highest frequency of exceeding AB411 single-sample ocean water sports contact standards.

The first four years of the Ambient Coastal Receiving Waters program involved monitoring the chemistry and aquatic toxicity of dry weather and stormwater discharges to ecologically sensitive areas along the southern Orange County coastline. During two storms aerial photographs were taken of the stormwater plumes to estimate the spatial extent of the impact of urban runoff. While the impacts of urban runoff to the coastline were monitored indirectly, it did enable the Permittees to identify the stormdrains that had the highest concentrations of urban pollutants and showed the greatest potential for toxic effects to nearshore areas. In Dana Point Harbor the impacts to the receiving waters were monitored directly. Monitoring was conducted in the harbor near the outlets of the stormdrains with measurements of water chemistry and aqueous toxicity, sediment chemistry, sediment toxicity, and benthic infaunal analyses.

11.4 Summary

The data analysis results form the basis for the following recommendations for further investigations and modifications to the monitoring design itself. The proposed further studies are focused on improving our understanding of the sources and causes of the observed impacts. The suggested modifications to the program are intended to improve the cost effectiveness of the program by focusing on those areas where impacts are most persistent or where substantial knowledge gaps remain.

11.4.1 Receiving Water Monitoring Program

Urban Stream Bioassessment

The past three years of bioassessment data suggest that physical habitat rather than water chemistry has a greater influence on IBI scores. The Permittees will conduct statistical analyses of the relationship between the components of the IBI and physical habitat (PHAB) scores to provide more detailed insight into the specific aspects of physical habitat most important to maintaining biological communities. If the specific aspect(s) of physical habitat causing the impairment can be identified, the Permittees will investigate BMPs and/or management measures to improve the physical habitat and reduce the impairment. The Permittees will also continue to participate in the SMC's working group to improve the current DF&G California Stream Bioassessment Procedure.

There are two sites (REF-CS and WC-WCT) that exhibited higher than system-wide average physical habitat scores but low IBI scores. These sites will be the focus of targeted special studies which would include:

- Reconnaissance of the immediate upstream watershed to locate all natural and manmade inputs to the channel. The discharges from these inputs will be field screened (using Dry-weather Reconnaissance tools) to identify candidates for more comprehensive monitoring.
- Sampling for intermittent discharges of low concentrations of toxicants (e.g. pesticides and dissolved metals) which may be affecting the intolerant species at the bioassessment locations. Using automatic sampling equipment, 24-hour composite samples will be collected at the bioassessment site, one day each week for the four weeks prior to bioassessment monitoring. The composite samples will be analyzed for nutrients, trace metals, pesticides (organophosphates, carbamates, pyrethroids), and water toxicity (Ceriodaphnia and Hyallella survival in undiluted samples).

Mass Emissions Monitoring

Two of the sites (PDCM01 and SDCM02) showed persistent toxicity in the mysid survival/growth tests. The OP pesticide data could not account for this toxicity. During the upcoming storm season the suite of pesticide analyses will be expanded to include carbamates and pyrethroids.

More high-flow instantaneous discharge measurements will be made at the streamgaging locations operated by the Permittees in order to improve the accuracy of the channel stage-discharge relationships (ratings). Equipment utilizing state-of-the-art acoustic Doppler current profiling technology has been recently purchased to enable rapid measurements of discharge rates.

Coastal Stormdrain Outfall Monitoring

Three years of monitoring data show that there is a small subset of coastal drains that display persistent exceedances of AB411 standards and for which there is a statistically significant relationship between bacterial indicator levels in the drain discharge and the surfzone.

The consistency of this overall pattern supports a recommendation to consider reducing monitoring effort at those stormdrains that rarely if ever have exceedances and reprogramming that effort toward more intensive investigations of the problematic drains. The actual amount of any such reduction would be determined only after an evaluation of the statistical consequences of a reduction in monitoring frequency and in consultation with the Permittees and Regional Board staff.

Ambient Coastal Receiving Water Monitoring

The ACRW monitoring results highlight the following questions and/or issues that will be addressed either through targeted special studies or modifications of the scope of on-going monitoring.

Source Identification and Determining Causes of Toxicity

Examination of the water chemistry results provided insight into the causes of toxicity in the sea urchin fertilization tests. The toxicity in the mysid /survival growth tests however could not be explained either with water chemistry or phase I TIEs. To aid in identifying the unknown causes of toxicity in the mysid tests, the water chemistry analyses of the stormdrain discharges will be expanded to include carbamate and pyrethroid pesticides. If found, the concentrations of these pesticides will be compared to their respective literature values for the LC₅₀ in the mysid survival test. If a carbamate and/or pyrethroid pesticide is consistently found and their LC₅₀s for the mysid survival test have not been determined, the program would propose that the SMC conduct toxicity tests to determine those LC₅₀s.

There is a subset of six stations that provide targets for special studies to identify upstream sources of contamination and toxicity, based on the number of pollutants showing exceedances to CTR criteria, the high percentage of the time these exceedances occurred, and the level of toxicity observed. These sites include the Doheny Beach stormdrains (DSB-1, DSB-3, DSB-4, and DSB-5), a 48-inch stormdrain south of Main Beach in Laguna Beach (LB-4), and Salt Creek Mouth (SCM1).

A start on these efforts was made during the 2005-06 monitoring year, when the discharge from the DSB-5 stormdrain (North Beach Creek) was monitored extensively during a storm in March 2006. An automatic sampler was used to collect samples representative of the first flush and a 24-hour period after the first flush. In addition to the usual stormwater analyses for nutrients, metals, OP pesticides, and aquatic toxicity the Permittees also analyzed these samples for dissolved organic carbon, pyrethroid pesticides, organochlorine pesticides, PCBs, polynuclear aromatic hydrocarbons, and oil and grease. The results of this monitoring will be presented in the 2005-06 PEA report and will be used as guidance for special investigations of the drains described in the preceding paragraph.

Measuring Direct Impacts to the ACRWs

The toxicity testing results and the aerial photographs of stormwater plumes were used to select two coastal receiving waters (off of North Beach Creek and Salt Creek) for nearshore monitoring during a significant stormwater runoff event in the upcoming year.

The discharge from North Beach Creek in Doheny has shown significant amounts of metals and toxicity during both dry weather and stormwater runoff conditions. The

spatial extent of the stormwater plume from this drain appears to be limited to the jetty immediately west of the mouth of the creek.

The discharge from Salt Creek has also shown significant amounts of toxicity in the mysid survival/growth tests. Although the watershed area and consequently the stormwater discharge volume are much smaller than those of San Juan or Aliso Creeks, the impact of Salt Creek on the nearshore habitat may be greater.

Because the Permittees do not currently possess an ocean-worthy vessel for offshore monitoring during storm conditions, a price agreement with a consultant will be established to perform the monitoring off the mouth of Salt Creek. The monitoring will be consistent with those used in the assessment of stormwater plumes conducted as part of the Bight '03 Regional Monitoring Program. Monitoring of the physical characteristics of the plume and sample collection will be conducted by the consultant. Sample analyses will be performed by the Permittees' analytical services and toxicity testing providers. The localized monitoring of the impacts from North Beach Creek near the Dana Point Harbor jetty will be conducted by Permittee staff.

Dana Point Harbor

The monitoring data indicate that at least one area is significantly impacted by urban runoff. To determine the type of contaminant causing the high toxicity in the benthic sediment near the outlet of East Basin stormdrain (DAPTEB), a sediment TIE will be conducted. In addition to the routine analyses for sediment chemistry these samples will also be analyzed for polynuclear aromatic hydrocarbons, mercury, and tributyl tin. If the cause of the toxicity is identified, a source identification study will be initiated in the watershed of the Golden Lantern stormdrain.

11.4.2 Database Improvements

A module will be created for the Labtrack database which will enable the Permittees to produce data files consistent with the SMC's Standardized Data Transfer Format (SDTF). The SDTF is a Microsoft Access based format that will allow data transfer between Southern California Stormwater agencies.

¹ At each site, one (upcoast) or two samples (upcoast and downcoast) are collected from the surfzone. For each sample three tests for pathogen indicator bacteria (total coliform, fecal coliform, and Enterococcus) are conducted. Hits represent the ratio of the number of exceedances of the AB-411 standards to the total number of tests conducted.

12.0 WATERSHED ACTION PLANS

12.1 Introduction

The Third Term Permits have, with varying degrees of specificity, required the Permittees to develop and implement a watershed-based approach to urban stormwater management to complement the established jurisdictional-based approaches. In the area of the County under the jurisdiction of the San Diego Regional Board, Watershed Urban Runoff Management Plans (WURMPs) termed DAMP/Watershed Action Plans¹ (WAPs), have been prepared for each of the six principal watersheds. In the Santa Ana Regional Board area of the County, which has a long history of watershed planning focused on the Newport Bay Watershed, the Permittees were required to update Appendix N of the DAMP to reflect the implementation measures and schedules related to the fecal coliform TMDL.

Watershed management is the term used for the approach to water quality planning that places an emphasis on the watershed (the area draining into a river system, ocean or other body of water through a single outlet) as the planning area and looks to solutions to problems that cut across programs and jurisdictions. In Orange County, these efforts focus additional effort on the highest priority water quality constituents of concern in each watershed.

The approach taken to develop the DAMP/WAPs establishes the jurisdictional DAMP/LIPs and the DAMP/WAPs as the principal policy and program documents for two separate, but nonetheless similar and highly interdependent, water quality planning processes targeting the control of pollutants in urban runoff (see **Section 3.0, 2007 DAMP**). In a number of watersheds these efforts are supportive of a third planning process that is focused on achieving broader objectives such as watershed habitat restoration and connectivity rather than specific water quality outcomes.

Six distinct watersheds (See **Figure 12.1**) were recognized in the Third Term Permits within the San Diego Regional Board area which are identified below:

Region 9	Watershed Planning Area	Major Watercourses
San Diego	Laguna Coastal Streams	Laguna Canyon Creek
	Aliso Creek	Aliso Creek
	Dana Point Coastal Streams	Salt Creek
	San Juan Creek	San Juan Creek, Oso Creek, Trabuco Creek, Bell canyon, Verdugo Canyon
	San Clemente Coastal Streams	Prima Deshecha, Segunda Deshecha
	San Mateo Creek	San Mateo Creek

¹ Previously termed DAMP/Watershed Chapters

12.2 Accomplishments

Through the current Permit term, the six south Orange County watersheds have been the focus of watershed-based water quality planning and a number of environmental restoration planning initiatives.

12.2.1 Watershed-Based Water Quality Planning Efforts

In August 2003, DAMP/WAPs, including new GIS-based watershed delineations (and sub-watershed delineations in the Aliso Creek Watershed), were completed for each of the six watersheds. The documents present a watershed-based planning process for each watershed to focus activities on priority water quality constituents of concern. Concurrently, DAMP/WAP committees were established which have met at least bi-annually (excepting the San Mateo DAMP/WAP).

DAMP/WAP Objectives:

- To meet the requirements for a Watershed Urban Runoff Management Plan (WURMP) contained in the municipal National Pollution Discharge Elimination System (NPDES) stormwater permit (Order R9-2002-0001, Section J).
- To identify the most significant water quality issues and constituents of concern on a watershed scale and relate these to urban sources.
- To focus the pollution prevention and source control programs implemented at an individual jurisdiction level on the identified constituents of concern and to identify any jurisdiction-specific treatment control opportunities.
- To identify the water quality issues that are most appropriately addressed through a multi-jurisdictional watershed-scale approach.
- To incorporate information obtained from prior planning studies.
- To develop an integrated plan of action that results in meaningful water quality improvement at a watershed scale that balances economic, social, and environmental constraints.
- To identify indicators to track progress.

At the time of their preparation it was assumed that the DAMP/WAPs would ultimately evolve into TMDL implementation plans. Indeed, the anticipated development of the Beaches and Creeks Pathogen Indicator Bacteria TMDL established pathogen indicator bacteria as the priority constituent of concern in each watershed

The DAMP/LIP and DAMP/WAP planning processes essentially result in *Baseline BMPs* and *Enhanced BMPs*, respectively. *Baseline BMPs* are based upon the model programs identified in the DAMP and are implemented on a countywide basis to contribute to the control of all pollutants. *Enhanced BMPs* generally target watershed priority constituents of concern (currently pathogen indicator bacteria). The DAMP/WAP planning process also incorporates actions to comply with California Water Code (CWC) directives and

SECTION 12, WATERSHED ACTION PLANS

abatement orders. Progress on DAMP/WAP implementation has been reported in the FY2003-04 and FY2004-05 Annual Progress Reports.

The subsequent sections identify the Enhanced BMPs, compiled by watershed, that have been implemented by the Permittees. The information in parentheses uniquely identifies each Enhanced BMP with respect to the Action Plans included in the FY2004-05 WAP Annual Progress Reports, specifically:

XX-Y#z

Where XX - Jurisdictional identifier e.g. LB = Laguna Beach
Y - Long term (L) or Short term (S) Strategy
- Objective
z - Management action

These reports should be referred to for more detailed information regarding the Enhanced BMP and its implementation schedule.

- **Laguna Coastal Streams:**

Examples of Enhanced BMP implementation efforts in the watershed targeting pathogen indicator bacteria include:

- Construction of diversion systems with hydrodynamic separator units to control runoff pollution (LB-L3b), and
- Provision of public education materials that address pet and horse care (AV-S3a, LB-S3a, LW-S3f, LW-S3d).

- **Aliso Creek:**

Monitoring Program

On March 2, 2001, the San Diego Regional Board issued a directive pursuant to California Water Code Section 13225 ("Directive") to the Principal Permittee and the cities within the Aliso Creek Watershed ("Watershed Permittees") for an investigation of urban runoff in the watershed. The Directive found that the Watershed Permittees may be discharging waste with high bacteria levels from municipal storm drain outfalls into Aliso Creek and its tributaries. To meet requirements of the Directive, the Watershed Permittees implemented a watershed-wide regional bacteriological monitoring program in April of 2001.

Monitoring data was collected weekly at 37 locations throughout the watershed. The monitoring of each site included collection of bacteriological samples from the storm drain discharge and within the receiving water body and estimates of flowrates. Data was analyzed for trends and patterns in bacteria levels and reported quarterly through November 2005.

A revised regional monitoring program that more efficiently allocates efforts to source identification and reduction was approved in [GET] and began implementation in June 2006. The revised program focuses monitoring efforts on “status sites” and “trends sites” in the lower watershed and on a “BMP evaluation sites” at high-priority drains throughout the watershed.

The monitoring of status and trend sites addresses two questions:

1. Are conditions in receiving waters protective of beneficial uses? (status)
 2. Are conditions in receiving waters getting better or worse over time? (trends)
- Status and trends monitoring takes place at five core stations in the lower portion of the watershed, which past studies indicate is the area of highest recreation use and related concern about potential human health impacts. Despite some variability among them, the stations as a group provide a picture of conditions in the lower portion of the Creek. These five stations will be monitored during August and September, at a frequency of 10 samples per month. This period represents the most conservative sampling period because it captures the annual peak of bacteria levels in the watershed and the time of year that body contact recreation is most likely.

The BMP evaluation monitoring focuses on answering three questions:

1. Have bacteria loads from the high-priority drains decreased?
2. Are BMPs having their intended effects on concentrations in and/or loads from the drains?
3. Have impacts from high-priority drains on the receiving waters decreased?

Data from the BMP evaluation sites will also be compared to the results of the status and trends monitoring in the lower sections of Aliso Creek. This will help to assess whether a reduction in loads at the high-priority drains is associated with improving conditions in the lower Creek. Data and results of the revised monitoring program will be submitted on an annual basis on November 15th of each year.

In the spring of 2003, on behalf of the Watershed Permittees, the Principal Permittee worked with UC Irvine researchers Dr. Sunny Jiang and Dr. Betty Olson to investigate sources of bacteria in the J03P02 sub-watershed. The UCI researchers used three Microbial Source Tracking (MST) methods to identify the sources of bacteria from samples collected in the sub-watershed from May through August 2002. These MST methods included: (1) analysis for human enteric viruses, (2) analysis for genetic biomarkers indicative of human, cow, pig/cat, rabbit, and bird sources, and (3) Antibiotic Resistance Analysis (ARA). The analysis of samples for biomarkers of human and animal sources showed no samples with biomarkers of human origin, and showed that all or almost all samples had biomarkers of bird, rabbit, and cow origin. Findings from the human virus and ARA studies suggest that sewage was an unlikely source of fecal coliform in the drainage system, and that bacteria from wild animal feces were the dominant source of *Enterococci* in the

watershed.
