The commission shall not find costs mandated by the state, as defined in Section 17514, in any claim submitted by a local agency ... if, after a hearing, the commission finds any one of the following: [¶]...[¶] (d) The local agency ... has the authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service.

The California Supreme Court upheld the constitutionality of Government Code section 17556, subdivision (d), in *County of Fresno v. State of California*.¹⁸⁷ The court, in holding that the term “costs” in article XIII B, section 6, excludes expenses recoverable from sources other than taxes, stated:

Section 6 was included in article XIII B in recognition that article XIII A of the Constitution severely restricted the taxing powers of local governments. (See *County of Los Angeles, supra*, 43 Cal.3d at p. 61.) The provision was intended to preclude the state from shifting financial responsibility for carrying out governmental functions onto local entities that were ill equipped to handle the task. (*Ibid.*; see *Lucia Mar Unified School Dist. v. Honig* (1988) 44 Cal.3d 830, 836, fn. 6 [244 Cal.Rptr. 677, 750 P.2d 318].) Specifically, it was designed to protect the tax revenues of local governments from state mandates that would require expenditure of such revenues. Thus, although its language broadly

¹⁸⁶ Water Code section 13376; 40 Code of Federal Regulations, section 122.21 (a). The Federal regulation applies to U.S. EPA-issued permits, but is incorporated into section 123.25 (the state-program provision) by reference. Also see the 2007 permit, page 2, part A.

¹⁸⁷ *County of Fresno v. State of California, supra*, 53 Cal.3d 482.

declares that the “state shall provide a subvention of funds to reimburse ... local government for the costs [of a state-mandated new] program or higher level of service,” read in its textual and historical context section 6 of article XIII B requires subvention only when the costs in question can be recovered *solely from tax revenues*.

In view of the foregoing analysis, the question of the facial constitutionality of section 17556(d) under article XIII B, section 6, can be readily resolved. As noted, the statute provides that “The commission shall not find costs mandated by the state ... if, after a hearing, the commission finds that” the local government “has the authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service.” Considered within its context, the section effectively construes the term “costs” in the constitutional provision as excluding expenses that are recoverable from sources other than taxes. Such a construction is altogether sound. As the discussion makes clear, the Constitution requires reimbursement only for those expenses that are recoverable solely from taxes. It follows that section 17556(d) is facially constitutional under article XIII B, section 6.¹⁸⁸

In another case about subdivision (d) of section 17556, *Connell v. Superior Court*,¹⁸⁹ the dispute was whether local agencies had sufficient fee authority for a mandate involving increased purity of reclaimed wastewater used for certain types of irrigation. The court cited statutory fee authority for the reclaimed wastewater, and noted that the water districts did not dispute their fee authority. Rather, the water districts argued that they lacked “sufficient” fee authority in that it was not economically feasible to levy fees sufficient to pay the mandated costs. In finding the fee authority issue is a question of law, the court stated that Government Code section 17556, subdivision (d), is clear and unambiguous, in that its plain language precludes reimbursement where the local agency has the authority, i.e., the right or the power, to levy fees sufficient to cover the costs of the state-mandated program.” The court rejected the districts’ argument that “authority” as used in the statute should be construed as a “practical ability in light of surrounding economic circumstances” because that construction cannot be reconciled with the plain language of section 17556, and would create a vague standard not capable of reasonable adjudication. The court also said that nothing in the fee authority statute (Wat. Code, § 35470) limited the authority of the districts to levy fees “sufficient” to cover their costs. Thus, the court concluded that the plain language of section 17556 made the fee authority issue solely a question of law, and that the water districts could not be reimbursed due to that fee authority.¹⁹⁰

¹⁸⁹ *Connell v. Superior Court* (1997) 59 Cal.App.4th 382.

¹⁹⁰ *Connell v. Superior Court*, *supra*, 59 Cal.App.4th 382, 398-402.

1. Claimants' have regulatory fee authority (within the meaning of Gov. Code, § 17556, subd. (d)) under the police power sufficient to pay for the mandated activities that do not require voter approval under Proposition 218: the hydromodification plan and low-impact development.

In its October 2008 comments, the State Board asserted that the claimants have fee authority to pay for the permit activities. Although the Board recognizes "limitations on assessing fees and surcharges under California law ... [concerning] the percentage of voters who must approve the assessment" the Board points to examples of local agencies (Cities of Los Angeles, San Clemente, and Palo Alto) that have successfully adopted an assessment. The State Board also argues that the cities' trash collection responsibilities may also include street sweeping and conveyance system cleaning for which the city could charge fees, and that developer fees could be charged for hydromodification and low impact development.

Claimants, in comments submitted in February 2009, state that they cannot unilaterally impose a fee to recover the cost to comply with the 2007 permit on water or sewer bills sent to residents because of *Howard Jarvis Taxpayer Assoc. v. City of Salinas*,¹⁹¹ in which the court invalidated a stormwater management utility fee imposed by the city on all owners of developed parcels in the city. The court held that article XIII D (Proposition 218) of the California Constitution "required the city to subject the proposed storm drainage fee to a vote of the property owners or the voting residents of the affected area."¹⁹² As to the argument that claimants can put the fee to a vote in their jurisdictions, claimants state as follows:

Articles XIII C and XIII D, which were added to the Constitution by Proposition 218, regulate the imposition of general and special taxes as well as the imposition of special assessments and property related fees. In each of these cases the question of whether to impose a tax, special assessment or a property related fee must be submitted to and approved by the voters. And, in the case of a special tax, and in certain instances the imposition of a fee or charge, the tax or fee must be approved by a two-thirds vote of the resident voters. The State fails to cite any authority that requires the copermittees to first submit the question of whether to impose a tax or fee to the voters and have them reject the proposition. Such a requirement would render all mandate claims moot, without first submitting the question of whether to impose a tax or assessment to a vote of the electorate.

The issue of local fee authority for municipal stormwater permit activities in this permit cannot be answered without discussing regulatory fee authority under the police power and the limitations on that authority via the voter-approval requirement in article XIII D of the California Constitution (Proposition 218).

Case law has recognized three general categories of local agency fees or assessments: (1) special assessments, based on the value of benefits conferred on property; (2) development fees, exacted in return for permits or other government privileges; and (3) regulatory fees, imposed under the police power.¹⁹³ The regulatory and development fees are discussed below in the context of

¹⁹¹ *Howard Jarvis Taxpayers Assoc. v. City of Salinas* (2002) 98 Cal.App.4th 1351, 1358-1359.

¹⁹² *Id.* at page 1358-1359.

¹⁹³ *Sinclair Paint v. State Board of Equalization* (1997) 15 Cal.4th 866, 874.

XIII D (Proposition 218) that would allow the claimants to impose fees for the activities in the test claim related to development.

Regulatory fee authority under the police power: The law on local government fee authority begins with article XI, section 7, of the California Constitution, which states: “A county or city may make and enforce within its limits all local, police, sanitary, and other ordinances and regulations not in conflict with general laws.” Article XI, section 7, includes the authority to impose fees, and courts have held that “the power to impose valid regulatory fees does not depend on legislatively authorized taxing power but exists pursuant to the direct grant of police power under article XI, section 7, of the California Constitution.”¹⁹⁴

Water pollution prevention is also a valid exercise of government police power.¹⁹⁵

In *Sinclair Paint v. State Board of Equalization*,¹⁹⁶ the California Supreme Court upheld a fee on manufacturers of paint that funded a child lead-poisoning program that provided evaluation, screening, and medically necessary follow-up services for children who were deemed potential victims of lead poisoning. The program was entirely supported by fees assessed on manufacturers or other persons contributing to environmental lead contamination. In upholding the fee, the court ruled that it was a regulatory fee imposed under the police power and not a special tax requiring a two-thirds vote under article XIII A, section 4, of the California Constitution. The court stated:

From the viewpoint of general police power authority, we see no reason why statutes or ordinances calling on polluters or producers of contaminating products to help in mitigation or cleanup efforts should be deemed less “regulatory” in nature than the initial permit or licensing programs that allowed them to operate.

Viewed as a mitigating effects measure, [the fee] is comparable in character to several police power measures imposing fees to defray the actual or anticipated adverse effects of various business operations.¹⁹⁷ [Emphasis added.]

Regulatory fees also help to prevent or mitigate pollution, as the Court said: “imposition of ‘mitigating effects’ fees in a substantial amount ... also ‘regulates’ future conduct by deterring further manufacture, distribution, or sale of dangerous products, and by stimulating research and development efforts to produce safer or alternative products.”¹⁹⁸ The court also recognized that regulatory fees do not depend on government-conferred benefits or privileges.¹⁹⁹

¹⁹⁴ *Mills v. County of Trinity* (1980) 108 Cal.App.3d 656, 662, in which a taxpayer challenged a county ordinance that imposed new and increased fees for county services in processing subdivision, zoning, and other land-use applications that had been adopted without a two-thirds affirmative vote of the county electors.

¹⁹⁵ *Freeman v. Contra Costa County Water Dist.* (1971) 18 Cal.App.3d 404, 408.

¹⁹⁶ *Sinclair Paint v. State Board of Equalization* (1997) 15 Cal.4th 866.

¹⁹⁷ *Sinclair Paint v. State Board of Equalization, supra*, 15 Cal.4th 866, 877.

¹⁹⁸ *Sinclair Paint v. State Board of Equalization, supra*, 15 Cal.4th 866, 875-877.

¹⁹⁹ *Id.* at page 875.

Although the holding in *Sinclair Paint* applied to a state-wide fee, the court's language (treating "ordinances" the same as "statutes") recognizes that local agencies also have police power to impose regulatory fees, and it relied on local government police power cases in its analysis.²⁰⁰

Other cases have defined a regulatory fee as an imposition that funds a regulatory program²⁰¹ or that distributes the collective cost of a regulation²⁰² and is "enacted for purposes broader than the privilege to use a service or to obtain a permit. ...the regulatory program is for the protection of the health and safety of the public."²⁰³ Courts will uphold regulatory fees if they do not exceed the reasonable cost of providing services necessary to the activity on which the fee is based and are not levied for an unrelated revenue purpose.

In upholding regulatory fees for environmental review by the California Department of Fish and Game, the court of appeal summarized the following rules on regulatory fees:

A regulatory fee may be imposed under the police power when the fee constitutes an amount necessary to carry out the purposes and provisions of the regulation. [Citations omitted.] Such costs ... include all those incident to the issuance of the license or permit, investigation, inspection, administration, maintenance of a system of supervision and enforcement. [Citations omitted.] Regulatory fees are valid despite the absence of any perceived "benefit" accruing to the fee payers. [Citations omitted.] Legislators "need only apply sound judgment and consider 'probabilities according to the best honest viewpoint of informed officials' in determining the amount of the regulatory fee."²⁰⁴ [Emphasis added.]

In *Tahoe Keys Property Owner's Assoc. v. State Water Resources Control Board*,²⁰⁵ the court refused to issue a preliminary injunction against collecting a pollution mitigation fee of \$4000 for each lot developed in the Tahoe Keys subdivision of Lake Tahoe. The fees were to be used for mitigation projects designed to achieve a net reduction in nutrients generated by the Tahoe Keys development. The court said: "on the face of the regulation, there appears to be a sufficient

²⁰⁰ *Sinclair Paint v. State Board of Equalization*, *supra*, 15 Cal.4th 866, 873. The Court stated: "Because of the close, 'interlocking' relationship between the various sections of article XIII A (Citation omitted) we believe these "special tax" cases [under article XIII A, § 3, state taxes] may be helpful, though not conclusive, in deciding the case before us. The reasons why particular fees are, or are not, "special taxes" under article XIII A, section 4, [local government taxes] may apply equally to section 3 cases."

²⁰² *Id.* at 952.

²⁰³ *Ibid.*

²⁰⁴ *California Assn. of Prof. Scientists v. Dept. of Fish and Game*, *supra*, 79 Cal.App.4th 935, 945.

²⁰⁵ *Tahoe Keys Property Owner's Assn. v. State Water Resources Control Board* (1993) 23 Cal.App.4th 1459.

nexus between the effect of the regulation and the objectives it was supposed to advance to support the regulatory scheme [mitigation of pollution in Lake Tahoe].”²⁰⁶

A variety of local agency regulatory fees have been upheld for various programs, including: processing subdivision, zoning, and other land-use applications,²⁰⁷ art in public places,²⁰⁸ remedying substandard housing,²⁰⁹ recycling,²¹⁰ administrative hearings under a rent-control ordinance,²¹¹ signage,²¹² air pollution mitigation,²¹³ and replacing converted residential hotel units.²¹⁴ Fees on developers for environmental mitigation under the California Environmental Quality Act have also been upheld.²¹⁵

Given the variety of examples where regulatory fees have been upheld, and the broad range of costs to which they may be applied (including those for ‘administration’), the claimants have fee authority under the police power to impose fees for the permit activities that are a state-mandated new program or higher level of service. But a determination as to whether the claimants’ fee authority is sufficient, within the meaning of Government Code section 17556, subdivision (d), to pay for the mandated activities and deny the test claim, cannot be made without analysis of the limitations on the fee authority imposed by Proposition 218.

Regulatory fee authority is limited by voter approval under Proposition 218: With some exceptions, local government fees or assessments that are incident to property ownership are subject to voter approval under article XIII D of the California Constitution, as added by Proposition 218 in 1996. Article XIII D defines a fee as “any levy other than an ad valorem tax, a special tax, or an assessment, imposed by an agency on a parcel or a person as an incident of property ownership, including a user fee or charge for a property-related service.” It defines an assessment as “any levy or charge upon real property by an agency for a special benefit conferred upon the real property [and] includes, but is not limited to, ‘special assessment,’ ‘benefit assessment,’ ‘maintenance assessment,’ and ‘special assessment tax.’”

Among other procedures, new or increased property-related fees require a majority-vote of the affected property owners, or two-thirds registered voter approval, or weighted ballot approval by the affected property owners (art. XIII D, § 6, subd. (c)). Assessments must also be approved by owners of the affected parcels (art. XIII D, § 4, subd.(d)). Expressly exempt from voter

approval, however, are property-related fees for sewer, water, or refuse collection services (art. XIII D, § 6, subd. (c)).

In 2002, an appellate court in *Howard Jarvis Taxpayers Association v. City of Salinas*, *supra*, 98 Cal.App.4th 1351, found that a city's charges on developed parcels to fund stormwater management were property-related fees, and were not covered by Proposition 218's exemption for "sewer" or "water" services. This means that an election would be required to charge stormwater fees if they are imposed "as an incident of property ownership."

The issue of whether a local agency has sufficient fee authority for the mandated activities under Government Code section 17556, subdivision (d), in light of the voter approval requirement for fees under article XIII D (Proposition 218) is one of first impression for the Commission.

The Commission finds that a local agency does not have sufficient fee authority within the meaning of Government Code section 17556 if the fee or assessment is contingent on the outcome of an election by voters or property owners. The plain language of subdivision (d) of this section prohibits the Commission from finding that the permit imposes "costs mandated by the state" if "The local agency ... has the authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service." [Emphasis added.] Under Proposition 218, the local agency has no authority to impose the fee without the consent of the voters or property owners.

Additionally, it is possible that the local agency's voters or property owners may never adopt the proposed fee or assessment, but the local agency would still be required to comply with the state mandate. Denying reimbursement under these circumstances would violate the purpose of article XIII B, section 6, which is to "to preclude the state from shifting financial responsibility for carrying out governmental functions to local agencies, which are 'ill equipped' to assume increased financial responsibilities because of the taxing and spending limitations that articles XIII A and XIII B impose."²¹⁶

In its January 2010 comments on the draft staff analysis, the State Board disagrees that "the requirement to subject new or increased fees to these voting or protest requirements strips the claimants of 'fee authority' within the meaning of Government Code section 17556, subdivision (d)." The State Board cites *Connell v. Superior Court*,²¹⁷ in which the water districts argued that they lacked "sufficient" fee authority because it was not economically feasible for them to levy fees that were sufficient to pay the mandated costs. The *Connell* court determined that "the plain language of the statute [Gov. Code, § 17556, subd. (d)] precludes reimbursement where the local agency has the authority, i.e., the right or the power, to levy fees sufficient to cover the costs of the state-mandated program."²¹⁸ The State Board equates the Proposition 218 voting requirement with the economic impracticability faced by the water districts in *Connell*.

The claimants disagree, citing a lack of authority that requires them to first submit the question of whether to impose a tax or fee to the voters and have them reject the proposition. According

²¹⁶ *County of San Diego*, *supra*, 15 Cal.4th 68, 81.

²¹⁷ *Connell v. Superior Court*, *supra*, 59 Cal.App.4th 382.

²¹⁸ *Id.* at page 401.

to the claimants, such a requirement would render all mandate claims moot, without first submitting the question of whether to impose a tax or assessment to a vote of the electorate.

The Commission disagrees with the State Board. The Proposition 218 election requirement is not like the economic hurdle to fees in *Connell*. Absent compliance with the Proposition 218 election and other procedures, there is no legal authority to impose or raise fees within the meaning of Government Code section 17556, subdivision (d). The voting requirement of Proposition 218 does not impose a mere practical or economic hurdle, as in *Connell*, but a legal and constitutional one. Without voter or property owner approval, the local agency lacks the “authority, i.e., the right or power, to levy fees sufficient to cover the costs of the state-mandated program.”²¹⁹

In fact, the fee at issue in the *Connell* case (Wat. Code, § 35470) was amended by the Legislature in 2007 to conform to Proposition 218. Specifically, the Water Code statute now requires compliance with “the “notice, protest, and hearing procedures in Section 53753 of the Government Code.”²²⁰ This Government Code statute implements Proposition 218.

For these reasons, the Commission finds that local agencies do not have fee authority that is sufficient within the meaning of Government Code section 17556, subdivision (d) to deny the test claim for those activities that would condition the fee or assessment on voter or property-owner approval under Proposition 218 (article XIII D). The Commission finds that Proposition 218 applies to all the activities in this test claim (except for the hydromodification and LID activities that are related to priority development projects discussed below) so that they impose “costs mandated by the state” (within the meaning of Gov. Code, § 17556, subd. (d)). To the extent that property-owner or voter-approved fees or assessments are imposed to pay for any of the permit activities found above to be a state-mandated new program or higher level of service, the fee or assessment would be identified as offsetting revenue in the parameters and guidelines to offset the claimant’s costs in performing those activities.

Fees imposed for two of the test-claim activities, however, i.e., for the hydromodification management plan and low-impact development, would not be subject to voter approval under Proposition 218, as discussed below.

Fees as a condition of property development are not subject to Proposition 218: Proposition 218 does not apply to development fees, including those imposed on activities in part D of the permit. Article XIII D expressly states that it shall not be construed to “affect existing laws relating to the imposition of fees or charges as a condition of property development.”²²¹

Moreover, the California Supreme Court has ruled that fees imposed “as an incident to property ownership” are subject to Proposition 218, but fees that result from the owner’s voluntary

²¹⁹ *Connell v. Superior Court, supra*, 59 Cal.App.4th 382, 401.

²²⁰ Water Code section 35470, as amended by Statutes 2007, chapter 27. Section 53753 of the Government Code requires compliance with “the procedures and approval process set forth in Section 4 of Article XIII D of the California Constitution” for assessments.

²²¹ California Constitution, article XIII D, section 1, subdivision (b).

decision to seek a government benefit are not.²²² Thus, fees imposed as a result of the owner's voluntary decision to undertake a development project are not subject to Proposition 218, because they are not merely incident to property ownership.²²³

The final issue, therefore, is whether claimants may impose fees that are sufficient within the meaning of Government Code section 17556, subdivision (d), to pay for the activities in the permit related to development: the hydromodification management plan (part D.1.g), and low-impact development (part D.1.d.(7)&(8)). The Commission finds claimants have fee authority that is sufficient within the meaning of Government Code section 17556, subdivision (d), and that these activities do not impose costs mandated by the state and are not reimbursable.

Hydromodification management plan: Part D.1 of the permit describes the development planning component of the JURMP. Part D.1.g. requires each copermitee to collaborate with other copermitees to develop and implement and report on developing a hydromodification management plan (HMP) to manage increases in runoff discharge rates and durations from all priority development projects, as specified. As discussed above, the HMP is a state-mandated new program or higher level of service for only private priority development projects. The purpose of the HMP is:

[T]o manage increases in runoff discharge rates and durations from all Priority Development Projects, where such rates and durations are likely to cause increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force.

According to the permit, priority development projects are:

- a) all new Development Projects that fall under the project categories or locations listed in section D.1.d.(2), and b) those redevelopment projects that create, add or replace at least 5,000 square feet of impervious surfaces on an already developed site that falls under the project categories or locations listed in section D.1.d.(2).

²²² In *Richmond v. Shasta Community Services Dist.* (2004) 32 Cal.4th 409, the court held that water service fees were subject to Proposition 218, but that water connection fees were not. In *Apartment Assoc. of Los Angeles County v. City of Los Angeles*, *supra*, 24 Cal.4th 830, 839-840, the court held that apartment inspection fees were not subject to Proposition 218 because they were not imposed on property owners as such, but in their capacity as landlords.

²²³ A recent report by the Office of the Legislative Analyst concurs with this conclusion: "Local governments finance stormwater clean-up services from revenues raised from a variety of fees and, less frequently, through taxes. Property owner fees for stormwater services typically require approval by two-thirds of the voters, or a majority of property owners. Developer fees and fees imposed on businesses that contribute to urban runoff, in contrast, are not restricted by Proposition 218 and may be approved by a vote of the governing body. Taxes for stormwater services require approval by two-thirds of the electorate." Office of the Legislative Analyst. *California's Water: An LAO Primer* (October 22, 2008) page 56. [Emphasis added.] See: <http://www.lao.ca.gov/2008/rsrc/water_primer/water_primer_102208.pdf> as of October 22, 2008.

The priority development project categories listed in part D.1.d.(2) are:

- (a) Housing subdivisions of 10 or more dwelling units. This category includes single-family homes, multi-family homes, condominiums, and apartments.
- (b) Commercial developments greater than one acre. [as specified]
- (c) Developments of heavy industry greater than one acre. This category includes, but is not limited to, manufacturing plants, food processing plants, metal working facilities, printing plants, and fleet storage areas (bus, truck, etc.).
- (d) Automotive repair shops. This category is defined as a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.
- (e) Restaurants. This category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812), where the land area for development is greater than 5,000 square feet. Restaurants where land development is less than 5,000 square feet shall meet all SUSMP requirements except ... hydromodification requirement D.1.g.
- (f) All hillside development greater than 5,000 square feet. This category is defined as any development which creates 5,000 square feet of impervious surface which is located in an area with known erosive soil conditions, where the development will grade on any natural slope that is twenty-five percent or greater.
- (g) Environmentally Sensitive Areas (ESAs). All development located within or directly adjacent to or discharging directly to an ESA (where discharges from the development or redevelopment will enter receiving waters within the ESA), which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10% or more of its naturally occurring condition. "Directly adjacent" means situated within 200 feet of the ESA. "Discharging directly to" means outflow from a drainage conveyance system that is composed entirely of flows from the subject development or redevelopment site, and not commingled with flows from adjacent lands.
- (h) Parking lots 5,000 square feet or more or with 15 or more parking spaces and potentially exposed to urban runoff. Parking lot is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce.
- (i) Street, roads, highways, and freeways. This category includes any paved surface that is 5,000 square feet or greater used for the transportation of automobiles, trucks, motorcycles, and other vehicles.
- (j) Retail Gasoline Outlets (RGOs). This category includes RGOs that meet the following criteria: (a) 5,000 square feet or more or (b) a projected Average Daily Traffic (ADT) of 100 or more vehicles per day.

The Commission finds that claimants have authority to impose fees for complying with the HMP activities in permit part D.1.g. for priority development projects, and their authority is sufficient within the meaning of Government Code section 17556, subdivision (d), in that the fee would not be subject to Proposition 218 voter approval. These activities involve collaborating with other copermitees to develop and implement a hydromodification management plan, and reporting on it. Because regulatory fees, pursuant to article XI, section 7 of the California Constitution, could be imposed on these priority development projects to pay for the costs of HMP, the Commission finds that permit part D.1.g. does not impose costs mandated by the state.

Low impact development: Low impact development is defined in Attachment C of the permit as a “storm water management and land development strategy that emphasizes conservation and the use of on-site natural features integrated with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions.” The purpose of LID is to “collectively minimize directly connected impervious areas and promote infiltration at Priority Development Projects.” LID best management practices include draining a portion of impervious areas into pervious areas prior to discharge into the storm drain, and constructing portions of priority development projects with permeable surfaces.

Part D.1.d.(7) requires updating the Standard Urban Storm Water Mitigation Plans (SUSMP) to include low impact development requirements, as specified, including BMP requirements that meet or exceed the requirements of sections D.1.d.(4)²²⁴ and D.1.d.(5).²²⁵ Both D.1.d.(4) and D.1.d.(5) are the LID requirement implemented at priority development projects.

Part D.1.d.(8) requires permittees to develop and submit an updated model SUSMP that defines minimum low impact development and other BMP requirements to incorporate into the permittees local SUSMPs for application to priority development projects.

The Commission finds that claimants have authority to impose fees for complying with the LID activities in parts D.1.d.(7) and D.1.d.(8) of the permit, and their authority is sufficient within the meaning of Government Code section 17556, subdivision (d), in that they are not subject to Proposition 218 voter approval. Because regulatory fees, pursuant to article XI, section 7 of the California Constitution, could be imposed on the priority development projects to pay for the costs associated with LID, the Commission finds that permit parts D.1.d.(7) and D.1.d.(8) do not impose costs mandated by the state.

²²⁴ Part D.1.d.(4) of the permit includes LID BMP requirements: “Each Copermitee shall require each Priority Development Project to implement LID BMPs which will collectively minimize directly connected impervious areas and promote infiltration at Priority Development Projects.” The Permit lists various LID site design BMPs that must be implemented at all Priority Development Projects, and other LID BMPs that must be implemented at all Priority Development Projects “where applicable and feasible.”

²²⁵ Part D.1.d.(5), regarding “Source control BMP Requirements” requires permittees to require each Priority Development Project to implement source control BMPs that must “Minimize storm water pollutants of concern in urban runoff” and include five other specific criteria.

2. Claimants also have fee authority regulated by the Mitigation Fee Act that is sufficient (within the meaning of Gov. Code, § 17556, subd. (d)) to pay for the hydromodification and low-impact development permit activities.

Development fees are also an exercise of the local police power under article XI, section 7 of the California Constitution.²²⁶ A fee is considered a development fee if it is exacted in return for building permits or other governmental privileges so long as the amount of the fee bears a reasonable relation to the development's probable costs to the community and benefits to the developer.²²⁷ Development fees are not restricted by Proposition 218 as discussed above.

Fees on developers as conditions of permit approval are governed by the Mitigation Fee Act (Gov. Code, §§ 66000-66025) which defines a "fee" as:

[A] monetary exaction other than a tax or special assessment, whether established for a broad class of projects by legislation of general applicability or imposed on a specific project on an ad hoc basis, that is charged by a local agency to the applicant in connection with approval of a development project for the purpose of defraying all or a portion of the cost of public facilities related to the development project, but does not include ... fees for processing applications for governmental regulatory actions or approvals²²⁸ [Emphasis added.]

Public facilities are defined in the Act as "public improvements, public services, and community amenities."²²⁹

When a local agency imposes or increases a fee as a condition of development approval, it must do all of the following: (1) Identify the purpose of the fee; (2) Identify the use to which the fee is to be put. If the use is financing public facilities, the facilities shall be identified. (3) Determine how there is a reasonable relationship between the fee's use and the type of development project on which the fee is imposed; and, (4) Determine how there is a reasonable relationship between the need for the public facility and the type of development project upon which the fee is imposed. (Gov. Code, § 66001, subd. (a).)

The city or county must also determine whether there is a reasonable relationship between the specific amount of the fee and the costs of building, expanding, or upgrading public facilities. These determinations, known as nexus studies, are in writing and must be updated whenever new fees are imposed or existing fees are increased.²³⁰ A fee imposed "as a condition of approval of

²²⁶ *California Building Industry Assoc. v. Governing Board* (1988) 206 Cal.App.3d 212, 234.

²²⁷ *Sinclair Paint, supra*, 15 Cal.4th at page 875.

²²⁸ Government Code section 66000, subdivision (b).

²²⁹ Government Code section 66000, subdivision (d).

²³⁰ Government Code section 66001, subdivision (b). The Act also requires cities to segregate fee revenues from other municipal funds and to refund them if they are not spent within five years. Any person may request an audit to determine whether any fee or charge levied by the city or county exceeds the amount reasonably necessary to cover the cost of the service provided (Gov. Code, §66006, subd. (d)). Under Government Code section 66014, fees charged for zoning changes, use permits, building permits, and similar processing fees are subject to the same nexus requirements as development fees. Lastly, under California Government Code

a proposed development or development project” is limited to the estimated reasonable cost of providing the service or facility.²³¹ This is in contrast to regulatory fees, which do not depend on government-conferred benefits or privileges.²³²

The Mitigation Fee Act defines a “development project” as “any project undertaken for the purpose of development ... includ[ing] a project involving the issuance of a permit for construction or reconstruction, but not a permit to operate.” (Gov. Code, § 66000, subd. (a).)

A fee does not become a development fee simply because it is made in connection with a development project. Approval of the development must be conditioned on the payment of the fee. The Mitigation Fee Act is limited to situations where the fee or exaction is imposed as a condition of approval of a development project.²³³

Because local agencies may make development of priority development projects conditional on the payment of a fee, the Commission finds that the claimants have fee authority, governed by the Mitigation Fee Act, that is sufficient within the meaning of Government Code section 17556, subdivision (d), to pay for the hydromodification management plan and low-impact development activities. As discussed below, HMP and LID are “public facilities,” which the Mitigation Fee Act defines as “public improvements, public services, and community amenities.”²³⁴

The County of San Diego, in its January 2010 comments on the draft staff analysis, disagrees that it can impose a fee for the hydromodification plan (HMP) activities in the permit, stating that development and implementation of the HMP does not constitute a “public facility.”

The Commission disagrees. The purpose of the permit is to prevent or abate pollution in waterways and beaches in San Diego County. More specifically, the purpose of the HMP is:

[T]o manage increases in runoff discharge rates and durations from all Priority Development Projects, where such increased rates and durations are likely to cause increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force.

All these stated purposes of the HMP provide public services or improvements, or community amenities within the meaning of the Act.²³⁵ Moreover, the California Supreme Court stated that the Act “concerns itself with development fees; that is, fees imposed on development projects in

section 66020, agencies collecting fees must provide project applicants with a statement of the amounts and purposes of all fees at the time of fee imposition or project approval.

²³¹ Government Code section 66005, subdivision (a).

²³² *Sinclair Paint, supra*, 15 Cal.4th at page 875.

²³³ *California Building Industry Ass’n v. San Joaquin Valley Air Pollution Control Dist.* (2009) 178 Cal.App.4th, 130, 131.

²³⁴ Government Code section 66000, subdivision (d).

²³⁵ Government Code section 66000, subdivision (d).

order to finance public improvements or programs that bear a 'reasonable relationship' to the development at issue."²³⁶ The HMP is such a program.

Similarly, the purposes of LID are to "collectively minimize directly connected impervious areas and promote infiltration at Priority Development Projects" and to reduce stormwater runoff from priority development projects. These activities are public services or improvements that fall within the Act's definition of public facility.

The County also argues that under the Mitigation Fee Act, the local agency must determine that there is "a reasonable relationship between the fee's use and the type of development project on which the fee is imposed." The County argues that there is no reasonable relationship between the costs incurred by claimants to develop and implement the HMP and a particular development project on which the fee might be imposed.

Again, the Commission disagrees. Every time a developer proposes a project that falls within one of the "priority development project" categories listed above, and the developer has "not yet begun grading or construction activities at the time any updated SUSMP or hydromodification requirement commences," the local agency may impose a fee subject to the Mitigation Fee Act. The fee would be for the costs of developing and implementing the HMP to "manage increases in runoff discharge rates and durations from all Priority Development Projects [that] cause ... impacts to beneficial uses and stream habitat due to increased erosive force." The local agency may also impose a fee on priority development projects to comply with LID, the purpose of which is to "collectively minimize directly connected impervious areas and promote infiltration at Priority Development Projects" and to reduce stormwater runoff.

Finally, the County argues that assessing fees on a private developer who submits a project for approval to recover the costs of reviewing and approving a particular project is "specifically excluded from the definition of 'fee' under the Act." The definition of fee in the Act states that it "does not include ... fees for processing applications for governmental regulatory actions or approvals" (Gov. Code, § 66000, subd. (b).)

The Commission disagrees that an HMP fee would be for "processing applications for governmental regulatory actions or approvals." Rather, it would be for permit approval of priority development projects, and used to implement the HMP and LID requirements. In *Barratt American Inc. v. City of Rancho Cucamonga* (2005) 37 Cal.4th 685, 698, the California Supreme Court distinguished between regulatory fees that implement state and local building safety standards under the Health and Safety Code and developer fees subject to the Mitigation Fee Act by stating: "These regulatory fees fund a program that supervises how, not whether, a developer may build." Thus, the Commission finds that the developer fees may be imposed for permit approval for priority development projects if the permit is conditional on payment of the fee, and the fee is used for HMP and LID compliance.

In sum, the Commission finds that the claimants have fee authority governed by the Mitigation Fee Act that is sufficient (within the meaning of Gov. Code, § 17556, subd. (d), to pay for the following parts of the permit that are related to development: the hydromodification management plan (part D.1.g) and updating the Standard Urban Storm Water Mitigation Plans to include Low Impact Development requirements (part D.1.d.(7)&(8)).

²³⁶ *Utility Cost Management v. Indian Wells Valley Water Dist.* (2001) 26 Cal.4th 1185, 1191.

3. Claimants' fee authority under Public Resources Code section 40059, or via benefit assessments, is not sufficient to pay for street sweeping, and Government Code section 17556, subdivision (d), does not apply to reporting on street sweeping.

Street sweeping is one test claim activity that is typically funded by local agency fees or assessments. Fees and assessments are both governed by Proposition 218.

The permit (in part D.3.a.5) requires a program to sweep "improved (possessing a curb and gutter) municipal roads, streets, highways, and parking facilities" at intervals depending on whether they are identified as consistently generating the highest volumes, moderate volumes, or low volumes of trash and/or debris. Reporting on street sweeping, such as curb-miles swept and tons of material collected, is also required (part J.3.a.(3)(c)x-xv).

Some local agencies collect fees for street sweeping for their refuse fund, such as the City of Pasadena.²³⁷ Other local agencies, e.g., the County of Fresno²³⁸ and the City of La Quinta,²³⁹ collect an assessment for street sweeping as a street maintenance activity. Both approaches are discussed below in light of the procedural requirements under Proposition 218.

Fees for street sweeping as refuse collection/solid waste handling: Article XI, section 7 of the California Constitution states: "A county or city may make and enforce within its limits all local, police, sanitary or other ordinances and regulations not in conflict with general laws." Local agency fees for refuse collection are authorized by Public Resources Code section 40059, which states:

(a) Notwithstanding any other provision of law, each county, city, district, or other local governmental agency may determine all of the following:

(1) Aspects of solid waste handling which are of local concern, including, but not limited to, frequency of collection, means of collection and transportation, level of services, charges and fees, and nature, location, and extent of providing solid waste handling services. [Emphasis added.]

"Solid waste" is defined in Public Resources Code section 40191 as:

[A]ll putrescible and nonputrescible solid, semisolid, and liquid wastes, including garbage, trash, refuse, paper, rubbish, ashes, industrial wastes, demolition and construction wastes, abandoned vehicles and parts thereof, discarded home and industrial appliances, dewatered, treated, or chemically fixed sewage sludge

²³⁷ City of Pasadena, Agenda Report, Resolution Nos. 8942 and 8943, April 27, 2009, "Public Hearing: Amendment to the General Fee Schedule to Increase the Residential Refuse Collection Fees and Solid Waste Franchise Fees." One of the findings in the resolution is: "Whereas, street sweeping is a refuse collection service involving solely the collection, removal and disposal of solid waste from public rights of way, and is, therefore, properly allocated to the Refuse Fund."

²³⁸ County of Fresno, Resolution Nos. 8942 and 8943, adopted January 15, 2008.

²³⁹ City of La Quinta, Resolution No. 2009-035, adopted May 5, 2009.

which is not hazardous waste, manure, vegetable or animal solid and semisolid wastes and other discarded solid and semisolid wastes.²⁴⁰

“Solid waste handling” is defined in Public Resources Code section 40195 as “the collection, transportation, storage, transfer, or processing of solid wastes.” Given the nature of material swept from city streets, street sweeping falls under the rubric of ‘solid waste handling.’

Under Proposition 218, “refuse collection” is expressly exempted from the voter-approval requirement (article XIII D, § 6, subd. (c)). Although “refuse collection” has no definition in article XIII D, the plain meaning of refuse²⁴¹ collection is the same as solid waste handling, as the dictionary definition of “refuse” and the statutory definition of “solid waste” both refer to rubbish and trash as synonyms. Refuse is collected via solid waste handling.

To impose or increase refuse collection fees, the local agency must provide mailed written notice to each parcel owner on which the fee will be imposed, and conduct a public hearing not less than 45 days after mailing the notice. If written protests against the proposed fee are presented by a majority of the parcel owners, the local agency may not impose or increase the fee (article XIII D, § 6, subd. (a)(2)). In addition, revenues are: (1) not to exceed the funds required to provide the service, (2) shall not be used for any other purpose than to provide the property-related service, and the amount of the fee on a parcel shall not exceed the proportional cost of the service attributable to the parcel. And the service must be actually used by or immediately available to the property owner (article XIII D, § 6, subd. (b)).

Government Code, section 17556, subdivision (d), does not apply to street sweeping because the fee is contingent on the outcome of a written protest by a majority of the parcel owners. The plain language of subdivision (d) of this section prohibits the Commission from finding that the permit imposes “costs mandated by the state” if “The local agency ... has the authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service.” [Emphasis added.] Under Proposition 218, the local agency has no authority to impose the fee if it is protested by a majority of parcel owners.

Additionally, it is possible that a majority of land owners in the local agency may never allow the proposed fee, but the local agency would still be required to comply with the state mandate. This would violate the purpose of article XIII B, section 6, which is to “to preclude the state from shifting financial responsibility for carrying out governmental functions to local agencies, which are ‘ill equipped’ to assume increased financial responsibilities because of the taxing and spending limitations that articles XIII A and XIII B impose.”²⁴²

Thus, the Commission finds that fee authority under Public Resources Code section 40059 is not sufficient to pay for the mandated program or increased level of service in permit parts D.3.a.5 (street sweeping). Therefore, the Commission finds that street sweeping imposes costs mandated by the state and is reimbursable.

²⁴⁰ This definition also excludes hazardous waste, radioactive waste and medical waste, as defined.

²⁴¹ “Refuse” is defined as “ Items or material discarded or rejected as useless or worthless; trash or rubbish.” <<http://dictionary.reference.com/browse/refuse>> as of November 23, 2009.

²⁴² *County of San Diego, supra*, 15 Cal.4th 68, 81.

Any proposed fees that are not blocked by a majority of parcel owners for street sweeping must be identified as offsetting revenue in the parameters and guidelines.

Fees for street sweeping reports: Proposition 218 does not contain an express exemption on voter approval for reporting on street sweeping, only for “refuse collection.” Moreover, Proposition 218 (art. XIII D, § 6, subd. (b)(4)) states: “No fee or charge may be imposed for a service unless that service is actually used by, or immediately available to, the owner of the property in question.” The permit does not require the street sweeping reports be available to property owners, only that the reports be submitted to the Regional Board. For these reasons, the Commission finds that Government Code section 17556, subdivision (d), does not apply to reporting on street sweeping, so that part J.3.a.(3)(c)x-xv of the permit imposes costs mandated by the state and is reimbursable.

Assessments for street operation and maintenance: As mentioned above, some local agencies collect an assessment for street sweeping, e.g., the County of Fresno²⁴³ and the City of La Quinta.²⁴⁴ Assessments are defined as “any levy or charge upon real property by an agency for a special benefit conferred upon the real property. ‘Assessment’ includes, but is not limited to, ‘special assessment,’ ‘benefit assessment,’ ‘maintenance assessment’ and ‘special assessment tax.’” (article XIII D, § 2, subd. (b).) The terms “maintenance and operation” of “streets” and “drainage systems,” although used in article XIII D, are not defined in it. The plain meaning of maintenance of streets and drainage systems, however, would include street sweeping because “maintenance” means “the work of keeping something in proper condition; upkeep.”²⁴⁵ Clean streets are used not only for transportation, but for conveying storm water to storm drains.

The Supreme Court defined special assessments as follows:

A special assessment is a “compulsory charge placed by the state upon real property within a pre-determined district, made under express legislative authority for defraying in whole or in part the expense of a permanent public improvement therein...” [Citation.] [Citation.] In this regard, a special assessment is ‘levied against real property particularly and directly benefited by a local improvement in order to pay the cost of that improvement.’ [Citation.] ‘The rationale of special assessment[s] is that the assessed property has received a special benefit over and above that received by the general public. The general public should not be required to pay for special benefits for the few, and the few specially benefited should not be subsidized by the general public.’²⁴⁶

The Supreme Court summarized the constitutional procedures for creating an assessment district.

Under Proposition 218's procedures, local agencies must give the record owners of all assessed parcels written notice of the proposed assessment, a voting ballot, and a statement disclosing that a majority protest will prevent the assessment's

²⁴³ County of Fresno, Resolution Nos. 8942 and 8943, adopted January 15, 2008.

²⁴⁴ City of La Quinta, Resolution No. 2009-035, adopted May 5, 2009.

²⁴⁵ <<http://dictionary.reference.com/browse/maintenance>> as of December 7, 2009.

²⁴⁶ *Silicon Valley Taxpayers Ass'n. v. Santa Clara Open Space Authority* (2008) 44 Cal.4th 431, 442.

passage. (Art. XIII D, § 4, subs. (c), (d).) The proposed assessment must be “supported by a detailed engineer's report.” (Art. XIII D, § 4, subd. (b).) At a noticed public hearing, the agencies must consider all protests, and they “shall not impose an assessment if there is a majority protest.” (Art. XIII D, § 4, subd. (e).) Voting must be weighted “according to the proportional financial obligation of the affected property.” (*Ibid.*)²⁴⁷

Proposition 218 dictated that as of July 1, 1997, existing assessments were to comply with its procedural requirements, but an exception was created for “any assessment imposed exclusively to finance the capital costs or maintenance and operation expenses for sidewalks, streets, sewers, water, flood control, drainage systems or vector control.” (art. XIII D, § 5, subd. (a), emphasis added.) This means that the procedural requirements of Proposition 218 apply only to increases in assessments for street sweeping that were imposed after Proposition 218 was enacted.²⁴⁸

Absent any evidence in the record that assessments imposed before July 1, 1997 for street sweeping are sufficient to pay for the street sweeping specified in part D.3.a. of the permit, the Commission cannot find that assessments imposed before that date would pay for the costs mandated by the state for street sweeping within the meaning of Government Code section 17556, subdivision (d).

Should a local agency determine that its existing assessments are not sufficient to pay for the mandated street sweeping, it can raise assessments by following the article XIII D (Proposition 218) procedures detailed above. Those procedures, however, include an election and a protest, both of which were found above to extinguish local fee authority sufficient to pay for the mandate and to block the application of Government Code section 17556, subdivision (d).

Thus, to the extent that the claimants impose or increase assessments to pay for the street sweeping, they would be identified as offsetting revenue in the parameters and guidelines.

4. Claimants' fee or assessment authority under Health and Safety Code section 5471 is not sufficient to pay for conveyance-system cleaning, and Government Code section 17556, subdivision (d), does not apply to reporting on conveyance-system cleaning

Conveyance-system cleaning for operation and maintenance of the MS4 and MS4 facilities (catch basins, storm drain inlets, open channels, etc.) is required in the permit (part D.3.a.(3)). Specifically, claimants are required to clean in a timely manner “Any catch basin or storm drain inlet that has accumulated trash and debris greater than 33% of design capacity.... Any MS4 facility that is designed to be self cleaning shall be cleaned of any accumulated trash and debris immediately. Open channels shall be cleaned of observed anthropogenic litter in a timely manner.” Claimants are also required to report on the number of catch basins and inlets inspected and cleaned (J.3.a.(3)(c)iv-viii).

²⁴⁷ *Silicon Valley Taxpayers Ass'n v. Santa Clara Open Space Authority, supra*, 44 Cal.4th 431, 438.

²⁴⁸ See also *Howard Jarvis Taxpayers Ass'n. v. City of Riverside* (1999) 73 Cal.App.4th, 679, holding that a preexisting streetlighting assessment is ‘exempt under Proposition 218.’

Local agencies have fee authority under Health and Safety Code section 5471 to charge fees for storm drainage maintenance and operation as follows:

[A]ny entity²⁴⁹ shall have power, by an ordinance approved by a two-thirds vote of the members of the legislative body thereof, to prescribe, revise and collect, fees, tolls, rates, rentals, or other charges for services and facilities furnished by it, either within or without its territorial limits, in connection with its water, sanitation, storm drainage, or sewerage system. ... Revenues derived under the provisions in this section, shall be used only for the acquisition, construction, reconstruction, maintenance, and operation of water systems and sanitation, storm drainage, or sewerage facilities [Emphasis added.]

This plain meaning of this statutory fee for storm drain operation and maintenance would include conveyance-system cleaning as required in the permit (part D.3.a.(3)(iii)), which the permit specifies as cleaning “catch basins or storm drain inlets.” This cleaning is within the operation and maintenance of the storm drains.

The statutory fee, adopted in 1953, is now subject to the procedural requirements of Proposition 218. As it states in subdivision (d) of Health and Safety Code section 5471:

If the procedures set forth in this section as it read at the time a standby charge was established were followed, the entity may, by ordinance adopted by a two-thirds vote of the members of the legislative body thereof, continue the charge pursuant to this section in successive years at the same rate. If new, increased, or extended assessments are proposed, the entity shall comply with the notice, protest, and hearing procedures in Section 53753 of the Government Code [the codification of the Proposition 218 procedural requirements].

Proposition 218 does not exempt from voting requirements fees for storm drain maintenance like it does for “water, sewer, and refuse collection” in section 6 (c) of article XIII D. In fact, in *Howard Jarvis Taxpayers Ass’n. v. City of Salinas* (2002) 98 Cal.App.4th 1351, the court invalidated a local storm drain fee and held that the exemption from an election for sewer fees does not include storm drainage fees. As to new or increased assessments imposed for storm drainage operation and maintenance, they would be subject to the same election requirement of Proposition 218 (art. XIII D, § 4, subd. (e)) as for other assessments.

Therefore, the Commission finds that local agencies do not have sufficient authority under section 5471 of the Health and Safety Code to impose fees or assessments (under Gov. Code § 17556, subd. (d)) for conveyance system cleaning as required by part D.3.a.(3)(iii) of the permit or reporting as required by part J.3.a.(3)(c)iv-viii of the permit.

Fees or assessments for conveyance-system reports: The Commission also finds that local agencies do not have fee or assessment authority for reporting on conveyance-system (in part J.3.a.(3)(c)iv-viii) on the number of catch basins and inlets inspected and cleaned. Fees or

²⁴⁹ Entity is defined to include “counties, cities and counties, cities, sanitary districts, county sanitation districts, sewer maintenance districts, and other public corporations and districts authorized to acquire, construct, maintain and operate sanitary sewers and sewerage systems.” Health and Safety Code section 5470, subdivision (e).

assessments imposed for this reporting would be subject to a vote of parcel owners. Moreover, Proposition 218 (art. XIII D, § 6, subd. (b)(4)) states: "No fee or charge may be imposed for a service unless that service is actually used by, or immediately available to, the owner of the property in question." The permit does not require the reports on conveyance-system cleaning be available to property owners, only that the reports be submitted to the Regional Board. For these reasons, the Commission finds that Government Code section 17556, subdivision (d), does not apply to reporting on conveyance-system cleaning, and that part J.3.a.(3)(c)iv-viii of the permit imposes costs mandated by the state within the meaning of Government Code section 17556, subdivision (d), and is reimbursable.

Any revenue from existing assessments, or assessments obtained after voter approval, for conveyance system cleaning would be included in the parameters and guidelines as offsets to reimbursement.

C. Claimants have potential fee authority and offsetting revenue if they comply with the requirements of Senate Bill 310 (Stats. 2009, ch. 577)

Effective January 2010, Senate Bill 310 (Stats. 2009, ch. 577) was enacted to add Water Code provisions authorizing local agencies to adopt watershed improvement plans.

SB 310 is intended to establish multiple watershed-based pilot programs.²⁵⁰ The bill creates the California Watershed Improvement Act of 2009 (commencing with Wat. Code, § 16000). Pursuant to Water Code section 16101, each county, city, or special district that is a copermittee under a NPDES permit *may* develop either individually or jointly a watershed improvement plan. The process for developing a watershed improvement plan is to be conducted consistent with all applicable open meeting laws. Each county, city, or special district, or combination thereof, is to notify the appropriate Regional Board of its intention to develop a watershed improvement plan.

The watershed improvement plan is voluntary – it is not necessarily the same watershed activities required by the permit in the test claim.

SB 310 includes the following local agency fee authority:

16103. (a) In addition to making use of other financing mechanisms that are available to local agencies to fund watershed improvement plans and plan measures and facilities, a county, city, special district, or combination thereof may impose fees on activities that generate or contribute to runoff, stormwater, or surface runoff pollution, to pay the costs of the preparation of a watershed improvement plan, and the implementation of a watershed improvement plan if all of the following requirements are met:

- (1) The Regional Board has approved the watershed improvement plan.
- (2) The entity or entities that develop the watershed improvement plan make a finding, supported by substantial evidence, that the fee is reasonably related to the cost of mitigating the actual or anticipated past, present, or future adverse effects of the activities of the feepayer. "Activities," for the purposes of this paragraph,

²⁵⁰ Senate Rules Committee, Office of Senate Floor Analyses, Analysis of Senate Bill 310 (2009-2010 Reg. Sess.) as amended August 31, 2009, page 4.

means the operations and existing structures and improvements subject to regulation under an NPDES permit for municipal separate storm sewer systems.

(3) The fee is not imposed solely as an incident of property ownership.

(b) A county, city, special district, or combination thereof may plan, design, implement, construct, operate, and maintain controls and facilities to improve water quality, including controls and facilities related to the infiltration, retention and reuse, diversion, interception, filtration, or collection of surface runoff, including urban runoff, stormwater, and other forms of runoff, the treatment of pollutants in runoff or other waters subject to water quality regulatory requirements, the return of diverted and treated waters to receiving water bodies, the enhancement of beneficial uses of waters of the state, or the beneficial use or reuse of diverted waters.

(c) The fees authorized under subdivision (a) may be imposed as user-based or regulatory fees consistent with this chapter.

However, Water Code section 16102, subdivision (d), states: "A regional board may, if it deems appropriate, utilize provisions of the approved watershed improvement plan (approved under this new act) to promote compliance with one of more of the regional board's regulatory plans or programs." Subdivision (e) states "Unless a regional board incorporates the provisions of the watershed improvement plan into waste discharge requirements issued to a permittee, the implementation of a watershed improvement plan by a permittee shall not be deemed to be in compliance with those waste discharge requirements."

Therefore, the Commission finds that Water Code section 16103 may only provide offsetting revenue for this test claim to the extent that a local agency voluntarily complies with Water Code section 16101, the Regional Board approves the plan and incorporates it into the test claim permit to satisfy the requirements of the permit.

D. The holding in *San Diego Unified School Dist. v. Commission on State Mandates* does not apply to the test claim activities.

The State Board's January 2010 comments on the draft staff analysis cite *San Diego Unified v. Commission on States Mandates*,²⁵¹ arguing that the permit in this test claim, like the pupil expulsion hearings, are intended to implement a federal law, and has costs that are, in context, de minimis. In *San Diego Unified School District*, the California Supreme Court held costs for hearing procedures and notice are not reimbursable for pupil expulsions that are discretionary under state law. The court found that these hearing procedures are incidental to federal due process requirements and the costs are de minimis, and thus not reimbursable.

The Commission disagrees. The permit in this case does not meet the criteria in the *San Diego Unified School District* case. Unlike the discretionary expulsions in *San Diego Unified School District*, the permit imposes state-mandated activities. And although the permit is intended to implement the federal Clean Water Act, there is no evidence or indication that its costs are de minimis. Claimants submitted declarations of costs totaling over \$10 million for fiscal year

²⁵¹ *San Diego Unified School Dist.*, *supra*, 33 Cal.4th 859.

2007-2008 alone.²⁵² Claimants further submitted documentation of 2008-2009 costs of over \$18 million. The State Board offers no evidence or argument to refute these cost declarations, so the Commission finds that permit activities (except for LID and HMP discussed above) impose costs mandated by the state that are not de minimis.

Summary: To recap fee authority under issue 2, the Commission finds that, due to the fee authority under the police power generally, and as governed by the Mitigation Fee Act, there are no “costs mandated by the state” within the meaning of Government Code sections 17514 and 17556 for the following parts of the permit that have a reasonable relationship to property development:

- Hydromodification Management Plan (part D.1.g);
- Updating the Standard Urban Storm Water Mitigation Plans to include Low Impact Development requirements (parts D.1.d.(7) & D.1.d.(8));

The Commission also finds that the claimants’ fee or assessment authority is not sufficient within the meaning of Government Code section 17556, subdivision (d), and that there are costs mandated by the state within the meaning of Government Code section 17514 for all the activities in the permit, including:

- The fee authority in Public Resources Code section 40059 for the permit activities in parts D.3.a.5 (street sweeping) and J.3.a.(3)(c)x-xv (reporting on street sweeping);
- The fee authority in Health and Safety Code section 5471, for the permit activities in part D.3.a.(3)(iii) (conveyance system cleaning) or part J.3.a.(3)(c)iv-viii (reporting on conveyance system cleaning) of the permit.

Further, the Commission finds the following would be identified as offsetting revenue in the parameters and guidelines for this test claim:

- Any fees or assessments approved by the voters or property owners for any activities in the permit, including those authorized by Public Resources Code section 40059 for street sweeping or reporting on street sweeping, and those authorized by Health and Safety Code section 5471, for conveyance-system cleaning, or reporting on conveyance-system cleaning;
- Any proposed fees that are not subject to a written protest by a majority of parcel owners and that are imposed for street sweeping.
- Effective January 1, 2010, fees imposed pursuant to Water Code section 16103 only to the extent that a local agency voluntarily complies with Water Code section 16101 by developing a watershed improvement plan pursuant to Statutes 2009, chapter 577, and the Regional Board approves the plan and incorporates it into the test claim permit to satisfy the requirements of the permit.

²⁵² The County and city declarations are attached to the test claim.

CONCLUSION

For the reasons discussed above, the Commission finds that parts of 2007 permit issued by the California Regional Quality Control Board, San Diego Region (Order No. R9-2007-001, NPDES No. CAS0108758), are a reimbursable state-mandated program within the meaning of article XIII B, section 6 of the California Constitution for the claimants to perform the following activities.

The term of the permit is from January 24, 2007 – January 23, 2012.²⁵³ The permit terms and conditions are automatically continued, however, pending issuance of a new permit if all requirements of the federal NPDES regulations on the continuation of expired permits are complied with.²⁵⁴

I. Jurisdictional Urban Runoff Management Program and Reporting (parts D & J)

Street sweeping (part D.3.a.(5)): Sweeping of Municipal Areas

Each Copermittee shall implement a program to sweep improved (possessing a curb and gutter) municipal roads, streets, highways, and parking facilities. The program shall include the following measures:

- (a) Roads, streets, highways, and parking facilities identified as consistently generating the highest volumes of trash and/or debris shall be swept at least two times per month.
- (b) Roads, streets, highways, and parking facilities identified as consistently generating moderate volumes of trash and/or debris shall be swept at least monthly.
- (c) Roads, streets, highways, and parking facilities identified as generating low volumes of trash and/or debris shall be swept as necessary, but no less than once per year.

Street sweeping reporting (J.3.a.(3)(c)x-xv): Report annually on the following:

- x. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating the highest volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.
- xi. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating moderate volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.

²⁵³ According to attachment B of the permit: “*Effective Date*. This Order shall become effective on the date of its adoption provided the USEPA has no objection....” “(q) *Expiration*. This Order expires five years after adoption.”

²⁵⁴ According to attachment B of the permit: “(r) *Continuation of Expired Order* [23 CCR 2235.4]. After this Order expires, the terms and conditions of this Order are automatically continued pending issuance of a new permit if all requirements of the federal NPDES regulations on the continuation of expired permits (40 CFR 122.6) are complied with.”

- xii. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating low volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.
- xiii. Identification of the total distance of curb-miles swept.
- xiv. Identification of the number of municipal parking lots, the number of municipal parking lots swept, and the frequency of sweeping.
- xv. Amount of material (tons) collected from street and parking lot sweeping.

Conveyance system cleaning (D.3.a.(3)):

- (a) Implement a schedule of inspection and maintenance activities to verify proper operation of all municipal structural treatment controls designed to reduce pollutant discharges to or from its MS4s and related drainage structures.
- (b) Implement a schedule of maintenance activities for the MS4 and MS4 facilities (catch basins, storm drain inlets, open channels, etc). The maintenance activities shall, at a minimum, include: [¶]...[¶]
- iii. Any catch basin or storm drain inlet that has accumulated trash and debris greater than 33% of design capacity shall be cleaned in a timely manner. Any MS4 facility that is designed to be self cleaning shall be cleaned of any accumulated trash and debris immediately. Open channels shall be cleaned of observed anthropogenic litter in a timely manner.

Conveyance system cleaning reporting (J.3.a.(3)(c)(iv)-(viii)): Update and revise the copermittees' JURMPs to contain:

- iv. Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned.
- v. Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned.
- vi. Identification of the total distance (miles) of open channels, the distance of the open channels inspected, the distance of the open channels found with anthropogenic litter, and the distance of open channels cleaned.
- vii. Amount of waste and litter (tons) removed from catch basins, inlets, the MS4, and open channels, by category.
- viii. Identification of any MS4 facility found to require inspection less than annually following two years of inspection, including justification for the finding.

Educational component (part D.5): To implement an education program using all media as appropriate to (1) measurably increase the knowledge of the target communities regarding MS4s, impacts of urban runoff on receiving waters, and potential BMP solutions for the target audience; and (2) measurably change the behavior of target communities and thereby reduce pollutant releases to MS4s and

the environment. At a minimum, the education program shall meet the requirements of this section and address the following target communities:

- Municipal Departments and Personnel
- Construction Site Owners and Developers
- Industrial Owners and Operators
- Commercial Owners and Operators
- Residential Community, General Public, and School Children

a.(1) Each Copermittee shall educate each target community on the following topics where appropriate: (i) Erosion prevention, (ii) Non storm water discharge prohibitions, and (iii) BMP types: facility or activity specific, LID,-source control, and treatment control.

a.(2) Copermittee educational programs shall emphasize underserved target audiences, high-risk behaviors, and “allowable” behaviors and discharges, including various ethnic and socioeconomic groups and mobile sources.

b. SPECIFIC REQUIREMENTS

(1) Municipal Departments and Personnel Education

(a) Municipal Development Planning – Each Copermittee shall implement an education program so that its Planning Boards and Elected Officials, if applicable, have an understanding of:

- i. Federal, state, and local water quality laws and regulations applicable to Development Projects;
- ii. The connection between land use decisions and short and long-term water quality impacts (i.e., impacts from land development and urbanization);
- iii. How to integrate LID BMP requirements into the local regulatory program(s) and requirements; and
- iv. Methods of minimizing impacts to receiving water quality resulting from development, including:

- [1] Storm water management plan development and review;
- [2] Methods to control downstream erosion impacts;
- [3] Identification of pollutants of concern;
- [4] LID BMP techniques;
- [5] Source control BMPs; and
- [6] Selection of the most effective treatment control BMPs for the pollutants of concern.

(b) Municipal Construction Activities – Each Copermittee shall implement an education program that includes annual training prior to the rainy season so that its construction, building, code enforcement, and grading review staffs, inspectors, and other responsible construction staff have, at a minimum, an understanding of the following topics, as appropriate for the target audience:

- iii. Proper implementation of erosion and sediment control and other BMPs to minimize the impacts to receiving water quality resulting from construction activities.
- iv. The Copermittee's inspection, plan review, and enforcement policies and procedures to verify consistent application.
- v. Current advancements in BMP technologies.
- vi. SUSMP Requirements including treatment options, LID BMPs, source control, and applicable tracking mechanisms.

(c) Municipal Industrial/Commercial Activities - Each Copermittee shall train staff responsible for conducting storm water compliance inspections and enforcement of industrial and commercial facilities at least once a year [except for staff who solely inspect new development]. Training shall cover inspection and enforcement procedures, BMP implementation, and reviewing monitoring data.

(d) Municipal Other Activities – Each Copermittee shall implement an education program so that municipal personnel and contractors performing activities which generate pollutants have an understanding of the activity specific BMPs for each activity to be performed.

(2) New Development and Construction Education

As early in the planning and development process as possible and all through the permitting and construction process, each Copermittee shall implement a program to educate project applicants, developers, contractors, property owners, community planning groups, and other responsible parties. The education program shall provide an understanding of the topics listed in Sections D.5.b.(1)(a) and D.5.b.(1)(b) above, as appropriate for the audience being educated. The education program shall also educate project applicants, developers, contractors, property owners, and other responsible parties on the importance of educating all construction workers in the field about stormwater issues and BMPs through formal or informal training.

(3) Residential, General Public, and School Children Education

Each Copermittee shall collaboratively conduct or participate in development and implementation of a plan to educate residential, general public, and school children target communities. The plan shall evaluate use of mass media, mailers, door hangers, booths at public events, classroom education, field trips, hands-on experiences, or other educational methods.

II. Watershed Urban Runoff Management Program (parts E.2.f & E.2.g.)

Each Copermittee shall collaborate with other Copermittees within its WMA(s) [Watershed Management Area] as in Table 4 [of the permit] to develop and implement an updated Watershed Urban Runoff Management Program for each watershed. Each updated Watershed Urban Runoff Management Program shall meet the requirements of section E of this Order, reduce the discharge of pollutants from the MS4 to the MEP, and prevent urban runoff discharges from the MS4 from causing or contributing to a violation of water quality standards. At

a minimum, each Watershed Urban Runoff Management Program shall include the elements described below: [¶]...[¶]

[Paragraphs (a) through (e) were not part of the test claim.]

f. Watershed Activities

(1) The Watershed Copermittees shall identify and implement Watershed Activities that address the high priority water quality problems in the WMA. Watershed Activities shall include both Watershed Water Quality Activities and Watershed Education Activities. These activities may be implemented individually or collectively, and may be implemented at the regional, watershed, or jurisdictional level.

(a) Watershed Water Quality Activities are activities other than education that address the high priority water quality problems in the WMA. A Watershed Water Quality Activity implemented on a jurisdictional basis must be organized and implemented to target a watershed's high priority water quality problems or must exceed the baseline jurisdictional requirements of section D of this Order.

(b) Watershed Education Activities are outreach and training activities that address high priority water quality problems in the WMA.

(2) A Watershed Activities List shall be submitted with each updated Watershed Urban Runoff Management Plan (WURMP) and updated annually thereafter. The Watershed Activities List shall include both Watershed Water Quality Activities and Watershed Education Activities, along with a description of how each activity was selected, and how all of the activities on the list will collectively abate sources and reduce pollutant discharges causing the identified high priority water quality problems in the WMA.

(3) Each activity on the Watershed Activities List shall include the following information:

- (a) A description of the activity;
- (b) A time schedule for implementation of the activity, including key milestones;
- (c) An identification of the specific responsibilities of Watershed Copermittees in completing the activity;
- (d) A description of how the activity will address the identified high priority water quality problem(s) of the watershed;
- (e) A description of how the activity is consistent with the collective watershed strategy;
- (f) A description of the expected benefits of implementing the activity; and
- (g) A description of how implementation effectiveness will be measured.

(4) Each Watershed Copermittee shall implement identified Watershed Activities pursuant to established schedules. For each Permit year, no less than two Watershed Water Quality Activities and two Watershed Education Activities shall

be in an active implementation phase. A Watershed Water Quality Activity is in an active implementation phase when significant pollutant load reductions, source abatement, or other quantifiable benefits to discharge or receiving water quality can reasonably be established in relation to the watershed's high priority water quality problem(s). Watershed Water Quality Activities that are capital projects are in active implementation for the first year of implementation only. A Watershed Education Activity is in an active implementation phase when changes in attitudes, knowledge, awareness, or behavior can reasonably be established in target audiences.

g. Watershed Copermittees shall collaborate to develop and implement the Watershed Urban Runoff Management Programs. Watershed Copermittee collaboration shall include frequent regularly scheduled meetings.

III. Regional Urban Runoff Management Program (parts F.1, F.2 & F.3)

The Regional Urban Runoff Management Program shall, at a minimum:

Each copermittee shall collaborate with the other Copermittees to develop, implement, and update as necessary a Regional Urban Runoff Management Program that meets the requirements of section F of the permit, reduces the discharge of pollutants from the MS4 to the MEP, and prevents urban runoff discharges from the MS4 from causing or contributing to a violation of water quality standards. The Regional Urban Runoff Management Program shall, at a minimum: []...[]

1. Develop and implement a Regional Residential Education Program. The program shall include:

a. Pollutant specific education which focuses educational efforts on bacteria, nutrients, sediment, pesticides, and trash. If a different pollutant is determined to be more critical for the education program, the pollutant can be substituted for one of these pollutants.

b. Education efforts focused on the specific residential sources of the pollutants listed in section F.1.a.

2. Develop the standardized fiscal analysis method required in section G of the permit, and,

3. Facilitate the assessment of the effectiveness of jurisdictional, watershed, and regional programs.

IV. Program Effectiveness Assessment (parts I.1 & I.2)

1. Jurisdictional

a. As part of its Jurisdictional Urban Runoff Management Program, each Copermittee shall annually assess the effectiveness of its Jurisdictional Urban Runoff Management Program implementation. At a minimum, the annual effectiveness assessment shall:

(1) Specifically assess the effectiveness of each of the following:

- (a) Each significant jurisdictional activity/BMP or type of jurisdictional activity/BMP implemented;
 - (b) Implementation of each major component of the Jurisdictional Urban Runoff Management Program (Development Planning, Construction, Municipal, Industrial/Commercial, Residential, Illicit Discharge²⁵⁵ Detection and Elimination, and Education); and
 - (c) Implementation of the Jurisdictional Urban Runoff Management Program as a whole.
- (2) Identify and utilize measurable targeted outcomes, assessment measures, and assessment methods for each of the items listed in section I.1.a.(1) above.
 - (3) Utilize outcome levels 1-6²⁵⁶ to assess the effectiveness of each of the items listed in section I.1.a.(1) above, where applicable and feasible.
 - (4) Utilize monitoring data and analysis from the Receiving Waters Monitoring Program to assess the effectiveness each of the items listed in section I.1.a.(1) above, where applicable and feasible.
 - (5) Utilize Implementation Assessment,²⁵⁷ Water Quality Assessment,²⁵⁸ and Integrated Assessment,²⁵⁹ where applicable and feasible.

²⁵⁵ Illicit discharge, as defined in Attachment C of the permit, is “any discharge to the MS4 that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from firefighting activities [40 C.F.R. 122.26 (b)(2)].”

²⁵⁶ Effectiveness assessment outcome levels are defined in Attachment C of the permit as follows: Effectiveness assessment outcome level 1 – Compliance with Activity-based Permit Requirements – Level 1 outcomes are those directly related to the implementation of specific activities prescribed by this Order or established pursuant to it. Effectiveness assessment outcome level 2 – Changes in Attitudes, Knowledge, and Awareness – Level 2 outcomes are measured as increases in knowledge and awareness among target audiences such as residents, business, and municipal employees. Effectiveness assessment outcome level 3 – Behavioral Changes and BMP Implementation – Level 3 outcomes measure the effectiveness of activities in affecting behavioral change and BMP implementation. Effectiveness assessment outcome level 4 – Load Reductions – Level 4 outcomes measure load reductions which quantify changes in the amounts of pollutants associated with specific sources before and after a BMP or other control measure is employed. Effectiveness assessment outcome level 5 – Changes in Urban Runoff and Discharge Quality – Level 5 outcomes are measured as changes in one or more specific constituents or stressors in discharges into or from MS4s. Effectiveness assessment outcome level 6 – Changes in Receiving Water Quality – Level 6 outcomes measure changes to receiving water quality resulting from discharges into and from MS4s, and may be expressed through a variety of means such as compliance with water quality objectives or other regulatory benchmarks, protection of biological integrity [i.e., ecosystem health], or beneficial use attainment.

²⁵⁷ Implementation Assessment is defined in Attachment C of the permit as an “Assessment conducted to determine the effectiveness of copermitttee programs and activities in achieving

b. Based on the results of the effectiveness assessment, each Copermittee shall annually review its jurisdictional activities or BMPs to identify modifications and improvements needed to maximize Jurisdictional Urban Runoff Management Program effectiveness, as necessary to achieve compliance with section A of this Order. The Copermittees shall develop and implement a plan and schedule to address the identified modifications and improvements. Jurisdictional activities/BMPs that are ineffective or less effective than other comparable jurisdictional activities/BMPs shall be replaced or improved upon by implementation of more effective jurisdictional activities/BMPs. Where monitoring data exhibits persistent water quality problems that are caused or contributed to by MS4 discharges, jurisdictional activities or BMPs applicable to the water quality problems shall be modified and improved to correct the water quality problems.

c. As part of its Jurisdictional Urban Runoff Management Program Annual Reports, each Copermittee shall report on its Jurisdictional Urban Runoff Management Program effectiveness assessment as implemented under each of the requirements of sections I.1.a and I.1.b above.

2. Watershed

a. As part of its Watershed Urban Runoff Management Program, each watershed group of Copermittees (as identified in Table 4)²⁶⁰ shall annually assess the effectiveness of its Watershed Urban Runoff Management Program implementation. At a minimum, the annual effectiveness assessment shall:

(1) Specifically assess the effectiveness of each of the following:

(a) Each Watershed Water Quality Activity implemented;

(b) Each Watershed Education Activity implemented; and

(c) Implementation of the Watershed Urban Runoff Management Program as a whole.

measureable targeted outcomes, and in determining whether priority sources of water quality problems are being effectively addressed.”

²⁵⁸ Water Quality Assessment is defined in Attachment C of the permit as an “Assessment conducted to evaluate the condition of non-storm water discharges, and the water bodies which receive these discharges.”

²⁵⁹ Integrated Assessment is defined in Attachment C of the permit as an “Assessment to be conducted to evaluate whether program implementation is properly targeted to and resulting in the protection and improvement of water quality.”

²⁶⁰ Table 4 of the permit divides the copermittees into nine watershed management areas. For example, the San Luis Rey River watershed management area lists the city of Oceanside, Vista and the County of San Diego as the responsible watershed copermittees. Table 4 also lists where the hydrologic units are and major receiving water bodies.

- 2) Identify and utilize measurable targeted outcomes, assessment measures, and assessment methods for each of the items listed in section I.2.a.(1) above.
- 3) Utilize outcome levels 1-6 to assess the effectiveness of each of the items listed in sections I.2.a.(1)(a) and I.2.a.(1)(b) above, where applicable and feasible.
- 4) Utilize outcome levels 1-4 to assess the effectiveness of implementation of the Watershed Urban Runoff Management Program as a whole, where applicable and feasible.
- 5) Utilize outcome levels 5 and 6 to qualitatively assess the effectiveness of implementation of the Watershed Urban Runoff Management Program as a whole, focusing on the high priority water quality problem(s) of the watershed. These assessments shall attempt to exhibit the impact of Watershed Urban Runoff Management Program implementation on the high priority water quality problem(s) within the watershed.
- 6) Utilize monitoring data and analysis from the Receiving Waters Monitoring Program to assess the effectiveness each of the items listed in section I.2.a.(1) above, where applicable and feasible.
- 7) Utilize Implementation Assessment, Water Quality Assessment, and Integrated Assessment, where applicable and feasible.

b. Based on the results of the effectiveness assessment, the watershed Copermittees shall annually review their Watershed Water Quality Activities, Watershed Education Activities, and other aspects of the Watershed Urban Runoff Management Program to identify modifications and improvements needed to maximize Watershed Urban Runoff Management Program effectiveness, as necessary to achieve compliance with section A of this Order.²⁶¹ The Copermittees shall develop and implement a plan and schedule to address the identified modifications and improvements. Watershed Water Quality Activities/Watershed Education Activities that are ineffective or less effective than other comparable Watershed Water Quality Activities/Watershed Education Activities shall be replaced or improved upon by implementation of more effective Watershed Water Quality Activities/Watershed Education Activities. Where monitoring data exhibits persistent water quality problems that are caused or contributed to by MS4 discharges, Watershed Water Quality Activities and Watershed Education Activities applicable to the water quality problems shall be modified and improved to correct the water quality problems.

c. As part of its Watershed Urban Runoff Management Program Annual Reports, each watershed group of Copermittees (as identified in Table 4) shall report on its Watershed Urban Runoff Management Program effectiveness assessment as implemented under each of the requirements of section I.2.a and I.2.b above.

Long Term Effectiveness Assessment (I.5):

²⁶¹ Section A is "Prohibitions and Receiving Water Limitations."

a. Collaborate with the other Copermittees to develop a Longterm Effectiveness Assessment (LTEA), which shall build on the results of the Copermittees' August 2005 Baseline LTEA. The LTEA shall be submitted by the Principal Permittee to the Regional Board no later than 210 days in advance of the expiration of this Order.

b. The LTEA shall be designed to address each of the objectives listed in section I.3.a.(6)²⁶² of this Order, and to serve as a basis for the Copermittees' Report of Waste Discharge for the next permit cycle.

c. The LTEA shall address outcome levels 1-6, and shall specifically include an evaluation of program implementation to changes in water quality (outcome levels 5 and 6).

d. The LTEA shall assess the effectiveness of the Receiving Waters Monitoring Program in meeting its objectives and its ability to answer the five core management questions. This shall include assessment of the frequency of monitoring conducted through the use of power analysis and other pertinent statistical methods. The power analysis shall identify the frequency and intensity of sampling needed to identify a 10% reduction in the concentration of constituents causing the high priority water quality problems within each watershed over the next permit term with 80% confidence.

e. The LTEA shall address the jurisdictional, watershed, and regional programs, with an emphasis on watershed assessment.

1. Collaborate with all other Copermittees regulated under the permit to address common issues, promote consistency among Jurisdictional Urban Runoff Management Programs and Watershed Urban Runoff Management Programs, and to plan and coordinate activities required under this Order.

V. All Copermittee Collaboration (part L)

(a) Collaborate with all other Copermittees to address common issues, promote consistency among Jurisdictional Urban Runoff Management Programs and

²⁶² Part I.3.a.(6) of the permit states: At a minimum, the annual effectiveness assessment shall:
(6) Include evaluation of whether the Copermittees' jurisdictional, watershed, and regional effectiveness assessments are meeting the following objectives: (a) Assessment of watershed health and identification of water quality issues and concerns. (b) Evaluation of the degree to which existing source management priorities are properly targeted to, and effective in addressing, water quality issues and concerns. (c) Evaluation of the need to address additional pollutant sources not already included in Copermittee programs. (d) Assessment of progress in implementing Copermittee programs and activities. (e) Assessment of the effectiveness of Copermittee activities in addressing priority constituents and sources. (f) Assessment of changes in discharge and receiving water quality. (g) Assessment of the relationship of program implementation to changes in pollutant loading, discharge quality, and receiving water quality. (h) Identification of changes necessary to improve Copermittee programs, activities, and effectiveness assessment methods and strategies.

Watershed Urban Runoff Management Programs, and to plan and coordinate activities required under the permit.

Jointly execute and submit to the Regional Board no later than 180 days after adoption of the permit, a Memorandum of Understanding, Joint Powers Authority, or other instrument of formal agreement that at a minimum: [¶]...[¶]

3. Establishes a management structure to promote consistency and develop and implement regional activities;
4. Establishes standards for conducting meetings, decisions-making, and cost-sharing.
5. Provides guidelines for committee and workgroup structure and responsibilities;
6. Lays out a process for addressing Copermittee non-compliance with the formal agreement.

The Commission finds that due to the fee authority under the police power (Cal. Const. art. XI, § 7) and as governed by the Mitigation Fee Act, there are no “costs mandated by the state” within the meaning of Government Code sections 17514 and 17556 for the following parts of the permit that have a reasonable relationship to property development:

- Hydromodification Management Plan (part D.1.g);
- Updating the Standard Urban Storm Water Mitigation Plans to include Low Impact Development requirements (parts D.1.d.(7) & D.1.d.(8));

The Commission also finds that the claimants’ fee or assessment authority is not sufficient within the meaning of Government Code section 17556, subdivision (d), and that there are costs mandated by the state within the meaning of Government Code section 17514 for all the activities in the permit, including:

- The fee authority in Public Resources Code section 40059 for the permit activities in parts D.3.a.5 (street sweeping) and J.3.a.(3)(c)x-xv (reporting on street sweeping);
- The fee authority in Health and Safety Code section 5471, for the permit activities in part D.3.a.(3)(iii) (conveyance system cleaning) or part J.3.a.(3)(c)iv-viii (reporting on conveyance system cleaning) of the permit.

Further, the Commission finds the following would be identified as offsetting revenue in the parameters and guidelines for this test claim:

- Any fees or assessments approved by the voters or property owners for any activities in the permit, including those authorized by Public Resources Code section 40059 for street sweeping or reporting on street sweeping, and those authorize by Health and Safety Code section 5471, for conveyance-system cleaning, or reporting on conveyance-system cleaning;
- Any proposed fees that are not subject to a written protest by a majority of parcel owners and that are imposed for street sweeping.

- Fees imposed pursuant to Water Code section 16103 only to the extent that a local agency voluntarily complies with Water Code section 16101, the Regional Board approves the plan and incorporates it into the test claim permit to satisfy the requirements of the permit.

Attorneys for Petitioners

SUPERIOR COURT OF THE STATE OF CALIFORNIA
COUNTY OF SACRAMENTO

**STATE OF CALIFORNIA DEPARTMENT OF
FINANCE, STATE WATER RESOURCES
CONTROL BOARD, AND CALIFORNIA
REGIONAL WATER QUALITY CONTROL
BOARD, SAN DIEGO REGION,**

Petitioners,

v.

COMMISSION ON STATE MANDATES,

Respondent,

**COUNTY OF SAN DIEGO AND CITIES OF
CARLSBAD, CHULA VISTA, CORONADO, DEL
MAR, EL CAJON, ENCINITAS, ESCONDIDO,
IMPERIAL BEACH, LA MESA, LEMON
GROVE, NATIONAL CITY, OCEANSIDE,
POWAY, SAN DIEGO, SAN MARCOS, SANTEE,
SOLANA BEACH, AND VISTA,**

Real Parties In Interest.

CASE NO.:

**PETITION FOR WRIT OF
ADMINISTRATIVE MANDAMUS**

[Gov. Code, § 17559(b);
Code Civ. Proc., § 1094.5]

1 Petitioners State of California Department of Finance (“Department of Finance”), State
2 Water Resources Control Board (“State Water Board”), and California Regional Water Quality
3 Control Board, San Diego Region (“San Diego Regional Board”) hereby petition this Court for a
4 writ of administrative mandamus pursuant to Government Code section 17559, subsection (b) and
5 Code of Civil Procedure section 1094.5. Petitioners seek a writ directed at respondent
6 Commission on State Mandates (“Commission”), commanding it to set aside, in part, its
7 Statement of Decision relating to Test Claim No. 07-TC-09 (“Test Claim”), which was issued by
8 the Commission on March 30, 2010, and to issue a new decision.

9 Petitioners allege as follows:

10 1. Petitioner Department of Finance is the state government entity charged with
11 supervising the financial and business policies of the State of California. The Department of
12 Finance is given these fiscal supervisory powers in order to conserve the financial interests of the
13 State, to prevent improvidence, and to control the expenditure of State funds by various state
14 government entities. The Department of Finance is authorized to institute proceedings as it
15 deems proper in order to conserve the rights and interests of the State. Petitioner Department of
16 Finance is aggrieved by the decision of respondent Commission to grant the Test Claim, as
17 alleged herein. The Department of Finance is authorized to commence this proceeding to set
18 aside the decision of respondent Commission in part, on the grounds that it is not supported by
19 substantial evidence and is contrary to law.

20 2. Petitioner State Water Board is within the California Environmental Protection
21 Agency. Petitioner State Water Board, together with the nine Regional Water Quality Control
22 Boards, comprise the principal agencies with primary responsibility for coordination and control
23 of water quality in the State of California. Petitioner State Water Board is the state water
24 pollution control agency for all purposes stated in the Federal Water Pollution Control Act
25 (“Clean Water Act”). Petitioner State Water Board is aggrieved by the decision of respondent
26 Commission to grant the Test Claim, as alleged herein. The State Water Board is authorized to
27 commence this proceeding to set aside the decision of respondent Commission in part, on the
28 grounds that it is not supported by substantial evidence and is contrary to law.

1 3. Petitioner San Diego Regional Board is the state agency with primary
2 responsibility to protect water quality in the San Diego region. Whereas the State Water Board
3 establishes statewide policy for water quality control, the San Diego Regional Board formulates
4 and adopts water quality control plans for areas within its jurisdiction. The San Diego Regional
5 Board issues waste discharge requirements within the San Diego region, including waste
6 discharge requirements that serve as National Pollutant Discharge Elimination System (NPDES)
7 permits. Petitioner San Diego Regional Board is aggrieved by the decision of respondent
8 Commission to grant the Test Claim, as alleged herein. The San Diego Regional Board is
9 authorized to commence this proceeding to set aside the decision of respondent Commission in
10 part, on the grounds that it is not supported by substantial evidence and is contrary to law.

11 4. Respondent Commission is the quasi-judicial body charged with carrying out
12 the administrative procedures for resolving claims for reimbursement of state mandated local
13 costs arising out of article XIII B, section 6, of the California Constitution. The functions,
14 powers, and duties of respondent Commission are set out in Government Code section 17500, et
15 seq., and the Commission's implementing regulations, California Code of Regulations, title 2,
16 section 1181, et seq.

17 5. Real parties in interest, the County of San Diego and cities of Carlsbad, Chula
18 Vista, Coronado, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon
19 Grove, National City, Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, and
20 Vista (collectively, "San Diego Real Parties"), are "local governments" within the meaning of
21 article XIII B, section 6 of the California Constitution.

22 6. On or about June 20, 2008, the County of San Diego filed Test Claim No. 07-
23 TC-09.

24 7. Between July and August 2008, the cities of Carlsbad, Chula Vista, Coronado,
25 Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon Grove, National City,
26 Oceanside, Poway, San Diego, San Marcos, Santee, Solana Beach, and Vista joined the filing of
27 Test Claim No. 07-TC-09 and were added as co-claimants by the Commission.

28

1 8. The Test Claim is the subject of this proceeding and, therefore, the San Diego
2 Real Parties have an interest in the outcome of this petition to set aside a portion of the decision
3 of respondent Commission.

4 9. Venue is proper because the cause of action arose in Sacramento County.

5 10. The Test Claim pertains to a NPDES permit issued by the San Diego Regional
6 Board in 2007 (Board Order No. R9-2007-0001, NPDES Permit CAS0108758) ("San Diego
7 Permit") (attached hereto as Exhibit A).

8 11. Congress established the NPDES permit system as part of the 1972
9 amendments to the Clean Water Act, which prohibits all discharges of pollutants from point
10 sources to waters of the United States, unless specifically authorized by an NPDES permit.

11 12. Under the Clean Water Act, the U.S. Environmental Protection Agency ("U.S.
12 EPA") would issue the NPDES permits unless a state obtains authorization to issue them in lieu
13 of issuance by the U.S. EPA.

14 13. In 1972, the California Legislature enacted Chapter 5.5 of the Porter-Cologne
15 Water Quality Control Act (commencing at Water Code section 13370), which authorized the
16 State Water Board to apply to the U.S. EPA for authority to issue NPDES permits in lieu of
17 issuance by the U.S. EPA.

18 14. In 1973, California became the first state in the nation to obtain authorization to
19 issue NPDES permits. The State Water Board and the nine regional boards, including the San
20 Diego Regional Board, implement the NPDES program in California. Therefore, the U.S. EPA
21 does not directly issue NPDES permits to dischargers in California.

22 15. Separate storm sewer systems owned and/or operated by municipalities
23 ("MS4s") are covered "point sources" within the meaning of the Clean Water Act and its NPDES
24 program. Therefore, federal law requires municipalities, such as the San Diego Real Parties, to
25 obtain an NPDES permit before discharging pollutants from their systems. Federal regulations
26 further require permittees to apply for a new permit every five years.

27 16. Although the State Water Board and regional water boards are State agencies,
28 they issue NPDES permits that must be "no less stringent" than required by applicable federal law

1 and regulations. California regulations require that NPDES permits be issued in accordance with
2 the U.S. EPA's NPDES regulations.

3 17. U.S. EPA retains continuing jurisdiction and authority to disapprove specific
4 permits and to supplant the water boards as the permitting authority if State-issued permits do not
5 meet federal requirements.

6 18. The federal Clean Water Act mandates that NPDES permits issued for MS4s
7 "shall require controls to reduce the discharge of pollutants to the maximum extent practicable,
8 including management practices, control techniques and system, design and engineering methods,
9 and such other provisions as the Administrator or the State determines appropriate for the control
10 of such pollutants." 33 U.S.C. § 1342 (p)(3)(B)(iii).

11 19. U.S. EPA regulations further mandate that entities subject to the permitting
12 system must propose management programs that the permitting authority (i.e., the State Water
13 Board and the nine regional water boards) will consider "when developing permit conditions to
14 reduce pollutants in discharges to the maximum extent practicable." 40 C.F.R. § 122.26
15 (D)(2)(iv)(1998). The management programs must include "a comprehensive planning process .
16 . to reduce the discharge of pollutants to the maximum extent practicable using management
17 practices, control techniques and system, design and engineering methods, and such other
18 provisions which are appropriate." (*Ibid.*)

19 20. The San Diego Real Parties, among others, own and/or operate an MS4 that
20 discharges pollutants into waters of the United States, as defined by the Clean Water Act.

21 21. The San Diego Real Parties applied for, and received, their first NPDES permit
22 for the MS4 in 1990. They applied for, and received, their second NPDES permit for the MS4 in
23 2001.

24 22. In 2005, the San Diego Real Parties submitted another permit application to the
25 San Diego Regional Board. After receiving voluminous comments from stakeholders and
26 interested parties, holding public hearings, meetings and workshops, and after consulting with the
27 San Diego Real Parties, either directly or by proxy, the San Diego Regional Board issued the San
28 Diego Permit.

1 23. In the Test Claim, claimants asserted, among other things, that the following
2 parts of the San Diego Permit constitute reimbursable state mandated activities within the
3 meaning of Government Code section 17514 and article XIII B, section 6, of the California
4 Constitution:

- 5 (a) D.1.d.(7) and D.1.d.(8) (low-impact development) (Exhibit A at 21-22);
6 (b) D.1.g (hydromodification management plan) (Exhibit A at 25-28);
7 (c) D.3.a(5) and J.3.a(3)(c) x-xv of the San Diego Permit (street sweeping
8 and reporting thereof) (Exhibit A at 34 & 68, respectively)
9 (d) D.3.a(3) and J.3.a.(3)(c) iv-viii of the San Diego Permit (conveyance
10 system cleaning and reporting thereof) (Exhibit A at 33-34 & 67-68, respectively)
11 (e) D.5 (educational components) (Exhibit A at 44-46);
12 (f) E.2.f and E.2.g (watershed activities and collaboration in the Watershed
13 Urban Runoff Management Program) (Exhibit A at 48-49);
14 (g) F.1, F.2, and F.3 (Regional Urban Runoff Management Program) (Exhibit
15 A at 50);
16 (h) I.1 and I.2 (program effectiveness assessment) (Exhibit A at 52-54);
17 (i) I.5 of the (long-term effectiveness assessment) (Exhibit A at 57); and
18 (j) L (all permittee collaboration) (Exhibit A at 76).

19 24. Pursuant to article XIII B, section 6, whenever the Legislature or any state
20 agency mandates a new program or higher level of service on a local government, the state shall
21 provide a subvention of funds to reimburse the local government for the costs of such program or
22 increased level of service.

23 25. Government Code section 17514 provides that “[c]osts mandated by the state”
24 means any increased costs which a local agency is required to incur after July 1, 1980, as a result
25 of any statute enacted on or after January 1, 1975, or any executive order implementing any
26 statute enacted on or after January 1, 1975, which mandates a new program or higher level of
27 service of an existing program within the meaning of article XIII B, section 6.
28

1 26. On March 30, 2010, respondent Commission issued its Statement of Decision
2 (attached hereto as Exhibit B), finding, among other things, that the following permit parts are
3 state mandates subject to article XIII B, section 6 (hereinafter referred to as "Commission-Found
4 Mandates"):

5 (a) D.1.g (except part D.1.g.(2) and except for municipal priority
6 development projects) (Exhibit B at 45);

7 (b) D.1.d.(7) and (8) for private priority development projects (Exhibit B at
8 51);

9 (c) D.3.a.(5) and J.3.a.(3)(c)x-xv (Exhibit B at 55);

10 (d) D.3.a.(3) and J.3.a.(3)(c)iv-viii (Exhibit B at 59);

11 (e) D.5 (Exhibit B at 63);

12 (f) E.2.f and E.2.g (Exhibit B at 74);

13 (g) F.1, F.2, and F.3 (Exhibit B at 80-83);

14 (h) I.1 and I.2 (Exhibit B at 86);

15 (i) I.5 (Exhibit B at 92); and

16 (i) L (Exhibit B at 94).

17 27. The Commission also found that the following permit parts impose a "new
18 program or higher level of service" within the meaning of article XIII B, section 6 (hereinafter
19 referred to as "Commission-Found New Programs"):

20 (a) D.1.g (except part D.1.g.(2) and except for municipal priority
21 development projects) (Exhibit B at 50);

22 (b) D.1.d.(7) and (8) for private priority development projects (Exhibit B at
23 53);

24 (c) D.3.a.(5) and J.3.a.(3)(c)x-xv (Exhibit B at 57);

25 (d) D.3.a.(3)(b)(iii) and J.3.a.(3)(c)iv-viii (Exhibit B at 61-62);

26 (e) D.5.a.(1), D.5.a.(2), D.5.b.(1)(a)(i) & (ii) for planning boards and elected
27 officials, D.5.b.(1)(a)(iii) & (iv), D.5.b.(1)(b)(iii)-(vi), D.5.(b)(1)(c) and (d), D.5.b.(2) for project
28

1 applicants, contractors, or community planning groups who are not developers or construction
2 site owners, and D.5.b.(3) (Exhibit B at 68-71);

3 (f) E.2.f and E.2.g (Exhibit B at 77-78);

4 (g) F.1, F.2, and F.3 (Exhibit B at 80-83);

5 (h) I.1 and I.2 (Exhibit B at 89, 91);

6 (i) I.5 (Exhibit B at 93)

7 (i) L.1.a.(3)-(6) (Exhibit B at 96).

8 28. The Commission also found that the Commission-Found New Programs, except
9 permit parts D.1.g, D.1.d.(7), and D.1.d.(8), are reimbursable state mandates within the meaning
10 of article XIII B, section 6 and Government Code section 17514 due in part to the San Diego Real
11 Parties' lack of sufficient fee authority.

12 29. The Commission's finding that the Commission-Found Mandates are state
13 mandates subject to article XIII B, section 6 constitutes a prejudicial abuse of discretion within
14 the meaning of Code of Civil Procedure section 1094.5, subsection (b). The Commission did not
15 proceed in the manner required by law and the finding is not supported by substantial evidence
16 for the following reasons:

17 (a) The Commission-Found Mandates are federal, not state, mandates.
18 Article XIII B, section 6 requires state subvention only when the mandate is imposed by the
19 Legislature or a state agency. Government Code section 17556, subsection (c) further provides
20 that state subvention is not required when the federal government, rather than the state
21 government, imposes the costs on local agencies. Federal Clean Water Act and U.S. EPA
22 regulations mandate that the NPDES permits "shall require," at a minimum, controls to reduce the
23 discharge of pollutants to the "maximum extent practicable" using appropriate "management
24 practices, control techniques and system, design and engineering methods." (33 U.S.C. § 1342
25 (p)(3)(B)(iii).) The management practices set out in the San Diego Permit, including the
26 Commission-Found Mandates, collectively and individually, reduce pollutant discharges to the
27 "maximum extent practicable" as mandated by the federal law and regulations. The San Diego
28

1 Regional Board, in issuing the San Diego Permit, implemented and did not exceed the
2 requirements of the Clean Water Act and the relevant U.S. EPA regulations;

3 (b) The Commission's finding that the Commission-Found Mandates are
4 activities that mandate costs that exceed the federal mandate because they are not "expressly
5 required" by the federal statutes and regulations is not supported by substantial evidence. Federal
6 law and regulations do not expressly provide for every management practice or control that they
7 require in an NPDES permit. Rather, federal law and regulations require that permitted
8 management practices and controls reduce the discharge of pollutants to the maximum extent
9 practicable, which specific practices are to be proposed by the municipalities, or, in the absence
10 of an acceptable proposal, defined by the federal or state permitting agency;

11 (c) The Commission's finding that the State freely chose to impose
12 Commission-Found Mandates on the San Diego Real Parties is not supported by substantial
13 evidence. As a matter of federal law, the State Water Board and the San Diego Regional Board
14 cannot adopt an NPDES permit that is "less stringent" than the federal "maximum extent
15 practicable" standard. Furthermore, had the San Diego Regional Board not issued the NPDES
16 permit at issue, or had the U.S. EPA disapproved of that permit, the San Diego Real Parties would
17 have had to obtain an NPDES permit directly from the U.S. EPA, which would prescribe specific
18 permit requirements using the same "maximum extent practicable" standard that the San Diego
19 Regional Board used in issuing the Permit;

20 (d) After erroneously concluding that the Commission-Found Mandates are
21 state mandates, the Commission failed to consider the incidental nature of these provisions to the
22 federal requirements, and that any costs imposed which exceed the federal requirements are
23 merely de minimis and nonreimbursable. As a matter of law, any state rule or procedure intended
24 to implement an applicable federal law, and whose costs are de minimis in the proper context, are
25 treated as part of the underlying federal mandate;

26 (e) The Commission's finding that the activities prescribed by the
27 Commission-Found Mandates were not undertaken at the option or discretion of the San Diego
28 Real Parties is not supported by substantial evidence. U.S. EPA regulations require the San

1 Diego Real Parties to propose management programs to the permitting authority. The San Diego
2 Real Parties, however, had discretion over which activities and conditions to propose as best
3 management practices to the San Diego Regional Board for adoption. Exercising that discretion,
4 the San Diego Real Parties proposed management practices, which the San Diego Regional Board
5 used as a basis for adopting the Commission-Found Mandates, with additions and revisions
6 necessary to meet the federal "maximum extent practicable" standard. Furthermore, if the San
7 Diego Real Parties had believed that the Commission-Found Mandates exceeded the maximum
8 extent practicable standard, they had the option to propose alternate management practices to the
9 San Diego Regional Board for implementation, but they chose not to do so; and

10 (f) The Commission's finding that Commission-Found Mandates are
11 "mandated costs" is not supported by substantial evidence. "Costs mandated by the state" are
12 increased costs incurred by local governments as a result of any statute enacted on or after
13 January 1, 1975. (Gov. Code, § 17514.) The State Water Board's and the regional water boards'
14 authority to issue NPDES permits in implementing the federal Clean Water Act is granted by
15 Chapter 5.5 of the Porter-Cologne Act. Chapter 5.5 of the Porter-Cologne Act was enacted in
16 1972. Any increased costs incurred by the San Diego Real Parties in implementing the San Diego
17 Permit are, therefore, not "costs mandated by the state."

18 30. The Commission's finding that the Commission-Found New Programs impose
19 "a new program or higher level of service" constitutes a prejudicial abuse of discretion within the
20 meaning of Code of Civil Procedure section 1094.5, subsection (b). The Commission did not
21 proceed in the manner required by law and the finding is not supported by substantial evidence
22 for the following reasons:

23 (a) The State need only reimburse a local agency for "a new program or
24 higher level of service." A "program" under article XIII B, section 6 is one that carries out the
25 governmental function of providing services to the public, or a law which, to implement a state
26 policy, imposes unique requirements on local governments and does not apply generally to all
27 residents and entities in the state. The State Water Board and the regional water boards issue
28 NPDES permits to both public and private entities subject to the Clean Water Act. As required

1 by the Clean Water Act and U.S. EPA regulations, the State Water Board and the regional water
2 boards actually impose more stringent requirements on private entities than on public entities.
3 The permit at issue, therefore, does not impose “a new program or higher level of service”
4 because it does not force the San Diego Real Parties to carry out any public service peculiar to
5 governments and imposes no requirements unique to the San Diego Real Parties; and

6 (b) The Commission’s finding that the requirements of the Commission-
7 Found New Programs constitute “a new program or higher level of service” is incorrect. The
8 requirements imposed by the San Diego Permit are the same as or similar to those of the permit in
9 effect immediately before, but with more specificity, and thus do not impose “a new program or
10 higher level of service.”

11 31. The Commission’s finding that the San Diego Real Parties lack appropriate
12 authority to levy fees sufficient to pay for the Commission-Found New Programs, other than for
13 permit parts D.1.g, D.1.d.(7), and D.1.d.(8), constitutes a prejudicial abuse of discretion within
14 the meaning of Code of Civil Procedure section 1094.5, subsection (b). The Commission did not
15 proceed in the manner required by law and the finding is not supported by substantial evidence:

16 (a) The Commission’s finding that the San Diego Real Parties do not have
17 fee authority within the meaning of Government Code section 17556, subsection (d) if adoption
18 of the fee is contingent on the outcome of an election is contrary to law. As a matter of law, costs
19 are not deemed to be mandated by the state if the San Diego Real Parties have the authority to
20 levy service charges, fees, or assessments sufficient to pay for the mandated program or increased
21 level of service. Whether the San Diego Real Parties actually levy the charges, fees, or
22 assessment to pay for the Commission-Found New Programs does not affect the determination of
23 whether costs are mandated by the state. Section 6 of article XIII B requires subvention only
24 when the costs in question can be recovered solely from tax revenues. When the local agencies
25 have the legal authority to levy charges, fees, or assessments, as the San Diego Real Parties do in
26 this case, they do not have to expend proceeds of taxes and no subvention is required;

27 (b) The Commission’s determination that the Commission-Found New
28 Programs, except for permit parts D.1.g, D.1.d.(7), and D.1.d.(8), impose “costs mandated by the

1 state” is not supported by its own finding that the San Diego Real Parties have authority under the
2 police power to impose fees for all Commission-Found New Programs. Government Code
3 section 17556, subsection (d) provides that the Commission “shall not find costs mandated by the
4 state” if the local agency has “the authority to levy service charges, fees, or assessments sufficient
5 to pay for the mandated program or increased level of service,” which the Commission found in
6 this case;

7 (c) The Commission’s finding that the Real Parties lack the fee authority
8 under Public Resources Code section 40059 sufficient to pay for the permit part D.3.a.(5) activity
9 is not supported by substantial evidence. The San Diego Real Parties have the authority to levy
10 fees sufficient to pay for cost associated with implementing permit part D.3.a.(5) under Public
11 Resources Code section 40059;

12 (d) The Commission’s finding that the Real Parties lack the fee authority
13 under Health and Safety Code section 5471 sufficient to pay for the permit part D.3.a.(3) activity
14 is not supported by substantial evidence. The San Diego Real Parties have the authority to levy
15 fees sufficient to pay for cost associated with implementing permit part D.3.a.(3) under Health
16 and Safety Code section 5471.

17 32. Petitioners have no plain, speedy, and adequate remedy in the ordinary course
18 of law.

19 33. Petitioners have requested that respondent Commission prepare a true and
20 correct copy of the administrative record of all proceedings in connection with the Test Claim. A
21 true and correct copy of the administrative record will be lodged with the Court prior to the
22 hearing on this petition.

23 ///

25 ///

26

27

28

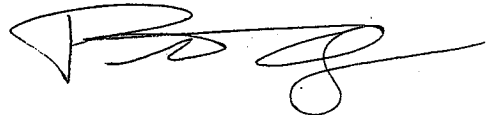

1 WHEREFORE, petitioners Department of Finance, State Water Board, and San Diego
2 Regional Board pray as follows:

- 3 1. That a writ of mandate issue pursuant to Government Code section 17559,
4 subsection (b) and Code of Civil Procedure section 1094.5, directed to respondent Commission
5 on State Mandates, commanding it to set aside its decision granting Test Claim No. 07-TC-09, in
6 part, and to issue a new decision consistent with the Court's opinion and judgment;
- 7 2. That petitioners recover their costs incurred in this proceeding; and,
- 8 3. For such other relief that the Court considers proper.

ATTACHMENT 29

**SUPERIOR COURT OF CALIFORNIA
COUNTY OF SACRAMENTO**

DATE/TIME	November 4, 2011 1:30 p.m.	DEPT. NO	42
JUDGE	HON. ALLEN SUMNER	CLERK	J. ZGRAGGEN
STATE OF CALIFORNIA, DEPARTMENT OF FINANCE, et al., Petitioners v. COMMISSION ON STATE MANDATES, Respondent		Case No.: 34-2010-80000604	
<hr/> COUNTY OF SAN DIEGO, et al., Real Parties in Interest			
Nature of Proceedings:		WRIT OF MANDATE	

The petition for writ of mandate by the State Department of Finance, et al., challenging the decision by the Commission on State Mandates is GRANTED.

INTRODUCTION

At issue is whether the conditions that the San Diego Regional Quality Control Board imposed on a permit allowing the County of San Diego and eighteen cities within San Diego County to discharge storm water runoff constitutes a "state mandate" within the meaning of article XIII B of the California Constitution requiring the State to reimburse the County and cities for their cost in complying. Specifically, did the State require the County and cities to meet conditions beyond what is required by the federal Clean Water Act?

The court's tentative ruling was heard November 4, 2011. Petitioners, the Department of Finance, State Water Resources Control Board and San Diego Regional Water Quality Control Board (collectively "State") were represented by Deputy Attorney General Kathleen Lynch. Respondent Commission on State Mandates ("Commission") was represented by Eric Feller. The real parties in interest, the County of San Diego and eighteen cities within San Diego County (collectively "Permittees") were represented by James O'Day, Helen Peak and Shawn Hagerty.

BACKGROUND

In 2007 the San Diego Regional Water Quality Control Board issued a permit to Permittees allowing the discharge of storm water runoff.

The Permittees filed a test claim with the Commission seeking reimbursement from the State for costs incurred in complying with the permit. The Commission concluded several conditions of the permit imposed new programs, or higher levels of service, for which reimbursement is required under article XIII B, section 6.

The State filed a petition for writ of administrative mandamus to overturn the Commission's decision.¹

The court finds the Commission erred in concluding the challenged provisions of the permit are state-mandated programs merely because the permit conditions are not expressly required by federal statute or regulation. The relevant inquiry is whether the conditions are required by federal law, not whether they are explicitly described in federal statute or regulation. Because the Commission failed to apply the proper standard, the petition for writ is granted and the matter remanded to the Commission for proceedings consistent with this decision and judgment.

¹ The Permittees filed a cross-petition challenging the Commission's finding that Permittees are not entitled to reimbursement for some of the alleged mandates because they have authority to levy fees sufficient to recoup their costs. Given the court's conclusion the Commission erred in determining these were state-mandated costs, the court need not address Permittees' ability to recover the costs through local fees.

STATEMENT OF THE CASE

A. Federal Regulation of Storm Water Pollution

Background

The federal Water Pollution Control Act, enacted in 1948, initially relied primarily on state and local enforcement efforts to remedy water pollution problems. (*Building Industry Association v. State Water Resources Control Board* (2004) 124 Cal.App.4th 866, 872.) However, by the early 1970's it was apparent local enforcement was ineffective, resulting in "accelerating environmental degradation of rivers, lakes, and streams . . ." (*ibid.* [citing *Natural Resources Defense Council, Inc. v. Costle* (D.C. Cir. 1977) 568 F.2d 1369, 1371].) In response, Congress adopted the Water Pollution Control Amendments of 1972, commonly known as the Clean Water Act.

The Clean Water Act is a comprehensive water quality statute intended to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters." (*City of Burbank v. State Water Resources Control Board* (2005) 35 Cal.4th 613, 620.) The Act seeks to eliminate discharge of pollutants into navigable waters of the United States. (*ibid.*) To accomplish this, the Act requires compliance with "effluent limitations" which restrict the quantities, rates or concentrations of chemical, physical, biological and other constituents discharged into navigable waters. (*ibid.*)

The Act provides two sets of effluent limitations: First, "technology-based" effluent limitations, based on the best available or practical technology for reduction of water pollution. (*Communities for a Better Environment v. State Water Resources Control Board* (2003) 109 Cal.App.4th 1089, 1093.) Second, "water quality" effluent limitations, assuring that pollution will not fall below acceptable water quality standards. (*ibid.*)

The primary means of enforcing the Clean Water Act's effluent limitations and water quality standards is the National Pollutant Discharge Elimination System ("NPDES") permit. Generally, it is unlawful for any person to discharge a pollutant from a "point source" without first obtaining a NPDES permit. (*Building Industry Association,*

supra, 124 Cal.App.4th at p.872.) The NPDES permit sets specific terms and conditions for each source discharging pollutants. The NPDES permit also sets any technology-based or water quality effluent limitations necessary to meet water quality standards. (*Communities for a Better Environment, supra*, 109 Cal.App.4th at p.1093.)

State Authorization

Under the Clean Water Act, the EPA may authorize a state with an EPA-approved water quality control program to issue NPDES permits. (*Communities for a Better Environment, supra*, at p.1092; 33 U.S.C. § 1342(a) & (b).) A state requesting authorization to administer its own permit program must demonstrate its state program meets federal requirements. (33 U.S.C. § 1342(b); 40 C.F.R. § 123.25; see also *Shell Oil Co. v. Train* (9th Cir. 1978) 585 F.2d 408, 410.) Once approved by the EPA, the state program is operated in lieu of the federal permit program. (33 U.S.C. § 1342(c); 40 C.F.R. §§ 123.22, 123.61.) Suspension of the federal program creates a separate and independent state authority to administer the NPDES pollution controls. (*Shell Oil, supra*, 585 F.2d at p.410.) A state authorized to administer the federal Clean Water Act may also adopt state water quality restrictions more stringent than those required by federal law. (*City of Burbank, supra*, at pp.627-628; 33 U.S.C. § 1370; 40 C.F.R. § 123.1.)

If an authorized state fails meet federal requirements, the EPA may withdraw approval and administer the federal permit program in that state. (33 U.S.C. § 1342(c).)

Discharge of Storm Waters

Shortly after the Clean Water Act was enacted, the EPA adopted regulations exempting most municipal storm sewer systems from NPDES permit requirements. This exemption was overturned in *Natural Resources Defense Council v. Costle* (1977) 568 F.2d 1369, and the EPA was ordered to require NPDES permits for storm water runoff. When the EPA failed to adopt regulations implementing a permitting system for

storm water runoff, Congress adopted the Water Quality Act of 1987, amending the Clean Water Act to impose NPDES permit requirements for storm water discharges.

Congress distinguished between industrial and municipal storm water discharges, establishing a lower bar for discharges from municipal storm sewer systems: Industrial NPDES permits are required to meet applicable effluent limitations, while municipal NPDES permits are generally required to control pollutants to the "**maximum extent practicable**." (See *Building Industry Association, supra*, 124 Cal.App.4th at pp.874, 884.) The Act provides:

Permits for discharges from municipal storm sewers . . . shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. (33 U.S.C. § 1342(p)(3)(B)(iii).)

B. California's Regulation of Storm Water Pollution

In 1969, three years before Congress enacted the Clean Water Act, California enacted its own water quality protection legislation, the Porter-Cologne Water Quality Control Act ("Porter-Cologne Act"). The Porter-Cologne Act seeks to attain the highest reasonable quality water, considering all demands made on those waters and the total value involved: beneficial and detrimental, economic and social, tangible and intangible. (Water Code § 13000.) The Porter-Cologne Act requires water quality plans to ensure the reasonable protection of beneficial uses and prevent nuisance. (Water Code §§ 13050(f), 13241.)

The Porter-Cologne Act makes the State Water Resources Control Board and the nine Regional Water Quality Control Boards responsible for establishing water quality standards. Together the State and regional boards are the state agencies with primary responsibility for coordination and control of California's water quality. (Water Code § 13001.)

The Porter-Cologne Act requires regional boards to establish water quality objectives (standards) and a program to achieve these objectives through regional water quality control plans. The regional board's program must describe the actions necessary to achieve its objectives, including recommendations for appropriate action by regulated entities; a schedule for actions to be taken; and a description of the surveillance to be undertaken to determine compliance. (Water Code § 13242.)

Under the Porter-Cologne Act, any person or entity discharging "waste" that could affect the quality of the state's waters is required to file a Report of Waste Discharge. (Water Code §§ 13260, 13263.) The regional water board may then issue a permit, known as a Waste Discharge Requirement, allowing the discharge. In issuing a Waste Discharge Requirement, the regional board sets conditions for the discharge. (Water Code § 13263.)

Shortly after Congress enacted the Clean Water Act in 1972, California took steps to implement the new federal requirements. California sought EPA approval to issue NPDES permits "in order to avoid direct regulation by the federal government of persons already subject to regulation under state law pursuant to [the Porter-Cologne Act]." (Water Code § 13370(c).) To ensure California meets federal requirements to issue NPDES permits, the Legislature added chapter 5.5 to the Porter-Cologne Act requiring the state and regional water boards to satisfy federal Clean Water Act requirements when issuing Waste Discharge Requirements. (Water Code § 13377.) As a result, Waste Discharge Requirements are the equivalent of NPDES permits required by the Clean Water Act. (Water Code § 13374.)

The EPA thereafter granted California approval to issue NPDES permits. Thus, Waste Discharge Requirements issued by California's regional water boards ordinarily serve as NPDES permits under federal law. (*Building Industry Association, supra*, 124 Cal.App.4th at p.875; *City of Burbank, supra*, 35 Cal.4th at p.631.)

C. Reimbursement for State Mandated Programs

In June 1978, the voters adopted Proposition 13, adding article XIII A to the California Constitution limiting the authority of local governments to impose *ad valorem*

property taxes or new special taxes. (*County of Fresno v. State of California* (1991) 53 Cal.3d 482, 486.) In November of 1979 the voters adopted Proposition 4, adding article XIII B to the California Constitution imposing the "Gann Limit" on local expenditures. The voters intended articles XIII A and XIII B to work in tandem, restricting the power of local government to both levy and spend taxes. (*County of Fresno, supra*, 53 Cal.3d at p.486.)

Recognizing that article XIII A severely restricted the taxing powers of local government, article XIII B prevents the State from transferring the cost of governmental programs from the State to local governments. (*County of Fresno, supra*, 53 Cal.3d at p.487.) Article XXII B generally requires the State to reimburse local governments for the cost of governmental services which the State mandates local governments provide. (*County of Los Angeles v. Commission on State Mandates* (2007) 150 Cal.App.4th 898, 906.) Although the State may require local entities to provide new programs or services, it may not require local entities to use their own tax revenues to pay for the programs or services. (*California School Boards Assn. v. State of California* (2011) 192 Cal.App.4th 770, 787.) Specifically, article XIII B, section 6, provides in relevant part:

Whenever the Legislature or any state agency mandates a new program or higher level of service on any local government, the state shall provide a subvention of funds to reimburse such local government for the costs of such program or increased level of service (Cal. Const, art. XIII B, § 6.)

Article XIII B, section 6, requires the State to reimburse local agencies for the cost of any new governmental program, or higher level of service, that the State imposes. (*County of Los Angeles, supra*, 150 Cal.App.4th at pp.906-907.) However, section 6 applies only to costs mandated by the State; the State is not required to reimburse costs mandated by federal law. (See *County of Los Angeles, supra*, 150 Cal.App.4th at p.907; see also Gov. Code §§ 17513, 17514, 17556(c).)

To implement article XIII B, the Legislature created the Commission on State Mandates. (Gov't. Code § 17500 et seq.) The Commission is a quasi-judicial body

charged with resolving state mandate claims. (*Kinlaw v. State of California* (1991) 54 Cal.3d 326, 331; see Gov. Code § 17500 *et seq.*) The Commission determines whether the State has imposed a reimbursable mandate. (*County of Los Angeles, supra*, 150 Cal.App.4th at pp.907-908.) The Commission has exclusive authority to make this determination. (*Redevelopment Agency v. Commission on State Mandates* (1996) 43 Cal.App.4th 1180, 1193; *County of Los Angeles, supra*, 150 Cal.App.4th at p.908; Gov. Code § 17552.)

A local government initiates the process for reimbursement under article XIII B, section 6, by filing a "test claim" with the Commission. The Commission must then determine whether a state mandate exists and, if so, the amount of reimbursement due the local entity. (Gov. Code §§ 17551, 17557, 17558.) Judicial review of the Commission's decision is available through a petition for writ of mandate under Code of Civil Procedure section 1094.5. (*Kinlaw, supra*, 54 Cal.3d at p.332; Gov. Code § 17559.)

D. Permittees' Test Claim

The Permittees filed a test claim with the Commission seeking reimbursement for various requirements imposed by NPDES Permit No. CAS0108758.² After hearing, the Commission issued a 133-page decision partially approving the claim. The Commission concluded the following requirements in the permit imposed reimbursable state-mandated new programs or higher levels of service within the meaning of article XIII B, section 6:

- Street sweeping and reporting (parts D.3.a(5), J.3.a(3)(c) x-xv);
- Conveyance system cleaning and reporting (parts D.3.a(3), J.3.a(3)(c)(iv)-(viii));
- Educational components of the Jurisdictional Urban Runoff Management Program (parts D.5.a(1)-(2), D.5.b(1)(c)-(d), D.5(b)(3));

² That NPDES permit was first issued in 1990 (Order No. 90-42), and renewed in 2001. (Order No. 2001-01.) In 2005, the County of San Diego submitted the required Report of Waste Discharge to renew the permit.

- Provisions of the Watershed Urban Runoff Management Program (parts E.2.f, E.2.g);
- Provisions of the Regional Urban Runoff Management Program (parts F.1, F.2, F.3);
- The program and long term effectiveness assessments (parts I.1, I.2, I.5); and
- The "all permittee collaboration" requirements (parts L.1.a(3)-(6)).³

F. Petition and Cross-Petition

On July 20, 2010, the State filed a petition for writ of administrative mandate challenging the Commission's finding that the above permit requirements are reimbursable state mandates. The State argues the Commission's decision is erroneous because (1) the NPDES permit and its conditions are required by federal law; (2) California's administration of the NPDES permit program does not transform the federal requirements into a state mandate; (3) the permit does not impose a new program or higher level of service under an existing program; and (4) even if the challenged activities are state mandates, they are not reimbursable because the Permittees have authority to levy fees to recover their costs.

DISCUSSION

The State challenges three aspects of the Commission's decision: the permit requirements are not federal mandates; the permit requirements impose new programs or higher levels of service; and the Permittees lack sufficient fee authority to recover the costs of the program.

³ The Commission also found the hydromodification management plan and low-impact development requirements of the Jurisdictional Urban Runoff Management Program (parts D.1.d(7)-(8), D.1.g) are state-mandated new programs or higher levels of service. However, the Commission concluded the Permittees are not entitled to reimbursement for these costs because they have sufficient authority to levy fees to pay these expenses.

The Permittees' cross-petition challenges this portion of the Commission's decision. Because the matter is remanded to the Commission for further procedures on the threshold question of whether these are state-mandated costs, the Permittees' cross-petition is not addressed.

The court concludes the Commission applied the wrong legal standard in addressing the first question, whether the permit conditions exceed federal requirements. Accordingly, the court concludes that a writ should issue remanding this matter to the Commission for further proceedings consistent with this court's decision and judgment.

Given this determination, it is unnecessary to address the other issues raised by the petition and cross-petition

Standard of Review

The court must determine whether the Commission proceeded without, or in excess of, jurisdiction; whether the parties received a fair hearing; and whether there was prejudicial abuse of discretion. (Code Civ. Proc. § 1094.5) Abuse of discretion is established if the Commission did not proceed in the manner required by law, its order or decision is not supported by the findings, or the findings are not supported by the evidence. (*Ibid.*)

Whether the State imposed conditions exceeding the requirements of the federal Clean Water Act is an issue of fact. (*City of Burbank, supra*, 35 Cal.4th at p.628.)

The Commission's factual findings are reviewed under the substantial evidence test. (*City of Richmond v. Commission on State Mandates* (1998) 64 Cal.App.4th 1190, 1194-1195; Cal. Gov. Code § 17559.) Under the substantial evidence test, the court does not reweigh the evidence, views the evidence in the light most favorable to the Commission's findings, and indulges all reasonable inferences in support thereof. (*Camarena v. State Personnel Bd.* (1997) 54 Cal.App.4th 698, 701; *Hosford v. State Personnel Bd.* (1977) 74 Cal.App.3d 302, 306-07.) The court may not overturn the Commission's finding of fact simply because a contrary finding would have been more reasonable. (*Boreta Enterprises, Inc. v. Department of Alcoholic Beverage Control* (1970) 2 Cal.3d 85, 94; *Wilson v. State Personnel Bd.* (1976) 58 Cal.App.3d 865, 870.)

However, in addition to examining whether the Commission's findings are supported by substantial evidence, the court must determine whether the Commission committed any errors of law. The Commission's legal conclusions are reviewed de

novo. (*Jenron Corp. v. Dept. of Social Services* (1997) 54 Cal.App.4th 1429, 1434.) This includes the Commission's interpretation of a regulation or statute. (*Samples v. Brown* (2007)) 146 Cal.App.4th 787, 799.)

While an agency's interpretation of a statute or regulation it is charged with enforcing is entitled to deference, the court makes the ultimate interpretation of the law. (See, *Family Planning Associates Med. Group, Inc. v. Belshe* (1998) 62 Cal.App.4th 999, 1004.) The California Supreme Court explained:

[T]he standard of judicial review of an agency interpretation of law is the independent judgment of the court, giving deference to the determination of the agency appropriate to the circumstances of the agency action. (*Yamaha Corp. of America v. State Board of Equalization* (1998) 19 Cal.4th 1, 8.)

The weight to be given an agency's interpretation will depend upon the thoroughness of its consideration, the validity of its reasoning, and its consistency with earlier and later pronouncements. (*Yamaha, supra*, at p.14.) However, final responsibility for interpreting the law rests with the court. (*Id.* at p.7.)

Here, we have conflicting interpretations of what the federal Clean Water Act requires for the Permittees' permit. The San Diego Regional Water Quality Control Board concluded the permit conditions are required by the Clean Water Act. The Regional Board is charged with administering the Clean Water Act and approving the NPDES permit program in San Diego County. The court must accord appropriate deference to the Regional Board's construction of the Clean Water Act. (See *Building Industry Association, supra*, 124 Cal.App.4th at pp.873, 879 fn.9; *County of Los Angeles v. California State Water Resources Control Board* (2006) 143 Cal.App.4th 985, 997.)

The Commission disagreed with the Regional Board's construction, concluding the permit conditions go beyond what is required by the Clean Water Act. The Commission thus concluded the permit conditions imposed state-mandated costs within the meaning of article XIII B. The Commission has exclusive authority for enforcing article XIII B, including determining if the State has imposed a mandate requiring reimbursement. (See *Redevelopment Agency v. Commission on State Mandates*,

supra, 43 Cal.App.4th at p.1193.) The court must accord appropriate deference to the Commission's construction of whether there is a state mandate within the meaning of article XIII B.

1. State administration of the federal Clean Water Act does not make the permits a state-mandated program

The fact that the State chose to administer the federal NPDES permit program does not make the permit requirements a state-mandated program. In the seminal case of *Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1564, school districts sought reimbursement for costs incurred in providing special education programs implementing the federal Education of the Handicapped Act. The State argued these programs were required by federal law, and thus article XIII B did not require reimbursement.

The court agreed the federal Act required the State to provide the programs. However, under federal law, the State itself could have provided the programs. The court in *Hayes* concluded that if the State decided to shift the costs to local agencies, the State cannot claim the costs are a federal mandate because, "as far as the local agency is concerned, the burden is imposed by a state rather than a federal mandate." (*Id.* at p.1594.)

Here, in contrast, the federal government has imposed the NPDES requirements directly on local agencies that discharge pollutants. Federal law requires the Permittees to obtain a NPDES permit in order to discharge pollutants. Federal law also requires the permit to include controls reducing the discharge of pollutants "to the maximum extent practicable." (33 U.S.C. § 1342(p)(3)(B); See *Building Industry Association, supra*, 124 Cal.App.4th at pp.874, 884.)

Unlike *Hayes*, the State is not shifting federally-mandated costs to local agencies. Even if the State had not been approved to issue the NPDES permit, the Permittees would still have to comply with federal requirements to reduce their discharge of pollutants to the "maximum extent practicable." Californians choice to

administer the NPDES permit program did not transform the federal NPDES requirements into a state-mandated program.

2. The Commission failed to apply the federal standard requiring that discharge of pollutants must be reduced to the "maximum extent practicable."

The parties agree the issue is whether the State required Permittees to comply with conditions beyond those required by federal law. (See, e.g., *Long Beach Unified School District v. State of California* (1990) 225 Cal.App.3d 155, 173 [State Executive Order requiring school districts to adopt plans to alleviate segregation went beyond constitutional requirements and thus imposed a state-mandated program].) The Permittees argue the court must take a "comparative approach" – comparing the permit conditions to what is required by the federal Clean Water Act. But this begs the question – what is required by the federal Clean Water Act?

The Commission provided a lengthy discussion of whether the various permit conditions are required by federal law. However, the Commission looked only to whether federal law expressly requires the particular conditions specified in the permit. The Commission concluded that since nothing in federal statute or regulation expressly requires the conditions specified in the NPDES permit, the permit must therefore exceed the requirements of federal law. This was error.

As discussed above, the Clean Water Act requires every NPDES permit to include controls reducing discharge of pollutants to the "maximum extent practicable." The Clean Water Act uses a *flexible standard*, requiring each permitting agency to develop conditions based on the unique circumstances of the water affected. (*Building Industry Association, supra*, 124 Cal.App.4th at pp.873, 889.) The "maximum extent practicable" standard balances numerous factors, including technical feasibility, cost, public acceptance, regulatory compliance and effectiveness. (*Ibid.*)

In evaluating whether the challenged NPDES permit exceeds the requirements of federal law, the Commission must determine whether any of the permit conditions exceed the "maximum extent practicable" standard. The Commission never undertook

this inquiry. Instead, it simply asked whether the permit conditions are expressly specified in federal regulations or guidelines. This is not the test. The fact that a permit condition is not specified in a federal regulation or guideline does not determine whether the condition is "practicable," and thus required by federal law. The mere fact that a permit condition is not promulgated as a federal regulation does not mean it exceeds the federal standard.⁴

By failing to consider whether the permit requirements exceed the "maximum extent practicable" standard, the Commission failed to proceed in the manner required by law. As a result, there is nothing in the record to support the Commission's finding that the permit requirements exceed the "maximum extent practicable" standard. The Commission's conclusion that the permit goes beyond federal law must be set aside and the matter remanded to the Commission to reconsider its Decision. (*Voices of the*

⁴ The court appreciates the Commission's difficulty given the flexible test under the federal Clean Water Act. The Commission faced a similar challenge in *San Diego Unified School Dist. v. Commission on State Mandates* (2004) 33 Cal.4th 859, where the Commission was required to determine if state procedures requiring hearing when a student was being expelled exceeded federal due process requirements. Our Supreme Court sympathized with the challenge posed to the Commission attempting to resolve the exact extent of nebulous federal law in the context of a state mandate proceeding:

The record reveals that in the extended proceedings before the Commission, the parties spent numerous hours producing voluminous pages of analysis directed toward determining whether various provisions of Education Code section 48918 exceed federal due process requirements. The task below was complicated by the circumstance that this area of federal due process law is not well developed. The Commission, which is not a judicial body, did as best it could and concluded that in certain respects the various provisions . . . 'exceeded' the requirements of federal due process.

Even for an appellate court, it would be difficult and problematic in this setting to categorize the various . . . requirements here at issue as falling within or without the general federal due process mandate. The difficulty results not only from the circumstance that . . . the case law in the area of due process procedures concerning expulsion matters is relatively undeveloped, but also from the circumstance that when such an issue is raised in an action for reimbursement, as opposed to its being raised in litigation challenging an actual expulsion on the grounds of allegedly inadequate hearing procedures, the issue inevitably is presented in the abstract, without any factual context that might help frame the legal issue. (*Id.* at 889-890.)

Wetlands v. State Water Resources Control Bd. (2011) 52 Cal.4th 499, 534-535; *Fascination, Inc. v. Hoover* (1952) 39 Cal.2d 260, 268.)⁵

Remand

The State argues remand is unnecessary. The State argues the Regional Board's determination that the permit requirements are necessary to comply with the federal Clean Water Act must be given preclusive effect, and that the Permittees may not "collaterally attack" the Regional Board's findings before the Commission. In short, the State insists the federal requirements are whatever the Water Board says they are. With this the court does not agree.

In addition to administering the federal Clean Water Act, the Regional Board has authority under state law to impose requirements beyond the federal "maximum extent practicable" standard of federal law. (See *Building Industry Association, supra*, 124 Cal.App.4th at p.889 ["practicable" does not simply equate to "possible"].) If the Regional Board requires the Permittees to meet standards beyond those mandated by federal law, the additional costs would be a state mandate requiring reimbursement under article XIII B. (See *Hayes v. Commission on State Mandates, supra*, 11 Cal.App.4th at p.1564) The Commission has exclusive authority to determine whether the Regional Board has imposed a state mandate. (*Redevelopment Agency v. Commission on State Mandates, supra*, 43 Cal.App.4th at p.1188.)

⁵ The State asks this court to take judicial notice that the Los Angeles County Superior Court reached the same conclusion in a case reviewing the Commission's finding that similar conditions imposed in the NPDES permit for the County of Los Angeles constituted a state mandate requiring reimbursement. (*State of California v. County of Los Angeles* (Super. Ct. Los Angeles County, 2011, No. B5130730.) The State also asks this court to take judicial notice of a decision by the United States Environmental Protection Agency entitled *In re City of Irving, Texas, Municipal Separate Storm Sewer System* (July 16, 2001) 10 E.A.D. 111 (E.P.A.), allegedly showing the Clean Water Act allows permit writers to use a combination of pollution controls that may be different in different permits.

Permittees oppose the State's request for judicial notice of the Los Angeles Superior Court and EPA decisions, contending that neither decision is relevant and that the court is prohibited from citing to or relying on the Los Angeles Superior Court decision under California Rule of Court, Rule 8.1115.

The objection to the Los Angeles Superior Court decision is granted. (*Schmier v. Supreme Court* (2002) 96 Cal.App.4th 873, 881-882.) In contrast, the objection to the EPA decision is denied. (*County of Stanislaus v. Pacific Gas & Elec. Co.* (E.D. Cal. 1995) 1995 U.S. Dist. LEXIS 21411, 22; *Smiley v. Citibank (S.D.), N.A.* (1995) 11 Cal.4th 138, 145.) Although the EPA decision is not binding, it qualifies for judicial notice. Accordingly, the court grants the request for judicial notice of the EPA decision, but denies the request for judicial notice of the Los Angeles Superior Court decision.

Because the Commission failed to properly address this question, the court grants the writ and remands this matter for further proceedings consistent with this decision. This, however, does not mean the Commission is precluded from determining if the Regional Board has imposed a state-mandated program.

The Commission's Other Findings

Having concluded the writ should be granted because the Commission applied the wrong legal standard in determining whether the permit exceeded federal requirements, it is unnecessary to review the Commission's other findings at this time, including those raised in the cross-petition. (See *Gruschka v. Unemployment Ins. Appeals Bd.* (1985) 169 Cal.App.3d 789, 793 [use of wrong standard constituted error of law necessitating remand]; *County of Stanislaus v. Assessment Appeals Bd.* (1989) 213 Cal.App.3d 1445, 1450, 1452 [same].)

DISPOSITION

For the foregoing reasons, the State's petition for writ of mandate is GRANTED. A writ shall issue directing the Commission to set aside its decision and remanding this matter to the Commission for further proceedings consistent with this court's decision and judgment.

Counsel for the State is directed to prepare a formal judgment incorporating this ruling as an exhibit; submit it to opposing counsel for approval as to form; and thereafter submit it to the court for signature and entry of judgment in accordance with California Rule of Court, rule 3.1312.

The State is entitled to recover its costs upon appropriate application. The State shall recover any fees waived pursuant to Government Code section 6103, and reimbursed the clerk of the court pursuant to Government Code section 6103.5.

CASES

Barratt American, Inc. v. City of Rancho Cucamonga
(2005) 37 Cal.4th 6859, 10, 13

INTRODUCTION

2 The Commission on State Mandates properly found that the County of San Diego and
3 several cities named in the petition (referred to below collectively as the “County of San Diego”)
4 are authorized to impose fees for the hydromodification management plan and low impact
5 development permit requirements that are the subject of this proceeding.¹ Reimbursement by the
6 state is not required where the local agency may impose fees to cover its costs, instead of raising
7 taxes. Since the County has statutory authority to impose fees, if the County chooses to do so, the
8 Commission properly found that the permit requirements for hydromodification and low impact
9 development are not reimbursable.

10 The County argues that despite the explicit statutory authority to impose a fee, any fee that
11 might be imposed under the statute would be unconstitutional. Since no fee has yet been enacted,
12 the County’s argument is purely hypothetical. Furthermore, the County’s argument relies on
13 erroneous interpretations of the governing law. Nothing prevents the County from imposing a fee
14 on developers for governmental costs reasonably associated with preventing or mitigating
15 environmental harm caused by the developers’ projects.

16 In addition, the Commission properly found that under the California Watershed
17 Improvement Act of 2009 the County of San Diego has fee authority and offsetting revenue if
18 they complied with the Act’s voluntary requirements.

19

BACKGROUND

20 **I. CHALLENGED PERMIT PROVISIONS FOR REDEVELOPMENT AND SIGNIFICANT**
21 **REDEVELOPMENT**

22 The challenged permit requirements for the hydromodification management plan and low
23 impact development arise in the context of managing increases in runoff discharge rates and
24 durations from new development and significant redevelopment. (AR 269, 271-272, 275-278.)
25 Generally speaking, part D.1 of the permit, Development Planning Component, requires each

26 _____
27 ¹ The other fee issues related to the challenged permit requirements are addressed in the
28 state’s petition and related briefing as well as issues surrounding whether the permit and the
particular permit requirements are state mandates.

1 Copermittee to implement a program in its jurisdiction that includes managing “increases in
2 runoff discharge rates and durations from Development Projects that are likely to cause increased
3 erosion of stream, beds and banks, silt pollutant generation, or other impacts to beneficial users
4 and stream habitat due to increased erosive force.” (AR 266.)

5 “Development Projects” is defined in the permit as “[n]ew development or redevelopment
6 with land disturbing activities; structural development, including construction or installation of a
7 building or structure, the creation of impervious surfaces, public agency projects, and land
8 subdivision.” (AR 341.)

9 **A. Hydromodification Management Plan**

10 Section g of part D.1 requires Copermittees to collaborate with each other to “develop and
11 implement a Hydromodification Management Plan (HMP) to manage increases in runoff
12 discharge rates and durations from all Priority Development Projects, where such increased rates
13 and durations are likely to cause increased erosion of channel beds and banks, sediment pollutant
14 generation, or other impacts to beneficial uses and stream habitat due to increased erosive force.”
15 (AR 275-276.) The specific permit requirements are found on pages 275 through 278 of the
16 administrative record.

17 “Hydromodification” is defined in the permit to mean, in part, the “change in the natural
18 watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland
19 flow and ground water flow) caused by urbanization or other land use changes that result in
20 increased stream flows and sediment transport.” (AR 343.)

21 “Priority Development Projects” is defined in the permit as “[n]ew development and
22 redevelopment project categories listed in section D.1.d(2) of the permit and includes certain
23 housing subdivisions; commercial, industry, and hillside development; automotive repair shops;
24 restaurants; environmentally sensitive areas; parking lots; streets, roads, highways, and freeways,
25 and retail gasoline outlets. (AR 346, 268-269.)

26 The need for hydromodification in the development and significant redevelopment of
27 property is both well-established and undisputed. (AR 432-435.) “As the total area of
28 impervious surfaces increases in previously undeveloped areas, infiltration of rainfall decreases,

1 causing more water to run off the surface at a higher rate. Runoff from developed areas can
2 produce erosive flows in channels under rainfall conditions where previously they did not exist.
3 Moreover, runoff from developed areas increases the duration and the length that channels are
4 exposed to erosive flows. The increase in the volume of runoff and the length of time that erosive
5 flows occur ultimately intensify sediment transport, causing changes in sediment transport
6 characteristics and the hydraulic geometry (width, depth, slope) of channels.” (AR 432.)

7 The hydromodification permit requirement only applies to development “projects which
8 have not yet begun grading or construction activities at the time” the requirement commences.
9 (AR 275.) And certain aspects of the hydromodification plan do not apply if there is “minimal
10 potential for erosion or other impacts to beneficial uses.” (AR 277.)

11 **B. Low Impact Development**

12 Relevant to this litigation, part of this land use planning for new development and
13 significant redevelopment includes low impact development (LID) best management practices
14 (BMP). (AR 269-275.) “Low Impact Development” is defined in the permit as “[a] storm water
15 management and land development strategy that emphasizes conservation and the use of on-site
16 natural features integrated with engineered, small-scale hydrologic controls to more closely
17 reflect pre development hydrologic functions.” (AR 343.) “Site design BMPs are a critical
18 component to urban runoff management at new development projects, since the BMPs provide
19 multiple benefits including preservation of hydrologic conditions, reduction of pollutant
20 discharges, cost effectiveness, and green space.” (AR 283.)

21 The County of San Diego only challenges two of the permit requirements related to low
22 impact development, paragraphs 7 and 8. Paragraph 7 requires that Copermittees “collectively
23 review and update the BMP requirements that are listed in their local SUSMPs.” (AR 271.) And
24 paragraph 8 of section d requires the Copermittees to “develop and submit an updated Model
25 SUSMP that defines minimum LID and other BMP requirements to be incorporated into the
26 Copermittees’ local SUSMPs for application to Priority Development Projects.” (AR 271.) The
27 specific permit requirements for the Model SUSMP are found on pages 271-272 of the
28 administrative record.

LEGAL ANALYSIS

I. IF A LOCAL AGENCY HAS FEE AUTHORITY TO PAY FOR MANDATED PROGRAMS, THEN SUCH PROGRAMS ARE NOT SUBJECT TO REIMBURSEMENT UNDER ARTICLE XIII B, SECTION 6.²

Under Government Code section 17556, subdivision (d), a state mandate is not subject to reimbursement if the local agency has the authority to charge a fee. Specifically, subdivision (d) provides that a state mandate does not exist if:

The local agency or school district *has the authority* to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service. This subdivision applies regardless of whether the authority to levy charges, fees, or assessments was enacted or adopted prior to or after the date on which the statute or executive order was enacted or issued.

(Emphasis added.)

[T]he plain language of section 17556, subdivision (d), precludes reimbursement where the local agency has the authority, *i.e., the right or the power, to levy fees sufficient to cover the costs of the state-mandated program.*” (*Clovis Unified School Dist. v. Chiang* (2010) 188 Cal.App.4th 794, 812, quoting *Connell v. Superior Court* (1997) 59 Cal.App.4th 382, 401, emphasis added.)

In interpreting subdivision (d), the courts examine the existence or nonexistence of fee authority. Courts do not speculate as to the wisdom or practicability of the fee. For example, in *Connell, supra*, several water districts alleged that a state regulation requiring an increased level of water purity was a state mandate. (59 Cal.App.4th 382.) The Third District Court of Appeal found that Water Code section 35470 “on its face authorizes the [water] districts to levy fees sufficient to pay for the costs involved in the regulatory amendment.” (*Id.* at p. 398.) The water districts argued that the fee authority is not “sufficient” because it was politically impracticable to impose the fees. (*Id.* at p. 401.) The court held that it was irrelevant whether it was practicable to impose the fees, rather, “[t]he question is whether the Districts have authority, *i.e., the right or power, to levy fees sufficient to cover the costs.*” (*Ibid.*)

² The state does not concede that the hydromodification management plan and low impact development requirements in the permit are state mandates. As explained in the state’s opening brief, these permit requirements as well as the other challenged provisions are federal mandates and not subject to subvention.

1 And in *Clovis, supra*, the college districts challenged the Controller’s claiming instruction
2 that automatically reduced reimbursement claims by the amount the districts are statutorily
3 authorized to charge students for health fees, even when a district chooses not to charge its
4 students those fees. (188 Cal.App.4th at p. 812.) The Third District Court of Appeal disagreed
5 with the districts, holding that “[to] the extent a local agency or school district ‘has the authority’
6 to charge for the mandated program or increased level of service, that charge cannot be recovered
7 as a state-mandated cost.” (*Ibid.*) The court explained that “this basic principle flows from
8 common sense as well. As the Controller succinctly puts it, ‘Claimants can choose not to require
9 these fees, but not at the state’s expense.’” (*Ibid.*)

10 The only relevant issue here is whether the County of San Diego has fee authority for the
11 hydromodification management plan and low impact development permit requirements. Once the
12 court finds that the County has this authority, section 17556, subdivision (d), precludes
13 reimbursement. Issues surrounding the amount or allocation of any proposed fees are not before
14 this court until some plan for the amount and allocation of the fees is in place. For the court to
15 decide those issues at this time would amount to an improper advisory opinion. (*Pacific Legal
16 Foundation v. California Coastal Com.* (1982) 33 Cal.3d 158, 173, [courts will “not be drawn
17 into disputes which depend for their immediacy on speculative future events”].)

18 **II. THE COUNTY OF SAN DIEGO HAS FEE AUTHORITY TO PAY FOR THE
19 HYDROMODIFICATION MANAGEMENT PLAN AND LOW IMPACT DEVELOPMENT
20 PERMIT REQUIREMENTS UNDER THEIR POLICE POWER.**

21 **A. Regulatory Fee Authority Under the Police Power**

22 “As long as the local enactments are not in conflict with general laws, the power to impose
23 valid regulatory fees is not dependent on any legislatively authorized taxing power but exists
24 pursuant to the direct grant of police power under article XI, section 7, of the California
25 Constitution.” (*Mills v. County of Trinity* (1980) 108 Cal.App.3d 656, 662.) Section 7 states: “A
26 county or city may make and enforce within its limits all local, police, sanitary, and other
27 ordinances and regulations not in conflict with general laws.” (Cal. Const., art. XI, § 7.)

28 A fee is permissible under Proposition 13 if the County can show “(1) the estimated costs of
the service or regulatory activity, and (2) the basis for determining the manner in which the costs

1 are apportioned, so that charges allocated to a payor bear a fair or reasonable relationship to the
2 payor's burdens on or benefits from the regulatory activity." (*Sinclair Paint Co. v. State Bd. of*
3 *Equalization* (1997) 15 Cal.4th 866, 878, quoting *San Diego Gas & Electric Co. v. San Diego*
4 *County Air Pollution Control Dist.* (1988) 203 Cal.App.3d 1132, 1146, emphasis added.) The fee
5 must "not exceed the reasonable cost of providing services necessary to regulate the activity for
6 which the fee is charged." (*Id.* at p. 876.) "A valid fee may not be imposed for unrelated revenue
7 purposes." (*Ibid.*)

8 "The scope of a regulatory fee is somewhat flexible and is related to the overall purposes of
9 the regulatory governmental action." (*California Farm Bureau Federation v. State Water*
10 *Resources Control Board* (2011) 51 Cal.4th 421, 438.) Costs may "include all those incident to
11 the issuance of the license or permit, investigation, inspection, administration, maintenance of a
12 system of supervision and enforcement." [Citation.] (*California Association of Professional*
13 *Scientists et al. v. Department of Fish and Game, et al.* (2000) 79 Cal.App.4th 935, 945.)

14 In this case, the "burden" is pollution, and the "regulatory activity" is mitigating pollution,
15 not solely the creation of the hydromodification management plan. The County of San Diego, if
16 it chooses, can enact an ordinance charging developers of specific property whose increases in
17 runoff discharge rates and durations "are likely to cause increased erosion of channel beds and
18 banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to
19 increased erosive force." (AR 275-276.) Those developers can be charged the costs to
20 implement and develop the hydromodification management plan because their development
21 properties are likely to increase erosion and sediment pollutant generation. In other words, the
22 fee is reasonably related to the "burdens" that are imposed by the developers on the environment
23 that make the hydromodification management plan necessary.

24 Another way of analyzing the possible fee is in terms of the "benefit" that the fee payers
25 receive from the regulatory program. (See *Sinclair Paint Co.*, *supra*, 15 Cal.4th at p. 878
26 ["charges allocated to a payor bear a fair or reasonable relationship to the payor's burdens on or
27 benefits from the regulatory activity"].) Here, the developers are receiving a benefit: the right to
28 develop their land in exchange for paying the fee.

1 And the impact or relationship of development and redevelopment of property on
2 downstream erosion is undisputed. “As the total area of impervious surfaces increases in
3 previously undeveloped areas, infiltration of rainfall decreases, causing more water to run off the
4 surface at a higher rate. Runoff from developed areas can produce erosive flows in channels
5 under rainfall conditions where previously they did not exist.” (AR 288.) The developers of the
6 designated property are responsible for the downstream erosion and should share the costs to
7 prevent that erosion.

8 The pool of individuals that will be assessed the fee is limited. The potential fee payers
9 include only those developers of new development and significant redevelopment that have not
10 begun “grading or construction activities at the time” the hydromodification requirement was
11 imposed. (AR 275.) And the relevant part of the plan does not apply “where the pre-existing
12 channel or storm drain conditions result in minimal potential for erosion or other impacts to
13 beneficial uses.” (AR 277.) And the potential fee would cover the County of San Diego’s
14 administrative costs for developing and implanting the plan, which are certainly costs that may be
15 included in a regulatory fee. (*California Association of Professional Scientists, supra*,
16 79 Cal.App.4th at p. 945.)

17 The County of San Diego assumes that the “burden” is the creation of the
18 hydromodification management plan. The County asserts that a fee based on the implementation
19 and development of the hydromodification management plan is impermissible because it “would
20 be akin to charging developers for infrastructure that is already built which would serve the
21 project” and would not be based on “a specific environmental impact, an actual fee processing
22 requirement, or to mitigate the impacts to newly built public facilities.” (Cross-Petitioners and
23 Real Parties Points and Authorities in Support of Cross Petition (“Cross-Pet. P&A”) p. 12, ll. 20-
24 21, p. 13, ll. 3-4.)

25 The County is not only mischaracterizing any potential fee in order to disclaim their fee
26 authority, but they are also erroneously interpreting fee law. The County of San Diego relies on
27 cases that suggest that you cannot charge a fee for something that has already been done—such as
28 the creation of a regulatory plan. But none of these cases addressed that issue; it simply was not

1 presented. And while it is true that the programs involved in those cases might not have charged
2 a fee for the creation of regulations, that does not mean it could not be lawfully done under the
3 authorities cited herein.

4 Charging developers for a plan that has already been developed and implemented by the
5 County of San Diego is permissible as it will help mitigate the effects of future downstream
6 erosion. This is illustrated by *Sinclair Paint Co., supra*, in which the Supreme Court upheld a fee
7 for the costs of mitigating the adverse effects of lead contamination on manufacturers and other
8 persons whose products exposed children to lead-poisoning. (15 Cal.4th at p. 866.) The fee was
9 imposed on companies responsible for dispersing lead contamination in the environment, even
10 though 99 percent of the fees were imposed on companies that had stopped engaging in their
11 harmful activities decades earlier. The Supreme Court explained:

12 Viewed as a ‘mitigating effects’ measure, it is comparable in character to similar
13 police power measures imposing fees to defray the actual or *anticipated adverse*
effects of various business operations.

14 From the viewpoint of general police power authority, we see no reason why statutes
15 or ordinances calling on polluters or producers of contaminating products to help in
16 mitigation or cleanup efforts should be deemed less “regulatory” in nature than the
initial permit or licensing programs that allowed them to operate.

17 (*Id.* at p. 877, emphasis added.) Thus, as in the present case, the fee was not being charged at the
18 same time as the activities that made the fee necessary.

19 And this type of mitigation fee has already been upheld in the context of air emissions. In
20 *California Bldg. Industry Ass’n v. San Joaquin Valley Air Pollution Control Dist.* (2009)
21 178 Cal.App.4th 120, the air pollution district adopted an indirect source review program to
22 reduce certain emissions from new development projects, which included a fee to recover its costs
23 of administering and operating program. (178 Cal.App.4th at pp. 127-128.) Among other things,
24 the court found that a fee to support air pollution mitigation was proper, as there was a nexus
25 between the fee charged and the burden posed by the development contributing to the emissions.
26 (*Id.* at p. 131-132.) The same is true here. The County of San Diego can, if it chooses, charge the
27 developers of new development of significant development a fee to cover the overall cost of the
28 hydromodification management plan.

1 The County of San Diego has failed to establish that any barriers exist preventing it from
2 imposing a regulatory fee to cover the administrative costs to implement and develop the
3 hydromodification management plan required under the permit. Thus, under section 17556,
4 subdivision (d), the plan is not subject to reimbursement.

5 For the same reasons, the County of San Diego could also impose a fee on developers for
6 the County's costs in developing low impact development best management practices. These are
7 practices that address "[a] storm water management and land development strategy that
8 emphasizes conservation and the use of on-site natural features integrated with engineered, small-
9 scale hydrologic controls to more closely reflect pre development hydrologic functions."
10 (AR 343.) As above, the purpose of low impact development is to "collectively minimize directly
11 connected impervious areas and promote infiltration at Priority Development Projects." (AR 269.)
12 The permit requirements for complying with low impact development can be assessed against the
13 developers to mitigate downstream erosion.

14 Because the County of San Diego has fee authority to cover the costs of the
15 hydromodification management plan and low impact development, these permit requirements are
16 not subject to reimbursement under article XIII B, section 6 as they do not impose costs mandated
17 by the state. The Commission's decision to that effect should be affirmed. (AR 3930-3932.)

18 **B. Development Fee Authority Under the Police Power**

19 Courts have found that "[d]evelopment fees are an exercise of the local police power
20 granted to cities and counties by article XI, section 7, of the California Constitution." (*California*
21 *Building Industry Assoc. v. Governing Board of the Newhall School District of Los Angeles*
22 *County* (1988) 206 Cal. App.3d 212, 234.)

23 A fee is considered a development fee if it is exacted in return for building permits or other
24 governmental privileges so long as the amount of the fee bears a reasonable relation to the
25 development's probable costs to the community and benefits to the developer. (*Sinclair Paint,*
26 *supra*, 15 Cal.4th at p. 875.) In other words, development fees are fees "that alleviate the effects
27 of development on the community." (*Barratt American, Inc. v. City of Rancho Cucamonga* (2005)
28 37 Cal.4th 685, 696.) However, "a fee does not become a 'development fee' simply because it is

1 made in connection with a development project.” (*Id.* at p. 699.) Rather, approval of the
2 development project must be conditioned on payment of the fee. (*Ibid.*; see also *Capistrano*
3 *Beach Water Dist. v. Taj Development Corp.* (1999) 72 Cal.App.4th 524, 529-530.)

4 The County of San Diego could impose the fee in such a manner that development of a
5 specific project is conditioned on the payment of the hydromodification management plan and
6 low impact development fees. This is another basis that supports the County of San Diego’s
7 ability to charge a fee and precludes reimbursement under article XIII B, section 6. (See
8 discussion of development fees in section III below.)

9 **C. Proposition 26 Does Not Apply to the Hydromodification Management**
10 **Plan and Low Impact Development Permit Requirements.**

11 The County of San Diego does not really dispute that it has the authority to impose fees for
12 the hydromodification management plan and low impact development permit requirements under
13 the police power. Rather, the County claims that this authority has been limited by Proposition
14 26 or article XIII C, section 1, subdivision (e), paragraphs (1) and (3). (Cross-Pet. P&A p.17,
15 ll.10-18.) According to the County of San Diego, the constitution “now prohibits user fees that
16 do not provide benefits directly to the entity paying the user fee.” (Cross-Pet P&A p. 17, ll. 17-
17 19.) The County has misapplied Proposition 26 to this case.

18 First, it is important to understand the context of subdivision (e) as well as the other
19 subdivisions in article XIII C, section 1. This subdivision simply lists the various charges that a
20 local agency *can* impose without creating a tax. Subdivision (e)(1) exempts a “charge imposed
21 for a specific benefit conferred or privilege granted directly to the payor that is not provided to
22 those not charged, and which does not exceed the reasonable costs to the local government of
23 conferring the benefit or granting the privilege.” Similarly, subdivision (e)(3) exempts a “charge
24 imposed for the reasonable regulatory costs to a local government for issuing licenses and permits,
25 performing investigations, inspections, and audits, enforcing agricultural marketing orders, and
26 the administrative enforcement and adjudication thereof.”

27 As discussed above, the County of San Diego, if it chooses, can impose fees for the
28 hydromodification management plan and low impact development permit requirements within

1 these exemptions. The regulatory fees could be imposed only on those developers of new
2 development and significant redevelopment in exchange for the benefit of developing the land.
3 The nexus between the developer and the possible fees is clear, the class of fee payers is narrow,
4 and the fees could be established and allocated in a reasonable manner, again if the County
5 chooses to do so.

6 Second, the County of San Diego completely ignores that they could establish the fees as
7 development fees, which are also exempted under subdivision (e)(6). It specifically excludes as a
8 tax a “charge imposed as a condition of property development.”

9 Last, the County of San Diego restates its argument that they could not charge a fee to pay
10 for “infrastructure” that is already in place. (Cross-Pet. P&A p.18, ll. 14-21) Charging
11 developers fees for the administrative cost for plans that have already been developed and
12 implemented by the County of San Diego is permissible as the plans will help mitigate the effects
13 of future downstream erosion.

14 Accordingly, Proposition 26 has no impact on the County of San Diego’s ability to impose
15 fees for the hydromodification management plan or low impact development best management
16 practices as either regulatory or development fees under the County’s police power.

17 **D. The County of San Diego’s Proposition 26 Argument Is Not Properly**
18 **Before the Court.**

19 It is undisputed that the Commission’s decision does not address the effect of Proposition
20 26 on the County’s fee authority because the Commission’s decision was adopted on March 26,
21 2010, over seven months before Proposition 26 was passed by the voters. (AR 3823.)
22 Government Code section 17570, subdivision (c), provides an administrative process through
23 which the County of San Diego may seek to obtain a new test claim decision from the
24 Commission based upon a subsequent change in the law. Thus, to the extent that the County of
25 San Diego is claiming that Proposition 26 limits its fee authority here, this must first be decided
26 by the Commission. The County must first pursue this administrative remedy prior to bringing
27 their claims. (*In re Strick* (1983) 148 Cal.App.3d 906, 911 [“a litigant will not be afforded relief
28 in the courts unless and until he has exhausted available administrative remedies”].)

1 For the same reason, a court cannot grant relief based on a legal theory not presented at the
2 administrative hearing. (*NBS Imaging Sys., Inc. v. Reed* (1997) 60 Cal.App.4th 328, 336-337 &
3 fn. 11 [holding that the superior court had no authority to consider petitioner's new legal theories
4 not raised in the administrative proceeding and thus erred in granting relief based on such
5 theories].) For these reasons, the County cannot press its Proposition 26 argument in this forum.

6 **III. THE COUNTY OF SAN DIEGO HAS FEE AUTHORITY TO PAY FOR THE**
7 **HYDROMODIFICATION MANAGEMENT PLAN AND LOW IMPACT DEVELOPMENT PERMIT**
8 **REQUIREMENTS UNDER THE MITIGATION FEE ACT.**

9 The Mitigation Fee Act was passed by the Legislature "in response to concerns among
10 developers that local agencies were imposing development fees for purposes unrelated to
11 development projects." (*Ehrlich v. City of Culver City* (1996) 12 Cal.4th 854, 864.) Under the
12 Act, a fee is defined as:

13 [A] monetary exaction other than a tax or special assessment, whether established for
14 a broad class of projects by legislation of general applicability or imposed on a
15 specific project on an ad hoc basis, that is charged by a local agency to the applicant
16 in connection with approval of a development project for the purpose of defraying all
17 or a portion of the cost of public facilities related to the development project, but does
18 not include fees specified in Section 66477, fees for processing applications for
19 governmental regulatory actions or approvals, fees collected under development
20 agreements adopted pursuant to Article 2.5 (commencing with Section 65864) of
21 Chapter 4, or fees collected pursuant to agreements with redevelopment agencies that
22 provide for the redevelopment of property in furtherance or for the benefit of a
23 redevelopment project for which a redevelopment plan has been adopted pursuant to
24 the Community Redevelopment Law (Part 1 (commencing with Section 33000) of
25 Division 24 of the Health and Safety Code).

26 (Gov. Code, § 66000, subd. (b).)

27 The Act defines "Public facilities" to include "public improvements, public services, and
28 community amenities." (Gov. Code, § 66000, subd. (d).)

When a local agency establishes, imposes, or increases a fee as a condition of development
approval, it must do all of the following: (1) "Identify the purpose of the fee" (Gov. Code,
§ 66001, subd. (a).); (2) "Identify the use to which the fee is to be put. If the use is financing
public facilities, the facilities shall be identified" (*Ibid.*); (3) "Determine how there is a reasonable
relationship between the fee's use and the type of development project on which the fee is
imposed" (*Ibid.*); and (4) "Determine how there is a reasonable relationship between the need for
the public facility and the type of development project on which the fee is imposed." (*Ibid.*)

1 For the same reasons the County of San Diego has fee authority under the police power, the
2 County also, if it chooses, can enact an ordinance addressing these requirements for the
3 hydromodification management plan under the Mitigation Fee Act. The County can easily
4 identify the purpose and use of the proposed fee. The proposed fee would impose the costs to
5 implement and develop the hydromodification management plan on certain developers of specific
6 property whose increases in runoff discharge rates and durations “are likely to cause increased
7 erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial
8 uses and stream habitat due to increased erosive force.” (AR 275-276.)

9 Next, the County of San Diego can effortlessly show that there is a reasonable relationship
10 between the use of the fee and the type of development. The proposed fee would be used to cover
11 the administrative costs to develop and implement the plan, which is needed to address the effects
12 of downstream erosion from new development and urbanization. (AR 275-276.) And the need
13 for the plan is reasonably related to the type of development: new development and
14 redevelopment “projects which have not yet begun grading or construction activities at the time”
15 the hydromodification requirement commences. (AR 275.)

16 Last, the hydromodification management plan meets the definition of “public facilities.”
17 The definition specifically includes “public improvements, public services, and community
18 amenities.” (Gov. Code, § 66000, subd. (d).) The Supreme Court explained that the Act
19 “concerns itself with development fees; that is, fees imposed on development projects in order to
20 finance public improvements or programs that bear a ‘reasonable relationship’ to the development
21 at issue.” [Citation omitted.] (*Utility Cost Management v. Indian Wells Valley Water Dist.* (2001)
22 26 Cal.4th 1185, 1191; *Barratt American, Inc, supra*, 37 Cal.4th at p. 696.)

23 The County of San Diego could also impose a fee on certain future developers for the
24 County’s costs in developing low impact development best management practices. The purpose
25 of low impact development is to “collectively minimize directly connected impervious areas and
26 promote infiltration at Priority Development Projects.” (AR 269) The permit requirements for
27 complying with low impact development can be assessed against the developers to mitigate
28 downstream erosion.

1 Thus, because the County of San Diego has fee authority to cover the costs of the
2 hydromodification management plan and low impact development, these permit requirements are
3 not subject to reimbursement under article XIII B, section 6, and the Commission's decision to
4 that effect should be affirmed.

5 As with the discussion related to the County of San Diego's fee authority under the police
6 power, the County continues to cast the possible fees in a light that would undercut their fee
7 authority in an effort to get around section 17556, subdivision (d). With respect to a development
8 fee under the Mitigation Fee Act, the County objects to the possible fees primarily on the theory
9 that the permit requirements for hydromodification and low impact development are not public
10 facilities and thus are being imposed for general revenue raising purposes. (Cross-Pet P&A
11 pp. 13-16.) The County is wrong.

12 The County of San Diego claims that the hydromodification and low impact development
13 requirements do not meet the definition of public facilities under the Act, because the
14 Commission and the Supreme Court read the term "program" into the definition. (Cross-Pet P&A
15 p. 13, ll. 20-27.) The definition includes "public improvements, public services, and community
16 amenities." (Gov. Code, § 66000, subd. (d).) The Supreme Court read the term "public
17 improvements" broadly to include programs that concern themselves "with development fees."
18 (*Utility Cost Management, supra*, 26 Cal.4th at p. 1191.)

19 The County is trying to limit the term "public improvements" to "capital facilities" or
20 physical assets to exclude the permit requirements for hydromodification and low impact
21 development. (Cross-Pet P&A p. 14, ll. 1-13.) To support this argument the County cites to
22 *Homebuilders Association of Tulare/Kings Counties, Inc. v. City of Lemoore* (2010)
23 185 Cal.App.4th 554 in which the court excluded some fees because there was no nexus between
24 the fees and the burdens imposed by the new housing. (*Ibid.*) This case has absolutely nothing to
25 do with the term "public improvements" or its interpretation by our Supreme Court.

26 Moreover, the term "public improvements" has been consistently applied to include
27 programs related to development. In *California Bldg. Industry Ass'n, supra*, 178 Cal.App.4th
28 120, the court found that the indirect source review fees to fund off-site mobile source emission

1 reducing projects were public facilities. (*Id.* at pp. 131-132.) But the court rejected that the fee
2 was a development fee since approval of a development project was not conditioned on the
3 developer's payment of the fees. (*Ibid.*) This is not the case here, the County can impose the fees
4 as a condition of development if it so chooses.

5 There is nothing stopping the County from imposing fees on specific developers to cover
6 the costs of the hydromodification and low impact development requirements in the permit in
7 exchange for the privilege of developing the land. And because there is fee authority, there are no
8 costs mandated by state for these permit requirements.

9 **IV. THE COUNTY OF SAN DIEGO HAS POTENTIAL FEE AUTHORITY AND OFFSETTING**
10 **REVENUE IF THEY COMPLY WITH THE CALIFORNIA WATERSHED IMPROVEMENT ACT OF**
11 **2009.**

12 Water Code section 16103, subdivision (a) provides that a local agency "may impose fees
13 on activities that generate or contribute to runoff, stormwater, or surface runoff pollution, to pay
14 the costs of the preparation of a watershed improvement plan, and the implementation of a
15 watershed improvement plan" subject to the following requirements:

16 (1) The regional board has approved the watershed improvement plan.

17 (2) The entity or entities that develop the watershed improvement plan make a finding,
18 supported by substantial evidence, that the fee is reasonably related to the cost of
19 mitigating the actual or anticipated past, present, or future adverse effects of the
20 activities of the feepayer. "Activities," for the purposes of this paragraph, means the
operations and existing structures and improvements subject to regulation under an
NPDES permit for municipal separate storm sewer systems.

(3) The fee is not imposed solely as an incident of property ownership.

21 (Wat. Code, § 16103, subd. (a), (1)-(3).) "The fees authorized under subdivision (a) may be
22 imposed as user-based or regulatory fees consistent with this chapter." (Wat. Code, § 16103,
23 subd. (c).)

24 The Commission found that section 16103 may provide offsetting savings to the extent that
25 the local agency complies with its provisions. (AR 3942.) This means that if the County of San
26 Diego can charge a fee for any activities consistent with the section 16103, the County must
27 deduct said fees from their reimbursement claims.

1 The County of San Diego is critical of the Commission's finding in that the Commission
2 did not define the specific offsetting fees. (Cross-Pet P&A p. 19, ll. 17-21.) The County misses
3 the point of the offsetting finding: it only applies if *all* of the provisions of section 16103 are met.
4 This would be determined on a case-by-case basis when the County submits their reimbursement
5 claims.

6 In addition, the County of San Diego seems to suggest that all permit requirements would
7 be excluded under section 16103 because in one case a court found that a specific stormwater
8 user fee was based on an incident of property ownership. (See *Howard Jarvis Taxpayer Assoc. v.*
9 *City of Salinas* (2002) 98 Cal.app.4th 1351, 1354-1356) According to the County, certain
10 stormwater user fees have been found to be based on an incident of property ownership, which in
11 the County's view would be excluded under section 16103, subdivision (a)(3). (Cross-Pet P&A
12 p. 9, ll. 22-25, p. 20, ll. 1-15.) This reading of section 16103 is too narrow. Section 16103,
13 subdivision (a) applies broadly to activities related to "the operations and existing structures and
14 improvements subject to regulation under an NPDES permit for municipal separate storm sewer
15 systems." And a fee is only excluded if it is "imposed *solely* as an incident of property
16 ownership." (Wat. Code, § 16103, subd. (a) (3), emphasis added.) Again, whether or not a
17 particular fee is consistent with section 16103 and subject to the offsetting provision is a factual
18 question to be resolved at the auditing stage of the County's reimbursement claims and is not a
19 proper legal issue before this court. The Commission's offsetting finding is proper.

20 Last, the County of San Diego again asserts that Proposition 26 limits the County's fee
21 authority under section 16103. (Cross-Pet P&A p. 21, ll. 1-14.) This is pure conjecture. In any
22 event, Proposition 26 was not before the Commission when it adopted its decision and thus is not
23 properly before this court.

CONCLUSION

The County of San Diego has the authority to impose fees for the hydromodification and low impact development permit requirements and thus the Commission's decision finding that the requirements were not reimbursable should be affirmed. Further, the County of San Diego has potential fee authority and offsetting revenue if they comply with the California Watershed Improvement Act and the Commission's finding providing for an offset should also be affirmed.

INTRODUCTION

The federal Clean Water Act prohibits appellants/real parties in interest (San Diego County and certain cities in that county) from discharging pollutants from their municipal storm sewer systems into waterbodies unless pursuant to a permit issued in compliance with the National Pollutant Discharge Elimination System ("NPDES"). The Commission on State Mandates erroneously determined that certain stated conditions of the NPDES permit issued to appellants (collectively, "County of San Diego") were mandates imposed by the State (rather than federal law) simply because respondent California Regional Water Quality Control Board, San Diego Region ("Regional Board") administers that federal permitting scheme.

The Clean Water Act and implementing federal regulations required that the County of San Diego obtain an NPDES permit and that the permit include actions to reduce the discharge of pollutants "to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods." (33 U.S.C § 1342(p)(3)(B); see 40 C.F.R. § 122.26.) Under article XIII B, section 6 of the California Constitution, the only way this federal standard could constitute a state mandate would be if the State *voluntarily elected* to require local agencies to implement state obligations under the Clean Water Act, or if the State took action to *exceed* the Act's requirements. The trial court correctly found that the Commission applied the wrong legal analysis to decide both issues.

First, given that NPDES permits are required by federal law, the State had "no real choice" in deciding to implement the Clean Water Act. Almost immediately upon enactment of the Clean Water Act, the State has administered the NPDES program in California in place of the federal Environmental Protection Agency. Regardless of the administering agency,

however, the County of San Diego was still required to obtain an NPDES permit and the same federal law governed its contents. The Regional Board's involvement added nothing to the County of San Diego's burdens. The State had no practical choice but to administer the Clean Water Act in lieu of direct regulation by the federal government.

Second, the Commission's finding that certain stated NPDES permit conditions were state mandates was based on a faulty reading of the applicable Clean Water Act provisions. As the lower court recognized, federal law and decisions make clear that the Clean Water Act's technology-forcing requirement to reduce pollutants in storm water from the County's municipal storm waters systems "to the maximum extent practicable" is comprehensive and flexible. NPDES permitting agencies, whether federal or state, must impose specific permit conditions on a case-by-case basis to meet that federal standard for a particular municipal system.

The County's counter-assertion, that states cannot impose permit conditions under that flexible federal standard, because they are somehow not exercising "delegated" federal authority, is incorrect. The County of San Diego's related argument, that the Regional Board was confined to a checklist of permit conditions explicitly set forth in federal regulations, is likewise incorrect. Both of these arguments are fundamentally out of sync with the actual federal standard, as written and as interpreted in federal regulations and judicial decisions.

And while the Commission may be an expert in state mandates, it has no expertise in the field of water quality permitting law. The Commission erroneously failed to give appropriate deference to the Regional Board's implementation of the Clean Water Act, including its findings that the challenged conditions (hydromodification, low-impact development, street sweeping and reporting, storm sewer cleaning and reporting, education,

watershed activities and collaboration, regional urban runoff management program, long-term effectiveness assessment, and all permittee collaboration) are within the federal maximum extent practicable standard. The Commission also incorrectly ignored that the County of San Diego administratively challenged these findings, but did not seek direct administrative mandamus review of whether the conditions were properly required under the Clean Water Act. Rather than seeking this direct judicial review, the County chose to contest these findings in the context of this state mandates action.

Because the Commission applied the wrong legal standard in determining whether the challenged permit requirements exceeded federal law, the trial court correctly granted the writ petition and ordered remand of the matter back to the Commission with instructions to issue a new decision (i.e., addressing relevant federal law) consistent with the court's decision and judgment.

Accordingly, respondents California Department of Finance, State Water Resources Control Board, and the Regional Board ask this Court to affirm the judgment below.

STATEMENT OF FACTS

I. FEDERAL REQUIREMENTS FOR NPDES PERMITS AT ISSUE

A. Federal Nature of NPDES Permits

In a "dramatic response to accelerating environmental degradation of rivers, lakes and streams in this country," Congress passed the Clean Water Act in 1972 to eliminate the discharge of pollution into the nation's waters. (33 U.S.C. § 1251, et seq.; *Natural Resources Defense Council, Inc. v. Costle* (D.C. Cir. 1977) 568 F.2d 1369, 1371.) The Clean Water Act seeks to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters," and is recognized by courts as a demanding law or

“strong medicine.” (33 U.S.C. § 1251(a); *Texas Mun. Power Agency v. Administrator of U.S. E.P.A.* (5th Cir. 1988) 836 F.2d 1482, 1488.)

The primary means for achieving the goals of the Clean Water Act is the NPDES program. (*Arkansas v. Oklahoma* (1992) 503 U.S. 91, 101-102.) The Act prohibits pollutant discharge from “point sources” unless provided for under an NPDES permit. (33 U.S.C. §§ 1311, 1342; see also *Communities for a Better Environment v. State Water Resources Control Bd.* (2003) 109 Cal.App.4th 1089, 1092-1093.)

NPDES permits are issued by either the United States Environmental Protection Agency (U.S. EPA) or a U.S. EPA-approved state. (33 U.S.C. § 1342(a)(1) & (b).) Congress provided that the U.S. EPA or an approved state could issue permits for all dischargers and could translate the Clean Water Act’s requirements into the conditions of individual permits for dischargers. (*Environmental Protection Agency v. California ex rel. State Water Resources Control Bd.* (1976) 426 U.S. 200, 219.) California has the U.S. EPA’s approval to issue NPDES permits, as do 45 other states. (*Building Industry Association of San Diego County v. State Water Resources Control Bd.* (2004) 124 Cal.App.4th 866, 875.)

When a state issues an NPDES permit, it must generally ensure that the permit complies with many federal requirements, including effluent limitations, national standards of performance, and toxic and pretreatment effluent standards. (33 U.S.C. §§ 1342(b)(1), 1311, 1312, 1316, 1317.) States must also provide for the continued inspection and monitoring of pollutants into our nation’s waters. (*Id.* § 1342(b)(2)(B).) NPDES permit requirements may be enforced as a matter of federal law by either the U.S. EPA or private citizens. (*Id.* §§ 1319(a)(1) & (3), 1365(a)(1).)

To ensure that state-authorized programs comply with the U.S. EPA’s mandates and federal law, the U.S. EPA maintains oversight and supervision. The state must provide the U.S. EPA with proposed permits

and notice of any action related to a discharger's permit application. (33 U.S.C. § 1342(d)(1).) The U.S. EPA may object to a permit, finding that it violates the Clean Water Act's guidelines and requirements. (*Id.* § 1342(d)(2).) Should the U.S. EPA determine that a state program does not comply with federal NPDES program guidelines, it may withdraw approval for the state program. (*Id.* § 1342(c)(3).)

When an NPDES permit is renewed, reissued, or modified, it generally must be at least as stringent as the prior permit. (33 U.S.C. § 1342(o); 40 C.F.R. § 122.44(l).) This is consistent with Congress' intent that state management programs evolve based on changing conditions due to program development and implementation, and corresponding improvements in water quality. (55 Fed.Reg. 47990, 48052 (Nov. 16, 1990).)

B. Federal Law Governing NPDES Permits for Municipal Separate Storm Sewer Systems (MS4)

While there are many types of discharges requiring NPDES permits under the Clean Water Act, this case is very specific, pertaining to the discharge of pollutants through municipal separate storm sewer systems. Those systems are often referred to as "MS4" (including in materials quoted in this Brief), and respondents will use that term hereafter. Congress has established a distinct technology standard that applies to NPDES permits for MS4s. (33 U.S.C. § 1342(p)(3)(B).) Further, unlike many other categories of point source discharges, U.S. EPA has not established any uniform national effluent limitation guidelines or standards for MS4 discharges. (Compare 40 C.F.R. § 122.26 [MS4 permit requirements] with 40 C.F.R. Parts 405-471 [various effluent limitation guidelines].) Instead, U.S. EPA required individual permit issuers at the federal or state level to develop the necessary MS4 controls to reduce

pollutants to the federal standards. (40 C.F.R. § 122.26(d); 55 Fed.Reg. 47990, 48043 (Nov. 16, 1990).)

Controlling discharges of municipal storm water and non-storm water is important because such discharges are one of the most significant sources of water pollution in the nation. (*Environmental Defense Center, Inc. v. U.S. E.P.A.* (9th Cir. 2003) 344 F.3d 832, 840.) These discharges carry “suspended metals, sediments, algae-promoting nutrients (nitrogen and phosphorus), floatable trash, used motor oil, raw sewage, pesticides, and other toxic contaminants into streams, rivers, lakes, and estuaries across the United States.” (*Id.* at pp. 840-841.) “Among the sources of stormwater contamination are urban development, industrial facilities, construction sites, and illicit discharges and connections to storm sewer systems.” (*Id.* at p. 841.)

The Clean Water Act requires NPDES permits for MS4 dischargers such as the County of San Diego “to include a requirement to effectively prohibit non-stormwater discharges into the storm sewers” and “shall require controls¹ to reduce the discharge of pollutants to the *maximum extent practicable*, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.” (33 U.S.C. § 1342(p)(3)(B), emphasis added.) Congress established the maximum extent practicable standard (as opposed to the blanket effluent limitations approach, which was impractical and

¹ The County of San Diego claims that at the trial level the State somehow purposefully omitted the phrase “shall require controls” from the maximum extent practicable standard. (AB p. 8, fn. 3.) Not true. In any event, this language of the Clean Water Act speaks for itself, the point does not affect the meaning of this clause, and the County never explains why the distinction would matter.

administratively burdensome in the context of storm water pollution) so that municipalities would have “the tools to meet the fundamental goals of the Clean Water Act.” (*Building Industry Ass’n of San Diego County, supra*, 124 Cal.App.4th at p. 884.)

The Clean Water Act’s technology-forcing requirements are designed to foster innovation. (See, e.g., *Chemical Mfrs. Ass’n v. Natural Resources Defense Council, Inc.* (1985) 470 U.S. 116, 155-56.) Permit writers (U.S. EPA and federally approved states) identify the MS4 requirements on a permit-by-permit basis. (*Natural Resources Defense Council, Inc. v. U.S. E.P.A.* (9th Cir. 1992) 966 F.2d 1292, 1308, fn. 17; see also 55 Fed.Reg. 47990, 48043 (Nov. 16, 1990).) To implement this maximum extent practicable standard for stormwater, MS4 permits usually require “best management practices” that reflect the technology-based effluent limitation. (See *Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, 1166-1167.) Federal law defines these practices to mean, in part, “schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of ‘waters of the United States.’” (40 C.F.R. § 122.2.)²

Large municipal storm water system operators must apply for an NPDES permit pursuant to U.S. EPA-promulgated regulations.

² As noted, the Clean Water Act imposes at least three distinct obligations on municipalities subject to MS4 permitting. One is “to effectively prohibit non-stormwater discharges into the storm sewers.” (33 U.S.C. § 1342(p)(3)(B)(ii).) A second is “to reduce the discharge of pollutants to the maximum extent practicable.” (*Id.* § 1342(p)(3)(B)(iii).) The third is the requirement to include “such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.” (*Ibid.*; *Building Industry Ass’n of San Diego County, supra*, 124 Cal.App.4th at p. 887.) While each of these separate bases would provide the foundation for a federal mandate, the discussion throughout this brief focuses on the “maximum extent practicable” standard.

(33 U.S.C. § 1342(p)(4)(A).) Those regulations specify the information that applicants for storm sewer permits must include in their applications. (40 C.F.R. § 122.26(d).) This application is extensive and represents the applicant's view of the required NPDES permit. (*Id.* § 122.26(d)(2)(iv).) The application, and ultimately the permit itself, must address management programs to reduce the discharge of pollutants using the maximum extent practicable standard. (*Ibid.*) These programs include practices for operating and maintaining public streets, roads, and highways (*id.* § 122.26(d)(2)(iv)(A)(3)); procedures to control pollution resulting from development and significant redevelopment, construction, and commercial, residential, industrial, and municipal land use activities (*id.* § 122.26(d)(2)(iv)(A)-(D)); processes to educate the public on the danger of urban runoff to our nation's waters and changing behavior to reduce pollutant releases to the environment (*id.* § 122.26(d)(2)(iv)(A)(5),(6), (D)(4)); and ways to address water quality and the discharge of pollutants through storm sewers on system-wide, jurisdictional-wide, watershed, or other basis, and through interagency agreements. (*Id.* § 122.26(a)(3)(ii), (d)(2)(i)(D), (iv).)

The U.S. EPA has also issued guidance documents that discuss the types of best management practices that may be included in MS4 storm water permits in order to reduce the discharge of pollutants in storm water to the maximum extent practicable. At the time that the subject test claim was considered by the Commission, the U.S. EPA had issued a Program Evaluation Guide for NPDES permits for large and medium MS4s, which addresses inspections of businesses and litter-related issues.

(Administrative Record ("AR") 1853-2058.)

II. CALIFORNIA'S ROLE IN IMPLEMENTING FEDERAL REQUIREMENTS FOR STORM WATER PERMITS

"[O]n May 14, 1973, California became the first state to be approved by the EPA to administer the NPDES permit program." (*County Sanitation*

Dist. No. 2 of Los Angeles County v. County of Kern (2005) 127

Cal.App.4th 1544, 1565-1566.)³ The Legislature did so by amending the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) to add Chapter 5.5 to implement federal law, and thereby avoided direct regulation by the federal government. (Wat. Code, § 13370; see generally Wat. Code, §§ 13370-13389.) Specifically, the legislative findings and declarations state, in relevant part:

It is in the interest of the people of the state, in order to avoid direct regulation by the federal government of persons already subject to regulation under state law pursuant to this division, to enact this chapter in order to authorize the state *to implement the provisions of the Federal Water Pollution Control Act* [Clean Water Act] and acts amendatory thereof or supplementary thereto, and federal regulations and guidelines issued pursuant thereto, provided, that the state board shall request federal funding under the Federal Water Pollution Control Act for the purpose of carrying out its responsibilities under this program.

(Wat. Code, § 13370, subd. (c), emphasis added.)

Additionally, the Porter-Cologne Act mandates that California's NPDES permit program be consistent with federal law. (Wat. Code, §§ 13372, 13377.) Section 2235.2 of title 23 of the California Code of Regulations states that "[w]aste discharge requirements for discharge from point sources to navigable waters shall be issued and administered in accordance with the currently *applicable federal regulations for the National Pollutant Discharge Elimination System (NPDES) program.*"

(Emphasis added.) Moreover, there are numerous federal requirements that the State must first comply with in issuing NPDES permits or risk the U.S. EPA taking over California's NPDES program.

³ Nine regional boards administer the program, overseen by the State Water Resources Control Board. (Wat. Code, §§ 13140, 13200, et seq.)

The federal Clean Water Act allows a state to establish more stringent requirements (33 U.S.C. § 1370), and nothing in the Porter-Cologne Act precludes the State from establishing more stringent requirements. (*City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 627.) As will be shown, however, the Regional Board applied relevant *federal* law to impose the requirements at issue. (33 U.S.C § 1342(p)(3)(B)(iii).)

III. RELEVANT NPDES PERMITS AND THE COUNTY OF SAN DIEGO'S APPLICATION

Starting in 1990 and pursuant to the Clean Water Act amendments of 1987, the permitting agency, the Regional Board, issued municipal storm water permits to the County of San Diego. Prior to the Clean Water Act amendments of 1987 and the U.S. EPA's issuance of regulations to implement those amendments, the Regional Board did not regulate the County's storm water discharges under either state or federal law. The order that is the subject of this litigation, Regional Order No. R9-2007-0001, NPDES permit number CAS0108758, is the third iteration of the permit issued since the 1987 amendments and was adopted on January 24, 2007. (AR 251-369, 1191.)⁴

Before the permit was reissued, and pursuant to federal law, the County of San Diego submitted a permit application to the Regional Board on August 25, 2005. (33 U.S.C. §1342(b)(2)(B)(3); 40 C.F.R. §§ 122.26(a)(4) [requiring initial application], 122.21(d)(2) [duty to reapply

⁴ The County of San Diego challenged order number R9-2007-001 by seeking administrative review by the State Water Board. The Board dismissed the challenge and no administrative mandamus action was filed to challenge whether the permit requirements were required by the Clean Water Act. (AB p. 22) The permit is no longer subject to legal challenge. (AR 1192; see Wat. Code, § 13330, subd. (d) [renumbered from subdivision (c), but otherwise unchanged from the applicable law at the time the Regional Board adopted the permit (Stats. 2010, ch. 288, § 31)].)

180 days before prior NPDES permit expired].) This application is entitled “Report of Waste Discharge (ROWD)” and represents the County of San Diego’s proposals for best management practices (sometimes referred to as “BMPs”) that would ultimately be required in the NPDES permit. (AR 2101-2367.) The permit that was adopted was based on the ROWD and the previous 2001 NPDES permit issued to the County of San Diego, with some revisions and additions necessary to meet minimum federal requirements.⁵ (AR 2101-2102.) A summary of the relevant permit provisions are as follows:

General Permit Provisions

The NPDES permit, as a whole, is designed to comply with the maximum extent practicable standard. Referring to the various County appellants as “Copermittees,” the permit states:

This Order specifies requirements necessary for the Copermittees to reduce the discharge of pollutants in urban runoff to the maximum extent practicable (MEP). However, since MEP is a dynamic performance standard which evolves over time as urban runoff management knowledge increases, the Copermittees’ urban runoff management programs must continually be assessed and modified to incorporate improved programs, control measures, best management practices (BMPs), etc. in order to achieve the evolving MEP standard.

(AR 255.)

⁵ The County argues in its background section that the challenged permit requirements “were *not* required by the 2001 Permit, [so] they must *not* have been federal mandates at that time.” (AB p. 14, emphasis added.) Putting aside that such an ostensibly fundamental point would seem oddly placed in a “background section,” it is not true. The 2001 NPDES permit did provide for some of the challenged permit conditions, generally speaking. In any event, the County’s assertion as to what may have been federal mandates in 2001 is not relevant to determining whether the current permit conditions challenged here exceed federal law, because of the Clean Water Act’s mandate to incorporate developing practices and technologies into permits as they are issued. (33 U.S.C. § 1342(o); 40 C.F.R. 122.44(l).)

The permit explains the flexible nature of the maximum extent practicable standard and the Regional Board's duty to define the same based on the waterways subject to the permit as follows:

A definition for MEP is not provided either in the statute or in the regulations. Instead the definition of MEP is dynamic and will be defined by the following process over time: municipalities propose their definition of MEP by way of their urban runoff management programs. Their collective and individual activities conducted pursuant to the urban runoff management programs becomes their proposal for MEP as it applies both to their overall effort, as well as to specific activities (e.g., MEP for street sweeping, or MEP for MS4 maintenance). In the absence of a proposal acceptable to the Regional Board, the Regional Board defines MEP.

(AR 343-345.)

Permit Provisions Challenged in the State Mandates Claim

Respondents defer a highly detailed discussion of the challenged permit conditions until Section V of this Brief, where it is presented in conjunction with the substantial evidence and specific federal regulations and materials showing the permit conditions are within the maximum extent practicable standard. The following is a general overview, sufficient to provide a basic foundation for critical evaluation of whether the Commission applied the correct federal standard in the first place when it found the permit conditions were not required under the Clean Water Act.

A. Jurisdictional Urban Runoff Management Program and Related Reporting

The portion of the permit that generally relates to each Copermittee's duty to manage and report urban runoff in its specific jurisdiction is found in Part D of the permit. (AR 265.) While this part of the permit imposes numerous duties on the County of San Diego to comply with the maximum extent practicable standard under the Clean Water Act, the County of San Diego has limited its state mandate claims to four permit requirements:

hydromodification management plan, low-impact development in local management plans, street sweeping and conveyance system cleaning and related reporting, and educational surveys and tests. (AR 3863.)

1. Hydromodification Management Plan

Part D.1 of the permit addresses hydromodification management plans (and related collaboration among Copermittees) for development and significant redevelopment projects. Plans must reduce discharges of pollutants from the MS4 to the maximum extent practicable standard, prevent discharges from these systems from causing or contributing to a violation of water quality standards, and manage increases in runoff discharge rates and durations from projects that are likely to cause increased erosion. (AR 275-276, 314-315.)

2. Low Impact Development Plans and Standard Urban Storm Water Mitigation

Similar to the above, section D.1.d of the permit generally requires that each Copermittee implement an updated Standard Urban Storm Water Mitigation Plan (SUSMP) for certain projects that reduces discharges of pollutants from the MS4 to the maximum extent practicable, that prevents runoff discharges from the storm sewers from causing or contributing to a violation of water quality standards, and that manages increases in runoff discharge rates and durations that are likely to cause increased erosion. (AR 267.)

Part of this planning for new development and redevelopment includes low impact development best management practices, such as treatment control for volume or flow of runoff. (AR 269-275.) The County of San Diego only challenges two of the permit requirements related to low impact development, paragraphs 7 and 8. Paragraph 7 requires that Copermittees collectively review and update best management practices that are listed in their local SUSMPs. (AR 271.) Paragraph 8 requires that

Copermittees develop and submit an updated Model SUSMP that defines minimum low impact development and best management practices to be incorporated into the Copermittees' local SUSMPs for certain projects. (AR 271.)

3. Street Sweeping and Maintaining and Cleaning Municipal Storm Sewer Systems

Existing development as it relates to municipalities is addressed in part D.3.a of the permit and generally requires that each Copermittee implement a municipal program that reduces municipal discharges of pollutants from the storm sewers to the maximum extent practicable. (AR 282.) Two sections of this part are relevant here: section 3, the operation and maintenance of storm sewer systems, and section 5, street sweeping. (AR 283-284.)

Section 3 requires each Copermittee to "implement a schedule of inspection and maintenance activities to verify proper operation of all municipal structural treatment controls designed to reduce pollutants to or from its MS4 and related drainage structures." (AR 283.) The frequency of maintenance depends on the volume of trash and debris found in the MS4 and includes proper disposal of the trash and debris and reporting of maintenance and cleaning activities. (AR 283-284.)

Section 5 requires each Copermittee to "implement a program to sweep improved (possessing a curb and gutter) municipal roads, streets, highways, and parking facilities" at certain times depending on the volume of litter and debris generated. (AR 284.) There are also reporting requirements for street sweeping in the permit. (AR 318.)

4. Public Education of Impact of Urban Runoff

The educational component of the permit is found in part D.5 of the permit and requires each Copermittee to implement an education program using the media as appropriate to increase the knowledge and change the

behavior of certain communities regarding urban runoff, its impact on receiving waters, and potential solutions to reduce pollutant discharges to storm sewers and the environment. (AR 293-294.) Target communities include municipal departments and personnel, construction site owners and developers, industrial owners and operators, residential community, general public, and school children. (AR 294.)

B. Watershed Urban Runoff Management Program

Part E of the permit addresses the Watershed Urban Management Program and requires each Copermittee to collaborate with other Copermittees within its Watershed Management Area(s) “to develop and implement an updated Watershed Urban Runoff Management Program for each watershed.” (AR 296-297.) Each program must reduce the discharge of pollutants from the storm sewers to the maximum extent practicable. (AR 297.) The specific programs should include elements such as lead watershed permittee identification, watershed map, watershed water quality assessment, watershed-based land use planning, watershed strategy, watershed activities, Copermittee collaboration, public participation, and review and updates of the programs. (AR 297-300.)

C. Regional Urban Runoff Management Program

Part F of the permit addresses the Regional Urban Runoff Management Program and requires each Copermittee to collaborate with the other Copermittees “to develop, implement, and update as necessary a Regional Urban Management Program.” (AR 300.) As with part E of the permit, the program must reduce the discharge of pollutants from the storm sewers to the maximum extent practicable. (AR 300.) At a minimum, the program must address the development and implementation of a Regional Residential Education Program, which includes pollutant specific education, development of a standard fiscal analysis for the educational program, and

the assessment of the effectiveness of jurisdictional, watershed, and regional programs. (AR 300.)

D. Program Effectiveness Assessment

Assessment of the effectiveness of the permit programs is addressed in part I of the permit and requires each Copermittee to annually assess the effectiveness of the above jurisdictional, watershed, and regional urban runoff programs. (AR 302-306.) Additionally, subsection I.5 requires that the Copermittees collaborate with each other to develop a long term effectiveness assessment, building on baseline results previously established by the Copermittees in August 2005. (AR 307.)

E. Collaboration Among Copermittees

Collaboration of the Copermittees is addressed in part L of the permit, which seeks collaboration to “address common issues, promote consistency among Jurisdictional Urban Runoff Management Programs and Watershed Urban Runoff Management Programs, and to plan and coordinate activities required under this Order.” (AR 325.) This includes developing a Memorandum of Understanding that defines Copermittees’ responsibilities, establishes a management structure and standards for conducting meetings, provides guidelines for work groups, lays out the process for non-compliance issues, and includes all other collaborative agreements for compliance with the permit. (AR 326.)

IV. OVERVIEW OF THE COMMISSION AND PRINCIPLES OF SUBVENTION AS IT PERTAINS TO FEDERAL REQUIREMENTS

The County filed a claim with the Commission, claiming that the above-described conditions in its NPDES permit were state mandates. The Commission is a quasi-judicial agency vested with the sole and exclusive authority to adjudicate all disputes over the existence and reimbursement of state-mandated programs within the meaning of article XIII B, section 6 of the California Constitution. (*Kinlaw v. State of California* (1991) 54 Cal.3d

326; Gov. Code, §§ 17551, 17552.) Article XIII B, section 6 of the California Constitution and Government Code section 17514 provide for the reimbursement of local government costs of carrying out new programs or higher levels of service that are mandated by the State. Article XIII B, section 6 provides, in part, as follows:

Whenever the Legislature or any state agency mandates a new program or higher level of service on any local government, the state shall provide a subvention of funds to reimburse such local government for the costs of such program or increased level of service. . . .

Government Code section 17514 defines “[c]osts mandated by the state” to mean:

any increased costs which a local agency or school district is required to incur . . . which mandates a new program or higher level of service of an existing program within the meaning of Section 6 of Article XIII B of the California Constitution.

But constitutional subvention is not required when the costs arise from implementing federal law. “[A]rticle XIII B, section 6, and the implementing statutes . . . provide for reimbursement only of *state-*mandated costs, not *federally* mandated costs.” (*San Diego Unified School Dist. v. Commission on State Mandates* (2004) 33 Cal.4th 859, 880, emphasis in original.)⁶

This constitutional limitation on providing state reimbursement for activities imposed by federal law is specifically spelled out in Government

⁶ One reason that State reimbursement of federally mandated costs is not required is that local governments are not subject to constitutional spending constraints in the face of federal mandates. Article XIII B, section 9, subdivision (b), excludes from calculation of the state or local spending limit any “appropriations required for purposes of complying with mandates of the . . . federal government.” (See *City of Sacramento v. State of California* (1990) 50 Cal.3d 51, 57-58.)

Code section 17556, subdivision (c). This subdivision states that the Commission shall not find “costs mandated by the state” if “[t]he statute or executive order imposes a requirement that is mandated by a federal law or regulation and results in costs mandated by the federal government, unless the statute or executive order mandates costs that exceed the mandate in that federal law or regulation.” Government Code section 17513 defines “costs mandated by the federal government” to mean, in relevant part, “any increased costs incurred by a local agency or school district after January 1, 1973, in order to comply with the requirements of a federal statute or regulation.”

V. SUMMARY OF THE COMMISSION’S DECISION

Local agencies file claims with the Commission for reimbursement of state-mandated costs. (Gov. Code, §§ 17551, 17560.) The first claim filed by a local agency alleging that a statute or an executive order imposes a reimbursable state-mandated program is a “test claim.” (Gov. Code, § 17521.) The test claim filed by the County of San Diego alleges “various activities related to reducing stormwater pollution in compliance with a permit issued by” the Regional Board. (AR 3823.) The Commission found that the permit requirements related to street sweeping and reporting, storm sewer cleaning and reporting, education, watershed activities, regional urban runoff management program, long-term effectiveness assessment, and permittee collaboration were reimbursable state mandates. (AR 3824.) The Commission also found that the permit requirements associated with hydromodification and low impact development, while state mandates, were not reimbursable because the County of San Diego has sufficient fee authority to pay for the permit requirements. (AR 3824.)

The Commission’s statement of decision is lengthy and can be found in the administrative record at pages 3823-3960. This appeal only addresses the Commission’s findings that the claimed permit requirements

are not federal mandates. (AR 3859-3920.) The Commission's analysis is long but is based primarily on the theory that the specific permit activities are not federal mandates because they go beyond the requirements of the Clean Water Act. (AR 3866-3867, 3873, 3877, 3880-3881, 3885, 3896, 3902, 3904, 3908, 3913-3914, 3916.)

STATEMENT OF THE CASE

I. RELEVANT PROCEDURAL HISTORY IN LOWER COURT

The respondents filed a petition for writ of mandate against the Commission and the County of San Diego in the Sacramento Superior Court, seeking an order setting aside part of the Commission's Statement of Decision for Test Claim 07-TC-09 issued by the Commission on March 30, 2010 and asking the court to direct the Commission to issue a new decision consistent with the petition. (Official Court File ("OCF") Volume ("V") 1, pp. 00001-00252.)

Relevant to this litigation, the petition challenges the Commission's findings that the permit requirements related to hydromodification management plans, low-impact development in local management plans, street sweeping and conveyance system cleaning and related reporting, educational surveys and tests, watershed and regional urban runoff management programs, program effectiveness assessment, and collaboration among Copermittees are state mandates. (OCF V1, pp. 00007-00011.) More specifically, the petition alleges that these findings are contrary to law because the permit requirements are federal mandates, not state mandates, and because the permit requirements are not "a new program or higher level of service." (*Ibid.*)

The petition also challenges the Commission's finding that the County of San Diego does not have fee authority to pay for the challenged permit requirements as to the parts of the permit not related to hydromodification and low impact development, which the Commission found were state

mandates, but not reimbursable state mandates. (OCF V1, pp. 00011-00012.)

The County of San Diego filed a cross-petition for writ of mandate and declaratory relief challenging the part of the Commission's decision that found the sections of the permit related to hydromodification and low impact development were not reimbursable state mandates because real parties have the ability to levy fees for these programs.⁷ (OCF V1, pp. 00272-00299.)

II. LOWER COURT'S STATEMENT OF DECISION, WRIT, AND JUDGMENT

The trial court found that the Commission applied the wrong legal standard and acted contrary to law in finding that the challenged permit requirements were state mandates and remanded the matter to the Commission for further proceedings consistent with the statement of decision and the judgment. (OCF V4, p. 01024.) Specifically, the trial court found that "the Commission erred in concluding the challenged provisions of the permit are state-mandated programs merely because the permit conditions are not expressly required by federal statute or regulation." (OCF V4, p. 01010.) The court explained:

The relevant inquiry is whether the conditions are required by federal law, not whether they are explicitly described in federal statute or regulation. Because the Commission failed to apply the proper standard, the petition for writ is granted and the matter remanded to the Commission for proceedings consistent with the decision and judgment.

(OCF V4, p. 01010.)

In finding that the Commission erred in concluding the challenged permit requirements were state mandates, the court first looked at whether

⁷ The State successfully demurred to the declaratory relief cause of action in the cross-petition. (OCF V2, pp. 00523-00529.)

the State had directly imposed the permit requirements on the County of San Diego, and found that it had not. (OCF V4, pp. 01020-01021.) According to the court, “the federal government has imposed the NPDES requirements directly on local agencies that discharge pollutants.” (OCF V4, p. 01020.) The court explained that “[f]ederal law requires the Permittees to obtain a NPDES permit in order to discharge pollutants. Federal law also requires the permit to include controls reducing the discharge of pollutants ‘to the maximum extent practicable.’” (*Ibid.*) Thus, the court held that by administering the NPDES permit program the State “did not transform federal NPDES requirements into a state-mandated program.” (OCF V4, pp. 01020-01021.)

The court then addressed whether the challenged permit requirements exceeded federal law, finding that the Commission failed to undertake the proper analysis and remanding the matter back to the Commission for further consideration. (OCF V4, pp. 01021-01023.) The court found that in analyzing this issue the Commission erred because it “looked only to whether federal law expressly requires the particular conditions specified in the permit” and simply ignored the maximum extent practicable standard in the Clean Water Act. (OCF V4, p. 01021.) The court explained:

In evaluating whether the challenged NPDES permit exceeds the requirements of federal law, the Commission must determine whether any of the permit conditions exceed the “maximum extent practicable” standard. The Commission never undertook this inquiry. Instead, it simply asked whether the permit conditions are expressly specified in a federal regulation or guideline. The fact that a permit condition is not specified in a federal regulation or guideline does not determine whether the condition is “practicable,” and thus required by federal law. The mere fact that a permit condition is not promulgated as a federal regulation does not mean it exceeds the federal standard.

(OCF V4, pp. 01021-01022.)

Thus, the court held that “[b]y failing to consider whether the permit requirements exceed the ‘maximum extent practicable’ standard, the Commission failed to proceed in the manner required by law.” (OCF V4, p. 01022.) Because “there is nothing in the record to support the Commission’s finding that the permit requirements exceed the ‘maximum extent practicable’ standard,” the court set aside the decision and remanded the matter to the Commission to reconsider. (OCF V4, pp. 01022-01023.)

In reaching its decision, the trial court recognized that it “must accord appropriate deference to the Commission’s construction of whether there is a state mandate within the meaning of article XIII B.” (OCF V4, p. 1020.) However, the court also recognized that it “must accord appropriate deference to the Regional Board’s construction of the Clean Water Act. [Citations.]” (OCF V4, p. 1019.) As the court explained, “[t]he San Diego Regional Water Quality Control Board concluded the permit conditions are required by the Clean Water Act. The Regional Board is charged with administering the Clean Water Act and approving the NPDES permit program in San Diego County.” (*Ibid.*)

The lower court did not address the fee issue raised by the petition and the cross-petition. (OCF V4, p. 01010, fn. 1.) In the court’s view, because “the Commission erred in determining these were state-mandates costs, the court need not address Permittees’ ability to recover the costs through local fees.” (*Ibid.*)

Consistent with the above Statement of Decision, the lower court entered judgment in favor of the State and granted the writ of mandate. (OCF V4, pp. 1080-1086.)

STANDARDS OF REVIEW

Pursuant to Government Code section 17559, subdivision (b), a proceeding may be brought under Code of Civil Procedure section 1094.5 “to set aside a decision of the commission on the ground that the

commission's decision is not supported by substantial evidence." Code of Civil Procedure section 1094.5, in turn, provides that the court's inquiry "shall extend to the questions whether the respondent has proceeded without, or in excess of jurisdiction; whether there was a fair trial; and whether there was any prejudicial abuse of discretion. Abuse of discretion is established if the respondent has not proceeded in the manner required by law, the order or decision is not supported by the findings, or the findings are not supported by the evidence." (Subd. (b).)

At the trial level and on appeal, the review of the Commission's factual determinations proceeds under the substantial evidence test. (*City of Richmond v. Commission on State Mandates* (1998) 64 Cal.App.4th 1190, 1194-1195.) Where the substantial evidence test applies, the court is under a duty to see that findings are legally relevant as well as supported by the evidence in order to support agency action. (*City and County of San Francisco v. Board of Permit Appeals* (1989) 207 Cal.App.3d 1099, 1110.) Substantial evidence review also includes a duty to determine whether the agency committed errors of law in applying the facts before it. (*Id.* at p. 1111.) Whether a statute creates a reimbursable state mandate is a pure question of law. (*Connell v. Superior Court* (1997) 59 Cal.App.4th 382, 395.) Questions of law are subject to de novo review. (*City of Richmond, supra*, 64 Cal.App.4th at p. 1195.)

ARGUMENT

I. THE CHALLENGED PERMIT REQUIREMENTS ARE FEDERAL MANDATES NOT SUBJECT TO STATE SUBVENTION.

The California Constitution is clear that state subvention is not required when the federal government imposes new costs on local governments. (Cal. Const., art. XIII B, § 9, subd. (b); Gov. Code, §§ 17556, subd. (c), 17513.) This is because federal costs are exempt from local agencies' taxing and spending limitations and is true "even though the

state has adopted an implementing statute or regulation pursuant to the federal mandate so long as the state had no 'true choice' in the manner of implementation of the federal mandate. [Citation.]" (*Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1564, 1593.) State subvention only comes into play when the state is required "to reimburse local governments for their costs resulting from *state* laws 'which mandate . . . new program[s] or . . . increased level[s] of service' at the local level." (*City of Sacramento, supra*, 50 Cal.3d 51, 57-58, emphasis added.)

The central question in this case is whether the NPDES program and the challenged permit requirements are federal mandates and not subject to state subvention. In making this determination, the Court must consider whether the federal program imposes a mandate on the State. (*City of Sacramento, supra*, 50 Cal.3d 51; *Hayes, supra*, 11 Cal.App.4th 1564.) Most relevant to this case, the Court must also consider whether there are state-mandated activities that exceed federal requirements. (*Long Beach Unified School Dist. v. State of California* (1990) 225 Cal.App.3d 155; *San Diego Unified School Dist., supra*, 33 Cal.4th 859; Gov. Code, § 17556, subd. (c).)

As explained in detail below, the trial court correctly found that the NPDES program is a mandatory federal program and that the Commission failed to analyze whether the challenged permit requirements exceed the federally required maximum extent practicable standard. (OCF V4, pp. 01020-01023.)

II. THE TRIAL COURT PROPERLY FOUND THAT CALIFORNIA'S ADMINISTRATION OF THE NPDES PROGRAM DOES NOT TRANSFORM CLEAN WATER ACT REQUIREMENTS INTO A STATE MANDATE.

"The test for determining whether there is a federal mandate is whether compliance with federal standards 'is a matter of true choice,' that is, whether participation in the federal program 'is truly voluntary.'" (*City*

of Sacramento, supra, 50 Cal.3d at p. 76.) A federal mandate exists, even if “the state has adopted an implementing statute or regulation pursuant to the federal mandate so long as the state had no ‘true choice’ in the manner of implementation of the federal mandate.” (*Hayes, supra*, 11 Cal.App.4th at p. 1593.) But “[t]his reasoning would not hold true where the manner of implementation of the federal program was left to the true discretion of the state.” (*Ibid.*)

The NPDES program is not optional; it is coercive on states, local governments, and private parties in every legal and practical sense. As a preliminary matter, the Commission found that because California “voluntarily adopts the [NPDES] permitting program” and because federal law “does not expressly require states to have this program, the state has freely chosen to effect the stormwater permit program.” (AR 3861.) What the Commission overlooked is given the complex, coordinated, and wide-ranging nature of the rules governing federal, state, and local agencies and private parties under the Clean Water Act, California had no practical choice but to administer the NPDES program, rather than have the federal government issue the permits.

In any event, regardless of which entity implements NPDES, *neither the requirement for a permit nor the actions required to meet the required standard for reduction in discharges was voluntary*. The Clean Water Act requires the County of San Diego to have an NPDES permit for MS4 discharges, and compels the County under the permit to effectively prohibit non-storm water discharges to the storm sewers, to reduce the discharge of pollutants in storm water to the maximum extent practicable, and to comply with any other requirements the Regional Board may deem appropriate to control pollutants. Neither the State nor the County of San Diego has any choice in complying with those requirements. (See *City of Sacramento, supra*, 50 Cal.3d at p. 76.) Further, unlike the situation addressed in *Hayes*,

the State is not “shift[ing] state costs to local agencies,” but instead is implementing federal law that MS4 owners and operators obtain an NPDES permit that reduces pollutants in storm water to the maximum extent practicable. (Cf. *Hayes, supra*, 11 Cal.App.4th at p. 1593.)

If California did not issue NPDES permits, California’s dischargers, both private and governmental, would still have to comply with the same federal law, just administered then by direct regulation from the federal government. California’s decision to take on administration of the federal law meant nothing in terms of any additional requirements. “It is in the interest of the people of the state, in order to avoid direct regulation by the federal government of persons already subject to regulation under state law pursuant to this division, to enact this chapter in order to authorize the state to implement the provisions of the Federal Water Pollution Control Act [Clean Water Act].” (Wat. Code, § 13370, subd. (c).) Faced with the federal requirements to obtain NPDES permits, 46 of the 50 states (including California) have implemented NPDES through a federally approved state agency process.

Moreover, the California Supreme Court has rejected the Commission’s narrow analysis that a state mandate is created when a state enacts its own laws to implement federal law. In *City of Sacramento, supra*, the Supreme Court found that the joint federal-state operation of a system of unemployment compensation was not a state mandate, but rather a federal one. (50 Cal.3d at pp. 75-76.) The Court rejected the idea that “California could have chosen to terminate its own unemployment insurance system, thus leaving the state’s employers faced only with the federal tax.” (*Id.* at p. 74.) The Court stated that “we cannot imagine the drafters and adopters of article XIII B intended to force the state to such draconian ends.” (*Ibid.*) The Court explained that “the state simply did what was necessary to avoid certain and severe federal penalties upon its

resident businesses. The alternatives were so far beyond the realm of practical reality that they left the state ‘without discretion’ to depart from federal standards.” (*Ibid.*)

Under *City of Sacramento*, a federal mandate exists where the federal government leaves the state with little or no practical choice. Adoption of the Commission’s analysis here would eviscerate that rule. Under the Commission’s analysis, a state mandate would exist anytime federal law gives the state any potential role in administering or enforcing federal requirements.

Accordingly, the trial court properly found that “the federal government has imposed the NPDES requirements directly on local agencies that discharge pollutants.” (OCF V4, p. 01020.) The court explained that “[f]ederal law requires the Permittees to obtain a NPDES permit in order to discharge pollutants. Federal law also requires the permit to include controls reducing the discharge of pollutants ‘to the maximum extent practicable.’” (*Ibid.*) Thus, the court held that by administering the NPDES permit program the state “did not transform federal NPDES requirements into a state-mandated program.” (OCF V4, pp. 01020-01021.) Since the County and the State had “no real choice” but to comply with the Clean Water Act in establishing NPDES permits that require pollutant reductions to the maximum extent practicable, such permits are based on federal requirements and are not state mandates. (*San Diego Unified School Dist., supra*, 33 Cal.4th at p. 880.)

The County of San Diego does not address the above analysis, the related lower court’s findings, or even the incorrect *Commission* finding that the State chose to participate in the NPDES program, in its appellants’ brief. (See AB p. 36.) Rather, the County haphazardly claims that California, as an “authorized state,” “is not delegated with federal authority to define what is required” in the permit. (AB pp. 35-39.) In the County’s

view, this means that California's decision to participate in the NPDES program was voluntary, and more broadly, that the challenged requirements were implemented pursuant to state law. (See AB pp. 35-39.) While it is true that the NPDES program is not a "delegated" federal program as that term of art is strictly understood in other contexts, the fact that the Regional Board issues the federally required permit pursuant to state administrative processes and law in lieu of U.S. EPA is of no moment for mandates analysis.

As explained in detail below, the County just does not come to grips with the federal nature of the Clean Water Act, the role of a state administrator under the Act, and the Act's standards, including the maximum extent practicable standard.

III. THE CLEAN WATER ACT'S MAXIMUM EXTENT PRACTICABLE STANDARD IS ONE OF THE FEDERAL REQUIREMENTS IMPOSED ON THE COUNTY OF SAN DIEGO AS THE DISCHARGER.

The County of San Diego claims that the State does not have the authority to implement federal law or more specifically, the maximum extent practicable standard because the State, as opposed to the U.S. EPA, is the governmental body that administers the NPDES program in California. (See AB 35-39.) According to the County, California "cannot independently define what is mandated by federal law." (AB p. 36.) As noted above, this is the County's fallback position throughout its brief in an effort to separate administering a permit program under state law, which California does, from complying with the permit requirements themselves, which the Clean Water Act compels the County to do. (See AB pp. 35-36.)

The Clean Water Act prohibits the County of San Diego from discharging pollutants from its MS4 unless it does so through an NPDES permit. (33 U.S.C. § 1342(p)(3)(B).) Under the Clean Water Act, the permit must contain controls "to effectively prohibit non-stormwater discharges into the storm sewers" and "controls to reduce the discharge of

pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.” (*Ibid.*)

Congress established the maximum extent practicable standard because municipal storm water runoff, unlike other pollutant discharges, could not be adequately addressed by blanket effluent limitations. (*Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at p. 884.) The understanding was that numeric effluent limitations were infeasible and administratively burdensome when addressing municipal urban storm water runoff due to the physical difference between runoff and other pollutants. (*Ibid.*) Congress determined that the maximum extent practicable standard is a “necessary and workable enforcement mechanism to achieving the goals of the Clean Water Act.” (*Ibid.*)

The Clean Water Act’s NPDES permit system requires the permitting agency, typically state agencies, to develop standards based on the unique conditions of particular waterways. Thus, the maximum extent practicable standard is necessarily flexible, rather than a one-size-fits-all standard, and contemplates that specific measures will be implemented to meet the unique requirements of any particular waterway and water quality. (*Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at p. 874.) The U.S. EPA expects individual permit writers to develop the practices that reflect the maximum extent practicable standard on a permit-by-permit basis. (*Natural Resources Defense Council, Inc. v. U.S. E.P.A., supra*, 966 F.2d at p. 1308, n. 17; see also 55 Fed.Reg. 47990, 48043 (Nov. 16, 1990).)

Moreover, when an NPDES permit is renewed, reissued, or modified, it must generally be at least as stringent as the prior permit. (33 U.S.C. § 1342(o); 40 C.F.R. § 122.44(l).) The U.S. EPA “anticipates that storm

water management programs will evolve and mature over time” and that NPDES permits “will be written to reflect changing conditions that result from program development and implementation and corresponding improvements over time.” (55 Fed.Reg. 47990, 48052 (Nov. 16, 1990).) Strategies for reducing pollutants should be “flexible enough to allow for consideration of what is attainable on the area’s climate, vegetation, hydrology, and land uses.” (*Id.* at p. 48053.)⁸

In an effort to avoid the Clean Water Act’s maximum extent practicable standard and to turn a federal program into a state mandate, the County of San Diego makes three interrelated arguments: (1) because state, not federal, courts review challenges to Regional Board NPDES permits, the State is not delegated federal authority to define the maximum extent practicable standard in the context of the challenged permit requirements, (2) the U.S. EPA has expressly stated the standards required to implement the maximum extent practicable standard through narrow and prescriptive federal regulations, and (3) specific federal regulations supplant the maximum extent practicable standard. All three of these theories are fundamentally wrong.

A. California’s Administration of the NPDES Program Does Not Remove the Federal Maximum Extent Practicable Requirement Imposed on the County of San Diego.

The County of San Diego improperly relies on two subject matter jurisdiction cases to support its theory that, although the State administers the NPDES permit program in California, the Regional Board cannot implement the federal maximum extent practicable standard. (See AB pp. 31-35.) The County has misconstrued these cases. In *Shell Oil*

⁸ The County’s argument that the challenged conditions are not required by federal law because they were purportedly not in the prior 2001 permit is meritless. (See fn. 5.)

Company v. Train (9th Cir, 1978) 585 F.2d 408, Shell brought an action against the U.S. EPA and its Administrator challenging various decisions of a state regional board concerning a NPDES permit. While the court dismissed the case for lack of subject matter jurisdiction, holding that “[j]urisdiction to review the State Board’s decision is specifically conferred on the states’ courts of general jurisdiction [citation],” the Ninth Circuit in no way held that California cannot apply federal law, including the maximum extent practicable standard, when implementing federal law through a NPDES permit. (*Id.* at p. 409.) The court explained that “Congress clearly intended that the states would eventually assume the major role *in the operation of the NPDES program.*” (*Id.* at p. 411, emphasis added.) However, “the EPA does retain a review authority over the states. *The EPA may veto particular permits issued by the state if it finds that federal requirements have not been met,* or it may withdraw approval of the entire state program upon a determination, after notice and an opportunity to respond, that the program is not being administered in compliance with the mandates of federal law.” (*Ibid.*, citations omitted, emphasis added.) Thus, the Clean Water Act created “a separate and independent State authority to administer the NPDES pollution controls” consistent with federal law. (*Ibid.*)

And in *State of California v. U.S. Department of the Navy* (9th Cir. 1988) 845 F.2d 222, California brought an action against the United States Department of Navy to recover civil penalties for the alleged violations of a state-issued NPDES permit. The court held that the State had jurisdiction over the matter because “Congress intended to grant states an active role in the enforcement process.” (*Id.* at p. 225.) As above, the court noted that the state’s NPDES program is separate and independent from the federal program; however, this does not mean that the State is not required to

follow or implement federal law or the maximum extent practicable standard, which is required by the Clean Water Act. (*Ibid.*)

Moreover, the California Supreme Court recently rejected a similar argument and underscored that while California administers aspects of the NPDES program in California, the program must conform to federal standards and be approved by a federal agency. (*Voices of the Wetlands v. State Water Resources Control Bd.* (2011) 52 Cal.4th 499, 522.)

Administering the program in lieu of the federal government does not alter the flexible federal requirement on municipalities to reduce pollutants in storm water discharges to the maximum extent practicable. Indeed, were the State to refrain from recognizing and implementing the flexible nature of the maximum extent practicable standard in MS4 permits, it would place its NPDES program approval at risk by failing to implement federal requirements. The County of San Diego's focus on the word "delegate" is simply not relevant to this case. As far as mandates law goes, it is a distinction without a difference. The Clean Water Act, and its implementing regulations, requires dischargers such as the County of San Diego "to reduce the discharge of pollutants to the maximum extent practicable."

B. Limiting Permit Conditions to Only Those Stated in Express Federal Regulations as Proposed by the County of San Diego and the Commission Cannot Be Reconciled with the Clean Water Act's Maximum Extent Practicable Standard.

The federal Clean Water Act requires municipalities to apply for a NPDES permit that requires pollutant reductions to the maximum extent practicable. (33 U.S.C. § 1342(p)(3)(B).) Despite the undisputed flexible nature of the maximum extent practicable standard, the County continues to search for prescriptive requirements in federal regulations to support its (and the Commission's) view that federal mandates only exist if expressly provided for in federal regulations. However, a flexible standard is not

amenable to the exclusive checklist of specific permit conditions that the County of San Diego argues can be the only federal mandate here. (See AB pp. 35-40.)

To support its erroneous theory, the County points to the Phase II regulations related to small storm sewer systems, and claims that the U.S. EPA has expressly stated that there are “six minimum control measures that constitute the framework for a storm water discharge control program for regulated small MS4s that, when properly implemented, will reduce pollutants to the maximum extent practicable (MEP) [citations omitted].” (AB pp. 38, 48.) This attempt is misguided.

First, the U.S. EPA quote relied on relates only to the regulations that address *small* storm sewers systems. The County of San Diego’s permit is actually governed by the Phase I regulations, covering medium or large MS4s. (AR 252.) The federal regulations relevant to this case require the County of San Diego’s NPDES permit to address management programs to reduce the discharge of pollutants using the maximum extent practicable standard (40 C.F.R § 122.26(d)(2)(iv)) and includes procedures to control pollution resulting from development and significant redevelopment, construction, and commercial, residential, industrial, and municipal land use activities; (*id.* § 122.26 (d)(2)(iv)(A)-(D)); to address the operation and maintenance of public streets, roads, highways, and parking facilities as well as MS4s (*id.* § 122.26 (d)(2)(iv)(A)(1)(3)(6)); to educate the public on the danger of urban runoff to our nation’s waters and to reduce pollutant releases to the environment (*id.* § 122.26(d)(2)(iv)(A)(5),(6), (D)(4)); and to address water quality and the discharge of pollutants through MS4s on system-wide, jurisdictional-wide, watershed, or other basis, and through interagency agreements. (*Id.*, § 122.26(a)(3)(ii), (d)(2)(i)(D), (iv).) These requirements, not the Phase II regulations and their “six minimum measures” for small MS4s, govern the permit at issue here.

Second, the County does not disclose that the requirements applicable under the Phase II regulations are also flexible: section 122.34(a) requires that dischargers into small sewer systems reduce pollutants to the maximum extent practicable standard! And then subsection (b), only emphasized by the County, outlines the “six *minimum* control measures.” (64 Fed.Reg. 68752 (Dec. 8, 1999) [six minimum control measures are specified in §122.34(b)].) Similar to the San Diego permit issued here and as explained by the U.S. EPA, “[t]hese minimum control measures are public education and outreach on storm water impacts, public involvement participation, illicit discharge detection and elimination, construction site storm water runoff control, post-construction storm water management in new development and redevelopment, and pollution prevention/good housekeeping for municipal operations.” (*Id.* at p. 68748.) The U.S. EPA disagrees with the notion that these federal regulations should create exclusive permit requirements, stating that “[t]he whole point of the permit scheme for these discharges is to avoid inflexibility in the types and levels of control.” (55 Fed.Reg. 47990, 48053 (Nov. 16, 1990).)⁹

To the extent, the Phase II regulations for small MS4s are relevant, they support the State’s case more than the County’s, as they show that the federal maximum extent practicable standard is a flexible standard and is imposed in different ways based on the water quality issues presented. Requirements in one permit would logically be different than the requirements in other permits. The regulations for storm water sewer

⁹ The County of San Diego states the U.S. EPA “is currently engaged in rulemaking to expand the federal NPDES program as it applies to storm water regulations,” which in their view creates a “reasonable inference” that “federal regulations establish the baseline federal requirements that are mandated by federal law.” (AB p. 38, fn. 10.) There is no basis for any such inference; it is pure speculation.

systems, whether large or small, simply do not explicitly prescribe a limited number of permit conditions as claimed by the County of San Diego.

Third, to support its prescriptive regulation theory, the County relies on a statement from the Ninth Circuit in *Environmental Defense Center v. United States Environmental Protection Agency* (2003) 344 F.3d 832 that spoke to the “Minimum Measures” discussed above in the overall context of general permits and notices of intent to seek coverage under a general permit for discharge purposes. In discussing an individual NPDES permit issued to a discharger, as opposed to a general NPDES permit issued to the State, the court noted that a discharger through a small sewer system “has complied with the requirement of reducing discharges to the ‘maximum extent practicable’ when it implements its stormwater management program, i.e., when it implements its Minimum Measures. [Citations.]” (*Id.* at p. 855.) While these “Minimum Measures” collectively establish the maximum extent practicable standard, there is no suggestion in the case that they are prescriptive requirements; they are simply based on the circumstances surrounding the issuance of the permit. This case does nothing to aid the County or the Commission in their quest for narrow and rigid regulations amounting to a checklist.

Finally, the County of San Diego claims that one U.S. EPA guidance document expressly states what NPDES requirements are mandated by law. (See AB p. 39.) As above, there is nothing to support this theory. The document relied upon is very simply a guide to “assist State and NPDES permitting authority.” (AR 1857.) Specifically, it states that “[t]he questions and issues addressed in this MS4 Evaluation Guidance are intended to be used as a reference during an MS4 program evaluation, not as a checklist during review. [¶] Each evaluation should be customized to the issues and requirements specific to that MS4.” (*Ibid.*) In any event, references to the contents of the guidance document is alone sufficient to

defeat the County's argument here, as the key regulation noted in the document is the flexible maximum extent practicable standard found in title 40, Code of Federal Regulations, section 122.26(d)(2)(iv). (See AR 1903.)

The Clean Water Act and its implementing regulations require dischargers such as the County of San Diego "to reduce the discharge of pollutants to the maximum extent practicable." This is a flexible standard not suited for reduction to a limited checklist of prescriptive regulations as advocated by the County of San Diego and the Commission.

C. Federal Regulations Do Not Supplant the Maximum Extent Practicable Standard in the Clean Water Act.

The County of San Diego's third and final broad-based argument is premised on the view that prescriptive federal regulations somehow replace the Clean Water Act's maximum extent practicable standard. (See AB pp. 48-54.) However, as just discussed in the previous point, supplanting the maximum extent practicable standard with various enumerated, specific permit application requirements is at odds with and not supported by the Clean Water Act, its implementing regulations, or the permit issued in this case. While regulations setting forth the required contents of permit applications provide general guidance for areas that must be addressed in NPDES permits, they are not a substitute for the Clean Water Act's maximum extent practicable standard.

Moreover, the flexibility of the maximum extent practicable standard does not equate to irrelevance as claimed by the County of San Diego. According to the County, this federal standard is not relevant because it "tells one nothing about whether a condition is mandated by federal law." (AB p. 49.) In the County's view, "whether a condition is 'practicable' sheds no light on whether such a condition is consistent with the MEP standard." (*Ibid.*) But the County misses the point. By definition, a flexible standard is not intended to be applied in the same manner under

circumstances that are not the same. And it does not matter if this standard amounts to a “lesser standard than other standards found in the Clean Water Act” as claimed by the County. (AB p. 50.) It is the federal standard required under the Clean Water Act. As above, to conclude that “[w]hen federal law requires specific controls, those controls are set forth in federal regulations,” completely ignores and misconstrues the Clean Water Act’s maximum extent practicable mandate. (AB pp. 51-52.)

Furthermore, if one takes the County’s argument to its logical conclusion, then every condition in every permit issued under state law is a state mandate, even if it is within the federally required maximum extent practicable standard, simply because it is not expressed in federal law. This reasoning is contrary to federal law and defies commonsense. Under the County’s analysis, a permit requirement that was merely practicable or easy (well short of practicable to the “maximum extent”) would be a state mandate if the U.S. EPA failed to express the requirement in a regulation.

The Clean Water Act’s maximum extent practicable standard is the key to understanding the NPDES permit requirements in this case. Simply because a federal law is flexible does not mean there is no federal mandate

IV. THE TRIAL COURT PROPERLY HELD THAT THE COMMISSION’S FINDINGS THAT THE CHALLENGED PERMIT REQUIREMENTS ARE STATE MANDATES APPLIED THE WRONG LEGAL STANDARD.

Government Code section 17556, subsection (c), states that the Commission shall not find “costs mandated by the state” if “[t]he statute or executive order imposes a requirement that is mandated by a federal law or regulation and results in costs mandated by the federal government, unless the statute or executive order mandates costs that exceed the mandate in that federal law or regulation.” (*San Diego Unified School Dist.*, *supra*, 33 Cal.4th at p. 880.) Under this statutory standard, the Commission is tasked with reviewing the applicable federal law, the maximum extent

practicable standard, and determining whether each challenged permit requirement exceeded this standard. The Commission did not attempt to meet this burden, and instead completely disregarded the maximum extent practicable standard, the flexible nature of this standard, and the Regional Board's exclusive authority in the area of water law.

A. The Commission Disregarded the Required Maximum Extent Practicable Standard.

Rather than addressing whether the challenged permit provisions exceeded the maximum extent practicable standard imposed by federal law, the Commission erroneously assumed that whenever the federal government imposes a standard that allows an individualized approach to be taken to meet federal requirements, there can be no federal mandate, and any act taken by the State to implement the federal standard is transformed into a state mandate. As explained by the lower court, the law is otherwise:

In evaluating whether the challenged NPDES permit exceeds the requirements of federal law, the Commission must determine whether any of the permit conditions exceed the "maximum extent practicable" standard. The Commission never undertook this inquiry. Instead, it simply asked whether the permit conditions are expressly specified in a federal regulation or guideline. The fact that a permit condition is not specified in a federal regulation or guideline does not determine whether the condition is "practicable," and thus required by federal law. The mere fact that a permit condition is not promulgated as a federal regulation does not mean it exceeds the federal standard.

(OCF V4, pp. 01021-01022.)

The County of San Diego sidesteps this proper analysis by essentially arguing quantity over quality. In the County's view, the Commission analyzed the maximum extent practicable standard because the decision was lengthy (over one hundred pages) and because the decision restated relevant federal law, state law, and the parties' positions. (See AB pp. 46-47.) Providing background information is not a substitute for analysis. A

simple review of the Commission's findings shows that the Commission did not analyze, and in fact ignored, the maximum extent practicable standard and simply found that state mandates exist because the challenged permit requirements are not provided for in federal law. Specifically, the Commission found:

- Hydromodification Management Plan – “Overall, there is nothing in the federal regulations that requires a municipality to adopt or implement a hydromodification plan. Thus, the HMP requirement in the permit ‘exceed[s] the mandate in that federal law or regulation.’” (AR 3866.)
- Low Impact Development – “The Commission finds nothing in the federal regulations (40 C.F.R. § 122.26) that requires local agencies to collectively review and update the BMP requirements listed in their SUSMPs, or to develop, submit and implement ‘an updated Model SUSMP’ that defines minimum LID and other BMP requirements for incorporation into the SUSMPs. Thus the LID requirements in the permit ‘exceed the mandate in that federal law or regulation.’” (AR 3873.)
- Street Sweeping – While the Commission acknowledges that the “permit requires activities that fall within the federal regulations [i.e., routine maintenance of public streets, roads, and highways to prevent the discharge of pollutants into storm drains],” it found that “the more specific requirements in the permit include variable street sweeping schedules for areas impacted by different amounts of trash” and “reporting on the amount of trash collected, which is [are] not required by the federal regulation.” (AR 3877.) “These activities ‘exceed the mandate in that federal law or regulation.’” (AR 3877.)
- Conveyance System Cleaning – “Like street sweeping, the permit requires conveyance system cleaning activities that fall within the federal regulations.” (AR 3880.) “Yet the permit requirements are more specific [than the federal regulations].” (AR 3880.) “These

activities, 'exceed[s] the mandate in that federal law or regulation.'" (AR 3881.)

- Educational Component – “[T]he federal regulations require nonspecific descriptions of educational programs, for example, requiring the permit application to ‘include appropriate educational and training measures for construction site operations’ and ‘controls such as educational activities.’” (AR 3885.) “The permit, on the other hand, requires implementation of an educational program with target communities and specific topics. These requirements ‘exceed the mandate in that federal law or regulation.’” (AR 3885.)
- Watershed Urban Runoff Management Program – “The Commission finds that the permit requirements in sections E.2.f and E.2.g are not federal mandates.” (AR 3896.) “As with the other requirements in the permit, the federal regulations authorize but do not require the specificity regarding whether collaboration occurs on a jurisdictional, watershed or other basis. These requirements ‘exceed the mandate in that federal law or regulation.’” (AR 3896.)
- Regional Urban Runoff Management Program – “The Commission finds that the requirements in part F.1 of the permit do not constitute a federal mandate. There is no federal requirement to provide a regional educational program, so the education program, ‘exceed[s] the mandate in that federal law or regulation.’” (AR 3902.)

“The Commission finds that the requirements in part F.2 and F.3 of the permit do not constitute a federal mandate. There is no federal requirement to collaborate on, develop, or implement a Regional Urban Runoff Management Program (RURMP). The Commission finds that these RURMP activities ‘exceed the mandate in that federal law or regulation.’” (AR 3904.)
- Program Effectiveness Assessment – “Although the federal regulations require assessment of controls and annual reports, they do not require the detailed assessment in the 2007 permit. The regulations do not require, for example, assessments of the effectiveness of

each significant jurisdictional activity/BMP or watershed quality activity, or the implementation of each major component of the JURMP or WURMP, or identification of modifications and improvements to maximize the JURMP and WURMP effectiveness. These requirements, ‘exceed the mandate in that federal law or regulation.’” (AR 3907-3908.)

“Although the federal regulations require assessment controls, they do not require the detailed assessment in the 2007 permit. They do not require, for example, collaboration with other copermittees, addressing specified objectives or outcome levels, or addressing jurisdictional, watershed, and regional programs. These requirements ‘exceed the mandate in that federal law or regulation.’” (AR 3913-3914.)

- All Copermittee Collaboration – “The Commission finds that there is no federal mandate to develop a management structure (memorandum of understanding or MOU) as required by part L of the 2007 permit.” (AR 3916.) “All the federal regulations address is authority to establish an interagency agreement or memorandum of understanding, but do not require it to be implemented or specify its contents beyond ‘controlling . . . the contribution of pollutants from one portion of the municipal system to another portion of the municipal system.’” (AR 3916.) “Thus, the permit activity ‘exceed[s] the mandate in that federal law or regulation.’” (AR 3916.)

The trial court correctly held that by taking this approach and “failing to consider whether the permit requirements exceed the ‘maximum extent practicable’ standard, the Commission failed to proceed in the manner required by law.” (OCF V4, p. 01022.) The trial court decision should be affirmed.

B. The Clean Water Act Required Unequivocally, but in Flexible Terms, the Regional Board to Specify the Permit's Comprehensive Measures to Reduce Pollutants to the Maximum Extent Practicable.

The Commission failed to consider and recognize the Regional Board's legal duty to prescribe controls to reduce the discharge of pollutants to the maximum extent practicable under the Clean Water Act. In issuing Clean Water Act large municipal storm water permits, "[t]he permitting agency has discretion to decide what practices, techniques, methods and other provisions are appropriate and necessary to control the discharge of pollutants. [Citation.]" (*City of Rancho Cucamonga v. Regional Water Quality Control Bd.-Santa Ana Region* (2006) 135 Cal.App.4th 1377, 1389.) However, the "Regional Board must comply with federal law requiring detailed conditions for NPDES permits." (*Ibid.*) Further, the U.S. EPA expects individual permit writers to develop the practices that reflect the maximum extent practicable standard on a permit-by-permit basis. (*Natural Resources Defense Council, Inc. v. U.S. E.P.A.*, *supra*, 966 F.2d at p. 1308, fn. 17; see also 55 Fed.Reg. 47990, 48043 (Nov. 16, 1990).)

And consistent with federal law, the permit at issue here makes clear that the challenged permit requirements are intended to reduce the discharge of pollutants in storm water in the County of San Diego to the maximum extent practicable under the Clean Water Act. (AR 3527.) It states:

[The permit] specifies requirements necessary for the Copermittees to reduce the discharge of pollutants in urban runoff to the maximum extent practicable (MEP). However, since MEP is a dynamic performance standard which evolves over time as urban runoff management knowledge increases, the Copermittees' urban runoff management programs must continually be assessed and modified to incorporate improved programs, control measures, best management practices (BMPs), etc. in order to achieve the evolving MEP standard.

(AR 255.) By definition, a flexible standard is not intended to be applied in the same manner under different circumstances.

The permit provides the County of San Diego the flexibility to substitute another best management practice, if proposed modification complies with all discharge prohibitions. (AR 325.) Thus, the NPDES permit that was actually issued to the County of San Diego is the best measure of what is required to comply with the maximum extent practicable standard.

Unlike the Commission, the trial court correctly interpreted federal law as requiring a flexible, comprehensive set of permit conditions and ruled that state mandate claims must be analyzed against this federal mandate, not the presence or absence of federal regulations specifically requiring particular permit conditions. (OCF V4, p. 01010.) The Commission failed to consider and recognize the Regional Board's legal duty to prescribe controls to reduce the discharge of pollutants to the maximum extent practicable under the Clean Water Act.

C. The Commission Should Have Deferred to the Regional Board's Findings and Considered the County's Failure to Seek Judicial Review.

The Regional Board's findings that the permit reflects the maximum extent practicable standard are not idle ruminations from an administrative agency. Instead, those findings and requirements are the expert conclusions of the principal state agency charged with implementing the NPDES program in San Diego. (Wat. Code, §§ 13001, 13200.) Courts have recognized that the regional boards are entitled to considerable deference in applying the statutes they implement, especially in the area of storm water regulation. (*County of Los Angeles v. California State Water Resources Control Bd.* (2006) 143 Cal.App.4th 985, 997 ["we defer to the regional board's expertise in construing language which is not clearly defined in statutes involving pollutant discharge into storm drain sewer systems"]);

City of Rancho Cucamonga, supra, 135 Cal.App.4th at p. 1384; *Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at p. 879.)

The Regional Board found the permit “specifies requirements necessary for the Copermitees to reduce the discharge of pollutants in urban runoff to the maximum extent practicable (MEP).” (AR 255.) In reaching its decision, the trial court recognized that it “must accord appropriate deference to the Regional Board’s construction of the Clean Water Act. [Citations.]” (OCF V4, p. 1020.) (*Ibid.*) As the court explained, “[t]he San Diego Regional Water Quality Control Board concluded the permit conditions are required by the Clean Water Act and approving the NPDES permit program in San Diego County.” (*Ibid.*) The Commission, while an expert in mandates, is not an expert in water quality law and should have deferred to the Regional Board’s findings that the challenged permit requirements are within the federal requirements of the Clean Water Act.

The Commission also missed another key point. The County chose not to seek review of the permit itself, the expert conclusion of the Regional Board, directly in court. The Regional Board’s decision was quasi-adjudicative in nature, and the County was entitled to procedural protections set forth in the Administrative Procedures Act, which provide a clear process for administrative and judicial resolution. (See *City of Rancho Cucamonga v. Regional Water Quality Control Bd.-Santa Ana Region, supra*, 135 Cal.App.4th at p. 1385; Wat. Code, § 13330.) If the County had disagreement with the scope of the permit conditions as being in excess of what was required or allowed under federal law, it should have challenged the permit during judicial review of the Regional Board’s permit decision under the applicable regulatory laws. (*Y.K.A. Industries, Inc. v. Redevelopment Agency of City of San Jose, supra*, 174 Cal.App.4th 339, 356.) Instead, the County of San Diego proceeded with a challenge only

through administrative review by the State Water Board. The Board dismissed the challenge, no lawsuit was subsequently filed to determine if the permit conditions were required by the Clean Water Act, and the permit may no longer be challenged. (See AB p. 22; Wat. Code, § 13330, subd. (d).) The County of San Diego should not now be allowed to collaterally attack the Regional Board's findings under the guise of the present state mandates claims. The doctrine of exhaustion of judicial remedies prevents an aggrieved party from being able to avoid the preclusive effects of an adverse administrative action by simply forgoing the right to judicial review. (*Y.K.A. Industries, Inc. v. Redevelopment Agency of City of San Jose* (2009) 174 Cal.App.4th 339, 356.) The County of San Diego could have argued that the permit requirements at issue in this appeal exceeded federal requirements under administrative mandamus review of the Regional Board's decision, but chose not to.

In summary, the Commission's decision here ignored two fundamental rules governing review of administrative decisions. First, it failed to afford the Regional Board the considerable deference due when that expert agency imposed the permit conditions at issue as being required under federal law. (*County of Los Angeles v. California State Water Resources Control Bd.*, *supra*, 143 Cal.App.4th 985, 997.) Second, the County forfeited any arguments it had on that point by failure to raise them through judicial review of the Regional Board's permit decision under the applicable regulatory laws. (*Y.K.A. Industries, Inc.*, *supra*, 174 Cal.App.4th 339, 356.) Instead, the Commission allowed the County to attempt to second-guess the Regional Board's permit and ignore proper judicial review under the ordinary governing water quality law.

D. The Trial Court Correctly Found That the Commission's Application of *Long Beach School Dist. v. State of California* Was Misplaced.

In support of its erroneous state mandates determination, the Commission relied incorrectly (and almost exclusively) on *Long Beach School Dist. v. State of California, supra*, 225 Cal.App.3d 155. In *Long Beach*, the court considered whether a state executive order setting forth specific measures to desegregate schools constituted a state mandate. The executive order required school districts to provide a higher level of service than required by judicial decisions recognizing a general federal constitutional duty to desegregate schools, an area in which courts "have been wary of requiring specific steps." (*Id.* at p. 173.) A state mandate was found based on the absence of any federal law that specified how the schools should implement their desegregation procedures. (*Ibid.*)

Here, as explained by the trial court, there is a specific federal statute, the Clean Water Act, including its maximum extent practicable standard for MS4 permits, that directly applies to the County of San Diego. (OCF V4, pp. 01021-01022.) Moreover, unlike in *Long Beach*, this federal statutory standard by definition must be implemented in terms more specific than the standard itself when applied to NPDES permits issued to dischargers. In *Long Beach*, there was no even remotely analogous express constitutional or federal requirement that a federal agency or a state intercede and develop desegregation procedures for school districts.

And while the Regional Board has some flexibility in implementing the maximum extent practicable standard, it is guided by the Clean Water Act and the U.S. EPA. The Clean Water Act explicitly imposes the "maximum extent practicable" standard and states that it will include "management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."

(33 U.S.C. § 1342(p)(3)(B).) Federal law further defines these practices to mean, in part, “schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of ‘waters of the United States.’” (40 C.F.R. § 122.2.) And the U.S. EPA has provided substantial guidance on how that federal law is to be implemented and specifically required permitting agencies to specify in NPDES permits the controls necessary to implement the federal standard. (40 C.F.R. § 122.26; *Natural Resources Defense Council, Inc. v. U.S. E.P.A.*, *supra*, 966 F.2d at p. 1308, fn. 17; see also 55 Fed.Reg. 47990, 48043 (Nov. 16, 1990).)

Moreover, California administers the NPDES program to follow federal requirements as closely as possible. For example, the federally required permit process starts with the discharger submitting a proposed application to the permitting authority, which must comply with all federal requirements, including effluent limitations, national standards of performance, and toxic and pretreatment effluent standards. (33 U.S.C. §§ 1342 (b)(1), 1311, 1312, 1316, 1317.) And federal law requires that the U.S. EPA be provided with the proposed permit and notice of any action related to the same, such as a hearing on the proposed requirements. (33 U.S.C. § 1342(d)(1).) The U.S. EPA may object to a permit and find that it is inconsistent with federal law. (*Id.* § 1342(d)(2).) This type of finding could result in the U.S. EPA determining that a state program does not comply with federal NPDES program guidelines and could be a reason for the U.S. EPA to withdraw approval for the state program. (*Id.* § 1342(c)(3).) The “Regional Board must comply with federal law requiring detailed conditions for NPDES permits.” (*City of Rancho Cucamonga, supra*, 135 Cal.App.4th at p. 1389.)

At most, the teachings of *Long Beach* tell us that the Commission should have compared the permit requirements to the federal Clean Water

Act standards and then determined whether they went beyond federal law. While the Commission provided a lengthy discussion of whether various permit conditions are expressed verbatim in federal law, it failed to consider whether the requirements were within the federally required maximum extent practicable standard set forth in the federal statute and regulations.

This true “comparative” approach was endorsed by the Supreme Court in *San Diego Unified School Dist. v. Commission on State Mandates*, *supra*, 33 Cal.4th 859, where the Commission was required to determine if state procedures requiring a hearing when a student was being expelled exceeded federal due process requirements. While the Supreme Court sympathized with the challenge presented to the Commission in attempting to resolve the extent of imprecise federal law in the context of a state mandates proceeding, the Court nonetheless stated that such an analysis was required. (*Id.* at pp. 889-890.) The Commission was likewise required to engage in such analysis here, but its task was easier, given the more explicit, detailed, and comprehensive federal law on permitting MS4s under the Clean Water Act.

The County of San Diego, like the Commission, simply ignores that in *Long Beach* there was no federal standard and that here there is: the flexible maximum extent practicable standard. (See AB pp. 43-45.) To be sure, the standard is flexible, requiring further explication and implementation by the Regional Board, but the federal standard is there which is sufficient to distinguish *Long Beach* from the present case.

V. SUBSTANTIAL EVIDENCE IN THE ADMINISTRATIVE RECORD SHOWS THAT THE CHALLENGED PERMIT REQUIREMENTS DO NOT EXCEED THE MAXIMUM EXTENT PRACTICABLE STANDARD.

A. It Was Within the Lower Court's Discretion To Remand the Case to the Commission for Further Consideration.

The lower court did not address whether the challenged permit requirements exceeded federal law. Instead, it set aside the decision and remanded the matter to the Commission to reconsider the requirements in light of the federal standards, including the maximum extent practicable standard. According to the court, "there is nothing in the record to support the Commission's finding that the permit requirements exceed the 'maximum extent practicable' standard." (OCF V4, pp. 01022-01023.) While the lower court could have decided (and this Court could decide on review) whether the challenged permit requirements are federal mandates and not subject to state subvention as a matter of law, respondents do not challenge the scope of the court's remand. Since the County of San Diego has addressed this issue in its brief (see AB pp. 54-59), however, respondents are left with no choice but to do the same. With that said, if this Court agrees with the lower court's remand, the following pages (addressing whether the permit requirements are specifically supported under the correct analysis of federal law) can be disregarded.¹⁰

B. The Challenged Permit Requirements

1. Hydromodification Management Plan

The permit imposes requirements for the control of hydromodification or the erosion of downstream channels caused by changes in runoff

¹⁰ As a side note, the individual analysis of each challenged permit requirement illustrates the analysis that the Commission should have undertaken when addressing the federal mandates issue instead of simply concluding that no federal mandates existed because the requirements were not expressed in federal law.

resulting from development and urbanization. (AR 275-278.) These controls are well within the scope of the maximum extent practicable standard imposed on the County of San Diego under the Clean Water Act, and neither the County, nor the Commission, have cited to any contradicting evidence. Instead, the Commission found that because the concept of hydromodification is not expressly set forth in detail in federal law, it must somehow exceed the maximum extent practicable standard. (AR 3866.) However, the maximum extent practicable standard requires flexible, best management practices, to eliminate or reduce the discharge of pollutants in storm water or runoff through MS4. (33 U.S.C. § 1342(p)(3)(B); 40 C.F.R. § 122.26(d)(2)(iv).) The Clean Water Act need not, nor could it in all practicality, set forth a specific plan for addressing the impact of downstream erosion from runoff from development and urbanization for each specific waterbody in order to require its implementation under the maximum extent practicable standard.

Runoff from newly developed areas can produce erosive flows in channels under rainfall conditions that previously did not exist. (AR 432.) As the total area of impervious surfaces increases from development, infiltration of rainfall decreases, causing more water to runoff the surface at a higher rate. (AR 432.) Among other things, this increase in runoff can adversely affect water quality, leading to the discharges of pollutants in the nearby waterbodies. The Regional Board reached this conclusion in its quasi-adjudicative permitting proceeding. (AR 259-261.) Designing, implementing, and monitoring a hydromodification management plan will help prevent runoff from new development and urbanization and will decrease pollutants escaping into the water to the maximum extent practicable. (*Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at p. 889 [“practicable does not necessarily mean the most that can possibly be done”].) And, as discussed above, the Commission is in no

position to determine what activities meet the maximum extent practicable standard. That expertise lies with the Regional Board. (*County of Los Angeles v. California State Water Resources Control Bd.*, *supra*, 143 Cal.App.4th at p. 997; *Divers' Environmental Conservation Organization* (2006) 145 Cal.App.4th 246, 252.)

Federal law also requires that permits include a comprehensive master plan to address storm water runoff from new development and significant redevelopment as follows:

[The plan should include a] description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed.

(40 C.F.R. § 122.26(d)(2)(iv)(A)(2).) And regulating the flow of runoff is authorized by the Clean Water Act. (*PUD No. 1 v. Washington Department of Ecology* (1994) 511 U.S. 700, 714-715.)

The restrictions on effluent flows are also supported by the U.S. EPA in the Preamble to the Phase II federal storm water regulations, which states:

EPA intends to prevent water quality impacts resulting from increased discharges of pollutants, which may result from increased volume of runoff. In many cases, consideration of the increased flow rate, velocity and energy of storm water discharges following development unavoidably must be taken into consideration in order to reduce the discharge of pollutants, to meet water quality standards and to prevent degradation of receiving streams. EPA recommends that municipalities consider these factors when developing their post-construction storm water management program.

(64 Fed. Reg. 68761 (Dec. 8, 1999).)

Moreover, the County of San Diego has implicitly conceded that the Clean Water Act requires that steps be taken to prevent downstream erosion

from runoff from new development or significant redevelopment. The County's own ROWD recommends various activities to address downstream erosion and the discharge of pollutants into the nation's water as follows:

- Re-issued permit should require improved procedures for analyzing downstream conditions of concern, including developing minimum criteria for conducting an analysis of downstream conditions, analyzing downstream conditions of concern, and developing methodologies for addressing such areas of concern. (AR 2197-2199.)
- Priority projects should "prepare a project-specific drainage study demonstrating that discharge flow rates, and velocities from a 2-year and 10-year, 24-hour rainfall event will not significantly impact downstream erosion or stream habitat." (AR 2197.)
- Project applicants should demonstrate that the project will not cause significant adverse impacts on downstream erosion or stream habitat or that the impact has been mitigated. (AR 2197.)
- Drainage studies must be conducted to determine the regional effect of a detention basin, if storm water detention is used to mitigate significant impacts to downstream erosion or stream habitat. (AR 2197-2199.)
- "[I]dentify multiple methods to address identified downstream conditions of concern. Examples of such methods include: detention; implementation of site design, source control (such as LID controls) or treatment control BMPS that would mitigate the potential impacts; project compliance with a jurisdictionally approved master drainage plan (or similar plan) or similar method acceptable to the Copermittee." (AR 2199.)

Since the hydromodification requirement in the permit is within the maximum extent practicable standard under the Clean Water Act, as the County of San Diego effectively concedes, as a matter of law it is imposed

by federal law, not state law, and is not a state mandate subject to reimbursement under article XIII B, section 6 of the California Constitution.

2. Low Impact Development and SUSMP Updates

Similar to hydromodification, the low impact development portion of the permit addresses the reduction of urban storm water runoff in land use planning for new development and significant redevelopment through low impact development strategies and updating storm water mitigation plans accordingly. (AR 269-271.) The same management practices that support the implementation of a hydromodification management plan also support the development of low impact strategies to avoid downstream erosion. Municipalities such as the County of San Diego are required to implement controls to reduce pollutants in urban runoff from new development and significant redevelopment, construction, and commercial, residential, industrial, and municipal land use activities. (40 C.F.R. § 122.26 (d)(2)(iv)(A)-(D).)

Requiring the development and updating of low impact development best management practices to reduce pollutants in storm water runoff from new development and significant redevelopment is within the maximum extent practicable standard imposed on the County of San Diego by the Clean Water Act. Such strategies confirm that best management practices are being effectively implemented in compliance with federal law.

The County of San Diego must have understood the importance of low impact development strategies because the proposed permit recommended such development and implementation. According to the proposed permit, low impact development best management practices “might be given increased emphasis in future program requirements.” (AR 2193.) “Site design and source control solutions are often more effective than many types of structural treatment for protecting water quality since design considerations eliminate the necessity of addressing

sources of pollution, rather than attempting to remove a percentage of the pollution after it has entered stormwater runoff.” (AR 2193.) In addition, the County acknowledged in its application that low impact development “controls may often be more effective than conventional structure treatment controls because maintenance is more assured (due to decreased maintenance requirement and because the maintenance is incorporated into the normal operations of a site, such as landscape maintenance).” (AR 2193)

Rather than addressing whether the permit’s low impact development best management practices and strategies exceed the federal maximum extent practicable standard, the Commission simply concluded that they did, because the requirements are not expressly stated in federal law. (AR 3873.)

3. Street Sweeping and Maintenance and Cleaning of Storm Sewer Systems

The street sweeping portion of the permit requires the implementation and monitoring of “a program to sweep improved (possessing a curb and gutter) municipal roads, streets, highways, and parking facilities” at certain times depending on the volume of litter and debris generated. (AR 284.) It generally includes identifying the distance of the street sweeping as well as the related frequency of sweeping, the total distance of curb-miles swept, the number and frequency of municipal parking lots, and the total amount of materials collected from the street and parking lot sweeping. (AR 318.)

In addition to the maximum extent practicable standard under the Clean Water Act, best management practices under federal law require dischargers to adopt plans “to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate.” (40 C.F.R. § 122.26(d)(2)(iv).) Other federal regulations also require dischargers to address activities such as

street sweeping in their permits to reduce the discharge of pollutants through storm sewer systems as follows:

- “A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities.” (40 C.F.R. § 122.26(d)(2)(iv)(A)(3).)
- “A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers.” (40 C.F.R. § 122.26(d)(2)(iv)(A)(1).)
- “A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.” (40 C.F.R. § 122.26(d)(2)(iv)(A)(6).)

If litter and debris are left to pile up on roads and parking facilities, the downstream effect is the introduction of pollutants into the storm sewer or drain systems, leading to the discharges of pollutants in the nearby waterways. Without question, street sweeping will help prevent this known source of pollutants from escaping into the water. To claim otherwise would defy common sense. Indeed, the County of San Diego agreed with the Regional Board and recommended street sweeping as a best management practice to reduce the discharge of pollutants from roads, streets, highways, and parking facilities. (AR 2229.) While the County did not identify baseline sweeping or reporting, and merely recommended street sweeping be addressed on an as-needed basis determined by the discharger, the State is not required to adopt a less stringent practicable

standard, but rather is obligated to protect the waterways to the maximum extent practicable. (AR 2229.)

The Commission did not dispute the above, but relied on its standard position that street sweeping is not a federal mandate because it is not expressly specified in federal law. (AR 3879.) As discussed above, to find a federal mandate does not require an explicit mention of every mandated activity required to comply with federal law.

The above analysis applies equally to the requirement for MS4 conveyance system cleaning and maintenance. (AR 1595.) The maintenance activities included, at a minimum, inspection and removal of waste, additional cleaning, record keeping, proper disposal of waste, and measures to eliminate waste discharge during storm sewer system maintenance and cleaning activities. (AR 1596.) Federal regulations and common sense dictate that cleaning and maintaining storm sewers on a regular basis reduces the discharge of pollutants to the nearby waterways. If not, the County of San Diego would not have recommended the continued maintenance and cleaning of these systems. (AR 2229.) And instead of addressing the maximum extent practicable standard or citing to any evidence contradicting that storm sewer maintenance and cleaning would be within the scope of this standard, the Commission summarily concluded that this requirement was not a federal mandate because it is not expressly provided for in the Clean Water Act or its implementing regulations. (AR 3880-3881.)

For these reasons, street sweeping and maintaining and cleaning storm sewer systems to reduce the discharge of pollutants through these systems to nearby waterways do not exceed the maximum extent practicable standard under the Clean Water Act. These activities are mandated by federal law and do not require state subvention.

4. Public Education About the Impact of Urban Runoff

This part of the permit generally requires an education program to increase the knowledge of certain communities regarding the impact of storm sewer urban runoff on receiving waters and potential solutions, in an effort to change the behavior of target communities and thereby to reduce pollutant releases. (AR 293-294.) Public education on the impact of urban runoff is consistent with the Clean Water Act's maximum extent practicable standard. (33 U.S.C. § 1342(p)(3)(B); 40 C.F.R. § 122.26(d)(2)(iv).) Indeed, education and knowledge about urban runoff and its effect on water quality go a long way in preventing pollutants from entering the MS4s and ultimately the nation's waterways.

Federal regulations provide for management practices to educate the public on the impact of urban runoff on water quality and generally include "educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials" (40 C.F.R. § 122.26(d)(2)(iv)(A)(6)), "educational programs to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers" (*id.* § 122.26(d)(2)(iv)(A)(5)), and "educational and training measures for construction site operators" (*id.* § 122.26(d)(2)(iv)(D)(4)).

The County of San Diego cannot reasonably dispute that the education component is within the maximum extent practicable standard because their proposed permit itself addressed public education. Consistent with the permit that was issued, the County proposed the education of target communities regarding the impact of MS4 on receiving waters and potential best management practices, and changing the behavior of target communities to reduce pollutant releases to these systems and the

environment. (AR 1602.) The proposal went on to make additional recommendations such as focusing education on the highest priorities, ensuring the most efficient use of educational resources, measuring progress and effectiveness, regional education program planning, and requirements to educate quasi-governmental entities. (AR 2261-2273.)

The Commission did not attempt to reconcile the education component in the permit with the maximum extent practicable standard. It simply concluded that the education requirements are not expressly stated in federal law and thus must be a state mandate. (AR 3885.) Once again, this flawed analysis is too narrow and fails to understand the requirements of the Clean Water Act or to defer to the Regional Board's expertise in applying the same.

**5. Watershed Urban Runoff Management Program
and Regional Urban Runoff Management
Program**

The Watershed Urban Runoff Management Program part of the permit divides the Copermittees into nine management areas by "major receiving bodies" and requires them "to develop and implement an updated Watershed Urban Runoff Management Program for each watershed." (AR 296-297.) Specifically, each program must reduce the discharge of pollutants from the storm sewer systems to the maximum extent practicable standard under the Clean Water Act. (AR 297.) The specific programs should include elements such as lead watershed permittee identification, watershed map, watershed water quality assessment, watershed-based land use planning, watershed strategy, watershed activities, Copermittee collaboration, public participation, and review and updates of the programs. (AR 297-300.)

Permits can be issued either separately or on a system-wide, jurisdiction-wide, watershed or other basis. (40 C.F.R. § 122.26(a)(3)(ii).) Permits "may specify different conditions relating to different discharges

covered by the permit, including different management programs for different drainage areas which contribute storm water to the system.” (40 C.F.R. § 122.26(a)(3)(v).) “Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls.” (40 C.F.R. § 122.26(d)(2)(iv).)

Because the watershed-based management program is based on federal law and within the maximum extent practicable standard to reduce the discharge of pollutants through MS4s, the County of San Diego agreed that such a program should be part of the permit. (AR 2161-2181.) The County made recommendations related to watershed permitting approach, identification of watershed water quality assessment data, identification of priority watershed pollutants and issues, identification of known pollutant sources, watershed coordination, and identification of watershed activities and education activities. (AR 2161-2181.)

Similar to the watershed-based program, the Regional Urban Runoff Management Program part of the permit requiring Copermittees “to develop, implement, and update as necessary a Regional Urban Management Program” is also within the scope of the maximum extent practicable standard and its implementing regulations. (AR 300.) The program must reduce the discharge of pollutants from the storm sewers to the maximum extent practicable standard and prevent urban runoff discharges from these systems from causing or contributing to a violation of water quality standards. (AR 300.) At a minimum, the program must address the development and implementation of a Regional Residential Education Program, which includes pollutant-specific education, development of a standard fiscal analysis for the educational program, and the assessment of the effectiveness of jurisdictional, watershed, and regional programs. (AR 300.)

The County of San Diego's permit proposal focused on an educational aspect and identified residential sources of pollution as their highest regional priority, and public education as the most important component of their program. (AR 2255.) The proposal recommends that efforts "must also be expended on better defining the links between residential activities and water quality and if necessary, development of alternative strategies to better address these sources of residential pollution." (AR 2255.)

As mentioned throughout this Brief, it is of no consequence that the watershed and regional residential programs are not expressly provided for in federal law or that the requirements go beyond the specific activities proposed by the County of San Diego. The maximum extent practicable standard is a flexible standard. The Regional Board had the discretion to determine that the programs are within the standard, and the Commission had no basis to conclude otherwise simply because the requirements are not spelled out in a federal statute or regulation. (AR 3896, 3902, 3904.) Thus, the watershed and regional education programs are required by federal law and are not a state mandate subject to reimbursement.

6. Program Effectiveness Assessment

This part of the permit requires each Copermittee to annually assess the effectiveness of the above jurisdictional, watershed, and regional urban runoff programs, and there are specific assessment requirements for each program. (AR 302-306.) Additionally, the permit requires that "[e]ach Copermittee shall collaborate with the other Copermittees to develop a Long Term Effectiveness Assessment (LTEA), which shall build on the results of the Copermittees' August 2005 Baseline LTEA." (AR 307.) The LTEA should be designed to meet many specified objectives related to the jurisdictional, watershed, and regional effectiveness assessments. (AR 307.)

The maximum extent practicable standard in the Clean Water Act and its implementing regulations require dischargers like the County of San

Diego to assess the effectiveness of their water quality programs. A proposed management program must be comprehensive “to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate.” (40 C.F.R. § 122.26(d)(2)(v).) And Copermittees must estimate “reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.” (40 C.F.R. § 122.26(d)(2)(iv).)

It would make little sense for federal law to require water quality management programs to assess their effectiveness through best management practices, but then to exclude the assessment of the effectiveness of these programs on either a short-term or long-term basis. As such, the County of San Diego recommended the continued short-term and long-term effectiveness assessment of jurisdictional, watershed, and regional urban runoff programs. (AR 2312, 2323-2325.)

The Commission agreed that effectiveness assessments are part of federal law but did not agree with the “details” in the permit, concluding once again that if the permit requirements are not expressly provided for in federal law, they are state mandates. (AR 3907.) This conclusion is wrong; the permit requirements are federal mandates and not subject to state subvention.

7. Collaboration Among Copermittees

This part of the permit requires Copermittees to collaborate to “address common issues, promote consistency among Jurisdictional Urban Runoff Management Programs and Watershed Urban Runoff Management Programs, and to plan and coordinate activities required under this Order.”

(AR 325.) This includes developing a Memorandum of Understanding that defines Copermittees' responsibilities, establishes a management structure and standards for conducting meetings, provides guidelines for work groups, lays out the process for non-compliance issues, and includes all other collaborative agreements for compliance with the permit. (AR 326.)

Federal law requires "control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system." (40 C.F.R. § 122.26(d)(2)(i)(D).) The Copermittees have been collaborating and working together under a memorandum of understanding since at least the time the 2001 NPDES permit was issued. (AR 1614.) And consistent with the 2001 NPDES permit, the County of San Diego in its permit proposal recommended the continued collaboration among the Copermittees and listed the following general areas of recommended Copermittee collaboration: water quality assessment, source identification and prioritization, establishment of program requirements (BMPs and discharge prohibitions), strategies for program implementation, and reporting and assessment. (AR 2157.) It also recommended the continued use of a memorandum of understanding and the formal establishment of subcommittees and working bodies to address budget and fiscal issues, data collection, management, and analysis, regional watershed activities, and source management programs. (AR 2157.)

This collaborative approach to managing and addressing common water quality issues falls squarely within the maximum extent practicable standard in the Clean Water Act, to prevent the discharge of pollutants through MS4 to nearby waterways. But despite this continued agreed-upon practice to implement federal law, the Commission still found a state mandate because the specific contents of the memorandum of understanding are not expressly provided for in federal law. (AR 3918.)

This is an incorrect application of federal law. The permit requirements are not state mandates.

VI. THERE IS NO EVIDENCE IN THE ADMINISTRATIVE RECORD THAT THE CHALLENGED PERMIT REQUIREMENTS GO BEYOND FEDERAL LAW.

The County of San Diego claims that certain evidence in the administrative record relied on by the Commission shows that the challenged permit requirements exceed federal law and are state mandates. (See AB pp. 54-59.) However, as discussed above, the Commission did not make any factual findings. It merely concluded as a matter of law that the specific permit requirements were not expressly provided for in federal law and thus were not federal mandates. In any event, the evidence does not show or even suggest that the specific permit requirements exceed federal law.

A. Street Sweeping

While the County of San Diego alleges that the street sweeping permit requirement exceeds the maximum extent practicable standard, the County does not explain its position. The County simply cites to eight documents in the administrative record in ostensibly support of its claim. (See AB pp. 54-55.) A cursory review of these documents is sufficient to conclude that they do not support the County's view of this permit requirement.

- Declaration of James P. Lough in Support of Test Claim (AR 945-1011.)

This document is self-explanatory, a declaration from counsel for the County of San Diego. The opinions and arguments of counsel are not evidence and should be disregarded.

- NPDES Permits for the City of Atlanta, Georgia, (AR 1125-1139); the District of Columbia (AR 2608-2658); Albuquerque, New Mexico, (AR 2659-2725); and Worcester, Massachusetts, draft permit, (AR 2727-2802.)

Although not stated, the County of San Diego seems to offer these permits as evidence that the street sweeping requirement in the permit exceeds federal law because the requirement is not found in U.S. EPA-issued permits or other state-issued permits. But NPDES permits “evolve and mature over time” and must be flexible to reflect changing conditions that result from program development and implementation and corresponding improvements in water quality.” (55 Fed.Reg. 47990, 48052; see also *In re City of Irving* (July 16, 2001) 10 E.A.D. 111 at *6; OCF IV, pp. 972-984.) Under federal law, each NPDES permit must be tailored to the unique characteristics of the surrounding waterways and communities. Thus, there is no reason to expect requirements in one permit would be the same as requirements in other permits unless of course the surrounding circumstances were identical. As U.S. EPA stated when establishing the municipal storm water permitting regulations: “The language of [Clean Water Act] section 402(p)(3) contemplates that, because of the fundamentally different characteristics of many municipalities, municipalities will have permits tailored to meet particular geographical, hydrological, and climatic conditions.” (55 Fed.Reg. 47990, 48053. (Nov. 16, 1990).)

Water quality issues in southern California cannot realistically be assumed to be the same or similar to water quality issues in Atlanta, the District of Columbia, Albuquerque, or Worcester. Thus, it is of no consequence that U.S. EPA issued permits or other state-issued permits in such diverse parts of the country do not include a specific requirement regarding street sweeping matching the County of San Diego’s. The only relevant considerations are the best management practices that implement

the maximum extent practicable standard for the County of San Diego's discharges through its storm systems.

- Excerpt from the U.S. EPA's MS4 Program Evaluation Guide (AR 1939.)

Contrary to the County of San Diego's suggestion, this part of the Guide supports treating the street sweeping permit condition at issue as a federal mandate. It states that permits "should address and include various practices for operating and maintaining public streets, roads, and highways that reduce the impact of receiving waters of discharges from municipal storm sewer systems. These practices should include regular street sweeping and proper use of BMPs during street Maintenance activities." (AR 1939.) The street sweeping requirement falls well within this federal guidance.

- Comparison of the 2001 permit to the then-existing permit (AR 2575-2606.)

This document compares the 2001 permit to the permit requirements in its predecessor permit. Presumably, it is used by the County to show that new permit requirements, by virtue of being "new," always exceed the maximum extent practicable standard. Once again, the County of San Diego seems to misunderstand the NPDES program and the Clean Water Act. When an NPDES permit is renewed, reissued, or modified, it generally must be at least as stringent as the prior permit. (33 U.S.C. § 1342 (o); 40 C.F.R. 122.44(l).) This is consistent with Congress' intent that state management programs evolve based on changing conditions from program development and implementation and corresponding improvements in water quality. (55 Fed.Reg. 48052 (Nov. 16, 1990).) The U.S. EPA "anticipates that storm water management programs will evolve and mature over time. The permits for discharges from municipal separate storm sewer systems will be written to reflect changing conditions that

result from program development and implementation and corresponding improvements in water quality.” (*Ibid.*) Thus, federal law anticipates that permit requirements will change over time and become more stringent. A new requirement in a permit does not alone mean (or even suggest) that the requirement is beyond the maximum extent practicable standard in federal law.

In any event, this document is not relevant to the challenged permit requirements in the 2007 permit. It concerns the 2001 permit and permit requirements in its predecessor permit.

- Commission’s Statement of Decision (AR 3877-3878.)

The County of San Diego, similar to the Commission, concludes that the street sweeping requirement goes beyond federal law because it is not specifically required under the Clean Water Act or its implementing regulations. As explained in this Brief in detail, the Clean Water Act’s NPDES permit system requires states to develop standards based on the unique conditions of particular waterways. Thus, the maximum extent practicable standard is necessarily flexible, rather than a one-size-fits-all standard. (*Building Industry Ass’n of San Diego County, supra*, 124 Cal.App.4th at p. 874.)

B. Other Challenged Permit Requirements

The County of San Diego identifies certain documents in the record as ostensible evidence that the remaining permit requirements exceed the maximum extent practicable standard. (OB 55-58.) None of the purported documents support any conclusion that the permit is a state mandate. The majority of the referenced documents are simply additional citations to the documents identified above concerning the street sweeping requirement. The respondents will not repeat the above discussion here and will only discuss the additional documentation, organized here with respect to each permit requirement.

- Storm Drain Cleaning and Maintenance and Regional Urban Runoff Management Program

There are no additional documents referenced for these requirements.

- Educational Component

The County of San Diego references an excerpt from the U.S. EPA's MS4 Program Evaluation Guide. (AR 1927.) As with the street sweeping requirement, this part of the Guide supports public education and participation as an important component of the municipal storm water permit program. (AR 1927.)

- Watershed Activities and Collaboration, Program Effectiveness Assessment, Long Term Effectiveness Assessment, and All Permittee Collaboration

The County of San Diego references an excerpt from the U.S. EPA's MS4 Program Evaluation Guide. (AR 1903.) This part of the Guide supports including comprehensive stormwater management planning, assessment, and collaboration as part of a municipal storm water permit. (AR 1903.)

- Hydromodification Management Plan and Low Impact Development

Again, the County of San Diego references an excerpt from the U.S. EPA's MS4 Program Evaluation Guide. (AR 1985.) As above, this part of the Guide supports the development and implementation of controls in a municipal storm water permit to address downstream erosion. (AR 1985.) The County also references an administrative statement of decision from a Washington case but does not explain why it is relevant. (AR 2389-2346.)

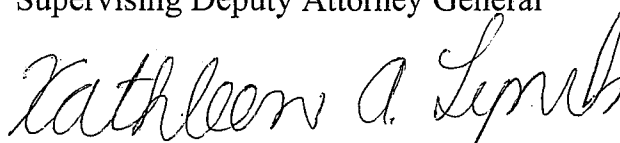

CONCLUSION

The trial court properly found that the permit is not a state mandate, because California must implement the federal NPDES program. The court also correctly found that the Commission failed to analyze the Clean Water

Act's maximum extent practicable standard, and remanded the matter back to the Commission for further consideration. Accordingly, the lower court's decision should be affirmed.

1 INTRODUCTION

2 This case is about the Commission on State Mandates treating a mandatory federal
3 pollutant discharge requirement under the Clean Water Act as a state mandate simply because the
4 state administers the Act. The Commission’s decision is contrary to California law prohibiting
5 state subvention for federal mandates and should be reversed.

6 The Clean Water Act prohibits real parties in interest County of San Diego and several
7 cities named in the petition (referred to below collectively as the “County of San Diego”) from
8 discharging pollutants from their municipal storm sewer systems into nearby waterways unless
9 they do so under a permit issued in compliance with the National Pollutant Discharge Elimination
10 System (NPDES). The Clean Water Act requires the County of San Diego’s NPDES permit to
11 reduce the discharge of pollutants from its storm drains to the *maximum extent practicable*.
12 Under article XIII B, section 6, of the California Constitution, the only way this federal standard
13 could constitute a state mandate would be if the state *voluntarily elected* to require local agencies
14 to implement state obligations under the Clean Water Act, or if the state took action to *exceed* the
15 Act’s “maximum extent practicable” standard. Neither occurred here.

16 Since 1973, the state¹ has administered the Clean Water Act’s NPDES program in
17 California, so it was the state that issued the NPDES permit to the County of San Diego.
18 However, with or without state action, the County of San Diego had no choice but to comply with
19 the Clean Water Act, and its maximum extent practicable standard, and the state added nothing to
20 the County of San Diego’s burdens. As such, the state had little practical choice but to implement
21 the Clean Water Act in lieu of direct regulation from the federal government.

22 The permit as a whole, including the more particular requirements challenged in this
23 litigation, merely applied the federal standard. While the Commission may be an expert in state
24 mandates, it has no expertise in the field of water law. The Commission erroneously failed to
25 defer to the San Diego Regional Water Quality Control Board’s (“Regional Board”)

26 _____
27 ¹ “State” refers collectively to the State Water Resources Control Board and the San
28 Diego Regional Water Quality Control Board, and “petitioners” refers to the two Boards as well
as the State of California Department of Finance.

1 implementation of federal water quality law. More specifically, the Commission failed to defer to
2 the Regional Board's determination that the permit as a whole and the more particular permit
3 requirements implement the Clean Water Act's maximum extent practicable standard.

4 Consequently, petitioners ask the court to reverse the Commission's findings of state mandates.

5 Further, because the federal maximum extent practicable standard and the specific permit
6 requirements are not new, there is no new program or higher level of service. The Commission's
7 decision to the contrary should be reversed as well.

8 Finally, even if this court were to find that the permit requirements are state mandates, they
9 are still not subject to reimbursement under article XIII B, section 6. Reimbursement is not
10 required where the local agency may impose fees to cover its costs, instead of raising taxes. The
11 County of San Diego has the necessary fee authority to impose fees for the permit requirements,
12 and the Commission's finding to the contrary should be reversed.

13 BACKGROUND

14 I. FEDERAL REQUIREMENTS FOR STORM WATER PERMITS

15 A. Federal Nature of NPDES Permits

16 In a "dramatic response to accelerating environmental degradation of rivers, lakes and
17 streams in this country," Congress passed the Clean Water Act in 1972 to eliminate the discharge
18 of pollution into the nation's waters by 1985. (33 U.S.C. § 1251, et. seq.; *Natural Resources*
19 *Defense Council, Inc. v. Costle* (D.C. Cir. 1977) 568 F.2d 1369, 1371.) The Clean Water Act
20 seeks to "restore and maintain the chemical, physical, and biological integrity of the Nation's
21 waters." (33 U.S.C. § 1251(a).) It prohibits the discharge of pollutants from "point sources" to
22 waters of the United States unless provided for under an NPDES permit.² (33 U.S.C. §§ 1311,
23 1342; see also *Communities for a Better Environment v. State Water Resources Control Bd.* (2003)
24 109 Cal.App.4th 1089, 1092-1093.)

25 ² "The term 'point source' means any discernible, confined and discrete conveyance,
26 including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure,
27 container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft,
28 form which pollutants are or may be discharged. This term does not include agricultural
stormwater dischargers and return from irrigated agriculture." (33 U.S.C. § 1362(14).)

1 Either the United States Environmental Protection Agency (U.S. EPA) or a U.S. EPA-
2 approved state may issue NPDES permits. (33 U.S.C. § 1342(a)(1) & (b).) Congress concluded
3 that the U.S. EPA could issues permits for all dischargers and translate the Clean Water Act's
4 requirements into the conditions of individual permits for individual dischargers, but states may
5 elect to take on that federal responsibility. (*Environmental Protection Agency v. California ex rel.*
6 *State Water Resources Control Bd.* (1976) 426 U.S. 200, 219.) California has the U.S. EPA's
7 approval to issue NPDES permits, as do 45 other states.³ (*Building Industry Ass'n of San Diego*
8 *County v. State Water Resources Control Bd.* (2004) 124 Cal.App.4th 866, 875.)

9 If a state elects to issue NPDES permits, it must ensure that the permits comply with many
10 federal requirements, including effluent limitations, national standards of performance, and toxic
11 and pretreatment effluent standards. (33 U.S.C. §§ 1342(b)(1), 1311, 1312, 1316, 1317.) States
12 must also provide for the continued inspection and monitoring of pollutants into our nation's
13 waters. (33 U.S.C. § 1342(b)(2)(B).) NPDES permit requirements, including those that
14 implement state water quality standards, may be enforced as a matter of federal law by either the
15 U.S. EPA or private citizens. (33 U.S.C. §§ 1319(a)(1), (3), 1365(a)(1).)

16 To ensure that state-authorized programs comply with the U.S. EPA's mandates and federal
17 law, the U.S. EPA maintains oversight and supervision of these programs. The state must provide
18 the U.S. EPA with proposed permits and notice of any action related to a discharger's permit
19 application. (33 U.S.C. § 1342(d)(1).) The U.S. EPA may object to a permit, finding that it
20 violates the Clean Water Act's guidelines and requirements. (*Id.*, § 1342(d)(2).) Should the U.S.
21 EPA determine that a state program does not comply with federal NPDES program guidelines, it
22 may withdraw approval for the state program. (*Id.*, § 1342(c)(3).)

23 When an NPDES permit is renewed, reissued or modified, it generally must be at least as
24 stringent as the prior permit. (33 U.S.C. § 1342(o); 40 C.F.R. 122.44(l).) This is consistent with
25 Congress' intent that state management programs evolve based on changing conditions from
26

27 ³ The list of states with the U.S. EPA approval to issue NPDES permits can be found at
28 http://cfpub1.epa.gov/npdes/statestats.cfm?program_id=12

1 program development and implementation and corresponding improvements in water quality.
2 (55 Fed.Reg. 47990, 48052.)

3 **B. State Required Compliance with Federal Law With Respect to Municipal**
4 **Separate Storm Sewer Systems.**

5 While many types of discharges require NPDES permits under the Clean Water Act, this
6 case is very specific, pertaining to the discharge of pollutants through municipal separate storm
7 sewer systems (referred to as either “MS4” or storm sewer systems).

8 Controlling municipal urban storm water runoff is important, because it is one of the most
9 significant sources of water pollution in the nation. (*Environmental Defense Center, Inc. v. EPA*
10 (9th Cir. 2003) 344 F.3d 832, 840.) It carries “suspended metals, sediments, algae-promoting
11 nutrients (nitrogen and phosphorus), floatable trash, used motor oil, raw sewage, pesticides, and
12 other toxic contaminants into streams, rivers, lakes, and estuaries across the United States.” (*Id.*
13 at pp. 840-841.) “Among the sources of stormwater contamination are urban development,
14 industrial facilities, construction sites, and illicit discharges and connections to storm sewer
15 systems.” (*Id.* at p. 841.)

16 The Clean Water Act requires dischargers such as the County of San Diego “to reduce the
17 discharge of pollutants to the *maximum extent practicable*, including management practices,
18 control techniques and system, design and engineering methods, and such other provisions as the
19 Administrator or the State determines appropriate for the control of such pollutants.”
20 (33 U.S.C. § 1342(p)(3)(B), emphasis added.) Congress established this flexible maximum extent
21 practicable standard so that administrative bodies would have “the tools to meet the fundamental
22 goals of the Clean Water Act in the context of storm water pollution.” (*Building Industry Ass'n of*
23 *San Diego County, supra*, 124 Cal.App.4th at p. 884.)

24 The maximum extent practicable standard is one of the Clean Water Act’s technology-
25 forcing requirements designed to foster innovation. (See, e.g., *Chemical Mfrs. Ass'n v. Natural*
26 *Resources Defense Council, Inc.* (1985) 470 U.S. 116, 155-56 [discussing technology-forcing
27 aspects of the Clean Water Act].) Unlike many other technology-based requirements, though, the
28 U.S. EPA articulated that permit writers would identify the municipal storm water requirements

1 on a permit-by-permit basis. (*Natural Resources Defense Council, Inc. v. U.S. E.P.A.* (9th Cir.
2 1992) 966 F.2d 1292, 1308, n. 17; see also, 55 Fed.Reg. 47990, 48043 (Nov. 16, 1990).) To
3 implement this maximum extent practicable standard, municipal storm water permits usually
4 require “best management practices” that reflect the technology-based effluent limitation. (See
5 *Natural Resources Defense Council, supra*, 568 F.2d at p. 1380; Administrative Record (“AR”)
6 340.) Federal law defines these practices to mean, in part, “schedules of activities, prohibitions of
7 practices, maintenance procedures, and other management practices to prevent or reduce the
8 pollution of ‘waters of the United States.’” (40 C.F.R. § 122.2.)

9 In order to legally discharge pollutants from point sources under an NPDES permit, entities,
10 both public and private, must file an application with the permitting authority.
11 (33 U.S.C. § 1342(B)(3).) The U.S. EPA regulations specify the information that applicants for
12 MS4 permits must include in their applications. (40 C.F.R. § 122.26(a)(4).) This application is
13 extensive and represents the applicant’s view of the required NPDES permit. (*Id.*,
14 § 122.26(d)(2)(iv).) Relevant to our case, federal regulations require that an application, and
15 ultimately the permit itself, address management programs to reduce the discharge of pollutants
16 using the maximum extent practicable standard (*id.*, § 122.26(d)(2)(iv)) and includes procedures
17 to control pollution resulting from development and significant redevelopment, construction, and
18 commercial, residential, industrial, and municipal land use activities; (*id.*, § 122.26 (d)(2)(iv)(A)-
19 (D)); to address the operation and maintenance of public streets, roads, highways, and parking
20 facilities as well as MS4s (*id.*, § 122.26(d)(2)(iv)(A)(1)(3)(6)); to educate the public on the danger
21 of urban runoff to our nation’s waters and changing behavior to reduce pollutant releases to the
22 environment (*id.*, § 122.26(d)(2)(iv)(A)(5)(6),(D)(4)); and to address water quality and the
23 discharge of pollutants through MS4s on system-wide, jurisdictional-wide, and watershed, or
24 other basis, and through interagency agreements (*id.*, § 122.26(a)(3)(ii), (d)(2)(i)(D), (iv)).

25 The U.S. EPA has also issued guidance documents that discuss the types of best
26 management practices that must be included in municipal storm water permits in order to reduce
27 the discharge of pollutants in storm water to the “maximum extent practicable.” At the time that
28 the subject test claims were considered by the Commission, the U.S. EPA had issued an MS4

1 Program Evaluation Guide, which addresses inspections of businesses and litter related issues.
2 (AR 1853-2058.) Most recently, in April of 2010, the U.S. EPA issued an updated guide, MS4
3 Permit Improvement Guide, that also provides guidance to federal and state permit writers on the
4 requirements for permitting discharges from municipal storm sewer systems under an NPDES
5 permit.⁴

6 **II. CALIFORNIA'S ROLE IN IMPLEMENTING FEDERAL REQUIREMENTS FOR STORM** 7 **WATER PERMITS**

8 “[O]n May 14, 1973, California became the first state to be approved by the EPA to
9 administer the NPDES permit program.” (*County Sanitation Dist. No. 2 of Los Angeles County v.*
10 *County of Kern* (2005) 127 Cal.App.4th 1544, 1565-1566.)⁵ The Legislature amended the Porter-
11 Cologne Water Quality Control Act (Porter-Cologne Act) by adding Chapter 5.5 to implement
12 federal law in order to avoid direct regulation by the federal government. (Wat. Code, § 13370;
13 see generally Wat. Code, §§ 13370-13389.) Specifically, the legislative findings and declarations
14 state, in relevant part:

15 It is in the interest of the people of the state, in order to avoid direct regulation by the
16 federal government of persons already subject to regulation under state law pursuant
17 to this division, to enact this chapter in order to authorize the state *to implement the*
18 *provisions of the Federal Water Pollution Control Act* [Clean Water Act] and acts
19 amendatory thereof or supplementary thereto, and federal regulations and guidelines
issued pursuant thereto, provided, that the state board shall request federal funding
under the Federal Water Pollution Control Act for the purpose of carrying out its
responsibilities under this program.

20 (Wat. Code, § 13370, subd. (c), emphasis added.)

21 Additionally, the Porter-Cologne Act mandates that California's NPDES permit program be
22 consistent with federal law. (Wat. Code, § 13372.) Section 2235.2 of title 23 of the California
23 Code of Regulations implements the Act stating that “[w]aste discharge requirements for
24 discharge from point sources to navigable waters shall be issued and administered in accordance
25 with the currently *applicable federal regulations for the National Pollutant Discharge*

26 ⁴ The Guide is available at www.epa.gov/npdes/pubs/ms4permit_improvement_guide.pdf.

27 ⁵ Nine regional boards administer the program, overseen by the State Water Resources
28 Control Board. (Wat. Code, §§ 13140, 13200, et. seq.)

1 *Elimination System (NPDES) program.*” (Emphasis added.) While the federal Clean Water Act
2 allows a state to establish more stringent requirements (33 U.S.C. § 1370) and nothing in the
3 Porter-Cologne Act precludes the state from establishing more stringent requirements (*City of*
4 *Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 627), this case does not
5 involve more stringent requirements than federal law. As explained in detail above, there are
6 numerous federal requirements that the state must comply with in issuing NPDES permits or risk
7 the U.S. EPA taking over California’s NPDES program. Among the federal requirements is the
8 mandate that NPDES permits for municipal storm sewers “require controls to reduce the
9 discharge of pollutants to the maximum extent practicable.” (33 U.S.C. § 1342(p)(3)(B)(iii).)

10 **III. NPDES PERMIT NUMBER CAS0108758, REGIONAL BOARD ORDER NUMBER R9-**
11 **2007-0001; 2001 NPDES PERMIT, REGIONAL BOARD ORDER NO. 2001-01; AND**
12 **COUNTY OF SAN DIEGO’S APPLICATION TO REISSUE PERMIT.**

13 Starting in 1990 and pursuant to the Clean Water Act amendments of 1987, the permitting
14 agency, the Regional Board, issued municipal storm water permits to the County of San Diego.
15 Prior to the Clean Water Act amendments of 1987 and the U.S. EPA’s issuance of regulations to
16 implement those amendments, the Regional Board did not regulate the County’s storm water
17 discharges under either state or federal law. The order that is the subject of this litigation is the
18 third, Regional Order No. R9-2007-0001, NPDES permit number CAS0108758, and was adopted
19 on January 24, 2007. (AR 251-369, 1191.)

20 Before the permit was reissued, and pursuant to federal law, the County of San Diego
21 submitted a permit application to the Regional Board on August 25, 2005. (33 U.S.C.
22 §1342(b)(2)(B)(3); 40 C.F.R. §§ 122.26(a)(4) [requiring initial application], 122.21(d)(2) [duty to
23 reapply 180 days before prior NPDES permit expired].) This application is entitled “Report of
24 Waste Discharge (ROWD)” and represents the County of San Diego’s proposals for best
25 management practices (sometimes referred to as “BMPs”) that would ultimately be required in
26 the NPDES permit. (AR 2101-2367.) The permit that was adopted was based on the ROWD and
27 the previous 2001 NPDES permit⁶ issued to the County of San Diego, with some revisions and

28 ⁶ The current NPDES permit, order number R9-2007-001, and the previous NPDES
permit, order number 2001-01, have the same NPDES permit number CAS0108758. Thus,
(continued...)

1 additions necessary to meet minimum federal requirements.⁷ (AR 2101-2102.) Because the
2 permit, the 2001 NPDES permit, and the ROWD are voluminous, stating the conditions
3 necessitating the permit and applying the mandatory federal requirements, we have summarized
4 the relevant provisions below. For readability and a better understanding of the overlap between
5 the specific permit requirements, the 2001 NPDES permit, and the County of San Diego's
6 ROWD, we have grouped the related discussion in all three documents by permit activity or
7 claimed state mandate.

8 **A. General Provisions**

9 Before summarizing the portions of the permit that pertain to the claimed state mandates,
10 there are some general provisions relating to the Clean Water Act's maximum extent practicable
11 standard that are worth noting. First and foremost, the permit as a whole is designed to comply
12 with the maximum extent practicable standard. The permit states:

13 *This Order specifies requirements necessary for the Copermittees to reduce the*
14 *discharge of pollutants in urban runoff to the maximum extent practicable (MEP).*
15 *However, since MEP is a dynamic performance standard which evolves over time as*
16 *urban runoff management knowledge increases, the Copermittees' urban runoff*
17 *management programs must continually be assessed and modified to incorporate*
18 *improved programs, control measures, best management practices (BMPs), etc. in*
order to achieve the evolving MEP standard. Absent evidence to the contrary, this
continual assessment, revision, and improvement of urban runoff management
program implementation is expected to ultimately achieve compliance with water
quality standards.

19 (AR 255, emphasis added.)

20 Second, the maximum extent practicable standard was established by the Clean Water Act
21 and requires dischargers like the County of San Diego to comply with this standard when

22 (...continued)

23 petitioners will refer to order number 2001-01 as the "2001 NPDES permit." The 2001 NPDES
24 permit was administratively appealed to the State Water Board and then challenged in the
25 Superior Court and Court of Appeal. The Fourth Appellate District found in favor of the
26 Regional Board, upholding all requirements in the permit. The Supreme Court denied review of
27 the matter. (See *Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th 866.)

28 ⁷The County of San Diego challenged order number R9-2007-001 by seeking
administrative review by the State Water Board. The Board dismissed the challenge and no
lawsuit was subsequently filed challenging the permit. The permit remains in effect and is no
longer subject to legal challenge. (AR 1192; see Wat. Code, § 13330, subd. (d) [renumbered
from subdivision (c), but otherwise unchanged from the applicable law at the time the Regional
Board adopted the permit (Stats. 2010, ch. 288, § 31)].)

1 discharging through MS4s. The permit explains the purpose of the maximum extent practicable
2 standard and its mandatory use by the County of San Diego as follows:

3 **Maximum Extent Practicable (MEP)** — The technology-based standard established
4 by Congress in CWA section 402(p)(3)(B)(iii) that operators of MS4s must meet.
5 Technology-based standards establish the level of pollutant reductions that
6 dischargers must achieve, typically by treatment or by a combination of source
7 control and treatment control BMPs. MEP generally emphasizes pollution prevention
8 and source control BMPs primarily (as the first line of defense) in combination with
9 treatment methods serving as a backup (additional line of defense). MEP considers
10 economics and is generally, but not necessarily, less stringent than BAT.⁸ A
11 definition for MEP is not provided either in the statute or in the regulations. Instead
12 the definition of MEP is dynamic and will be defined by the following process over
13 time: municipalities propose their definition of MEP by way of their urban runoff
14 management programs. Their collective and individual activities conducted pursuant
15 to the urban runoff management programs becomes their proposal for MEP as it
16 applies both to their overall effort, as well as to specific activities (e.g., MEP for
17 street sweeping, or MEP for MS4 maintenance). In the absence of a proposal
18 acceptable to the Regional Board, the Regional Board defines MEP.

12 (AR 343-345.)

13 This explanation of the maximum extent practicable standard was also part of the 2001
14 NPDES permit. (AR 1641.)

15 Third, the permit defines best management practices consistent with federal law as follows:

16 **Best Management Practices (BMPs)** — Defined in 40 CFR 122.2 as schedules of
17 activities, prohibitions of practices, maintenance procedures, and other management
18 practices to prevent or reduce the pollution of waters of the United States. BMPs also
19 include treatment requirements, operating procedures and practices to control plant
20 site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material
21 storage. In the case of municipal storm water permits, BMPs are typically used in
22 place of numeric effluent limits.

20 (AR 340.)

21 As with the maximum extent practicable standard above, the explanation of best
22 management practices was also in the 2001 NPDES permit. (AR 1641.)

23 **B. Jurisdictional Urban Runoff Management Program and Related Reporting**

24 Part D of the permit, Jurisdictional Urban Runoff Management Program, generally relates
25 to each Copermittee's duty to manage and report urban runoff in its specific jurisdiction to
26

27 ⁸ "BAT" is an acronym for best available technology that was established by Congress in
28 title 33, section 1311 and made application to industrial dischargers of storm water through
section 1342(p)(3)(a).

1 “reduce the discharge of pollutants from the MS4 to the MEP, and prevent urban runoff
2 discharges from the MS4 from causing or contributing to a violation of water quality standards.”
3 (AR 265.) While Part D imposes numerous duties on the County of San Diego to comply with
4 the maximum extent practicable standard under the Clean Water Act, the County of San Diego
5 has limited its state mandate claims to certain permit requirements: hydromodification
6 management plan, low-impact development in local management plans, street sweeping and
7 conveyance system cleaning and related reporting, and educational surveys and tests. (AR 3863.)

8 **1. Hydromodification Management Plan (Decrease Erosion From MS4**
9 **Discharges) for New Development and Redevelopment**

10 Part D.1, of the permit, Development Planning Component, requires each Copermittee to
11 implement a program in its jurisdiction that “(1) reduces Development Project discharges of
12 pollutants from the MS4 to the MEP, (2) prevents Development Project discharges from the MS4
13 from causing or contributing to a violation of water quality standards, and (3) manages increases
14 in runoff discharge rates and durations from Development Projects that are likely to cause
15 increased erosion of stream, beds and banks, silt pollutant generation, or other impacts to
16 beneficial users and stream habitat due to increased erosive force.”⁹ (AR 266)

17 Section g of Part D.1, Hydromodification, Limitations on Increases of Runoff Discharge
18 Rates and Durations, requires the Copermittees to collaborate with each other to “develop and
19 implement a Hydromodification Management Plan (HMP) to manage increases in runoff
20 discharge rates and durations from all Priority Development Projects, where such increased rates
21 and durations are likely to cause increased erosion of channel beds and banks, sediment pollutant
22 generation, or other impacts to beneficial uses and stream habitat due to increased erosive
23 force.”¹⁰ (AR 275-276.) Hydromodification is defined in the permit to mean, in part, the “change

24 ⁹ “Development Projects” is defined in the permit as “[n]ew development or
25 redevelopment with land disturbing activities; structural development, including construction or
26 installation of a building or structure, the creation of impervious surfaces, public agency projects,
27 and land subdivision.” (AR 341.)

26 ¹⁰ “Priority Development Projects” is defined in the permit as “[n]ew development and
27 redevelopment project categories listed in Section D.1.d(2) of Order No. R9-2007-001” and
28 include certain housing subdivisions; commercial, industry, and hillside development; automotive
repair shops; restaurants; environmentally sensitive areas; parking lots; streets, roads, highways,
(continued...)

1 in the natural watershed hydrologic processes and runoff characteristics (i.e., interception,
2 infiltration, overland flow and ground water flow) caused by urbanization or other land use
3 changes that result in increased stream flows and sediment transport.” (AR 343.) The specific
4 permit requirements are found on pages 275 through 278 of the administrative record.

5 Part D.1.g, 4 requires the Copermittees to “collaborate on HMP development as required in
6 section J.2.a of this Order.” (AR 277, 314-315.)

7 The 2001 NPDES permit does not speak explicitly in terms of hydromodification, but it
8 does address downstream erosion. Section F.1.b(2)(j) of the 2001 NPDES permit requires the
9 Copermittees to “develop criteria to ensure that discharges from new development and significant
10 redevelopment maintain or reduce pre-development downstream erosion and protect stream
11 habitat. At a minimum, criteria shall be developed to control peak storm water discharge rates
12 and velocities in order to maintain or reduce pre-development downstream erosion and protect
13 stream habitat. Storm water discharge volumes and durations should also be considered.”

14 (AR 1589.)

15 The ROWD also addresses the issue and prevention of hydromodification or downstream
16 erosion extensively. Recommendation D.2.4 states that the re-issued permit “should require
17 Copermittees to improve procedures for analyzing downstream conditions of concern,” including
18 developing minimum criteria for conducting an analysis of downstream conditions, analyzing
19 downstream conditions of concern, and developing methodologies for addressing such areas of
20 concern. (AR 2197-2199.)

21 In conducting an analysis of downstream conditions of concern, the ROWD recommends
22 that priority projects “prepare a project-specific drainage study demonstrating that discharge flow
23 rates, and velocities from a 2-year and 10-year, 24-hour rainfall event will not significantly
24 impact downstream erosion or stream habitat.” (AR 2197.) The ROWD also recommends that
25 project applicants demonstrate to the Copermittee that the project will not cause significant
26 adverse impacts on downstream erosion or stream habitat or that the impact has been mitigated.

27 (...continued)

28 and freeways, and retail gasoline outlets. (AR 346, 268-269.)

1 (AR 2197.) If stormwater detention is used to mitigate significant impacts to downstream erosion
2 or stream habitat, drainage studies must be conducted to determine the regional effect of a
3 detention basin. (AR 2197-2199.)

4 And the ROWD recommends that the “Copermittees should identify multiple methods to
5 address identified downstream conditions of concern. Examples of such methods include:
6 detention; implementation of site design, source control (such as LID controls) or treatment
7 control BMPS that would mitigate the potential impacts; project compliance with a
8 jurisdictionally approved master drainage plan (or similar plan) or similar method acceptable to
9 the Copermittee.” (AR 2199.)

10 **2. Low Impact Development Plans and Standard Urban Storm Water**
11 **Mitigation Plans Updates for New Development and Redevelopment**

12 Similar to part D.1 of the permit, section D.1.d generally requires that each Copermittee
13 implement an updated Standard Urban Storm Water Mitigation Plan (SUSMP) that “(1) reduces
14 Priority Development Project discharges of pollutants from the MS4 to the MEP (2) prevents
15 Priority Development Project runoff discharges from the MS4 from causing or contributing to a
16 violation of water quality standards, and (3) manages increases in runoff discharge rates and
17 durations from Priority Development Projects that are likely to cause increased erosion of stream,
18 beds and banks, silt pollutant generation, or other impacts to beneficial users and stream habitat
19 due to increased erosive force.” (AR 267.)

20 Relevant to this litigation, part of this land use planning for new development and
21 redevelopment includes Low Impact Development (LID) best management practices such as
22 treatment control best management practices for volume or flow of runoff.¹¹ (AR 269-275.) The
23 County of San Diego only challenges two of the permit requirements related to Low Impact
24 Development, paragraphs 7 and 8.

25
26 ¹¹ Low Impact Development is defined in the permit as “[a] storm water management and
27 land development strategy that emphasizes conservation and the use of on-site natural features
28 integrated with engineered, small-scale hydrologic controls to more closely reflect pre
development hydrologic functions.” (AR 343.)

1 Paragraph 7 of section d, Update of SUSMP BMP Requirements, requires that
2 Copermittees “collectively review and update the BMP requirements that are listed in their local
3 SUSMPs.” (AR 271.) This update includes updating or including LID best management
4 practices “in the local SUSMPs addressing pollutant removal efficiencies of treatment control
5 BMPs” and “review, and revision where necessary, of treatment control BMP pollutant removal
6 efficiencies.” (AR 271.)

7 And paragraph 8 of section d, Update to Incorporate LID and other BMP Requirements,
8 requires the Copermittees to “develop and submit an updated Model SUSMP that defines
9 minimum LID and other BMP requirements to be incorporated into the Copermittees’ local
10 SUSMPs for application to Priority Development Projects.” (AR 271.) “The purpose of the
11 updated Model SUSMP shall be to establish minimum standards to maximize the use of LID
12 practices and principles in local Copermittee programs as a means of reducing stormwater
13 runoff.” (AR 271.) The specific permit requirements for the Model SUSMP are found on pages
14 271-272 of the administrative record.

15 The 2001 NPDES permit does not use the term “Low Impact Development,” but it
16 nonetheless addresses the issue of reducing urban runoff in land use planning for new
17 development and redevelopment. Section F.1, Land Use Planning for New Development and
18 Redevelopment Component, states that “[e]ach Copermittee shall minimize the short and long-
19 term impacts on receiving water quality from new development and redevelopment” to “reduce
20 pollutants and runoff flows from new development and redevelopment to the maximum extent
21 practicable.” (AR 1582.) Indeed, section F.1.a requires “Copermittees to assess and modify their
22 general plans, or equivalent documents, to ensure that land use decisions are adequately guided
23 by water quality and watershed protection principles.” (AR 1582, 2185.)

24 And section F.1.b requires Copermittees to modify their development project approval
25 procedures “to ensure that pollutants and runoff from the development will be reduced to the
26 maximum extent practicable and will not cause or contribute to an exceedance of receiving water
27 quality objectives.” (AR 1583.)
28

1 Section F.1.b(2) addresses the Copermittees' Standard Urban Water Mitigation Plans with
2 respect to new development and redevelopment. Subsection (2) requires Copermittees to develop
3 and enforce a "model Standard Urban Storm Water Mitigation Plan to reduce pollutants and
4 runoff flows from new development and significant redevelopment projects." (AR 1583.) And
5 subsection (2)(b) requires the County of San Diego to develop "a list of recommended source
6 control and structural BMPs for new development and significant redevelopment," which
7 includes minimizing storm water runoff. (AR 1585.)

8 While the ROWD did not propose the specific best management practices for Low Impact
9 Development ultimately included in the permit, it did address the effectiveness of water quality
10 based land use policies such as Low Impact Development techniques during the planning process.
11 Specifically, the ROWD states: "If sound land use policies are adopted during the planning phase,
12 the need for source control or treatment BMPs for a site (which are always less effective) may be
13 avoided. With this in mind, water quality-based land use policies and decisions can be thought of
14 as the 'ultimate pollution prevention BMP.'" (AR 2185.)

15 The ROWD also recognizes that Low Impact Development BMPs "might be given
16 increased emphasis in future program requirements." (AR 2193.) It acknowledges that "[s]ite
17 design and source control solutions are often more effective than many types of structural
18 treatment for protecting water quality since design considerations eliminate the necessity of
19 addressing sources of pollution, rather than attempting to remove a percentage of the pollution
20 after it has entered stormwater runoff." (AR 2193.) In addition, the ROWD states that "LID
21 controls may often be more effective than conventional structure treatment controls because
22 maintenance is more assured (due to decreased maintenance requirement and because the
23 maintenance is incorporated into the normal operations of a site, such as landscape
24 maintenance)." (AR 2193.)

25 **3. Street Sweeping and Maintaining and Cleaning Municipal Storm**
26 **Sewer Systems**

27 Part D.3.a of the permit, Existing Development Component, Municipal, requires each
28 Copermittee to "implement a municipal program that reduces municipal discharges of pollutants

1 from the MS4 to the MEP, and prevents municipal discharges from the MS4 from causing or
2 contributing to a violation of water quality standards.” (AR 282.) Two sections of this part are
3 relevant here: section 3, Operation and Maintenance of Municipal Storm Sewer System and
4 Structural Controls, and section 5, Sweeping of Municipal Areas. (AR 283-284.)

5 Section 3 requires each Copermittee to “implement a schedule of inspection and
6 maintenance activities to verify proper operation of all municipal structural treatment controls
7 designed to reduce pollutant to or from its MS4 and related drainage structures.” (AR 283.) The
8 frequency of maintenance depends on the volume of trash and debris found in the MS4 and
9 includes proper disposal of the trash and debris and reporting of maintenance and cleaning
10 activities. (AR 283-284.)

11 Section 5 requires each Copermittee to “implement a program to sweep improved
12 (possessing a curb and gutter) municipal roads, streets, highways, and parking facilities” at
13 certain times depending on the volume of litter and debris generated. (AR 284.) The reporting
14 requirements for street sweeping are laid out in Part J.3.a.c. (x-xv) and includes identifying the
15 distance of the street sweeping as well as the related frequency of sweeping, the total distance of
16 curb-miles swept, the number of municipal parking lots swept and the frequency of sweeping, and
17 the total amount of materials collected from the street and parking lot sweeping. (AR 318.)

18 The 2001 NPDES permit also addresses the maintenance and cleaning of the MS4. Section
19 F.3.a.(5) requires each Copermittee to “implement a schedule of maintenance activities at all
20 structural controls designed to reduce pollutant discharges to or from its MS4 and related
21 drainage structures.” (AR 1595.) The maintenance activities included, at a minimum, inspection
22 and removal of waste, additional cleaning, record keeping, proper disposal of waste, and
23 measures to eliminate waste discharge during MS4 maintenance and cleaning activities.
24 (AR 1596.)

25 And while street sweeping is not expressly provided for in the 2001 NPDES permit,
26 sections F.3.a.(3) and (4) require Copermittees to develop best management practices to reduce
27 the discharge of pollutants from roads, streets, highways, and parking facilities. (AR 1594-1595.)
28 Copermittees implemented this provision by providing street sweeping of their roads, streets,

1 highways, and parking facilities. (AR 3878.) In other words, Copermittees determined that street
2 sweeping was a best management practice to reduce the discharge of pollutants to MS4 to the
3 maximum extent practicable, in compliance with the federal mandate.

4 Consistent with the 2001 NPDES permit, the ROWD recommends the continuation of street
5 sweeping as a best management practice to reduce the discharge of pollutants from roads, streets,
6 highways, and parking facilities. (AR 2229.) It also recommends the continued maintenance and
7 cleaning of MS4s consistent with the terms of the 2001 NPDES permit. (AR 2229.)

8 **4. Public Education of Impact of Urban Runoff**

9 Part D.5 of the permit, Educational Component, requires each Copermittee to “implement
10 an education program using the media as appropriate to (1) measurably increase the knowledge of
11 the target communities regarding MS4s, impacts of urban runoff on receiving waters, and
12 potential BMP solutions for the target audience; and (2) to measurably change the behavior of
13 target communities and thereby reduce pollutant discharges to MS4s and the environment.”

14 (AR 293-294.) Target communities include municipal departments and personnel, construction
15 site owners and developers, industrial owners and operators, residential community, general
16 public, and school children. (AR 294.) The educational topics generally include federal, state
17 and local laws related to water quality, best management practices, urban runoff concepts, and
18 public awareness and reporting. (AR 294.) There are also specific requirements as to each target
19 group. All of the general and specific requirements can be found on pages 295 through 296 of
20 the administrative record.

21 Similar to the permit requirements in question in this litigation, section F.4 of the 2001
22 NPDES permit requires that “[e]ach Copermittee shall implement an Education Component using
23 all media as appropriate to (1) measurably increase the knowledge of the target communities
24 regarding MS4s, impacts of urban runoff on receiving waters, and potential BMP solutions for
25 target audience; and (2) to measurably change the behavior of target communities and thereby
26 reduce pollutant releases to MS4s and the environment.” (AR 1602.) Target communities
27 include municipal departments and personnel, construction site owners and developers, industrial
28 owners and operators, residential community, general public, school children, and quasi-

1 governmental agencies. (AR 1602.) The educational topics generally include federal, state and
2 local laws related to water quality, best management practices, urban runoff concepts, and public
3 awareness and reporting. (AR 1602-1603.)

4 The ROWD, section D.7, addresses public education consistent with the 2001 NPDES
5 permit and makes additional recommendations such as focusing education on the highest
6 priorities, ensuring the most efficient use of educational resources, measuring progress and
7 effectiveness, regional education program plan, and requirements to educate quasi-governmental
8 entities. (AR 2261-2273.)

9 **C. Watershed Urban Runoff Management Program**

10 Part E of the permit, Watershed Urban Management Program, requires each Copermittee to
11 collaborate with other Copermittees within its Watershed Management Area(s) “to develop and
12 implement an updated Watershed Urban Runoff Management Program for each watershed.”
13 (AR 296-297.) Each program must “reduce the discharge of pollutants from the MS4 to the MEP,
14 and prevent urban runoff discharges from the MS4 from causing or contributing to a violation of
15 water quality standards.” (AR 297.) The specific programs should include elements such as lead
16 watershed permittee identification, watershed map, watershed water quality assessment,
17 watershed-based land use planning, watershed strategy, watershed activities, Copermittee
18 collaboration, public participation, and review and updates of the programs. (AR 297-300.)¹²

19 Section J of the 2001 NPDES permit requires Copermittees to “collaborate with other
20 Copermittees discharging urban runoff into the same watershed to develop and implement a
21 Watershed Urban Runoff Management Program.” (AR 1611.) This program includes, at a
22 minimum, map of the watershed, assessment of the water quality of receiving waters,
23 identification of water quality problems related to MS4 discharges, implementation schedule,
24 identification of responsible Copermittees, a mechanism for public participation, a mechanism to
25

26
27 ¹² A “watershed” is “[t]hat geographical area which drains to a specified point on a water
28 course, usually a confluence of streams or rivers (also known as drainage area, catchment, or river
basin.” (AR 349.)

1 facilitate collaboration among with neighboring governments, and a long-term strategy assessing
2 the effectiveness of the program. (AR 1611-1612.)

3 Section D.7 of the ROWD addresses the Watershed Urban Runoff Management Program
4 consistent with the 2001 NPDES permit and makes additional recommendations related to
5 watershed permitting approach, identification or watershed water quality assessment data,
6 identification of priority watershed pollutants and issues, identification of known pollutant
7 sources, watershed coordination, and identification of watershed activities and education
8 activities. (AR 2161-2181.)

9 **D. Regional Urban Runoff Management Program**

10 Part F of the permit, Regional Urban Runoff Management Program, requires each
11 Copermittee to collaborate with the other Copermittees “to develop, implement, and update as
12 necessary a Regional Urban Management Program.” (AR 300.) The program must “reduce the
13 discharge of pollutants from the MS4 to the MEP, and prevent urban runoff discharges from the
14 MS4 from causing or contributing to a violation of water quality standards.” (AR 300.) At a
15 minimum, the program must address the development and implementation of a Regional
16 Residential Education Program, which includes pollutant specific education, development of a
17 standard fiscal analysis for the educational program, and the assessment of the effectiveness of
18 jurisdictional, watershed, and regional programs. (AR 300.) Copermittees can go beyond the
19 residential component and develop and implement urban runoff management activities on a
20 regional level if they so choose, but regional plans are not required under the permit. (AR 300.)

21 Section F.3 of the 2001 NPDES permit requires Copermittees to implement a residential
22 component “to reduce pollutants in runoff from all residential land use areas and activities.”
23 (AR 1601.) At a minimum, this includes pollution prevention, threat to water quality
24 prioritization, implementation of best management practices, and enforcement of residential
25 activities. (AR 1601.)

26 Section D.6 of the ROWD addresses a residential component to prevent and reduce
27 pollutants in runoff from residential land use areas and activities consistent with the 2001 NPDES
28 permit. (AR 2249.) In their ROWD, Copermittees state that because of the unique characteristics

1 of residential sources of pollution, they have generally focused their residential component on
2 public education and response to complaints. (AR 2249) As such, the ROWD identifies
3 residential sources of pollution as their highest regional priority and public education as the most
4 important component of their program. (AR 2255.) It states that efforts “must also be expended
5 on better defining the links between residential activities and water quality and if necessary,
6 development of alternative strategies to better address these sources of residential pollution.
7 (AR 2255.)

8 **E. Program Effectiveness Assessment**

9 Part I of the permit, Program Effectiveness Assessment, requires each Copermittee to
10 annually assess the effectiveness of the above jurisdictional, watershed, and regional urban runoff
11 programs. (AR 302-306.) There are specific assessment requirements for each program, which
12 can be found in the administrative record at pages 302 through 306.

13 Additionally, subsection I.5 requires that “[e]ach Copermittee shall collaborate with the
14 other Copermittees to develop a Long Term Effectiveness Assessment (LTEA), which shall build
15 on the results of the Copermittees’ August 2005 Baseline LTEA.” (AR 307.) The LTEA should
16 be designed to address the following objectives related to the jurisdictional, watershed, and
17 regional effectiveness assessments above: (1) assessment of watershed health and water quality
18 issues and concerns; (2) evaluation of source management priorities; (3) evaluation of the need to
19 address additional pollutant sources; (4) assessment of progress in implementing programs; (5)
20 assessment of the effectiveness of activities addressing priority constituents and sources; (6)
21 assessment of change in discharge and receiving water quality; (7) assessment of the relationship
22 of program implementation to changes in pollutant loading, discharge quality, and receiving
23 water quality; and (8) identification of changes necessary to improve programs. (AR 305-306.)
24 The LTEA should also address outcome levels, the effectiveness of the Receiving Waters
25 Monitoring Program, and the jurisdictional, watershed, and regional programs. (AR 307.)

26 Sections F.7 and J of the 2001 NPDES permit require Copermittees to assess the
27 effectiveness of their jurisdictional and watershed runoff programs. (AR 1606, 1611.) It also
28

1 requires Copermittees to develop long-term strategies for assessing the effectiveness of these
2 programs. (AR 1606, 1611.)

3 As with the 2001 NPDES permit, the ROWD recommends the continued effectiveness
4 assessment of jurisdictional, watershed, and regional urban runoff programs. (AR 2321.) It also
5 recommends long-term effectiveness assessment of these programs. (AR 2323-2325.)

6 **F. Collaboration Among Copermittees**

7 Part L of the permit, All Copermittee Collaboration, provides that the Copermittees should
8 collaborate to “address common issues, promote consistency among Jurisdictional Urban Runoff
9 Management Programs and Watershed Urban Runoff Management Programs, and to plan and
10 coordinate activities required under this Order.” (AR 325.) This includes developing a
11 Memorandum of Understanding that defines Copermittees’ responsibilities, establishes a
12 management structure and standards for conducting meetings, provides guidelines for work
13 groups, lays out the process for non-compliance issues, and includes all other collaborative
14 agreements for compliance with the permit. (AR 326.)

15 Part N of the 2001 NPDES permit requires that “[e]ach Copermittee shall collaborate with
16 all other Copermittees regulated under this Order to address common issues, promote consistency
17 among Jurisdictional Urban Runoff Management Programs (Jurisdictional URMPs) and
18 Watershed Urban Runoff Management Programs (Watershed URMPs), and to plan and
19 coordinate activities required under this Order.” (AR 1614.) This includes a Memorandum of
20 Understanding addressing designation of joint responsibilities, decision making, watershed
21 activities, information management of data and reports, all other collaborative arrangements
22 between the Copermittees, and the development of a standardized form for all required reports.
23 (AR 1614.)

24 Consistent with the 2001 NPDES permit, the ROWD recommends the continued
25 collaboration among the Copermittees and lists the following general areas of recommended
26 Copermittee collaboration: water quality assessment; source identification and prioritization;
27 establishment of program requirements (BMPs and discharge prohibitions); strategies for
28 program implementation, and reporting and assessment. (AR 2157.) It also recommends the

1 continued use of a Memorandum of Understanding established in the 2001 NPDES permit, and
2 the formal establishment of subcommittees and working bodies to address budget and fiscal
3 issues, data collection, management, and analysis, regional watershed activities, source
4 management programs, and monitoring programs. (AR 2157.)

5 **IV. PRINCIPLES OF SUBVENTION AS IT PERTAINS TO FEDERAL LAW**

6 “In 1972, and again in 1973, the Legislature enacted comprehensive schemes for local
7 property tax relief. Though frequently amended thereafter, these statutes retained three principal
8 features. First, they placed a limit on the local property tax rate. Second, they required the state
9 to reimburse local governments for their costs resulting from state laws ‘which mandate ... new
10 program[s] or ... increased level[s] of service’ at the local level. Finally, they allowed local
11 governments to exceed their property taxation limits to fund certain other nondiscretionary
12 expenses, including ‘costs mandated by the federal government.’” (*City of Sacramento v. State of*
13 *California* (1990) 50 Cal.3d 51, 57 -58.)

14 In November 1979, the voters adopted Proposition 4, adding article XIII B to the state
15 Constitution. “Article XIII B - the so-called ‘Gann limit’ - restricts the amounts state and local
16 governments may appropriate and spend each year from the ‘proceeds of taxes’ [citations
17 omitted].” (*City of Sacramento, supra*, 50 Cal.3d at pp. 57 -58.) Section 6 of article XIII B calls
18 for state subvention by requiring the state to pay for any new governmental programs, or for
19 higher levels of service under existing programs, that it imposes upon local governmental
20 agencies. (*County of Los Angeles v. State of California* (1987) 43 Cal.3d 46, 56.) “[M]andatory
21 state subventions are excluded from the local agency’s spending limit, but included within the
22 state’s.” (*City of Sacramento, supra*, 50 Cal.3d at p. 59.) This does not mean that the state is
23 required to reimburse local agencies for all incidental costs that may result from the enactment of
24 a state law. Rather, the subvention requirement is restricted to governmental services which the
25 local agency is required to provide by state law as opposed to federal law. (*Id.* at p. 76.)

26 Article XIII B, section 6 of the California Constitution and Government Code section
27 17514, provide for the reimbursement of local government’s costs of carrying out new programs
28

1 or higher levels of service that are mandated by the State. Article XIII B, section 6 provides, in
2 part, as follows:

3 Whenever the Legislature or any state agency mandates a new program or higher
4 level of service on any local government, the state shall provide a subvention of funds
5 to reimburse such local government for the costs of such program or increased level
of service. . . .

6 (Cal. Const., art. XIII B, § 6.)

7 Government Code section 17514 defines “[c]osts mandated by the state” to mean:

8 . . . any increased costs which a local agency or school district is required to incur
9 after July 1, 1980, as a result of any statute enacted on or after January 1, 1975, or any
10 executive order implementing any statute enacted on or after January 1, 1975, which
mandates a new program or higher level of service of an existing program within the
meaning of Section 6 of Article XIII B of the California Constitution.

11 But constitutional subvention is not required when the costs implement federal law. Article
12 XIII B, section 9, subdivision (b), excludes from the state or local spending limit any

13 “appropriations required for purposes of complying with mandates of the . . . federal government.”

14 As the California Supreme Court stated recently, “article XIII B, section 6, and the implementing
15 statutes . . . provide for reimbursement only of state-mandated costs, not federally mandated costs.”

16 (*San Diego Unified School Dist. v. Commission on State Mandates* (2004) 33 Cal. 4th 859, 880.)

17 This constitutional prohibition against providing state reimbursement for activities imposed
18 by federal law is specifically spelled out in Government Code section 17556, subdivision (c).

19 (*Redevelopment Agency of the City of San Marcos v. Commission on State Mandates* (1996)

20 55 Cal.App.4th 976, 984 [article XIII B, section 6 creates “several classes of state-mandated

21 programs for which no state reimbursement of local agencies is required”].) Subdivision (c)

22 states that the Commission shall not find “costs mandated by the state” if “[t]he statute or

23 executive order imposes a requirement that is mandated by a federal law or regulation and results

24 in costs mandated by the federal government, unless the statute or executive order mandates costs

25 that exceed the mandate in that federal law or regulation.” Section 17513 defines “costs

26 mandated by the federal government” to mean, in relevant part “. . . any increased costs incurred

27 by a local agency or school district after January 1, 1973, in order to comply with the

28 requirements of a federal statute or regulation.”

1 Finally, if a local agency has sufficient fee authority to pay for mandated programs, then
2 such programs are not subject to reimbursement under article XIII B, section 6. (Gov. Code,
3 § 17556, subd. (d).) Specifically, subdivision (d) states that the Commission shall not find “costs
4 mandated by the state” if:

5 The local agency or school district has the authority to levy service charges, fees, or
6 assessments sufficient to pay for the mandated program or increased level of service.
7 This subdivision applies regardless of whether the authority to levy charges, fees, or
8 assessments was enacted or adopted prior to or after the date on which the statute or
9 executive order was enacted or issued.

8 **V. OVERVIEW OF THE COMMISSION ON STATE MANDATES**

9 The Commission is a quasi-judicial agency vested with the sole and exclusive authority to
10 adjudicate all disputes over the existence and reimbursement of state-mandated programs within
11 the meaning of article XIII B, section 6 of the California Constitution. (*Kinlaw v. State of*
12 *California* (1991) 54 Cal.3d 326; Gov. Code, §§ 17551, 17552.)

13 Local agencies and school districts file claims with the Commission for reimbursement of
14 state-mandated costs under article XIII B, section 6. (Gov. Code, §§ 17551, 17560.) The first
15 claim filed by a local agency or school district alleging that a statute or an executive order
16 imposes a reimbursable state-mandated program is a “test claim.” (Gov. Code, § 17521.) A
17 public hearing is held on the test claim, at which time evidence may be presented by the claimant,
18 the Department of Finance, any other state department or agency affected by the claim, and any
19 interested organization or individual. (Gov. Code, § 17555.)

20 The Commission must first determine if a state-mandated program exists. (Gov. Code,
21 § 17551.) If so, the Commission adopts parameters and guidelines for the reimbursement of
22 claims submitted by eligible claimants. (Gov. Code, § 17557, subd. (a).) The Commission
23 submits the adopted parameters and guidelines to the Controller, and the Controller issues
24 claiming instructions for each mandate that requires reimbursement. (Gov. Code, § 17558, subds.
25 (a),(c).) Judicial review of a final Commission decision is available through a petition for writ of
26 mandate filed pursuant to Code of Civil Procedure section 1094.5. (Gov. Code, § 17559.)

27 ///

28 ///

1 **VI. SUMMARY OF THE COMMISSION'S DECISION**

2 The test claim filed by the County of San Diego alleges "various activities related to
3 reducing stormwater pollution in compliance with a permit issued by" the Regional Board.
4 (AR 3823.) The Commission found that the permit requirements related to street sweeping and
5 reporting, MS4 cleaning and reporting, education, watershed activities, Regional Urban Runoff
6 Management Program, program and long-term effectiveness assessment, and permittee
7 collaboration were reimbursable state mandates. (AR 3824.) The Commission also found that
8 the permit requirements associated with the Hydromodification Management Plan and Low
9 Impact Development, while state mandates, were not reimbursable because the County of San
10 Diego has sufficient fee authority to pay for the permit requirements. (AR 3824.)

11 The Commission's statement of decision is lengthy and can be found in the administrative
12 record at pages 3823-3960. This petition does not address the entire statement of decision but
13 only three parts:

- 14 (1) The Commission's findings that the claimed permit requirements are not federal
15 mandates. (AR 3859-3920; Petition for Writ of Administrative Mandate ("Pet.") ¶ 26,
16 subsections (a)-(i).)
- 17 (2) The Commission's findings that certain permit requirements impose new programs or
18 higher levels of services on the County of San Diego. (AR 3859-3920; ¶ 27,
19 subsections (a)-(i).)
- 20 (3) The Commission's findings that the County of San Diego lacks sufficient fee authority
21 to pay for certain permit requirements. (AR 3922-3943; ¶ 31, subsections (a)-(d).)

22 With respect to the federal mandate findings, the Commission's analysis is long but is
23 based primarily on the theory that the specific permit activities are not federal mandates because
24 they go beyond the requirements of the Clean Water Act. (AR 3866-3867, 3873, 3877, 3880-
25 3881, 3885, 3896, 3902, 3904, 3908, 3913-3914, 3916.) The findings that the permit activities
26 are new programs or higher level of services are based on the assertion that the activities were not
27 contained in the 2001 NPDES permit issued to the County of San Diego and that the activities
28 were only imposed on local agencies and not the general public. (AR 3872, 3876, 3879, 3883-

1 3884, 3891-3892, 3899-3900, 3902, 3904-3905, 3911-3912, 3915, 3918-3921.) The findings that
2 the County of San Diego's fee authority is insufficient to pay for certain permit requirements are
3 based on the voter-approval provisions related to fees in article XIII D, section 6, subdivision (e)
4 of the California Constitution. (AR 3927-3929.)

5 STANDARD OF REVIEW

6 Pursuant to Government Code section 17559, subdivision (b), a proceeding may be brought
7 under Code of Civil Procedure section 1094.5 "to set aside a decision of the commission on the
8 ground that the commission's decision is not supported by substantial evidence." Code of Civil
9 Procedure section 1094.5, in turn, provides that the court's inquiry "shall extend to the questions
10 whether the respondent has proceeded without, or in excess of jurisdiction; whether there was a
11 fair trial; and whether there was any prejudicial abuse of discretion. Abuse of discretion is
12 established if the respondent has not proceeded in the manner required by law, the order or
13 decision is not supported by the findings, or the findings are not supported by the evidence."

14 The review of the Commission's factual determinations proceeds under the substantial
15 evidence test. (*City of Richmond v. Commission on State Mandates* (1998) 64 Cal.App.4th 1190,
16 1194-95.) Where the substantial evidence test applies, the court is under a duty to see that
17 findings are legally relevant as well as supported by the evidence in order to support agency
18 action. (*City and County of San Francisco v. Board of Permit Appeals* (1989) 207 Cal.App.3d
19 1099, 1110.) Substantial evidence review also includes a duty to determine whether the agency
20 committed errors of law in applying the facts before it. (*Id.* at p. 1111.) Whether a statute creates
21 a reimbursable state mandate is a pure question of law. (*Connell v. Superior Court* (1997)
22 59 Cal.App.4th 382, 395.) Questions of law are subject to de novo review. (*City of Richmond,*
23 *supra*, 64 Cal.App.4th at p. 1105.)

24 LEGAL ANALYSIS

25 I. THE PERMIT IS A FEDERAL MANDATE AND NOT SUBJECT TO REIMBURSEMENT 26 UNDER ARTICLE XIII B, SECTION 6, OF THE CALIFORNIA CONSTITUTION.

27 The California Constitution is clear that state subvention is not required when the federal
28 government imposes new costs on local governments. (Cal. Const., art. XIII B, § 9, subd. (b);

1 Gov. Code, §§ 17556, subd. (c), 17514.) There is a two-step process to determine whether a
2 program is mandated by federal law and thus not subject to state subvention. First, did the state
3 have “no real choice in deciding whether to comply with the federal act.” (*Hayes v. Commission*
4 *on State Mandates* (1992) 11 Cal.App.4th 1564, 1594.) Second, did the program exceed the
5 requirements of federal law. (Gov. Code, § 17556; *San Diego Unified School Dist, supra*, 33
6 Cal.4th at p. 880.) As explained below, the answer to both of these questions shows that the
7 permit is a federal mandate and not subject to state subvention.

8 **II. CALIFORNIA’S ADMINISTRATION OF THE NPDES PERMIT PROGRAM DOES NOT**
9 **TRANSFORM CLEAN WATER ACT REQUIREMENTS INTO A STATE MANDATE.**

10 “The test for determining whether there is a federal mandate is whether compliance with
11 federal standards ‘is a matter of true choice,’ that is, whether participation in the federal program
12 ‘is truly voluntary.’” (*City of Sacramento, supra*, 50 Cal.3d at p. 76.) A federal mandate exists,
13 even if “the state has adopted an implementing statute or regulation pursuant to the federal
14 mandate so long as the state had no ‘true choice’ in the manner of implementation of the federal
15 mandate.” (*Hayes, supra*, 11 Cal.App.4th at p. 1593.) But “[t]his reasoning would not hold true
16 where the manner of implementation of the federal program was left to the true discretion of the
17 state.” (*Ibid.*)

18 In *City of Sacramento, supra*, the state extended mandatory coverage under the state’s
19 unemployment insurance law to local governments and others. (50 Cal.3d 51.) The lower court
20 and the Court of Appeal found that the program was not so coercive as to constitute a federal
21 mandate, even though failure to implement the law would result in the potential loss of federal
22 funds and tax credits. (*Id.* at pp. 59 -60.) The California Supreme Court reversed, explaining that
23 “the drafters and adopters of article XIII B must have understood [that] certain regulatory
24 standards imposed by the federal government under ‘cooperative federalism’ schemes are
25 coercive on the states and localities in every practical sense.” (*Id.* at pp. 73-74.) Thus, federal
26 mandates are not limited to programs or activities resulting from “strict legal compulsion by the
27 federal government.” (*Id.* at p. 73.) Moreover, there is “no final test for ‘mandatory’ versus
28 ‘optional’ compliance with federal law.” (*Id.* at p. 76.) Rather, the standard is flexible and

1 depends on a number of factors such as “the nature and purpose of the federal program; whether
2 its design suggests an intent to coerce; when state and/or local participation began; the penalties,
3 if any, assessed for withdrawal or refusal to participate or comply; and any other legal and
4 practical consequences of nonparticipation, noncompliance, or withdrawal.” (*Ibid.*)

5 The NPDES program is not optional; it is coercive on the states and localities in every legal
6 and practical sense. The Commission did not find otherwise. Instead, the Commission found that
7 because California “voluntarily adopts the [NPDES] permitting program” and because federal law
8 does not “expressly require states to have *this* program, the state has freely chosen to effect the
9 stormwater permit program.” (AR 3861, emphasis added.) What the Commission overlooked is
10 that given the complex, coordinated, and interactive nature of the rules governing federal, state,
11 and local agencies under the Clean Water Act, California had little practical choice.

12 Initially, the Commission’s analysis distorts the holdings of *Hayes* and *City of Sacramento*.
13 Regardless of whether the state or the U.S. EPA issues an NPDES permit, the permit was not
14 voluntary. (*City of Sacramento, supra*, 50 Cal.3d at p. 76.) The federal Clean Water Act requires
15 the County of San Diego to have an NPDES permit for municipal storm water discharges and
16 compels those permittees to reduce the discharge of pollutants to the maximum extent practicable.
17 Neither the state nor the County of San Diego has a true choice in the permit or the requirement to
18 reduce pollutants to the maximum extent practicable. (*City of Sacramento, supra*, 50 Cal.3d at
19 p. 76.) Further, unlike the situation discussed in *Hayes*, the state is not “shift[ing] state costs to
20 local agencies,” but instead the federal municipal storm water program requires the County of San
21 Diego to obtain an NPDES permit that reduces pollutants to the maximum extent practicable.
22 (Cf. *Hayes, supra*, 11 Cal.App.4th at p. 1593.)¹³

23 ¹³ By way of contrast, the federal definition of municipal separate storm sewer system also
24 requires state agencies, such as CalTrans to obtain a municipal storm water permit for their
25 separate storm sewer discharges. (40 C.F.R. § 122.26(b)(8).) The State Water Resources Control
26 Board issues a municipal storm water permit to CalTrans for all of its storm sewers subject to the
27 Clean Water Act. (State Board Order No. 99-06-DWQ available at:
28 http://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/caltrans/caltranspmt.pdf.)
Hayes and *City of Sacramento* would yield the result sought by the County of San Diego if the
state freely choose to either (1) require the County to administer the NPDES program (something
the state does), or (2) require the County to implement the CalTrans permit (something the state
does).

1 California administers the NPDES program to follow federal requirements as closely as
2 possible. For example, the federally required permit process starts with the discharger submitting
3 a proposed application to the permitting authority, which must comply with all federal
4 requirements, including effluent limitations, national standards of performance, and toxic and
5 pretreatment effluent standards. (33 U.S.C. §§ 1342 (b)(1), 1311, 1312, 1316, 1317.) And
6 federal law requires that the U.S. EPA be provided with the proposed permit and notice of any
7 action related to the same, such as a hearing on the proposed requirements.
8 (33 U.S.C. § 1342(d)(1).) The U.S. EPA may object to a permit and find that it is inconsistent
9 with federal law. (*Id.*, § 1342(d)(2).) This type of finding could result in the U.S. EPA
10 determining that a state program does not comply with federal NPDES program guidelines and
11 could be a reason for the U.S. EPA to withdraw approval for the state program. (*Id.*,
12 § 1342(c)(3).)

13 These federal laws would mandate NPDES permitting even if California took no action at
14 all and played no role in the process. Furthermore, if California did not administer its own water
15 quality program through the Porter-Cologne Act, California's dischargers, both private and
16 governmental, would still have to comply with federal law, but would also be subject to direct
17 regulation from the federal government. This result would be directly contrary to the intent of the
18 California Legislature. As explained by the Legislature: "It is in the interest of the people of the
19 state, in order to avoid direct regulation by the federal government of persons already subject to
20 regulation under state law pursuant to this division, to enact this chapter in order to authorize the
21 state to implement the provisions of the Federal Water Pollution Control Act [Clean Water Act]." (*Wat. Code*, § 13370, subd. (c), emphasis added.) The lack of any practical alternative explains
22 why 46 of the 50 states, including California, have implemented the Clean Water Act by creating
23 a program to issue NPDES permits.

24
25 The California Supreme Court has rejected the Commission's narrow analysis that a state
26 mandate exists when a state enacts its own laws consistent with federal law. In *City of*
27 *Sacramento, supra*, the Supreme Court found that the joint federal-state operation of a system of
28 unemployment compensation was not a state-mandate, but a federal mandate. (50 Cal.3d at

1 pp. 75-76.) The Court rejected the idea that “California could have chosen to terminate its own
2 unemployment insurance system, thus leaving the state’s employers faced only with the federal
3 tax.” (*Id.* at p. 74.) The Court stated that “we cannot imagine the drafters and adopters of article
4 XIII B intended to force the state to such draconian ends.” (*Ibid.*) The Court explained that “the
5 state simply did what was necessary to avoid certain and severe federal penalties upon its resident
6 businesses. The alternatives were so far beyond the realm of practical reality that they left the
7 state ‘without discretion’ to depart from federal standards.” (*Ibid.*)

8 Thus, under *City of Sacramento*, a federal mandate exists where the federal government
9 leaves the state with little or no practical choice to participate in a federal program or otherwise
10 comply with federal law. The Commission’s analysis eviscerates that rule. Under the
11 Commission’s analysis, a state mandate would exist anytime federal law gives the state any
12 flexibility at all as to how it will comply with federal law.

13 Since the state has no true choice but to comply with the Clean Water Act in issuing
14 NPDES permits, such permits are based on federal requirements and are not state mandates. The
15 Commission’s decision holding to the contrary was erroneous and should be reversed.

16 **III. THE NPDES PERMIT DOES NOT GO BEYOND THE REQUIREMENTS OF THE CLEAN**
17 **WATER ACT.**

18 The second part of the analysis in determining if a program is a state mandate versus a
19 federal mandate focuses on whether the program goes beyond the requirements of federal law.
20 Government Code section 17556, subsection (c), states that the Commission shall not find “costs
21 mandated by the state” if “[t]he statute or executive order imposes a requirement that is mandated
22 by a federal law or regulation and results in costs mandated by the federal government, unless the
23 statute or executive order mandates costs that exceed the mandate in that federal law or
24 regulation.” (See *San Diego Unified School Dist.*, *supra*, 33 Cal.4th at p. 880.) As explained
25 below, the permit in question does not exceed the applicable federal standard.

26 ///

27 ///

28 ///

1 **A. The Clean Water Act Required the Regional Board to Specify the Permit's**
2 **Pollutant Reduction Requirements.**

3 The Clean Water Act prohibits the County of San Diego from discharging pollutants from
4 its MS4 unless it does so through an NPDES permit. And under the Clean Water Act, the permit
5 must include “controls to reduce the discharge of pollutants to the *maximum extent practicable*,
6 including management practices, control techniques and system, design and engineering methods,
7 and such other provisions as the Administrator or the State determines appropriate for the control
8 of such pollutants.” (33 U.S.C. § 1342(p)(3)(B), emphasis added.)

9 “The permitting agency has discretion to decide what practices, techniques, methods and
10 other provisions are appropriate and necessary to control the discharge of pollutants [citation
11 omitted].” (*City of Rancho Cucamonga v. Regional Water Quality Control Bd.-Santa Ana Region*
12 (2006) 135 Cal.App.4th 1377, 1389.) However, the “Regional Board must comply with federal
13 law requiring detailed conditions for NPDES permits.” (*Ibid.*) Further, it is because of the
14 unique nature of the federal municipal storm water program that the U.S. EPA expects individual
15 permit writers to develop the practices that reflect the maximum extent practicable standard on a
16 permit-by-permit basis. (*Natural Resources Defense Council, Inc. v. U.S. E.P.A., supra*, 966 F.2d
17 at p. 1308, n. 17; see also, 55 Fed.Reg. 47990, 48043.)

18 The NPDES permit that was issued to the County of San Diego is the best measure of what
19 is required to comply with the federally mandated maximum extent practicable standard.
20 Consistent with federal law, the permit makes clear that it is intended to reduce the discharge of
21 pollutants in storm water in the County of San Diego to the maximum extent practicable under
22 the Clean Water Act. (AR 3527.) The permit states:

23 *This Order specifies requirements necessary for the Copermittees to reduce the*
24 *discharge of pollutants in urban runoff to the maximum extent practicable (MEP).*
25 However, since MEP is a dynamic performance standard which evolves over time as
26 urban runoff management knowledge increases, the Copermittees’ urban runoff
27 management programs’ must continually be assessed and modified to incorporate
28 improved programs, control measures, best management practices (BMPs), etc. in
 order to achieve the evolving MEP standard. Absent evidence to the contrary, this
 continual assessment, revision, and improvement or urban runoff management

///

1 program implementation is expected to ultimately achieve compliance with water
2 quality standards.

3 (AR 255, emphasis added.)

4 The permit requirements, taken as a whole rather than individually, “are necessary to
5 improve Copermittees’ efforts to reduce the discharge of pollutants to the MEP and achieve water
6 quality standards.” (AR 255-256.) “Pollutants can be effectively reduced in urban runoff by the
7 application of a combination of pollution prevention, source control, and treatment control
8 BMPs.” (AR 256.) The permit provides the County of San Diego the flexibility to substitute
9 another best management practice, if proposed modification complies with all discharge
10 prohibitions.” (AR 325.)

11 The foregoing findings that the permit reflects the maximum extent practicable standard are
12 not idle ruminations from an administrative agency. Instead, those findings and requirements are
13 the expert conclusions of the principal state agency charged with implementing the NPDES
14 program in San Diego County. (Wat. Code, §§ 13001, 13200.) Courts have recognized that the
15 regional boards are entitled to considerable deference on the statutes they implement, especially
16 in the area of storm water regulation. (*County of Los Angeles v. California State Water*
17 *Resources Control Bd.* (2006) 143 Cal.App.4th 985, 997 [“we defer to the regional board’s
18 expertise in construing language which is not clearly defined in statutes involving pollutant
19 discharge into storm drain sewer systems”]; *City of Rancho Cucamonga, supra*, 135 Cal.App.4th
20 at p. 1384; *Building Industry Ass’n of San Diego County, supra*, 124 Cal.App.4th at p. 879.) The
21 Commission cannot disregard the Regional Board’s conclusions and find that the permit exceeds
22 the federal requirements. It is the Board’s prerogative, not the Commission’s, to ensure that the
23 permit meets federal requirements.

24 Further, the Regional Board’s findings are entitled to preclusive effect. The Regional
25 Board found the permit “specifies requirements necessary for the Copermittees to reduce the
26 discharge of pollutants in urban runoff to the maximum extent practicable (MEP).” (AR 255.)
27 This expert conclusion was not challenged in court. Further, that conclusion may no longer be
28 challenged in superior court. (Wat. Code, § 13330, subd. (d).) An administrative agency’s

1 adjudicative decision, such as the permit, has preclusive effect for purposes of subsequent
2 administrative and judicial proceedings. (*People v. Sims* (1982) 32 Cal.3d 468, 489-90; *cf.*
3 *Pacific Lumber Co. v. State Water Resources Control Bd.* (2006) 37 Cal.4th 921, 944 [noting the
4 absence of a judicial character to certain Forest Practices Act proceedings].) Here, the Regional
5 Board's decision was judicial in nature, subject to procedural protections of the Administrative
6 Procedures Act, and had a clear process for administrative and judicial resolution. (See, *City of*
7 *Rancho Cucamonga v. Regional Water Quality Control Bd.-Santa Ana Region, supra*,
8 135 Cal.App.4th at p. 1385; Wat. Code, § 13330.) The Regional Board found that the permit was
9 necessary to satisfy the federal maximum extent practicable standard. That is the pivotal issue in
10 whether the permit exceeds the requirements of federal law. The County of San Diego cannot
11 collaterally attack the Regional Board's findings either before the Commission or in superior
12 court.

13 **B. The Commission Incorrectly Construed the Nature of the Federal Mandate.**

14 Congress established the maximum extent practicable standard because municipal storm
15 water runoff, unlike other pollutant discharges, could not be adequately addressed by blanket
16 effluent limitations. (*Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at
17 p. 884.) Numeric effluent limitations may be infeasible and administratively burdensome when
18 addressing municipal urban storm water runoff due to the physical difference between runoff and
19 other pollutants. (*Ibid.*) Congress determined that the maximum extent practicable standard is a
20 "necessary and workable enforcement mechanism to achieving the goals of the Clean Water Act."
21 (*Ibid.*) Specifically, the permit explains that the maximum extent practicable standard is a
22 flexible standard and changes as water quality issues evolve. It states:

23 The [maximum extent practicable standard is a] technology-based standard
24 established by Congress in CWA section 402(p)(3)(B)(iii) that operators of MS4s
25 must meet. Technology-based standards establish the level of pollutant reductions
26 that dischargers must achieve, typically by treatment or by a combination of source
27 control and treatment control BMPs. MEP generally emphasizes pollution prevention
28 and source control BMPs primarily (as the first line of defense) in combination with
treatment methods serving as a backup (additional line of defense). MEP considers
economics and is generally, but not necessarily, less stringent than BAT. *A definition
for MEP is not provided either in the statute or in the regulations. Instead the
definition if MEP is dynamic and will be defined by the following process over time:
municipalities propose their definition of MEP by way of their urban runoff*

1 *management programs. Their collective and individual activities conducted pursuant*
2 *to the urban runoff management programs becomes their proposal for MEP as it*
3 *applies both to their overall effort, as well as to specific activities (e.g., MEP for*
 street sweeping, or MEP for MS4 maintenance). In the absence of a proposal
 acceptable to the Regional Board, the Regional Board defines MEP.

4 (AR 343-345, emphasis added.)

5 Rather than addressing whether the NPDES permit exceeded the maximum extent
6 practicable standard imposed by federal law, the Commission's analysis ignored that standard
7 altogether. Instead, the Commission looked only to whether federal law required the *particular*
8 *measures* specified in the County of San Diego's permit. However, the Clean Water Act's
9 NPDES permit system requires the permitting agency, typically state agencies, to develop
10 standards based on the unique conditions of particular waterways. Thus, the maximum extent
11 practicable standard is necessarily flexible, rather than a one-size-fits-all standard, and
12 contemplates that specific measures will be implemented to meet the unique requirements of any
13 particular waterway and water quality. (*Building Industry Ass'n of San Diego County, supra*,
14 124 Cal.App.4th at p. 874.) The Commission's analysis erroneously assumes that whenever the
15 federal government imposes a standard that allows an individualized approach to be taken to meet
16 federal requirements, there can be no federal mandate, and any act taken by the state to
17 implement the federal standard is a state mandate. The law is otherwise.

18 While the Commission may be considered an expert in mandates law, it is certainly not an
19 expert in applying and interpreting the Clean Water Act. The court should defer to the Regional
20 Board's determination that the permit is consistent with the maximum extent practicable standard.
21 (*Divers' Environmental Conservation Organization v. State Water Resources Control Bd.* (2006)
22 145 Cal.App.4th 246, 252 [courts must defer to an administrative agency's interpretation of a
23 statute or regulation involving its area of expertise]; see also *ante*, pp. 22-23 [discussing prior
24 litigation].)

25 Finally, the Commission's reliance on *Long Beach School Dist. v. State of California* (1990)
26 225 Cal.App.3d 155 is misplaced. In *Long Beach*, the court considered whether a state executive
27 order involving school desegregation constituted a state mandate. The court held that the
28 executive order required school districts to provide a higher level of service than required by the

1 federal constitution or case law because state requirements went beyond federal requirements. (*Id.*
2 at p. 173.) This reasoning was based on the absence of any federal law that specified how the
3 schools should implement their desegregation plans. (*Ibid.*) Here, there is federal law on point --
4 the maximum extent practicable standard -- that directly applies to the County of San Diego.
5 Moreover, the U.S. EPA has provided substantial guidance on how that federal law is to be
6 implemented, and it expressly required NPDES permitting agencies to specify in NPDES permits
7 the controls necessary to implement the federal standard. (40 C.F.R. § 122.26; *Natural Resources*
8 *Defense Council, Inc. v. U.S. E.P.A.*, *supra*, 966 F.2d at p. 1308, n. 17; see also,
9 55 Fed.Reg. 47990, 48043.) Thus, unlike the situation in *Long Beach School District*, *supra*, here
10 the federal government has specified a roadmap for compliance with the federal laws and
11 regulations at issue.

12 The same is true in *San Diego Unified School Dist.*, *supra*, where the Supreme Court found
13 that the state law exceeded federal due process requirements, because the state law required
14 expulsion recommendations or expulsion for firearm possession beyond federal law.
15 (33 Cal.4th at p. 880.)

16 Based on the foregoing, it is clear that the maximum extent practicable standard is imposed
17 on the County of San Diego under a federal mandate -- the Clean Water Act -- and the permit
18 issued pursuant to this federal mandate is thus not reimbursable under article XIII B, section 6.
19 The Commission's decision to the contrary in this regard should be reversed as a matter of law.

20 **IV. THE CLAIMED ACTIVITIES DO NOT EXCEED THE MAXIMUM EXTENT PRACTICABLE**
21 **STANDARD.**¹⁴

22 **A. Land Use Planning for Redevelopment and Significant Redevelopment to**
23 **Prevent the Discharge of Pollutants into Waterways.**

24 **1. Hydromodification Management Plan**

25 The permit imposes requirements for the control of hydromodification or the erosion of
26 downstream channels caused by changes in runoff resulting from development and urbanization.
27 (AR 275-278.) The Hydromodification Management Plan is necessary to meet the maximum
28

¹⁴ Because many of the legal arguments addressing the Clean Water Act's maximum extent practicable standard are the same for all of the permit requirements, the arguments referenced in the first few requirements apply equally to all of the remaining permit requirements and have not been repeated.

1 extent practicable standard imposed on the County of San Diego under the Clean Water Act, and
2 the Commission has not cited any contradicting evidence. Instead, the Commission found that
3 because the Plan or concept of hydromodification is not expressly set forth in detail in federal law,
4 it must somehow exceed the maximum extent practicable standard. (AR 3866.) However, as
5 explained above, the maximum extent practicable standard requires flexible, best management
6 practices, to eliminate or reduce the discharge of pollutants in storm water or runoff through MS4.
7 (33 U.S.C. § 1342(p)(3)(B); 40 C.F.R. § 122.26 (d)(2)(iv).) The Clean Water Act need not, nor
8 could it in all practicality, set forth a specific plan for addressing the impact of downstream
9 erosion from runoff from development and urbanization for each specific waterway in order to
10 require its implementation under the maximum extent practicable standard.

11 Runoff from newly developed areas can produce erosive flows in channels under rainfall
12 conditions that previously did not exist. (AR 432.) As the total area of impervious surfaces
13 increases from development, infiltration of rainfall decreases, causing more water to runoff the
14 surface at a higher rate. (AR 432.) Among other things, this increase in runoff can adversely
15 affect water quality, leading to the discharges of pollutants in the nearby waterways. The
16 Regional Board reached this conclusion in its quasi-judicial permitting proceeding, specifically
17 finding that the permit requirements, taken as a whole, reflect the maximum extent practicable
18 standard. (AR 259-261.) Designing, implementing, and monitoring a Hydromodification
19 Management Plan will help prevent runoff from new development and urbanization and will
20 decrease pollutants from escaping into the water to the maximum extent practicable. (*Building*
21 *Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at p. 889 [“practicable does not
22 necessarily mean the most that can possibly be done”].) And, as discussed above, it is not the
23 Commission’s place to determine what activities meet the maximum extent practicable standard.
24 That expertise lies with the Regional Board. (*County of Los Angeles v. California State Water*
25 *Resources Control Bd., supra*, 143 Cal.App.4th at p. 997; *Divers’ Environmental Conservation*
26 *Organization, supra*, 145 Cal.App.4th at p. 252.)

27 Federal law also requires a comprehensive master plan to address storm water runoff from
28 new development and significant redevelopment as follows:

1 [The plan should include a] description of planning procedures including a
2 comprehensive master plan to develop, implement and enforce controls to reduce the
3 discharge of pollutants from municipal separate storm sewers which receive
4 discharges from areas of new development and significant redevelopment. Such plan
5 shall address controls to reduce pollutants in discharges from municipal separate
6 storm sewers after construction is completed.

7 (40 C.F.R. § 122.26 (d)(2)(iv)(A)(2).) And regulating the flow of runoff is authorized by the
8 Clean Water Act. (*PUD No.1 v. Washington Department of Ecology* (1994) 511 U.S. 700, 714-
9 715.)

10 The restrictions on effluent flows are also supported by the U.S. EPA in the Preamble to the
11 Phase II federal storm water regulations, which states:

12 EPA intends to prevent water quality impacts resulting from increased discharges of
13 pollutants, which may result from increased volume of runoff. In many cases,
14 consideration of the increased flow rate, velocity and energy of storm water
15 discharges following development unavoidably must be taken into consideration in
16 order to reduce the discharge of pollutants, to meet water quality standards and to
17 prevent degradation of receiving streams. EPA recommends that municipalities
18 consider these factors when developing their post-construction storm water
19 management program.

20 (64 Fed. Reg. 68761.)

21 The County of San Diego has implicitly conceded that the Clean Water Act requires that
22 steps be taken to prevent downstream erosion from runoff from new development or significant
23 redevelopment. The County's own proposal or application recommends various activities to
24 address downstream erosion and the discharge of pollutants into the nation's water as follows:

- 25 ● Re-issued permit should require improved procedures for analyzing downstream
26 conditions of concern, including developing minimum criteria for conducting an
27 analysis of downstream conditions, analyzing downstream conditions of concern, and
28 developing methodologies for addressing such areas of concern. (AR 2197-2199.)
- Priority projects should "prepare a project-specific drainage study demonstrating that
discharge flow rates, and velocities from a 2-year and 10-year, 24-hour rainfall event
will not significantly impact downstream erosion or stream habitat." (AR 2197.)
- Project applicants should demonstrate that the project will not cause significant
adverse impacts on downstream erosion or stream habitat or that the impact has been
mitigated. (AR 2197.)

- 1 • Drainage studies must be conducted to determine the regional effect of a detention
2 basin, if storm water detention is used to mitigate significant impacts to downstream
erosion or stream habitat. (AR 2197-2199.)
- 3 • “[I]dentify multiple methods to address identified downstream conditions of concern.
4 Examples of such methods include: detention; implementation of site design, source
5 control (such as LID controls) or treatment control BMPS that would mitigate the
6 potential impacts; project compliance with a jurisdictionally approved master
drainage plan (or similar plan) or similar method acceptable to the Copermittee.”

7 (AR 2199.)

8 *County of Los Angeles v. Commission on State Mandates* (1995) 32 Cal.App.4th 805
9 presented similar circumstances regarding the effect of federal law on local government. In that
10 case, the county asserted that funds expended under Penal Code section 987.9, which required
11 counties to provide indigent criminal defendants with defense funds for ancillary investigation
12 services, constituted a reimbursable state mandate. The Court of Appeal disagreed, finding
13 instead that the Penal Code section merely implements the requirements of federal constitutional
14 law, and that “even in the absence of [Penal Code] section 987.9, . . . counties would be
15 responsible for providing ancillary services under the constitutional guarantees of due process . . .
16 and under the Sixth Amendment. . . .” (*Id.* at p. 815.)

17 Since the Hydromodification Management Plan in the permit is within the maximum extent
18 practicable standard under the Clean Water Act, as the County of San Diego itself concedes, as a
19 matter of law it is imposed by federal law, not state law, and is not a state mandate subject to
20 reimbursement under article XIII B, section 6, of the California Constitution.

21 **2. Low Impact Development and SUSMP Updates**

22 Similar to the Hydromodification Management Plan discussed above, this portion of the
23 permit pertains to reducing urban storm water runoff in land use planning for new development
24 and significant redevelopment through Low Impact Development strategies and updating storm
25 water mitigation plans accordingly. (AR 269-271.) The same management practices that support
26 the implementation of a Hydromodification Management Plan also support the development of
27 low impact strategies to avoid downstream erosion. Municipalities such as the County of San
28 Diego are required to implement controls to reduce pollutants in urban runoff from new

1 development and significant redevelopment, construction, and commercial, residential, industrial
2 and municipal land use activities. (40 C.F.R. § 122.26 (d)(2)(iv)(A)-(D).)

3 Requiring the development and updating of Low Impact Development best management
4 practices to reduce pollutants in storm water runoff from new development and significant
5 redevelopment is within the maximum extent practicable standard imposed on the County of San
6 Diego by the Clean Water Act. Such strategies confirm that best management practices are being
7 effectively implemented in compliance with federal law.

8 The County of San Diego must have understood the importance of Low Impact
9 Development strategies because the proposed permit recommended their development and
10 implementation. According to the proposed permit, Low Impact Development BMPs “might be
11 given increased emphasis in future program requirements.” (AR 2193.) “Site design and source
12 control solutions are often more effective than many types of structural treatment for protecting
13 water quality since design considerations eliminate the necessity of addressing sources of
14 pollution, rather than attempting to remove a percentage of the pollution after it has entered
15 stormwater runoff.” (AR 2193.) In addition, the County acknowledged in its application that
16 “LID controls may often be more effective than conventional structure treatment controls because
17 maintenance is more assured (due to decreased maintenance requirement and because the
18 maintenance is incorporated into the normal operations of a site, such as landscape
19 maintenance).” (AR 2193)

20 Rather than addressing whether the permit’s Low Impact Development best management
21 practices and strategies exceed the federal maximum extent practicable standard, the Commission
22 simply concluded that they did, because said requirements are not expressly stated in federal law.
23 (AR 3873.) For the reasons explained above, the Commission’s analysis is fundamentally flawed,
24 would result in bad policy, and must be reversed.

25 **B. Street Sweeping and Maintenance and Cleaning of Storm Sewer Systems**

26 The street sweeping portion of the permit requires the implementation and monitoring of
27 “a program to sweep improved (possessing a curb and gutter) municipal roads, streets, highways,
28 and parking facilities” at certain times depending on the volume of litter and debris generated.

1 (AR 284.) It generally includes identifying the distance of the street sweeping as well as the
2 related frequency of sweeping, the total distance of curb-miles swept, the number of municipal
3 parking lots swept and the frequency of sweeping, and the total amount of materials collected
4 from the street and parking lot sweeping. (AR 318.)

5 In addition to the maximum extent practicable standard under the Clean Water Act, best
6 management practices under federal law require dischargers to adopt plans “to reduce the
7 discharge of pollutants to the maximum extent practicable using management practices, control
8 techniques and system, design and engineering methods, and such other provisions which are
9 appropriate.” (40 C.F.R. § 122.26 (d)(2)(iv).) Other federal regulations also require dischargers
10 to address activities such as street sweeping in their permits to reduce the discharge of pollutants
11 through MS4s as follows:

- 12 ● “A description of practices *for operating and maintaining public streets, roads and*
13 *highways and procedures for reducing the impact on receiving waters of discharges*
14 *from municipal storm sewer systems, including pollutants discharged as a result of*
deicing activities.” (40 C.F.R. § 122.26 (d)(2)(iv)(A)(3), emphasis added.)
- 15 ● “A description of maintenance activities and a maintenance schedule for structural
16 controls to reduce pollutants (including floatables) in discharges from municipal
separate storm sewers.” (40 C.F.R. § 122.26 (d)(2)(iv)(A)(1).)
- 17 ● “A description of a program to reduce to the maximum extent practicable, pollutants
18 in discharges from municipal separate storm sewers associated with the application of
19 pesticides, herbicides and fertilizer which will include, as appropriate, controls such
20 as educational activities, permits, certifications and other measures for commercial
applicators and distributors, and controls for application in public right-of-ways and
at municipal facilities.” (40 C.F.R. § 122.26 (d)(2)(iv)(A)(6).)

21 If litter and debris are left to pile up on roads and parking facilities, the downstream effect
22 is the introduction of pollutants into the MS4 or drain systems, leading to the discharges of
23 pollutants in the nearby waterways. Without question, street sweeping will help prevent this
24 known source of pollutants from escaping into the water. To claim otherwise defies common
25 sense. Indeed, the County of San Diego agreed with the Regional Board and recommended street
26 sweeping as a best management practice to reduce the discharge of pollutants from roads, streets,
27 highways, and parking facilities. (AR 2229.) While the County did not identify baseline
28

1 sweeping or reporting, and merely recommended street sweeping be addressed on an as-needed
2 basis determined by the discharger, the state is not required to adopt the less stringent practicable
3 standard, but rather the maximum extent practicable. (AR 2229.)

4 The Commission did not dispute the above, but relied on its fallback position that street
5 sweeping is not a federal mandate because it is not expressly specified in federal law. (AR 3879.)
6 As discussed above, to find a federal mandate does not require an explicit mention of every
7 mandated activity required to comply with federal law.

8 The above analysis applies equally to the requirement that each Copermittee “implement a
9 schedule of maintenance activities at all structural controls designed to reduce pollutant
10 discharges to or from its MS4 and related drainage structures.” (AR 1595.) The maintenance
11 activities included, at a minimum, inspection and removal of waste, additional cleaning, record
12 keeping, proper disposal of waste, and measures to eliminate waste discharge during MS4
13 maintenance and cleaning activities. (AR 1596.) Federal regulations and common sense dictate
14 that cleaning and maintaining MS4s on a regular basis reduces the discharge of pollutants to the
15 nearby waterways. If not, the County of San Diego would not have recommended the continued
16 maintenance and cleaning of MS4s. (AR 2229.) And instead of addressing the maximum extent
17 practicable standard or citing to any evidence contradicting that MS4 maintenance and cleaning
18 fall outside this standard, the Commission summarily concluded that this requirement was not a
19 federal mandate because it is not expressly provided for in the Clean Water Act or its
20 implementing regulations. (AR 3880-3881.)

21 For these reasons, street sweeping and maintaining and cleaning MS4s to reduce the
22 discharge of pollutants through MS4 to nearby waterways do not exceed the maximum extent
23 practicable standard under the Clean Water Act. These activities are mandated by federal law and
24 do not require state subvention.

25 **C. Public Education of Impact of Urban Runoff**

26 This part of the permit generally requires an education program to increase the “knowledge
27 of the target communities regarding MS4s, impacts of urban runoff on receiving waters, and
28 potential BMP solutions for the target audience” and to “change the behavior of target

1 communities and thereby reduce pollutant releases to MS4s and the environment.” (AR 293-294.)
2 Target communities basically encompass the public at large and various subsets. (AR 294.)
3 Public education on the impact of urban runoff is consistent with the Clean Water Act’s
4 maximum extent practicable standard. (33 U.S.C. § 1342(p)(3)(B); 40 C.F.R. § 122.26 (d)(2)(iv).)
5 Indeed, education and knowledge about urban runoff and its effect on water quality go a long way
6 in preventing pollutants from entering the MS4s and ultimately the nation’s waterways.

7 Federal regulations provide for management practices to educate the public on the impact
8 of urban runoff on water quality and generally include “educational activities, public information
9 activities, and other appropriate activities to facilitate the proper management and disposal of
10 used oil and toxic materials” (40 C.F.R. § 122.26 (d)(2)(iv)(A)(6)), “educational programs to
11 promote, publicize, and facilitate public reporting of the presence of illicit discharges or water
12 quality impacts associated with discharges from municipal separate storm sewers” (*id.*,
13 § 122.26 (d)(2)(iv)(A)(5)), and “educational and training measures for construction site
14 operators” (*id.*, § 122.26 (d)(2)(iv)(D)(4)).

15 The County of San Diego cannot reasonably dispute that the education component is within
16 the maximum extent practicable standard because their proposed permit also addressed public
17 education. Consistent with the permit that was issued, the County proposed the education of
18 target communities regarding the impact of MS4s on receiving waters and potential BMP
19 solutions, and changing the behavior of target communities to reduce pollutant releases to MS4s
20 and the environment. (AR 1602.) The proposal went on to make additional recommendations
21 such as focusing education on the highest priorities, ensuring the most efficient use of educational
22 resources, measuring progress and effectiveness, regional education program planning, and
23 requirements to educate quasi-governmental entities. (AR 2261-2273.)

24 The Commission did not even attempt to reconcile the education component in the permit
25 with the maximum extent practicable standard. It simply concluded that the education
26 requirements are not expressly stated in federal law and thus must be a state mandate. (AR 3885.)
27 Once again, this flawed analysis is too narrow and fails to understand the requirements of the
28 Clean Water Act or to defer to the Regional Board’s expertise in understanding the same.

1 **D. Watershed Urban Runoff Management Program and Regional Urban**
2 **Runoff Management Program**

3 The Watershed Urban Runoff Management Program part of the permit divides the
4 Copermittees into nine management areas by “major receiving bodies” and requires them “to
5 develop and implement an updated Watershed Urban Runoff Management Program for each
6 watershed.” (AR 296-297.) Specifically, each program must reduce the discharge of pollutants
7 from the MS4 to the maximum extent practicable standard under the Clean Water Act. (AR 297.)
8 The specific programs should include elements such as lead watershed permittee identification,
9 watershed map, watershed water quality assessment, watershed-based land use planning,
10 watershed strategy, watershed activities, Copermittee collaboration, public participation, and
11 review and updates of the programs. (AR 297-300.)

12 Permits can be issued either separately or on a system-wide, jurisdiction-wide, watershed or
13 other basis. (40 C.F.R. § 122.26 (a)(3)(ii).) Permits “may specify different conditions relating to
14 different discharges covered by the permit, including different management programs for
15 different drainage areas which contribute storm water to the system.” (40 C.F.R. § 122.26
16 (a)(3)(v).) “Proposed programs may impose controls on a systemwide basis, a watershed basis, a
17 jurisdiction basis, or on individual outfalls.” (40 C.F.R. § 122.26 (d)(2)(iv).)

18 Because the watershed-based management program is based on federal law and within the
19 maximum extent practicable standard to reduce the discharge of pollutants through MS4s, the
20 County of San Diego agreed that such a program should be part of the permit. (AR 2161-2181.)
21 The County made recommendations related to watershed permitting approach, identification or
22 watershed water quality assessment data, identification of priority watershed pollutants and issues,
23 identification of known pollutant sources, watershed coordination, and identification of watershed
24 activities and education activities. (AR 2161-2181.)

25 Similar to the watershed-based program, the Regional Urban Runoff Management Program
26 part of the permit requiring Copermittees “to develop, implement, and update as necessary a
27 Regional Urban Management Program” is also within the scope of the maximum extent
28 practicable standard and its implanting regulations. (AR 300.) The program must “reduce the

1 discharge of pollutants from the MS4 to the MEP, and prevent urban runoff discharges from the
2 MS4 from causing or contributing to a violation of water quality standards.” (AR 300.) At a
3 minimum, the program must address the development and implementation of a Regional
4 Residential Education Program, which includes pollutant specific education, development of a
5 standard fiscal analysis for the educational program, and the assessment of the effectiveness of
6 jurisdictional, watershed, and regional programs. (AR 300.)

7 The County of San Diego’s permit proposal focused on an educational aspect and identified
8 residential sources of pollution as their highest regional priority, and public education as the most
9 important component of their program. (AR 2255.) The proposal recommends that efforts “must
10 also be expended on better defining the links between residential activities and water quality and
11 if necessary, development of alternative strategies to better address these sources of residential
12 pollution. (AR 2255.)

13 As mentioned throughout this brief, it is of no consequence that the watershed and regional
14 residential programs are not expressly provided for in federal law or that the requirements go
15 beyond the specific activities proposed by the County of San Diego. The maximum extent
16 practicable standard is a flexible standard. The Regional Board had the discretion to determine
17 that the programs are within the standard, and the Commission has no basis to conclude otherwise
18 simply because the requirements are not spelled out in a federal statute or regulation. (AR 3896,
19 3902, 3904.) Thus, the watershed and regional education programs are required by federal law
20 and are not a state mandate subject to reimbursement.

21 **E. Program Effectiveness Assessment**

22 This part of the permit requires each Copermittee to annually assess the effectiveness of the
23 above jurisdictional, watershed, and regional urban runoff programs, and there are specific
24 assessment requirements for each program. (AR 302-306.) Additionally, the permit requires that
25 “[e]ach Copermittee shall collaborate with the other Copermittees to develop a Long Term
26 Effectiveness Assessment (LTEA), which shall build on the results of the Copermittees’ August
27 2005 Baseline LTEA.” (AR-307.) The LTEA should be designed to meet many specified
28

1 objectives related to the jurisdictional, watershed, and regional effectiveness assessments.
2 (AR 307.)

3 The maximum extent practicable standard in the Clean Water Act and its implementing
4 regulations require dischargers like the County of San Diego to assess the effectiveness of their
5 water quality programs. A proposed management program must be comprehensive “to reduce the
6 discharge of pollutants to the maximum extent practicable using management practices, control
7 techniques and system, design and engineering methods, and *such other provisions which are*
8 *appropriate.*” (40 C.F.R. § 122.26 (d)(2)(v), emphasis added.) And Copermittees must estimate
9 “reductions in loadings of pollutants from discharges of municipal storm sewer constituents from
10 municipal storm sewer systems expected as the result of the municipal storm water quality
11 management program. The assessment shall also identify known impacts of storm water controls
12 on ground water.” (40 C.F.R. § 122.26 (d)(2)(iv).)

13 It would make little sense for federal law to require water quality management programs to
14 assess their effectiveness through best management practices, but then to exclude the assessment
15 of the effectiveness of these programs on either a short-term or long-term basis. As such, the
16 County of San Diego recommended the continued short-term and long-term effectiveness
17 assessment of jurisdictional, watershed, and regional urban runoff programs. (AR 2312, 2323-
18 2325.)

19 The Commission agrees that effectiveness assessments are part of federal law but does not
20 agree with the “details” in the permit, claiming once again that if the permit requirements are not
21 expressly provided for in federal law, they are state mandates. (AR 3907.) The Commission is
22 wrong. The permit requirements are federal mandates and not subject to state subvention.

23 **F. Collaboration Among Copermittees**

24 This part of the permit requires Copermittees to collaborate to “address common issues,
25 promote consistency among Jurisdictional Urban Runoff Management Programs and Watershed
26 Urban Runoff Management Programs, and to plan and coordinate activities required under this
27 Order.” (AR 325.) This includes developing a Memorandum of Understanding that defines
28 Copermittees’ responsibilities, establishes a management structure and standards for conducting

1 meetings, provides guidelines for work groups, lays out the process for non-compliance issues,
2 and includes all other collaborative agreements for compliance with the permit. (AR 326.)

3 Federal law requires “control through interagency agreements among coapplicants the
4 contribution of pollutants from one portion of the municipal system to another portion of the
5 municipal system.” (40 C.F.R. § 122.26 (d)(2)(i)(D).) The Copermittees have been collaborating
6 and working together under a memorandum of understanding since at least the time the 2001
7 NPDES permit was issued. (AR 1614.) And consistent with the 2001 NPDES permit, the
8 County of San Diego in its permit proposal recommended the continued collaboration among the
9 Copermittees and listed the following general areas of recommended Copermittee collaboration:
10 water quality assessment, source identification and prioritization, establishment of program
11 requirements (BMPs and discharge prohibitions), strategies for program implementation, and
12 reporting and assessment. (AR 2157.) It also recommended the continued use of a memorandum
13 of understanding and the formal establishment of subcommittees and working bodies to address
14 budget and fiscal issues, data collection, management, and analysis, regional watershed activities,
15 and source management programs. (AR 2157.)

16 This collaborative approach to managing and addressing common water quality issues falls
17 squarely within the maximum extent practicable standard in the Clean Water Act to prevent the
18 discharge of pollutants through MS4 to nearby waterways. But despite this continued agreed-
19 upon practice to implement federal law, the Commission still found a state mandate because the
20 specific contents of the memorandum of understanding are not expressly provided for in federal
21 law. (AR 3918.) This is an incorrect application of federal law. The permit requirements are not
22 state mandates.

23 **V. THE PERMIT AS A WHOLE AND THE CLAIMED MANDATED ACTIVITIES DO NOT**
24 **IMPOSE A NEW PROGRAM OR HIGHER LEVEL OF SERVICE.**

25 The Commission essentially found that the certain permit requirements were new because
26 they were not required by the previous permit issued to the County of San Diego, and that they
27 were a program because the requirements were only imposed on the County of San Diego.
28 (AR 5603-5604; see *Carmel Valley Fire Protection v. State of California* (1987) 190 Cal.App.3d,

1 521, 537.) Such a narrow focus is not supported by law. Instead, a holistic approach must be
2 taken by the Commission, while giving appropriate deference to the Regional Board. The
3 relevant “requirement” for purpose of state mandates law is the federal requirement that the
4 discharge of pollutants from a MS4 for a population the size of the County of San Diego requires
5 an NPDES permit. This permit must include, under federal law, “controls to reduce the discharge
6 of pollutants to the maximum extent practicable.” (33 U.S.C. §1342 (p)(3)(B).) This requirement
7 is not new and is imposed on all entities that own or operate a municipal separate storm sewer
8 system. (*Ibid.*) Thus, there is no new program or higher level of service, and therefore no state
9 mandate. The Commission’s decision to the contrary should be reversed.

10 However, even if the court were to adopt the Commission’s analysis and look to the
11 challenged permit requirements themselves, those requirements were part of the 2001 NPDES
12 permit and thus were not subject to reimbursement under article XIII B, section 6. The
13 Commission itself found that many of the permit requirements were found in the 2001 permit.
14 (AR 3871, 3875, 3878, 3880, 3889-3890, 3898-3899, 3905, 3911, 3918.) But it also found that
15 certain requirements were “new” because they were not expressly provided for in the 2001
16 NPDES permit. (AR 3871-3872, 3875-3876, 3877, 3880, 3893-3894, 3899-3900, 3905, 3911-
17 3912, 3915, 3919-3920.)¹⁵ As with the federal analysis above, the Commission’s focus is too
18 narrow and is not workable. NPDES permits must be assessed as a whole, given the maximum
19 extent practicable standard that applies throughout.

20 All of the permit requirements in the 2001 NPDES permit were intended to implement the
21 maximum extent practicable standard in the Clean Water Act. (See *Building Industry Ass’n of*
22 *San Diego County, supra*, 124 Cal.App.4th at p. 866 [2001 NPDES permit requirements did not
23 exceed the Clean Water Act’s maximum extent practicable standard].) The maximum extent
24 practicable standard requires flexible, best management practices to eliminate or reduce the
25 discharge of pollutants in storm water or runoff through MS4s. (33 U.S.C. § 1342(p)(3)(B).) The

26 _____
27 ¹⁵ For a more specific comparison of the permit requirements and the corresponding 2001
28 NPDES permit requirements, please see the summary of both permits in the Background section
of this brief.

1 Regional Board has the authority to determine what requirements meet the maximum extent
2 practicable standard. (*County of Los Angeles v. California State Water Resources Control Bd.*,
3 *supra*, 143 Cal.App.4th at p. 997; *Divers' Environmental Conservation Organization, supra*,
4 145 Cal.App.4th at p. 252.) Merely adjusting the requirements of the 2001 NPDES permit to
5 present circumstances to ensure that this standard is met does not impose a new program. Indeed,
6 when an NPDES permit is renewed, reissued or modified, it generally must be at least as stringent
7 as the prior permit. (33 U.S.C. § 1342 (o); 40 C.F.R. 122.44 (l).) This is consistent with
8 Congress' intent that state management programs evolve based on changing conditions from
9 program development and implementation and corresponding improvements in water quality.
10 (55 Fed.Reg. 47990, 48,052.) The Regional Board's focus is always on complying with the
11 federal standard. The Commission's analysis applies state mandates law in an overly technical,
12 myopic manner that disregards the essential nature of the Regional Board's job.

13 Because the challenged permit requirements are generally found in the 2001NPDES permit,
14 the specific requirements are not "new," and the Commission's findings to the contrary should be
15 reversed.

16 **VI. THE COUNTY OF SAN DIEGO HAS FEE AUTHORITY TO PAY FOR THE CLAIMED**
17 **MANDATED PERMIT REQUIREMENTS.**

18 Under Government Code section 17556, subdivision (d), a state mandate is not subject to
19 reimbursement if the local agency has the authority to charge a fee. Specifically, subdivision (d)
20 provides that a state mandate does not exist if:

21 The local agency or school district *has the authority* to levy service charges, fees, or
22 assessments sufficient to pay for the mandated program or increased level of service.
23 This subdivision applies regardless of whether the authority to levy charges, fees, or
assessments was enacted or adopted prior to or after the date on which the statute or
executive order was enacted or issued.

24 (Emphasis added.)

25 The Commission found that "the claimants have fee authority under the police power to
26 impose fees for the permit activities [requirements] that are a state-mandated new program or

27 ///

28 ///

1 higher level of service.” (AR 3927.) Petitioners do not challenge these findings.¹⁶ But the
2 Commission refused to apply section 17556, subdivision (d), to the claimed property related
3 permit requirements, with two exceptions.¹⁷ (AR 3929.) According to the Commission, the
4 County of San Diego has insufficient authority to impose fees for these requirements because
5 article XIII D, section 6, subdivision (e), requires voter approval for new or increased property-
6 related fees: “no property related fee or charge shall be imposed or increased unless and until that
7 fee or charge is submitted and approved by a majority vote of the property owners of the property
8 subject to the fee or charge or, at the option of the agency, by a two-thirds vote of the electorate
9 residing in the affected area.” (AR 3929.) For the reasons explained below, the Commission is
10 wrong and subdivision (e) is irrelevant to this mandates analysis.

11 “[T]he plain language of section 17556, subdivision (d), precludes reimbursement where
12 the local agency has the authority, *i.e., the right or the power, to levy fees sufficient to cover the*
13 *costs of the state-mandated program.*” (*Clovis Unified School Dist. v. Chiang* (2010)
14 188 Cal.App.4th 794, 812, quoting *Connell v. Superior Court* (1997) 59 Cal.App.4th 382, 401,
15 emphasis added.) In interpreting subdivision (d), the courts examine the existence or
16 nonexistence of fee *authority*, rather than whether it is politically *feasible* to impose a fee in each
17 instance.

18 For example, in *Connell, supra*, several water districts alleged that a state regulation
19 requiring an increased level of water purity was a state mandate. (59 Cal.App.4th 382.) The
20 Third District Court of Appeal found that Water Code section 35470 “on its face authorizes the
21 [water] districts to levy fees sufficient to pay for the costs involved in the regulatory amendment.”
22 (*Id.* at p. 398.) The water districts argued that the fee authority is not “sufficient” because it was
23 politically impracticable to impose the fees. (*Id.* at p. 401.) The court held that it was irrelevant

24 ¹⁶ The Commission also found that there was statutory fee authority to pay for street
25 cleaning and reporting under Public Resources Code section 40059 and conveyance-system
26 cleaning under Health and Safety Code section 5471. (AR 3936-3941.) Petitioners do not
27 challenge these findings. However, petitioners dispute the Commission’s findings that these
28 sections are subject to voter approval under article XIII D, section 6, subdivision (e).

¹⁷ Petitioners do not challenge the Commission’s findings that the County of San Diego
has constitutional and statutory fee authority to levy fees for the Hydromodification Management
Plan and the Low Impact Development permit requirements. (AR 3929-3935.)

1 whether it was practicable to impose the fees, rather, “[t]he question is whether the Districts have
2 authority, i.e., the right or power, to levy fees sufficient to cover the costs.” (*Ibid.*)

3 And in *Clovis, supra*, the college districts challenged the Controller’s claiming instruction
4 that automatically reduced reimbursement claims by the amount the districts are statutorily
5 authorized to charge students for health fees, even when a district chooses not to charge its
6 students those fees. (188 Cal.App.4th at p. 812.) The Third District Court of Appeal disagreed,
7 holding that “[to] the extent a local agency or school district ‘has the authority’ to charge for the
8 mandated program or increased level of service, that charge cannot be recovered as a state-
9 mandated cost.” (*Ibid.*) The court explained that “this basic principle flows from common sense
10 as well. As the Controller succinctly puts it, ‘Claimants can choose not to require these fees, but
11 not at the state’s expense.’” (*Ibid.*)

12 Here, the County of San Diego has the authority to levy fees for the claimed state-mandated
13 requirements. Whether the voters agree or disagree with a particular fee is irrelevant to this
14 analysis. The voters can choose to reject the proposed fees, but not at the state’s expense.
15 Mandates analysis has never depended on the political whims of legislative bodies or the
16 electorate.

17 By now imposing a will-of-the-voters restriction on section 17556, subdivision (d), the
18 Commission is essentially rewriting the law and adding a limitation that was not intended by the
19 Legislature. As discussed above, “the plain language of section 17556, subdivision (d), precludes
20 reimbursement where the local agency has the authority, *i.e., the right or the power, to levy fees*
21 *sufficient to cover the costs of the state-mandated program.*” (*Clovis, supra*, 188 Cal.App.4th
22 794, 812, emphasis added.) If the Legislature had intended to restrict this section to fees that
23 were ultimately approved by the electorate, it could have easily included such language in the
24 statute. It did not. And for good reason. If local legislative bodies and voters could avoid a fee
25 by simply not submitting it to the voters or voting against it, the state would always bear
26 responsibility for the costs. Such a result was not intended by the Legislature.

27 And in finding that the costs associated with the permit requirements are subject to state
28 subvention, the Commission is completely misinterpreting article XIII B, section 6. The “textual

1 and historical context [of] section 6 of article XIII B requires subvention only when the costs in
2 question can be recovered *solely from tax revenues*. (*County of Fresno v. State of California*
3 (1991) 53 Cal.3d 482, 487, emphasis in original.) Here, if the County of San Diego chooses, the
4 costs can be recovered from fees. The Commission completely ignores that article XIII B of the
5 Constitution was not intended to reach beyond taxation. (*Ibid.*)

6 Accordingly, the voter approval requirement in article XIII D, section (6), subdivision (e),
7 is not relevant to this mandates analysis. The County of San Diego has fee authority to pay for
8 the permit requirements. As such, the requirements are not subject state subvention, and the
9 Commission's decision to the contrary should be reversed.

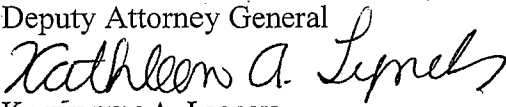

10 CONCLUSION

11 The Commission's decision finding that the claimed mandated activities are subject to
12 subvention by the state should be reversed because the NPDES permit is based on federal law, not
13 state law, and is not subject to subvention. For the same reason and for the additional reason that
14 the permit requirements are based on the 2001 NPDES permit, there is no new program or higher
15 level of service. Finally, even if this court were to find that the permit requirements are state
16 mandates, they are still not subject to reimbursement under article XIII B, section 6. The County
17 of San Diego has the necessary fee authority to impose fees for the permit requirements, and the
18 Commission's finding to the contrary should be reversed.

CONSTITUTIONAL PROVISIONS

California Constitution

Article XIII B, § 6.....	1, 7, 8
--------------------------	---------

INTRODUCTION

1
2 Federal law prohibits the County of San Diego and several cities named in the petition
3 (referred to below collectively as the “County of San Diego” or the “County”) from discharging
4 pollutants from their municipal storm sewer systems into nearby waterways unless they do so
5 under a permit issued in compliance with the National Pollutant Discharge Elimination System
6 (NPDES). The Clean Water Act requires the County of San Diego’s NPDES permit to include
7 specific requirements that reduce the discharge of pollutants from its storm drains to the
8 *maximum extent practicable*. Under article XIII B, section 6, of the California Constitution, the
9 only way this maximum extent practicable standard could constitute a state mandate would be if
10 the state *voluntarily elected* to require local agencies to implement state obligations under the
11 Clean Water Act, or if the state took action to *exceed* the Act’s maximum extent practicable
12 standard. As explained in great detail in petitioners’ opening brief, neither occurred here.

13 The Commission’s decision finding that the specific permit requirements are state mandates
14 must be reversed. Its analysis was based on a faulty assumption: that unless federal regulations
15 expressed the maximum extent practicable standard as an explicit requirement, there was no
16 federal mandate. Federal regulations and decisions make clear that the Clean Water Act’s
17 technology-forcing requirements for municipal storm water permits are flexible. The specific
18 requirements are derived on a case-by-case basis to reflect pollutant reductions to the maximum
19 extent practicable. The Regional Board previously made its determination that the permit taken
20 as a whole reflected the federal requirement.

21 While the Commission may be an expert in state mandates, it has no expertise in the field of
22 water law. The Commission erroneously failed to defer to the Regional Board’s implementation
23 of federal water quality law. More specifically, the Commission failed to defer to the Regional
24 Board’s determination that the permit as a whole and the more particular permit requirements
25 implement the Clean Water Act’s maximum extent practicable standard. Further, even if issue
26 preclusion and deference to the water board’s interpretation was not required or appropriate, the
27 Commission failed to articulate how the specific requirements exceeded the demanding *maximum*
28 *extent practicable* pollutant reduction.

1 And for the same reasons and for the additional reason that the permit requirements are
2 based on the 2001 NPDES permit issued to the County of San Diego, there is no new program or
3 higher level of service.

4 Although not a final published decision, and therefore not citeable as precedent, the Los
5 Angeles Superior Court recently addressed many of the same issues presented in this case. (See
6 *State of California Department of Finance, et al. v. County of Los Angeles et al.* (Super. Ct. Los
7 Angeles County, 2011, BS130730).¹ (Exhibit A, Court's Ruling on Petition for Writ of Mandate
8 Heard on August 10, 2011, attached to Petitioners' Request for Judicial Notice in Support of
9 Reply Brief.)

10 LEGAL ANALYSIS

11 I. THE COMMISSION'S FINDINGS THAT THE CHALLENGED PERMIT REQUIREMENTS 12 ARE STATE MANDATES PRESENT QUESTIONS OF LAW AND ARE SUBJECT TO DE 13 NOVO REVIEW.

14 Whether a statute or executive order, which includes water permits, creates a reimbursable
15 state mandate is a pure question of law. (*Connell v. Superior Court* (1997) 59 Cal.App.4th 382,
16 395; see also, *Long Beach Unified School Dist. v. State of California* (1990) 225 Cal.App.3d 155,
17 174.) And questions of law are subject to de novo review. (*City of Richmond v. Commission on*
State Mandates (1998) 64 Cal.App.4th 1190, 1105.)

18 The County of San Diego does its best to avoid this well-established standard of review, by
19 claiming that "the Commission made many factual determinations regarding the nature of the
20 2007 and 2001 Permit requirements at issue, their application to the Co-Permittees, the
21 application of the federal and state regulations in California and elsewhere." (Real Parties in
22 Interest's Memorandum of Points and Authorities in Opposition to Petition for Writ of
23 Administrative Mandamus ("Opp.") p. 16, ll. 18-20, p. 17, ll. 2-5.) It is true that in some cases,
24 findings of fact may be necessary before resolving the ultimate legal issue of whether a state
25 mandate exists. (See *County of Los Angeles v. Commission on State Mandates* (2007)

26
27 ¹ Petitioners filed a notice of related cases on November 8, 2010. The Los Angeles case
28 was originally filed in Sacramento Superior Court, Case Number 34-2010-80000605, but was
transferred to the Los Angeles Superior Court at the request of the real parties in interest.

1 150 Cal.App.4th 898, 917-918.) However, this does not mean that the court should defer to the
2 Commission's legal findings or assumptions. In the absence of evidence that the Regional Board
3 somehow exceeded the maximum extent practicable standard, the court should defer to the
4 Regional Board and conclude as a matter of law that the permit and its specific requirements are
5 federal mandates and not state mandates. While review of the Commission's factual
6 determinations proceeds under the substantial evidence test, whether a state mandate exists is still
7 a pure question of law. (See *City of Richmond, supra*, 64 Cal.App.4th at pp. 1194-1195.)

8 In *County of Los Angeles, supra*, the court noted that questions regarding whether permit
9 requirements are state mandates must first be resolved by the Commission and may present
10 factual issues. (*Id.* at pp. 917-918.) The County of San Diego reads this statement to mean that in
11 *all* cases where permit requirements are alleged to be a state mandates, the analysis involves pure
12 factual questions subject to substantial evidence review. (Opp. p. 16, ll. 25-28, p. 17, ll. 1-5.)
13 This interpretation is wrong. The County is taking the phrase "presents factual issues" out of
14 context. The court in *County of Los Angeles* did not suggest that *all* mandate determinations
15 related to permits turn on factual issues. The court merely acknowledged that factual issues *may*
16 be present. (*County of Los Angeles, supra*, 150 Cal.App.4th 918.) This statement does not wipe
17 out the de novo standard of review for determining whether a statute, regulation, or executive
18 order is a state mandate.

19 In any event, these claimed "factual findings" on the part of the Commission are pure
20 fiction created by the County of San Diego in an attempt to apply a less stringent standard of
21 review. *The Commission made no factual findings as to whether the claimed permit requirements*
22 *go beyond the maximum extent practicable standard found in the Clean Water Act.* The
23 Commission simply concluded that each challenged permit requirement was not expressly
24 provided for in federal law, and thus was a state mandate subject to subvention. Specifically, the
25 Commission found:

- 26 • Hydromodification Management Plan – "Overall, there is nothing in the federal
27 regulations that requires a municipality to adopt or implement a
28 hydromodification plan. Thus, the HMP requirement in the permit 'exceed[s]
the mandate in that federal law or regulation.'" (AR 3866.)

- 1 ● Low Impact Development - “The Commission finds nothing in the federal
2 regulations (40 C.F.R. § 122.26) that requires local agencies to collectively
3 review and update the BMP requirements listed in their SUSMPs, or to develop,
4 submit and implement ‘an updated Model SUSMP’ that defines minimum LID
5 and other BMP requirements for incorporation into the SUSMPs. Thus the LID
6 requirements in the permit ‘exceed the mandate in that federal law or
7 regulation.’” (AR 3873.)
- 8 ● Street Sweeping – While the Commission acknowledges that the “permit requires
9 activities that fall within the federal regulations [i.e., routine maintenance of public
10 streets, roads, and highways to prevent the discharge of pollutants into storm drains],”
11 it found that “the more specific requirements in the permit include variable street
12 sweeping schedules for area impacted by different amounts of trash” and “reporting
13 on the amount of trash collected, which is [are] not required by the federal
14 regulation.” (AR 3877.) “These activities ‘exceed the mandate in that federal law or
15 regulation.’” (AR 3877.)
- 16 ● Conveyance System Cleaning – “Like street sweeping, the permit requires
17 conveyance system cleaning activities that fall within the federal regulations.”
18 (AR 3880.) “Yet the permit requirements are more specific [than the federal
19 regulations].” (AR 3880.) “These activities, ‘exceed[s] the mandate in that
20 federal law or regulation.’” (AR 3881.)
- 21 ● Educational Component - “[T]he federal regulations require nonspecific
22 descriptions of educational programs, for example, requiring the permit
23 application to ‘include appropriate educational and training measures for
24 construction site operations’ and ‘controls such as educational activities.’”
25 (AR 3885.) “The permit, on the other hand, requires implementation of an
26 educational program with target communities and specific topics. These
27 requirements ‘exceed the mandate in that federal law or regulation.’”
28 (AR 3885.)
- Watershed Urban Runoff Management Program - “The Commission finds that
the permit requirements in sections E.2.f and E.2.g are not federal mandates.”
(AR 3896.) “As with the other requirements in the permit, the federal
regulations authorize but do not require the specificity regarding whether
collaboration occurs on a jurisdictional, watershed or other basis. These
requirements ‘exceed the mandate in that federal law or regulation.’”
(AR 3896.)
- Regional Urban Runoff Management Program - “The Commission finds that the
requirements in part F.1 of the permit do not constitute a federal mandate. There is
no federal requirement to provide a regional educational program, so the education
program, ‘exceed[s] the mandate in that federal law or regulation.’” (AR 3902.)

“The Commission finds that the requirements in part F.2 and F.3 of the permit do not
constitute a federal mandate. There is no federal requirement to collaborate on,
develop, or implement a Regional Urban Runoff Management Program (RURMP).
The Commission finds that these RURMP activities ‘exceed the mandate in that
federal law or regulation.’” (AR 3904.)
- Program Effectiveness Assessment - “Although the federal regulations require
assessment of controls and annual reports, they do not require the detailed
assessment in the 2007 permit. The regulations do not require, for example,
assessments of the effectiveness of each significant jurisdictional activity/BMP

1 or watershed quality activity, or the implementation of each major component
2 of the JURMP or WURMP, or identification of modifications and
3 improvements to maximize the JURMP and WURMP effectiveness. These
4 requirements, 'exceed the mandate in that federal law or regulation.'"
5 (AR 3907-3908.)

6 "Although the federal regulations require assessment controls, they do not require the
7 detailed assessment in the 2007 permit. They do not require, for example,
8 collaboration with other copermitees, addressing specified objectives or outcome
9 levels, or addressing jurisdictional, watershed, and regional programs. These
10 requirements 'exceed the mandate in that federal law or regulation.'" (AR 3913-
11 3914.)

- 12 • All Copermitee Collaboration - "The Commission finds that there is no federal
13 mandate to develop a management structure (memorandum of understanding or MOU)
14 as required by part L of the 2007 permit." (AR 3916.) "All the federal regulations
15 address is authority to establish an interagency agreement or memorandum of
16 understanding, but do not require it to be implemented or specify its contents beyond
17 'controlling . . . the contribution of pollutants from one portion of the municipal
18 system to another portion of the municipal system.'" (AR 3916.) "Thus, the permit
19 activity 'exceed[s] the mandate in that federal law or regulation.'" (AR 3916.)

20 The County of San Diego disregards that the Commission refused to make any factual
21 findings even though evidence was submitted by the claimants and interested parties. The
22 Commission simply concluded as a matter of law that the challenged permit requirements were
23 state mandates because they were not expressly provided for in federal law. Whether a statute,
24 regulation, or executive order is a state mandate is a pure question of law, and the County's
25 argument to the contrary must be rejected. (*Connell, supra*, 59 Cal.App. at p. 395.)

26 **II. THE PERMIT IS NOT A STATE MANDATE, BECAUSE CALIFORNIA MUST IMPLEMENT
27 THE FEDERAL NPDES PROGRAM AND BECAUSE THE PERMIT DOES NOT EXCEED
28 THE MAXIMUM EXTENT PRACTICABLE STANDARD IN FEDERAL LAW.**

A. The NPDES Program Is Mandated By Federal Law.

There is a two-step process to determine whether a program, or in this case, the permit, is
mandated by federal law. The first part of the analysis considers whether the state had "no real
choice in deciding whether to comply with the federal act." (*Hayes v. Commission on State
Mandates* (1992) 11 Cal.App. 4th 1563.) Relying on the Commission's analysis, the County of
San Diego asserts that "California's decision to become authorized to implement a state program
in lieu of the federal NPDES program was purely voluntary." (Opp. p. 18, ll. 1-4.) The County
and the Commission are wrong.

1 The federal Clean Water Act requires the County of San Diego to have an NPDES permit
2 for municipal storm water discharges and compels the County to reduce the discharge of
3 pollutants to the maximum extent practicable. Neither the state nor the County of San Diego has
4 a true choice in the permit or the requirement to reduce pollutants to the maximum extent
5 practicable. (*City of Sacramento v. State of California* (1990) 50 Cal.3d 51, 76.) If California did
6 not administer its own water quality program through the Porter-Cologne Act, California's
7 dischargers, both private and governmental, would still have to comply with federal law, but
8 would also be subject to direct regulation from the federal government. (See,
9 33 U.S.C. § 1362(4)-(5) [defining "person" to include "municipality," and "municipality" to
10 include public entities like the flood control district, county, and cities] and § 1342(p)(3)
11 [establishing technology standard of "maximum extent practicable" for municipal separate storm
12 sewer systems].)

13 Despite the obvious coercive nature of NPDES permits on the County of San Diego and the
14 state, the County asserts that the state's decision to *administer* the federal NPDES program was
15 voluntary because "certain and severe penalties" were not imposed upon the state. (Opp. p. 18, ll.
16 18-28, p. 19, ll. 1-7.) According to the County, the "test" for mandatory versus optional
17 compliance with federal law boils down to whether the state will incur "certain and severe federal
18 penalties," or monetary penalties. This is not the "test." In *City of Sacramento, supra*, the
19 California Supreme Court explained there is "no final test for 'mandatory' versus 'optional'
20 compliance with federal law." (50 Cal.3d at pp. 59-60.) The standard is flexible and depends on
21 a number of factors such as "the nature and purpose of the federal program; whether its design
22 suggests an intent to coerce; when state and/or local participation began; the penalties, if any,
23 assessed for withdrawal or refusal to participate or comply; and any other legal and practical
24 consequences of nonparticipation, noncompliance, or withdrawal." (*Ibid.*) As explained above
25 and in petitioners' opening brief, the NPDES program is not optional; it is coercive on the states
26 and localities in every legal and practical sense.

27 Next, the County of San Diego assumes that if the state did not issue the NPDES permit,
28 the permit would not contain the challenged requirements based on U.S. EPA-issued permits and

1 other state-issued permits. (Opp. p. 19, ll. 1-7.) This is pure conjecture and is not relevant to
2 whether the state voluntarily complies with federal law in issuing NPDES permits under article
3 XIII B, section 6.

4 Moreover, the substance of other permits whether issued by the U.S. EPA or other states
5 has no bearing on the County of San Diego's permit or the state's decision to administer the
6 NPDES program. Federal regulations require permit writers to tailor municipal storm water
7 NPDES permits to the unique characteristics of the surrounding waterways and community. As
8 U.S. EPA stated when establishing the municipal storm water permitting regulations: "The
9 language of [Clean Water Act] section 402(p)(3) contemplates that, because of the fundamentally
10 different characteristics of many municipalities, municipalities will have permits tailored to meet
11 particular geographical, hydrological, and climatic conditions." (55 Fed.Reg. 47990, 48053.)
12 Requirements in one permit would logically be different than the requirements in other permits
13 unless of course the surrounding circumstances were identical. The County's focus on other
14 permits is misguided and inaccurate and should be disregarded.

15 Last, the County of San Diego concludes that because state permits are issued under state
16 law, not federal law, they are voluntary and not "a delegation of federal authority to the state."
17 (Opp. p. 2, ll. 6-13, p. 5, ll. 11-22.) The County misses the point of the Clean Water Act.
18 Administering a permit program under state law, which California does, is not the same as
19 complying with the permit requirements themselves, which the Clean Water Act compels the
20 County to do. The federal Clean Water Act requires municipalities to apply for an NPDES permit
21 that requires pollutant reductions to the maximum extent practicable. Administering the program
22 in lieu of the federal government does not alter the federal requirement on municipalities to
23 reduce pollutants in these discharges to the maximum extent practicable.²

24 ² The County of San Diego relies on *Shell Oil Company v. Train* (9th Cir, 1978)
25 585 F.2d 408 and *State of California v. U.S. Department of Navy* (9th Cir. 1988) 845 F.2d 222 to
26 support their theory that federal law is not relevant to NPDES permitting. The California
27 Supreme Court recently rejected a similar argument and underscored that while California
28 administers aspects of the NPDES program in California, the program must conform to federal
standards and be approved by a federal agency. (*Voices of the Wetlands v. State Water Resources
Control Bd.* (Aug. 15, 2011, No. S160211) ___ Cal.4th ___ [p. 25].) Further, putting aside the
(continued...)

1 Since the state has no true choice but to comply with the Clean Water Act in establishing
2 NPDES permits that require pollutant reductions to the maximum extent practicable, such permits
3 are based on federal requirements and are not state mandates. (*San Diego Unified School Dist. v.*
4 *Commission on State Mandates* (2004) 33 Cal.4th 859, 880.)

5 **B. The Mere Flexibility of the Maximum Extent Practicable Standard Does**
6 **Not Mean that the NPDES Permit Exceeds This Standard.**

7 The second part of the federal mandates analysis focuses on whether the permit goes
8 beyond the requirements of federal law. (Gov. Code, § 17556; *San Diego Unified School Dist,*
9 *supra*, 33 Cal.4th at p. 880.) The federal requirement applicable to the discharge of pollutants
10 through municipal storm sewer systems is the maximum extent practicable standard.
11 (33 U.S.C. § 1342(p)(3)(B).) Congress established this flexible maximum extent practicable
12 standard so that administrative bodies would have “the tools to meet the fundamental goals of the
13 Clean Water Act in the context of storm water pollution.” (*Building Industry Ass’n of San Diego*
14 *County v. State Water Resources Control Board* (2004) 124 Cal.App.4th 866, 884.) It was
15 “designed to allow permit writers to use a combination of pollution controls that, as Congress
16 noted, ‘may be different in different permits.’” (*In re City of Irving, Texas, Municipal Separate*
17 *Storm Sewer System* (July 16, 2001) 10 E.A.D. 111 (E.P.A.), *6, attached as Exhibit B to
18 Petitioners’ Request for Judicial Notice in Support of Reply Brief.) And it includes the flexibility
19 “to tailor permits to the site-specific nature of MS4³,” and the flexibility “to direct permit
20 requirements at the sources of pollution in the MS4 rather than solely at the end of the pipe.”
21 (*Ibid.*) As explained by the U.S. EPA:

22 *Congress therefore created the “maximum extent practicable” (“MEP”) standard*
23 *and the requirement to “effectively prohibit non-storm water discharges” into the*
24 *MS4 in an effort to allow permit writers the flexibility necessary to tailor permits to*
the site-specific nature of MS4 discharges. Legis. Hist. at 646; House Committee on
Public Works and Transportation, Section-by-Section Analysis (100th Sess. 1987),

25 _____
26 (...continued)

27 County’s mischaracterization of these cases, they are not relevant to the discussion of whether the
28 state voluntarily administers the NPDES program under article XIII B, section 6.

³ MS4 is the acronym for municipal separate storm sewer system.

1 reprinted in 1987 U.S.C.C.A.N. (101 Stat. 7) 5, 38-39; see also 55 Fed. Reg. at
2 48,038. *Included in that flexibility was the capacity to direct permit requirements at*
3 *the sources of pollution in the MS4 rather than solely at the end of the pipe.*
4 55 Fed. Reg. at 48,038. Thus, the MS4 permit requirements set forth under CWA
5 § 402(p)(3)(iii) were designed to allow permit writers to use a combination of
6 *pollution controls that, as Congress noted, “may be different in different permits;”*
7 not all of the types of controls listed in § 402(p)(3)(iii) are required to be incorporated
8 into each MS4 permit. 1987 U.S.C.C.A.N. at 39.

9
10
11 (*Ibid*, emphasis added.)

12 The County of San Diego disregards the very nature of this flexible maximum extent
13 practicable standard and simply concludes, as the Commission did, that if the permit requirements
14 are not expressly provided for in the Clean Water Act or its implementing regulations, then there
15 is no federal mandate. (Opp. p. 27, ll. 9-15.) However, by definition, a flexible standard is not
16 intended to be applied in the same manner under different circumstances.

17 Likewise, a flexible standard does not lend itself to the monolithic federal regulations that
18 the Commission would say establishes a federal mandate. In this respect, the Commission was on
19 a quixotic quest doomed to relegate virtually any federal municipal storm water permit
20 requirement to a state mandate. Under the Commission’s analysis, a permit requirement that was
21 merely practicable or easy (not even practicable to the “maximum extent”) would be a state
22 mandate if U.S. EPA failed to express the requirement in a regulation. Such a result is contrary to
23 the California Supreme Court’s teachings in *City of Sacramento*, which looks to the federal nature
24 of the requirement. (50 Cal.3d 51, 76.)

25 And the County of San Diego’s reliance on *Long Beach School District v. State of*
26 *California* (1990) 225 Cal.App.3d 155 and other cases is misplaced. (Opp. p. 26.) In *Long Beach*,
27 the court considered whether a state executive order involving school desegregation constituted a
28 state mandate. The court held that the executive order required school districts to provide a
higher level of service than required by the federal constitution or case law because state
requirements went beyond federal requirements. (*Id.* at p. 173.) This reasoning was based on the
absence of any federal law that specified how the schools should implement their desegregation
plans. (*Ibid.*) Here, there is federal law on point—the maximum extent practicable standard—

1 that directly applies to the County of San Diego. (See *State of California Department of Finance*,
2 *supra*, Los Angeles Superior Court, Case No. BS130730, p. 8, fn. 12.)

3 Furthermore, the County of San Diego and the Commission simply ignore the
4 administrative proceeding that found the permit to be within the maximum extent practicable
5 standard. Those findings and requirements are the expert conclusions of the principal state
6 agency charged with implementing the NPDES program in San Diego County. (Wat. Code,
7 §§ 13001, 13200.) Courts have recognized that the regional boards are entitled to considerable
8 deference on the statutes they implement, especially in the area of storm water regulation.
9 (*County of Los Angeles v. California State Water Resources Control Bd.* (2006) 143 Cal.App.4th
10 985, 997 [“we defer to the regional board’s expertise in construing language which is not clearly
11 defined in statutes involving pollutant discharge into storm drain sewer systems”]; *City of Rancho*
12 *Cucamonga v. Regional Water Quality Control Bd. -Santa Ana Region* (2006) 135 Cal.App.4th at p.
13 1384; *Building Industry Ass’n of San Diego County, supra*, 124 Cal.App.4th at p. 879.) The
14 Commission cannot disregard the Regional Board’s conclusions and find that the permit exceeds
15 the federal requirements. It is the Board’s prerogative, not the Commission’s, to ensure that the
16 permit meets federal requirements.

17 The County of San Diego attempts to avoid this result by suggesting that the Court of
18 Appeal in *County of Los Angeles v. Commission on State Mandates, supra*, 150 Cal.App.4th 898,
19 914 indicated that the Commission must make a determination in the first instance and that there
20 could be provisions of a permit that exceeded federal requirements. (Opp. at p. 20, ll. 27-28,
21 p. 21, p. 22, ll. 1-16.) The County also relies on *Building Industry Ass’n of San Diego County v.*
22 *State Water Resources Control Board, supra*, 124 Cal.App.4th 866 and *City of Burbank v. State*
23 *Water Resources Control Board* (2005) 35 Cal.4th 613 for the proposition that a permit can
24 theoretically exceed federal requirements. (Opp. p. 29, ll. 1-22.) Again, the County misses the
25 mark. The water boards do not deny that they *could* impose requirements in excess of federal law.
26 (See Opening Brief pp. 6-7.)⁴ This case is not about requirements in excess of federal law though.

27 ⁴ The County’s argument regarding the State Water Resources Control Board’s
28 precedential decision (Water Quality Order WQ-2001-015) is irrelevant to this larger point. (See
(continued...)

1 The Commission failed to recognize and afford deference to the prior administrative finding that
2 the permit taken as a whole reflected the federal maximum extent practicable standard.⁵

3 Last, the County of San Diego argues that the specific requirements subject to the test claim
4 exceed the federal requirements. (Opp. p. 32, ll. 1-26, p. 33, ll. 1-13.) First, this argument fails
5 because the County advances no authority to demonstrate that one permit provision can require
6 more than the maximum extent practicable, when the permit as a whole does not. The federal
7 standard is flexible and may require more in some areas and less in others. (See, e.g.,
8 55 Fed.Reg. 47990, 48052-54 (Nov. 16, 1990); see also *In re City of Irving*, *supra*, 10 E.A.D. 111
9 at *6.) Second, as described below in more detail, neither the County of San Diego, nor the
10 Commission, provided evidence or made findings that the challenged permit requirements are not
11 practicable, let alone not practicable to the maximum extent. Instead, the Commission merely
12 looked for an absence of an identical requirement spelled out in federal regulations.

13 The Clean Water Act's maximum extent practicable standard is the key to understanding
14 the NPDES permit requirements. Simply because a federal law is flexible does not mean there is

15 (...continued)

16 Opp. at pp. 28, ll. 5-27.) The issue in that petition concerned an attempted *prohibition* that
17 required all discharges *into* to the municipal storm sewer system to have had their pollutants
18 reduced to the maximum extent practicable. The State Board's decision speaks to allowing
19 flexibility to decide on a mix of pollutant reductions before reaching the storm sewer system and
20 after, so long as the overall pollutant reductions are to the maximum extent practicable. Water
21 quality order WQ 2001-015 does not undermine U.S. EPA's recognition that the municipal storm
22 water program will include programs and requirements that reduce pollutants prior to reaching the
23 storm sewer. (*In re City of Irving*, *supra*, 10 E.A.D. 111 at *6 ["Included in that flexibility was
24 the capacity to direct permit requirements at the sources of pollution in the MS4 rather than solely
25 at the end of the pipe. 55 Fed. Reg. at 48,038."]) See also discussion at Section III, post.

26 ⁵ The County of San Diego claims, without reference, that in *Building Industry Ass'n of*
27 *San Diego County*, *supra*, 124 Cal.App.4th 866, the court concluded: "This discretion [regional
28 board's choice to exceed maximum extent practicable standard] is not exercised through the
federal MEP standard; rather, it is exercised to achieve state water quality standards or when the
state otherwise wished to regulate in ways that exceed the federal requirements." (Opp. p. 30, ll.
26-28.) This is an incorrect statement. With respect to discharges through storm drains, federal
law requires municipalities "to reduce the discharge of pollutants to the maximum extent
practicable, including management practices, control techniques and system, design and
engineering methods, and such other provisions as the Administrator or the State determines
appropriate for the control of such pollutants. (33 U.S.C. § 1342(p)(3)(B)(iii).) In *Building*
Industry Ass'n of San Diego County, the court said nothing to contradict federal law, but simply
acknowledged that the state has the discretionary authority to go beyond the maximum extent
practicable standard, which, of course, is not the situation presented by this litigation.
(124 Cal.App.4th at p. 884.)

1 no federal mandate. The permit as a whole, including the challenged provisions, is based on the
2 Clean Water Act's maximum extent practicable standard and is not a state mandate.

3 **C. There Is No Evidence That the Claimed Permit Requirements Go Beyond**
4 **Federal Law.**

5 The County of San Diego claims that certain evidence in the administrative record relied on
6 by the Commission shows that the challenged permit requirements exceed federal law and are
7 state mandates. (Opp. p. 34, ll. 23-28, pp. 35-37.) However, as discussed above, the Commission
8 did not make any factual findings. It merely concluded as a matter of law that the specific permit
9 requirements were not expressly provided for in federal law and thus were not federal mandates.
10 In any event, the evidence does not show or even suggest that the specific permit requirements
11 exceed federal law.

12 **1. Street Sweeping**

13 While the County of San Diego alleges that the street sweeping permit requirement exceeds
14 the maximum extent practicable standard, the County does not explain their position. The County
15 simply cites to eight documents in the administrative record that allegedly support their claim.
16 (Opp. p. 35, ll. 1-4.) A quick review of these documents shows that they do not support the
17 County's view of this permit requirement.

18 Declaration of James P. Lough in Support of Test Claim (AR 945-1011.)

19 This document is self-explanatory, a declaration from counsel for the County of San Diego.
20 The opinions and arguments of counsel are not evidence and should be disregarded.

21 NPDES Permits for the City of Atlanta, Georgia, (AR 1125-1139); the District of Columbia
22 (AR 2608-2658); Albuquerque, New Mexico, (AR 2659-2725); and Worcester, Massachusetts,
23 draft permit, (AR 2727-2802.)

24 Although not stated, the County of San Diego seems to offer these permits as evidence that
25 the street sweeping requirement in the permit exceeds federal law because the requirement is not
26 found in U.S. EPA-issued permits or other state-issued permits. NPDES permits "evolve and
27 mature over time" and must be flexible to reflect changing conditions that result from program
28 development and implementation and corresponding improvements in water quality."

1 (55 Fed.Reg. 47990, 48052; see also *In re City of Irving, supra*, 10 E.A.D. 111 at *6.) Under
2 federal law, each NPDES permit must be tailored to the unique characteristics of the surrounding
3 waterways and communities. Thus, requirements in one permit would logically be different than
4 the requirements in other permits unless of course the surrounding circumstances were identical.
5 As U.S. EPA stated when establishing the municipal storm water permitting regulations: “The
6 language of [Clean Water Act] section 402(p)(3) contemplates that, because of the fundamentally
7 different characteristics of many municipalities, municipalities will have permits tailored to meet
8 particular geographical, hydrological, and climatic conditions.” (55 Fed.Reg. 47990, 48053.)

9 Water quality issues in southern California cannot realistically be the same or similar to
10 water quality issues in Atlanta, the District of Columbia, Albuquerque, or Worcester. None of
11 those municipalities have world-class beaches that support a thriving, multi-billion dollar tourist
12 economy. As such, the NPDES permits are all different and unique and consistent with federal
13 law. Thus, it is of no consequence that U.S. EPA issued permits or other state-issued permits do
14 not include a specific requirement regarding street sweeping. The only relevant considerations
15 are the best management practices that implement the maximum extent practicable standard for
16 the County of San Diego’ discharges through its storm systems.

17 Excerpt from the U.S. EPA’s MS4 Program Evaluation Guide (AR 1939.)

18 Contrary to the County of San Diego’s suggestion, this part of the Guide supports street
19 sweeping. It states that permits “should address and include various practices for operating and
20 maintaining public streets, roads, and highways that reduce the impact of receiving waters of
21 discharges from municipal storm sewer systems. These practices should include regular street
22 sweeping and proper use of BMPs during street Maintenance activities.” (AR 1939.)

23 Comparison of the 2001 permit and the then-existing permit (AR 2575-2606.)

24 Once again, the County of San Diego seems to misunderstand the NPDES program and the
25 Clean Water Act. When an NPDES permit is renewed, reissued or modified, it generally must be
26 at least as stringent as the prior permit. (33 U.S.C. § 1342 (o); 40 C.F.R. 122.44 (l).) This is
27 consistent with Congress’ intent that state management programs evolve based on changing
28 conditions from program development and implementation and corresponding improvements in

1 water quality. (55 Fed.Reg. 48052.) The U.S. EPA “anticipates that storm water management
2 programs will evolve and mature over time. The permits for discharges from municipal separate
3 storm sewer systems will be written to reflect changing conditions that result from program
4 development and implementation and corresponding improvements in water quality.” (*Ibid.*)
5 Thus, federal law anticipates that permit requirements will change over time and become more
6 stringent. A new requirement in a permit alone does not mean that the requirement is beyond the
7 maximum extent practicable standard in federal law. In any event, this document is not relevant
8 to the challenged permit requirements in the 2007 permit. It concerns the 2001 permit and permit
9 requirements in its predecessor permit.

10 Commission’s Statement of Decision (AR 3877-3878.)

11 The County of San Diego, similar to the Commission, concludes that the street sweeping
12 requirement goes beyond federal law because it is not specifically required under the Clean Water
13 Act or its implementing regulations. As explained in this reply and the opening brief, the Clean
14 Water Act’s NPDES permit system requires states to develop standards based on the unique
15 conditions of particular waterways. Thus, the maximum extent practicable standard is necessarily
16 flexible, rather than a one-size-fits-all standard. (*Building Industry Ass’n of San Diego County,*
17 *supra*, 124 Cal.App.4th at p. 874.)

18 **2. Other Challenged Permit Requirements**

19 The County of San Diego identifies certain documents in the record that allegedly show that
20 the remaining permit requirements exceed the maximum extent practicable standard. (Opp. p. 35,
21 ll. 7-28, pp. 36-37.) The County is wrong and none of the purported documents support the
22 conclusion that the permit is a state mandate. The majority of the referenced documents are
23 simply additional citations to the documents identified above concerning the street sweeping
24 requirement. Petitioners will not repeat them in this section but will only discuss additional
25 documentation with respect to each permit requirement.

26 Storm Drain Cleaning and Maintenance and Regional Urban Runoff Management Program

27 There are no additional documents referenced for these requirements.
28

1 Educational Component

2 The County of San Diego references an excerpt from the U.S. EPA's MS4 Program
3 Evaluation Guide. (AR 1927.) As with the street sweeping requirement, this part of the Guide
4 supports public education and participation as an important component of the municipal storm
5 water permit program. (AR 1927.)

6 Watershed Activities and Collaboration, Program Effectiveness Assessment, Long Term
7 Effectiveness Assessment, and All Permittee Collaboration

8 The County of San Diego references an excerpt from the U.S. EPA's MS4 Program
9 Evaluation Guide. (AR 1903.) This part of the Guide supports including comprehensive
10 stormwater management planning, assessment, and collaboration as part of a municipal storm
11 water permit. (AR 1903.)

12 Hydromodification Management Plan and Low Impact Development

13 Again, the County of San Diego references an excerpt from the U.S. EPA's MS4 Program
14 Evaluation Guide. (AR 1985.) As above, this part of the Guide supports the development and
15 implementation of controls in a municipal storm water permit to address downstream erosion.
16 (AR 19853.) The County also references an administrative statement of decision from a
17 Washington case but does not explain why it is relevant. (AR 2389-2346.)

18 **III. THE PERMIT LAWFULLY REGULATES DISCHARGES TO REDUCE THE**
19 **INTRODUCTION OF POLLUTANTS INTO THE MUNICIPAL STORM DRAIN SYSTEM.**

20 In an effort to get around the maximum extent practicable standard, the County of San
21 Diego claims that the specific permit requirements are not subject to this standard. (Opp. p. 7, ll.
22 4-14, p. 28, ll. 5-27.) According to the County, the State Board has made a broad-based
23 determination that the maximum extent practicable standard does not apply to the "entry of
24 pollutants *into* the storm sewer system." (Opp. p. 28, ll. 14-15, emphasis in original.) The State
25 Board made no such broad-based determination: the County has misinterpreted the State Board's
26 ruling.

27 This claimed administrative proclamation by the State Board was part of a 2001
28 administrative decision involving different permit requirements that the County has wrenched out

1 of context. In that case, the challengers claimed that permit provision A.3, Discharge Prohibition,
2 requiring that “treatment and control discharges must always occur prior to entry in the MS4” is
3 too broad. (AR 2558-2574.) The State Board agreed, finding that the “specific language in this
4 prohibition too broadly restricts all discharges ‘into’ an MS4, and does not allow flexibility to use
5 regional solutions, where they could be applied in a manner that fully protects receiving waters.”
6 (AR 2567.) The State Board went on to explain that “[i]t is important to emphasize that
7 dischargers into MS4s continue to be required to implement a full range of BMPs, including
8 source control.” (AR 2567.) Consistent with the maximum extent practicable standard, the State
9 Board was critical of an absolute standard that did not provide the Regional Board with the
10 flexibility to determine the appropriate mix of best management practices, including source
11 control.

12 The State Board’s decision did not constrain the Clean Water Act’s requirements for
13 permits to include controls to reduce pollutants in municipal storm water discharges to the
14 maximum extent practicable. It certainly does not prohibit control of discharges into a municipal
15 storm sewer system. To interpret this determination to mean that the maximum extent practicable
16 standard does not apply to trash, inspections, or other source control mechanism is inconsistent
17 with U.S. EPA and court decisions.

18 And while the County of San Diego is required to obtain an NPDES permit to discharge
19 pollutants *from* their municipal storm sewer systems, by no stretch of the imagination does this
20 mean that the Clean Water Act exempts from municipal permit requirements the discharge of
21 pollutants *into* the system. The maximum extent practicable standard includes the flexibility to
22 “*direct permit requirements at the sources of pollution in the MS4 rather than solely at the end of*
23 *the pipe* [citation omitted].” (*In re City of Irving, supra*, 10 E.A.D. 111 at *6, emphasis added.)

24 The Clean Water Act itself uses the words “in” or “into,” not just “from.” Section
25 1342(p)(3)(B)(ii) requires that permits, like the one at issue before this court, “shall include a
26 requirement to effectively prohibit non-stormwater discharges into the storm sewers.” Also,
27 federal regulations require information about discharges “into” storm drains (see e.g.,
28 40 C.F.R. § 122.26(d)(1)(iv)), including a program “to reduce pollutants in storm runoff from

1 construction sites to the municipal storm sewer system” (40 C.F.R. § 122.26(d)(2)(iv)(D);
2 programs “to identify illicit connections to the municipal storm sewer system,”
3 (40 C.F.R. § 122.26(d)(1)(v)(B)); and programs that specify “source control measures to reduce
4 pollutants from runoff from commercial and residential areas” as well as a comprehensive
5 “master plan to develop, implement and enforce controls to reduce the discharge of pollutants
6 from municipal storm sewers which receive discharges from areas of new development and
7 significant redevelopment.” (40 C.F.R. § 122.26(d)(2)(iv)(A).)

8 And on a common sense level, controlling pollution at the source before it reaches the
9 storm sewer system allows for less expensive controls—like public education, street cleaning, and
10 screens—at the beginning of the system and avoids the difficulties of cleaning up a massive
11 amount of pollutants once they are in the system and receiving waters.

12 Thus, neither the Clean Water Act nor its implementing regulations limits the contents of
13 permits and their programs to discharges “from” storm sewer systems. Instead, the Clean Water
14 Act requires the permitting agency to “require controls to reduce the discharge of pollutants,”
15 including, inter alia, management practices and control techniques to prevent pollution at the
16 source. (33 U.S.C. § 1342(p)(3)(B)(iii).)

17 **IV. THE PERMIT AS A WHOLE AND THE CLAIMED MANDATED ACTIVITIES DO NOT IMPOSE A**
18 **NEW PROGRAM OR HIGHER LEVEL OF SERVICE.**

19 The County of San Diego, like the Commission, concludes that the majority of the
20 challenged permit requirements are “new” because they are not identical to the same requirements
21 found in the 2001 permit. (Opp. p. 22, ll. 19-28, p. 23-24, p. 25, ll. 1-8.) As explained in detail in
22 petitioners’ opening brief, such a narrow focus is not supported by law. The relevant
23 “requirement” for purpose of state mandates law is the federal requirement that the discharge of
24 pollutants from a MS4 for a population the size of the County of San Diego requires an NPDES
25 permit. This permit must include, under federal law, “controls to reduce the discharge of
26 pollutants to the maximum extent practicable.” (33 U.S.C. §1342 (p)(3)(B).) This requirement is
27 not new and is imposed on all entities that own or operate a municipal separate storm sewer
28 system. (*Ibid.*)

1 And even if the court were to look to the challenged permit requirements, those
2 requirements were part of the 2001 NPDES permit. All of the permit requirements in the 2001
3 NPDES permit were intended to implement the maximum extent practicable standard in the Clean
4 Water Act. (See *Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at p. 866
5 [2001 NPDES permit requirements did not exceed the Clean Water Act's maximum extent
6 practicable standard].) Merely adjusting the requirements of the 2001 NPDES permit to present
7 circumstances to ensure that this standard is met does not impose a new program.

8 As with the federal analysis, the Commission did not make any factual findings with
9 respect to whether the challenged permit requirements were a new program. Rather, it simply
10 concluded that certain requirements were "new" because they were not expressly provided for in
11 the 2001 NPDES permit. (AR 3871-3872, 3875-3876, 3877, 3880, 3893-3894, 3899-3900, 3905,
12 3911-3912, 3915, 3919-3920.) This type of analysis applies state mandates law in an overly
13 technical, myopic manner that disregards the essential nature of the Regional Board's job.

14 Last, there is no evidence that the requirements are brand new as opposed to mere
15 adjustment of the 2001 permit requirements. The claimed evidenced referenced by the County of
16 San Diego includes the 2007 permit (AR 249-369), the 2007 Fact Sheet (371-487), and the 2001
17 permit (AR 1569-1649). (Opp. p. 35-37.) These documents do not show that the challenged
18 2007 permit requirements were nonexistent before the 2007. Indeed, collectively these
19 documents show that all of the challenged requirements are modifications or adjustments to
20 previously established requirements in the 2001 permit.

21 Because the challenged permit requirements are generally found in the 2001 NPDES permit,
22 the specific requirements are not "new," and the Commission's findings to the contrary should be
23 reversed.

CONCLUSION

The permit is not a state mandate, because California must implement the federal NPDES program and because the permit does not exceed the maximum extent practicable standard in federal law. For the same reason and for the additional reason that the permit requirements are based on the 2001 NPDES permit, there is no new program or higher level of service. The Commission's decision finding that the permit and the claimed mandated activities are state mandates should be reversed.

DECLARATION OF SERVICE BY OVERNIGHT COURIER

Case Name: **State of California Department of Finance, et al. v. Commission on State Mandates**

No.: **34-2010-80000604**

I declare:

I am employed in the Office of the Attorney General, which is the office of a member of the California State Bar, at which member's direction this service is made. I am 18 years of age or older and not a party to this matter; my business address is: 1300 I Street, Suite 125, P.O. Box 944255, Sacramento, CA 94244-2550.

On August 25, 2011, I served the attached **Reply in Support of Petition for Writ of Administrative Mandamus** by placing a true copy thereof enclosed in a sealed envelope with the **Golden State Overnight courier service**, addressed as follows:

CAMILLE SHELTON
Chief Legal Counsel
ERIC D. FELLER
Senior Staff Counsel
Commission on State Mandates
980 Ninth Street, Suite 300
Sacramento, CA 95814

TIMOTHY M. BARRY
Senior Deputy
Office of the County Counsel
County of San Diego
1600 Pacific Highway, Room 355
San Diego, California 92101-2469

CASE NO.:
 PETITION FOR WRIT OF
 ADMINISTRATIVE MANDAMUS
 [Gov. Code, § 17559(b);
 Code Civ. Proc., § 1094.5]

1 Petitioners State of California Department of Finance (“Department of Finance”), State
2 Water Resources Control Board (“State Water Board”), and California Regional Water Quality
3 Control Board, Los Angeles Region (“Los Angeles Regional Board”) hereby petition this Court
4 for a writ of administrative mandamus pursuant to Government Code section 17559, subsection
5 (b) and Code of Civil Procedure section 1094.5. Petitioners seek a writ directed at respondent
6 Commission on State Mandates (“Commission”), commanding it to set aside, in part, its
7 Statement of Decision relating to Test Claim Nos. 03-TC-04, 03-TC-19, 03-TC-20, and 03-TC-21
8 (“Test Claims”), which was issued by the Commission on September 3, 2009, and to issue a new
9 decision.

10 Petitioners allege as follows:

11 1. Petitioner Department of Finance is the state government entity charged with
12 supervising the financial and business policies of the State of California. The Department of
13 Finance is given these fiscal supervisory powers in order to conserve the financial interests of the
14 State, to prevent improvidence, and to control the expenditure of State funds by various state
15 government entities. The Department of Finance is authorized to institute proceedings as it
16 deems proper in order to conserve the rights and interests of the State. Petitioner Department of
17 Finance is aggrieved by the decision of respondent Commission to grant the Test Claims, as
18 alleged herein. The Department of Finance is authorized to commence this proceeding to set
19 aside the decision of respondent Commission in part, on the grounds that it is not supported by
20 substantial evidence and is contrary to law.

21 2. Petitioner State Water Board is within the California Environmental Protection
22 Agency. Petitioner State Water Board, together with the nine Regional Water Quality Control
23 Boards, comprise the principal agencies with primary responsibility for coordination and control
24 of water quality in the State of California. Petitioner State Water Board is the state water
25 pollution control agency for all purposes stated in the Federal Water Pollution Control Act
26 (“Clean Water Act”). Petitioner State Water Board is aggrieved by the decision of respondent
27 Commission to grant the Test Claims, as alleged herein. The State Water Board is authorized to
28

1 commence this proceeding to set aside the decision of respondent Commission in part, on the
2 grounds that it is not supported by substantial evidence and is contrary to law.

3 3. Petitioner Los Angeles Regional Board is the state agency with primary
4 responsibility to protect water quality in the Los Angeles region, including Los Angeles and
5 Ventura counties. Whereas the State Water Board establishes statewide policy for water quality
6 control, the Los Angeles Regional Board formulates and adopts water quality control plans for
7 areas within its jurisdiction. The Los Angeles Regional Board issues waste discharge
8 requirements within the Los Angeles region, including waste discharge requirements that serve as
9 National Pollutant Discharge Elimination System (NPDES) permits. Petitioner Los Angeles
10 Regional Board is aggrieved by the decision of respondent Commission to grant the Test Claims,
11 as alleged herein. The Los Angeles Regional Board is authorized to commence this proceeding to
12 set aside the decision of respondent Commission in part, on the grounds that it is not supported by
13 substantial evidence and is contrary to law.

14 4. Respondent Commission is the quasi-judicial body charged with carrying out
15 the administrative procedures for resolving claims for reimbursement of state mandated local
16 costs arising out of article XIII B, section 6, of the California Constitution. The functions,
17 powers, and duties of respondent Commission are set out in Government Code section 17500, et
18 seq., and the Commission's implementing regulations, California Code of Regulations, title 2,
19 section 1181, et seq.

20 5. Real parties in interest, the County of Los Angeles and the cities of Artesia,
21 Azusa, Bellflower, Beverly Hills, Carson, Commerce, Covina, Downey, Monterey Park,
22 Norwalk, Rancho Palo Verdes, Signal Hill, Vernon, and Westlake Village (collectively, "Los
23 Angeles Real Parties"), are "local governments" within the meaning of article XIII B, section 6 of
24 the California Constitution.

25 6. In 2003, the Los Angeles Real Parties, among others, individually and/or
26 collectively, filed Test Claim Nos. 03-TC-04, 03-TC-19, 03-TC-20, and 03-TC-21. The
27 Commission initially refused jurisdiction based on Government Code section 17516, which
28 excluded permits issued by the State Water Board and the regional water boards as executive

1 orders subject to state mandate reimbursement. After litigation, a writ issued commanding the
2 Commission to consider the Test Claims.

3 7. On or about October 18, 2007, real party County of Los Angeles refiled Test
4 Claim Nos. 03-TC-04 and 03-TC-19.

5 8. On or about November 28, 2007, real parties cities of Artesia, Azusa, Beverly
6 Hills, Carson, Commerce, Norwalk, Rancho Palos Verdes, Vernon, and Westlake Village refiled
7 Test Claim No. 03-TC-20.

8 9. On or about October 7, 2007, the cities of Arcadia, Baldwin Park, Bellflower,
9 Cerritos, Covina, Downey, Monterey Park, Pico Rivera, Signal Hill, South Pasadena, and West
10 Covina refiled Test Claim No. 03-TC-21.

11 10. On or about July 30, 2008, Test Claim No. 03-TC-21 was amended. Real
12 parties cities of Bellflower, Covina, Downey, Monterey Park, and Signal Hill remained as
13 claimants. The cities of Arcadia, Baldwin Park, Cerritos, Pico Rivera, South Pasadena, and West
14 Covina were removed as claimants.

15 11. The Test Claims are the subject of this proceeding and, therefore, the Los
16 Angeles Real Parties have an interest in the outcome of this petition to set aside a portion of the
17 decision of respondent Commission.

18 12. Venue is proper because the cause of action arose in Sacramento County.

19 13. The Test Claims pertain to a NPDES permit issued by the Los Angeles
20 Regional Board in 2001 (Board Order No. 01-182, NPDES Permit CAS004001) ("Los Angeles
21 Permit") (attached hereto as Exhibit A).

22 14. Congress established the NPDES permit system as part of the 1972
23 amendments to the Clean Water Act, which prohibits all discharges of pollutants from point
24 sources to waters of the United States, unless specifically authorized by an NPDES permit.

25 15. Under the Clean Water Act, the U.S. Environmental Protection Agency ("U.S.
26 EPA") would issue the NPDES permits unless a state obtains authorization to issue them in lieu
27 of issuance by the U.S. EPA.

28

1 16. In 1972, the California Legislature enacted Chapter 5.5 of the Porter-Cologne
2 Water Quality Control Act (commencing at Water Code section 13370), which authorized the
3 State Water Board to apply to the U.S. EPA for authority to issue NPDES permits in lieu of
4 issuance by the U.S. EPA.

5 17. In 1973, California became the first state in the nation to obtain authorization to
6 issue NPDES permits. The State Water Board and the nine regional boards, including the Los
7 Angeles Regional Board, implement the NPDES program in California. Therefore, the U.S. EPA
8 does not directly issue NPDES permits to dischargers in California.

9 18. Separate storm sewer systems owned and/or operated by municipalities
10 (“MS4s”) are covered “point sources” within the meaning of the Clean Water Act and its NPDES
11 program. Therefore, federal law requires municipalities, such as the Los Angeles Real Parties, to
12 obtain an NPDES permit before discharging pollutants from their systems. Federal regulations
13 further require permittees to apply for a new permit every five years.

14 19. Although the State Water Board and regional water boards are State agencies,
15 they issue NPDES permits that must be “no less stringent” than required by applicable federal law
16 and regulations. California regulations require that NPDES permits be issued in accordance with
17 the U.S. EPA’s NPDES regulations.

18 20. U.S. EPA retains continuing jurisdiction and authority to disapprove specific
19 permits and to supplant the water boards as the permitting authority if State-issued permits do not
20 meet federal requirements.

21 21. The federal Clean Water Act mandates that NPDES permits issued for MS4s
22 “shall require controls to reduce the discharge of pollutants to the maximum extent practicable,
23 including management practices, control techniques and system, design and engineering methods,
24 and such other provisions as the Administrator or the State determines appropriate for the control
25 of such pollutants.” 33 U.S.C. § 1342 (p)(3)(B)(iii).

26 22. U.S. EPA regulations further mandate that entities subject to the permitting
27 system must propose management programs that the permitting authority (i.e., the State Water
28 Board and the nine regional water boards) will consider “when developing permit conditions to

1 reduce pollutants in discharges to the maximum extent practicable.” 40 C.F.R. § 122.26
2 (D)(2)(iv)(1998). The management programs must include “a comprehensive planning process . .
3 . to reduce the discharge of pollutants to the maximum extent practicable using management
4 practices, control techniques and system, design and engineering methods, and such other
5 provisions which are appropriate.” (*Ibid.*)

6 23. The Los Angeles Real Parties, among others, own and/or operate an MS4 that
7 discharges pollutants into waters of the United States, as defined by the Clean Water Act.

8 24. The Los Angeles Real Parties applied for, and received, their first NPDES
9 permit for the MS4 in 1990. They applied for, and received, their second NPDES permit for the
10 MS4 in 1996.

11 25. In 2001, the Los Angeles Real Parties submitted another permit application to
12 the Los Angeles Regional Board. After receiving voluminous comments from stakeholders and
13 interested parties, holding public hearings, meetings and workshops, and after consulting with the
14 Los Angeles Real Parties, either directly or by proxy, the Los Angeles Regional Board issued the
15 Los Angeles Permit.

16 26. In Test Claim Nos. 03-TC-04, 03-TC-20, and 03-TC-21, claimants asserted,
17 among other things, that part 4F5c3 of the Permit (placing and maintaining trash receptacles at
18 transit stops) (Exhibit A at 49) constitutes a reimbursable state mandated activity within the
19 meaning of Government Code section 17514 and article XIII B, section 6, of the California
20 Constitution.

21 27. In Test Claim Nos. 03-TC-19, 03-TC-20, and 03-TC-21, claimants asserted,
22 among other things, that part 4C2a of the Permit (inspecting commercial facilities) (Exhibit A at
23 28-31) constitutes a reimbursable state mandated activity within the meaning of Government
24 Code section 17514 and article XIII B, section 6, of the California Constitution.

25 28. In Test Claim Nos. 03-TC-19, 03-TC-20, and 03-TC-21, claimants asserted,
26 among other things, that part 4C2b of the Permit (inspecting Phase I industrial facilities) (Exhibit
27 A at 31) constitutes a reimbursable state mandated activity within the meaning of Government
28 Code section 17514 and article XIII B, section 6, of the California Constitution.

1 29. In Test Claim Nos. 03-TC-20 and 03-TC-21, claimants asserted, among other
2 things, that part 4E of the Permit (inspecting construction sites) (Exhibit A at 42-45) constitutes a
3 reimbursable state mandated activity within the meaning of Government Code section 17514 and
4 article XIII B, section 6, of the California Constitution.

5 30. Pursuant to article XIII B, section 6, whenever the Legislature or any state
6 agency mandates a new program or higher level of service on a local government, the state shall
7 provide a subvention of funds to reimburse the local government for the costs of such program or
8 increased level of service.

9 31. Government Code section 17514 provides that “[c]osts mandated by the state”
10 means any increased costs which a local agency is required to incur after July 1, 1980, as a result
11 of any statute enacted on or after January 1, 1975, or any executive order implementing any
12 statute enacted on or after January 1, 1975, which mandates a new program or higher level of
13 service of an existing program within the meaning of article XIII B, section 6.

14 32. On September 3, 2009, respondent Commission issued its Statement of
15 Decision (attached hereto as Exhibit B), finding, among other things, that:

16 (a) Permit parts 4F5c3, 4C2a, 4C2b, and 4E (other than the use of a database
17 or GIS system) are state mandates subject to article XIII B, section 6 of the California
18 Constitution;

19 (b) Permit parts 4F5c3, 4C2a, 4C2b, and 4E impose a “new program or
20 higher level of service” within the meaning of article XIII B, section 6; and

21 (c) Permit part 4F5c3 is a reimbursable state mandate within the meaning of
22 article XIII B, section 6 and Government Code section 17514 due in part to the Los Angeles Real
23 Parties’ lack of sufficient fee authority.

24 33. The Commission’s finding that permit parts 4F5c3, 4C2a, 4C2b, and 4E (other
25 than the use of a database or GIS system) are state mandates subject to article XIII B, section 6
26 constitutes a prejudicial abuse of discretion within the meaning of Code of Civil Procedure
27 section 1094.5, subsection (b). The Commission did not proceed in the manner required by law
28 and the finding is not supported by substantial evidence for the following reasons:

1 (a) Permit parts 4F5c3, 4C2a, 4C2b, and 4E are federal, not state, mandates.
2 Article XIII B, section 6 requires state subvention only when the mandate is imposed by the
3 Legislature or a state agency. Government Code section 17556, subsection (c) further provides
4 that state subvention is not required when the federal government, rather than the state
5 government, imposes the costs on local agencies. Federal Clean Water Act and U.S. EPA
6 regulations mandate that the NPDES permits “shall require,” at a minimum, controls to reduce the
7 discharge of pollutants to the “maximum extent practicable” using appropriate “management
8 practices, control techniques and system, design and engineering methods.” (33 U.S.C. § 1342
9 (p)(3)(B)(iii).) The management practices set out in the Los Angeles Permit, including permit
10 parts 4F5c3, 4C2a, 4C2b, and 4E, collectively and individually, reduce pollutant discharges to the
11 “maximum extent practicable” as mandated by the federal law and regulations. The Los Angeles
12 Regional Board, in issuing the Los Angeles Permit, implemented and did not exceed the
13 requirements of the Clean Water Act and the relevant U.S. EPA regulations;

14 (b) The Commission’s finding that permit parts 4F5c3, 4C2a, 4C2b, and 4E
15 are activities that “mandate costs that exceed the mandate in the federal law” fails to give
16 conclusive effect to a prior Superior Court proceeding, brought by all Los Angeles Real Parties
17 except Azusa against the Los Angeles Regional Board, in which the court expressly found that
18 the terms of the Los Angeles Permit did not exceed the “maximum extent practicable” standard.
19 (*In re Los Angeles County Municipal Storm Water Permit Litigation* (Super. Ct. Los Angeles
20 County, 2005, No. BS 080548).) The earlier Superior Court proceeding reached final judgment
21 on the merits and has binding effect on this issue as against the Los Angeles Real Parties;

22 (c) The Commission’s finding that permit parts 4F5c3, 4C2a, 4C2b, and 4E
23 are activities that mandate costs that exceed the federal mandate because they are not “expressly
24 required” by the federal statutes and regulations is not supported by substantial evidence. Federal
25 law and regulations do not expressly provide for every management practice or control that they
26 require in an NPDES permit. Rather, federal law and regulations require that permitted
27 management practices and controls reduce the discharge of pollutants to the maximum extent
28

1 practicable, which specific practices are to be proposed by the municipalities, or, in the absence
2 of an acceptable proposal, defined by the federal or state permitting agency;

3 (d) The Commission's finding that the State freely chose to impose permit
4 parts 4F5c3, 4C2a, 4C2b, and 4E on the Los Angeles Real Parties is not supported by substantial
5 evidence. As a matter of federal law, the State Water Board and the Los Angeles Regional Board
6 cannot adopt an NPDES permit that is "less stringent" than the federal "maximum extent
7 practicable" standard. Furthermore, had the Los Angeles Regional Board not issued the NPDES
8 permit at issue, or had the U.S. EPA disapproved of that permit, the Los Angeles Real Parties
9 would have had to obtain an NPDES permit directly from the U.S. EPA, which would prescribe
10 specific permit requirements using the same "maximum extent practicable" standard that the Los
11 Angeles Regional Board used in issuing the Los Angeles Permit;

12 (e) After erroneously concluding that permit parts 4F5c3, 4C2a, 4C2b, and
13 4E are state mandates, the Commission failed to consider the incidental nature of these provisions
14 to the federal requirements, and that any costs imposed which exceed the federal requirements are
15 merely de minimis and nonreimbursable. As a matter of law, any state rule or procedure intended
16 to implement an applicable federal law, and whose costs are de minimis in the proper context, are
17 treated as part of the underlying federal mandate;

18 (f) The Commission's finding that the activities prescribed by permit parts
19 4F5c3, 4C2a, 4C2b, and 4E were not undertaken at the option or discretion of the Los Angeles
20 Real Parties is not supported by substantial evidence. U.S. EPA regulations require the Real
21 Parties to propose management programs to the permitting authority. The Los Angeles Real
22 Parties, however, had discretion over which activities and conditions to propose as best
23 management practices to the Los Angeles Regional Board for adoption. Exercising that
24 discretion, the Los Angeles Real Parties proposed management practices, which the Los Angeles
25 Regional Board used as a basis for adopting permit parts 4F5c3, 4C2a, 4C2b, and 4E, with
26 additions and revisions necessary to meet the federal "maximum extent practicable" standard.
27 Furthermore, if the Los Angeles Real Parties had believed permit parts 4F5c3, 4C2a, 4C2b, and
28 4E exceeded the maximum extent practicable standard, they had the option to propose alternate

1 management practices to the Los Angeles Regional Board for implementation, but they chose not
2 to do so; and

3 (g) The Commission's finding that permit parts 4F5c3, 4C2a, 4C2b, and 4E
4 are "mandated costs" is not supported by substantial evidence. "Costs mandated by the state" are
5 increased costs incurred by local governments as a result of any statute enacted on or after
6 January 1, 1975. (Gov. Code, § 17514.) The State Water Board's and the regional water boards'
7 authority to issue NPDES permits in implementing the federal Clean Water Act is granted by
8 Chapter 5.5 of the Porter-Cologne Act. Chapter 5.5 of the Porter-Cologne Act was enacted in
9 1972. Any increased costs incurred by the Los Angeles Real Parties in implementing the Los
10 Angeles Permit are, therefore, not "costs mandated by the state."

11 34. The Commission's finding that permit parts 4F5c3, 4C2a, 4C2b, and 4E impose
12 "a new program or higher level of service" constitutes a prejudicial abuse of discretion within the
13 meaning of Code of Civil Procedure section 1094.5, subsection (b). The Commission did not
14 proceed in the manner required by law and the finding is not supported by substantial evidence
15 for the following reasons:

16 (a) The State need only reimburse a local agency for "a new program or
17 higher level of service." A "program" under article XIII B, section 6 is one that carries out the
18 governmental function of providing services to the public, or a law which, to implement a state
19 policy, imposes unique requirements on local governments and does not apply generally to all
20 residents and entities in the state. The State Water Board and the regional water boards issue
21 NPDES permits to both public and private entities subject to the Clean Water Act. As required
22 by the Clean Water Act and U.S. EPA regulations, the State Water Board and the regional water
23 boards actually impose more stringent requirements on private entities than on public entities.
24 The permit at issue, therefore, does not impose a "new program or higher level of service"
25 because it does not force the Los Angeles Real Parties to carry out any public service peculiar to
26 governments and imposes no requirements unique to the Los Angeles Real Parties; and

27 (b) The Commission's finding that the requirements of permit parts 4C2a,
28 4C2b, and 4E constitute "a new program or higher level of service" is incorrect. The

1 requirements imposed by the Los Angeles Permit are the same as or similar to those of the permit
2 in effect immediately before, but with more specificity, and thus do not impose "a new program
3 or higher level of service."

4 35. The Commission's finding that the Los Angeles Real Parties lack appropriate
5 authority to levy fees sufficient to pay for the permit part 4F5c3 constitutes a prejudicial abuse of
6 discretion within the meaning of Code of Civil Procedure section 1094.5, subsection (b). The
7 Commission did not proceed in the manner required by law and the finding is not supported by
8 substantial evidence. The Los Angeles Real Parties have the authority to levy fees sufficient to
9 pay for cost associated with implementing permit part 4F5c3 under their general police power
10 and/or under Public Resources Code section 40059(a):

11 (a) Under their general police power, the Los Angeles Real Parties may make
12 and enforce local, police, sanitary, and other ordinances and regulations. This includes the
13 authority to implement permit part 4F5c3 and the authority to impose fees to pay for such
14 implementation; and

15 (b) Under Public Resources Code section 40059(a), municipalities may
16 determine "[a]spects of solid waste handling which are of local concern, including, but not
17 limited to, frequency of collection, means of collection and transportation, level of services,
18 charges and fees, and nature, location, and extent of providing solid waste handling services."
19 Placing and maintaining trash receptacles at transit stops, as required by permit part 4F5c3, is an
20 aspect of solid waste handling for which the Los Angeles Real Parties may determine charges and
21 fees.

22 36. Petitioners have no plain, speedy, and adequate remedy in the ordinary course
23 of law.

24 37. Petitioners have requested that respondent Commission prepare a true and
25 correct copy of the administrative record of all proceedings in connection with the Test Claims.
26 A true and correct copy of the administrative record will be lodged with the Court prior to the
27 hearing on this petition.

WHEREFORE, petitioners Department of Finance, State Water Board, and Los Angeles Regional Board pray as follows:

1. That a writ of mandate issue pursuant to Government Code section 17559, subsection (b) and Code of Civil Procedure section 1094.5, directed to respondent Commission on State Mandates, commanding it to set aside its decision granting Test Claim Nos. 03-TC-04, 03-TC-19, 03-TC-20, and 03-TC-21, in part, and to issue a new decision consistent with the Court's opinion and judgment;
2. That petitioners recover their costs incurred in this proceeding; and,
3. For such other relief that the Court considers proper.

Dated: July 20, 2010

11 TO RESPONDENT COMMISSION ON STATE MANDATES:

12 Judgment having been entered in this action that a Peremptory Writ of Mandate be issued
13 from this Court,

14 YOUR ARE HEREBY COMMANDED immediately upon receipt of this writ:

15 1. To set aside and vacate the Commission on State Mandates' Statement of Decision
16 on the test claims of Real Parties in Interest, case numbers 03-TC-04, 03-TC-19, 03-TC-20, and
17 03-TC-21, entitled "Municipal Stormwater and Urban Runoff Discharges," adopted by the
18 Commission on July 31, 2009.

19 2. To adopt a new decision consistent with the Court's order of August 15, 2011 on
20 the grounds that the challenged permit provisions in permit number CAS004001, consisting of
21 part 4F5c3 (placing and maintaining trash receptacles at transit stops), part 4C2a (inspecting
22 commercial facilities), part 4C2b (inspecting Phase I industrial facilities); and part 4E (inspecting
23 construction sites), are within the maximum extent practicable standard under the mandatory
24 provisions of the Clean Water Act and are federal mandates not subject to reimbursement under
25 article XIII B, section 6, of the California Constitution.

INTRODUCTION

The California Regional Water Quality Control Board, Los Angeles Region, issued a sewer permit pursuant to its duty and authority under the federal Clean Water Act and United States Environmental Protection Agency (EPA) regulations. The Regional Board determined, as has every reviewing court, that the permit did not exceed the requirements of federal law. Yet when discrete terms of the permit were later challenged before the Commission on State Mandates, the Commission contradicted the legal conclusion of the Regional Board as well as the courts. The Commission held that the challenged permit terms exceeded the requirements of federal law and were therefore state mandates. Because the Commission erred in construing the requirements of federal law, the superior court issued a writ of mandate overruling the Commission's decision. The Court of Appeal affirmed that determination, and Respondents now ask this Court to do the same.

Under the California Constitution, when the State requires that local governments provide a new program or higher level of service, the State must reimburse the costs of the mandated activity. (Cal. Const., art. XIII B, § 6.) The Constitution does not, however, require the State to pay for local government compliance with federal mandates.

The permit issued by the Regional Board is a federal mandate. It is required by federal law and does not exceed the requirements of federal law. The Clean Water Act forbids local governments from operating a municipal separate storm sewer system (MS4) without a permit that implements the requirements of the Clean Water Act, including controls designed to reduce the discharge of pollutants in stormwater to the "maximum extent practicable." The permit, whether issued by the EPA or an authorized state agency acting in lieu of the EPA, must meet the maximum-extent-practicable standard. Congress delegated to authorized

permitting agencies the discretion to determine the particular combination of practices and controls that will meet this standard. This flexibility allows permitting agencies to effectively address the specific conditions in which different MS4s operate, which can vary widely. The permit defines how MS4 operators must comply with the Clean Water Act and is enforceable in federal district court. Because the permit that the Regional Board issued here did not exceed the requirements of federal law, it is a federal mandate.

The permit contains a set of interrelated terms designed to work together to achieve the federal standard, the requirements of which must be construed pursuant to federal law. As the courts below found, the Commission did not properly construe the requirements of federal law. Federal law does not prescribe an approved list of controls from which the permitting agency must choose in drafting a permit; it leaves the choice of controls that will achieve the federal standard to the expertise of the permitting authority, subject to judicial review. Thus, the extent to which the permit or its terms meets or exceeds the federal maximum-extent-practicable standard cannot fairly be analyzed, as the Commission did, by determining whether discrete terms of the permit are themselves expressly prescribed by federal law. While a regional board may in some circumstances exceed federal permitting requirements and impose additional requirements under California's Porter-Cologne Water Quality Control Act, the Regional Board found, and the courts that reviewed its decision agreed, that the permit here did not exceed federal requirements. The Appellants' arguments fail to provide grounds for reversal, and this Court should therefore affirm the judgment.

LEGAL FRAMEWORK

A. The Federal Clean Water Act and the Origin of the Maximum-Extent-Practicable Standard

The federal government regulates water pollution through the Federal Water Pollution Control Act, commonly known as the Clean Water Act. (33 U.S.C. § 1251 et seq.) The act makes it unlawful to discharge pollutants into waters of the United States from any “point source”—a pipe, ditch, or similar conveyance—without first obtaining a permit under the National Pollutant Discharge Elimination System (NPDES). (*Id.*, §§ 1311, 1342, 1362(14).) A permit translates the act’s general requirements into specific obligations that allow a discharger to comply with the act. (See *id.*, § 1342(k).) Put differently, the permit facilitates compliance with, and enforcement of, the act by defining “a preponderance of a discharger’s obligations” under the act. (*Environmental Protection Agency v. California ex rel. State Water Resources Control Board* (1976) 426 U.S. 200, 205 (*Environmental Protection Agency*)).

An NPDES permit may be effective for up to five years. (33 U.S.C. § 1342(b)(1)(B).) Congress intended that compliance with the act would become increasingly demanding as water quality and pollution-control techniques improved, anticipating that each new permit would contain more stringent standards than the last. (See 55 Fed.Reg. 48052 (Nov. 16, 1990); see also volume 3, Administrative Record (AR) page 3797.) Every condition within an NPDES permit is enforceable in federal court, under federal law. (See 33 U.S.C. § 1365.) Violating the permit subjects the permittee to civil suit and criminal penalties. (See *id.*, §§ 1319, 1342(i).)

1. State Implementation of the Federal NPDES Permitting Program

“The Clean Water Act anticipates a partnership between the States and the Federal Government, animated by a shared objective: ‘to restore

and maintain the chemical, physical, and biological integrity of the Nation's waters.'" (*Arkansas v. Oklahoma* (1992) 503 U.S. 91, 101, quoting 33 U.S.C. § 1251(a).) Although it charged the EPA with administering the NPDES permitting program, Congress envisioned that states would assist in implementation of the program by issuing permits in lieu of the EPA. (See 33 U.S.C. §§ 1251(b), 1342(b).)

Regulations promulgated by the EPA implement the NPDES program, including the criteria that states must meet to obtain federal permitting authority. (See generally 40 C.F.R. parts 122 to 125.) In issuing permits, approved states must ensure that the permit complies with all applicable requirements of the Clean Water Act and its implementing regulations. (*Id.*, § 122.4(a).) But federal law and regulations form a regulatory floor. States may impose more stringent or extensive permit requirements under their own laws. (33 U.S.C. § 1370; 40 C.F.R. § 123.1(i); *City of Burbank v. State Water Resources Control Board* (2005) 35 Cal.4th 613, 627-628 (*City of Burbank*) [holding that state-issued NPDES permits may impose requirements more stringent than federal law].)

State permitting authority is also conditioned on compliance with general procedural requirements, like giving public notice of draft permits and allowing for the public to comment on them before they become final. (See, e.g., 40 C.F.R. §§ 124.3, 124.6, 124.8.) State issuers must also follow certain additional requirements. (See 33 U.S.C. § 1342(b); 40 C.F.R. § 123.1 et seq.) For example, states issuing NPDES permits must have legal authority to carry out the permitting program and must provide for judicial review in state court of final approval or denial of permits. (See 33 U.S.C. § 1342(b)(1); 40 C.F.R. §§ 123.1(c), 123.30.) The EPA may review and veto a state-issued permit for failure to comply with the Clean Water Act or its implementing regulations. (See 33 U.S.C. § 1342(d); 40 C.F.R.

§ 123.44.) It also retains ultimate authority to rescind a state's approval to issue NPDES permits. (33 U.S.C. § 1342(c).)

2. **Development of the Maximum-Extent-Practicable Standard for Issuance of MS4 Permits**

Congress instituted the NPDES permitting program in a 1972 amendment to the Clean Water Act. (See generally *Environmental Protection Agency, supra*, 426 U.S. at pp. 202-205.) Initially, the EPA exempted MS4 discharges from the act's permitting requirements. (*Building Industry Association of San Diego County v. State Water Resources Control Board* (2004) 124 Cal.App.4th 866, 873 (*Building Industry*)). An environmental group successfully challenged that decision before the D.C. Circuit, which rejected the EPA's argument that the variable nature of stormwater pollution made restrictions on the amount of pollutants, called "effluent limitations" in the act, infeasible. (*Natural Resources Defense Council, Inc. v. Costle* (D.C. Cir. 1977) 568 F.2d 1369, 1372-1373, 1377-1380.) The court held that the EPA Administrator did not have authority to exempt MS4s and ordered the EPA to promulgate regulations. (*Id.* at p. 1383.)

Over the next 15 years, the EPA attempted to draft regulations that "reconcil[e] the statutory requirement of point source regulation with the practical problems of regulating possibly millions of diverse point source discharges of storm water." (*Building Industry, supra*, 124 Cal.App.4th at p. 874.) During that same period, stormwater came to be seen as "one of the most significant sources of water pollution in the nation" because it carries "suspended metals, sediments, algae-promoting nutrients (nitrogen and phosphorus), floatable trash, used motor oil, raw sewage, pesticides, and other toxic contaminants into streams, rivers, lakes, and estuaries across the United States." (See *Environmental Defense Center, Inc. v. United States Environmental Protection Agency* (9th Cir. 2003) 344 F.3d

832, 840-841 (*Environmental Defense Center*.) In response to the EPA's struggle to develop a workable regulatory scheme for MS4s, and in recognition of the environmental threat posed by stormwater, Congress passed the Water Quality Act of 1987. (See *Natural Resources Defense Council, Inc. v. United States Environmental Protection Agency* (9th Cir. 1992) 966 F.2d 1292, 1296 (*Natural Resources Defense Council*.) The act added section 402(p) to the Clean Water Act to address stormwater permitting. (See 33 U.S.C. § 1342(p).) The new MS4 standard marked a shift away from the previous practice of requiring NPDES permittees to comply with numeric effluent limitations fixed by law or regulation. (*Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, 1163, 1165-1166.)

Clean Water Act section 402(p)(3)(B) introduced a flexible permitting standard for MS4 permits. (See 33 U.S.C. § 1342(p)(3)(B).) That is, rather than adopting effluent limitations that would apply across the board to all MS4 permittees or requiring immediate end-of-pipe compliance with water quality standards, Congress empowered the permitting authority—either the EPA or a state—to issue permits that respond to the unique circumstances of each MS4. (*Building Industry, supra*, 124 Cal.App.4th at p. 874; see also *Communities for a Better Environment v. State Water Resources Control Board* (2003) 109 Cal.App.4th 1089, 1092-1094 [discussing effluent limitations and NPDES permitting generally].)

Section 402(p)(3)(B) includes three discrete obligations for MS4 permits. First, permits for MS4 discharges must prohibit non-stormwater discharges into the MS4. (33 U.S.C. § 1342(p)(3)(B)(ii).) Second, permits for MS4 discharges must include “controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods.” (*Ibid.*) Third, the permits for MS4 discharges “shall require . . . such other

provisions as the Administrator or the State determines appropriate for the control of such pollutants.” (*Ibid.*) Collectively, these statutory requirements reflect the federal standard, although this case concerns only the maximum-extent-practicable standard.

In 1990, the EPA adopted regulations implementing the new rule for large and medium MS4s. (See generally 55 Fed.Reg. 47990; *Natural Resources Defense Council, supra*, 966 F.2d at pp. 1296-1298.) Large MS4s serve populations of 250,000 or more, while medium MS4s serve populations between 100,000 and 250,000. (40 C.F.R. § 122.26(b)(4), (7).) The regulations, which are codified at 40 C.F.R. § 122.26, implement the Clean Water Act’s maximum-extent-practicable standard. Neither the act nor the EPA’s regulations, however, defines the maximum-extent-practicable standard. As the EPA’s notice of rulemaking explained, the maximum-extent-practicable standard represented Congress’s recognition that effectively regulating discharges from MS4s is a complex undertaking and that MS4 permit requirements “should be developed in a flexible manner to allow site-specific permit conditions to reflect the wide range of impacts that can be associated with these discharges.” (55 Fed.Reg. at pp. 48037-48038.) Developing permits in a flexible manner allows the agencies charged with drafting them to “tailor permits to the site-specific nature of MS4 discharges,” and it reflects Congress’s recognition that different permits may have different requirements. (See *In re: City of Irving, Texas Municipal Separate Storm Sewer System* (U.S. E.P.A. Environmental Appeals Board, July 16, 2001) 10 E.A.D. 111 [2001 WL 988723 at p. *6] (*City of Irving*).) The “standard is a highly flexible concept that depends on balancing numerous factors, including the particular control’s technical feasibility, cost, public acceptance, regulatory compliance, and effectiveness.” (*Building Industry, supra*, 124 Cal.App.4th at p. 889.)

Under the EPA's regulations, municipalities seeking permits to operate a large or medium MS4 must submit detailed applications. (See 40 C.F.R. § 122.26(d).) The applicant must propose a management program to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques, system, design and engineering methods, and any other appropriate approaches. (*Id.*, § 122.26(d)(2)(iv); see also 3 AR 3393.) As with any NPDES permit, although the applicant proposes permit provisions that it believes will comply with the Clean Water Act and EPA regulations, it is the permitting agency that ultimately "has discretion to decide what practices, techniques, methods and other provisions are appropriate and necessary to control the discharge of pollutants" to comply with federal law. (See *City of Rancho Cucamonga v. Regional Water Quality Control Board – Santa Ana Region* (2006) 135 Cal.App.4th 1377, 1389 (*Rancho Cucamonga*); cf. *Environmental Defense Center, supra*, 344 F.3d at p. 856 [explaining that "stormwater management programs that are designed by regulated parties must, in every instance, be subject to meaningful review by an appropriate regulating entity to ensure that each such program reduces the discharge of pollutants to the maximum extent practicable"].)

**B. The Porter-Cologne Act and California's
Implementation of the NPDES Permitting Program**

The California Legislature passed the Porter-Cologne Water Quality Control Act in 1969 to promote conservation, to attain the highest water quality reasonable, and to protect the public health, safety, and welfare. (Wat. Code, § 13000.) The act required the State Water Resources Control Board (State Board) and nine regional boards (collectively, the Water Boards) to implement water law and policy. (*Id.*, §§ 13100, 13140, 13200, 13201, 13240, 13241, 13243.) Shortly after Congress added the NPDES program to the federal Clean Water Act in 1972, the California Legislature

determined that it was in the interest of the people to have the State issue NPDES permits in lieu of the EPA, “to avoid direct regulation by the federal government of persons already subject to regulation under state law” (See *id.*, § 13370.) The Legislature added chapter 5.5 to the Porter-Cologne Act to achieve that goal and to align California law with federal law. (See *id.*, § 13372.) In 1973, California became the first State to receive EPA approval to issue NPDES permits. (See *Environmental Protection Agency, supra*, 426 U.S. at p. 209.)

Under the Porter-Cologne Act, the Water Boards issue waste discharge requirements. (Wat. Code, § 13377.) Those requirements “are the equivalent of the NPDES permits required by federal law.” (*City of Burbank, supra*, 35 Cal.4th at p. 621, citing Wat. Code, § 13374.) To obtain waste discharge requirements from the Water Boards, a discharger must submit a report of waste discharge, which is the equivalent of an NPDES permit application. (See Wat. Code, §§ 13260, 13374.) The Water Boards then process the application in accordance with federal NPDES permitting rules and procedures. (See Cal. Code Regs., tit. 23, §§ 2235.1-2235.2.) After considering an applicant’s report of waste discharge, along with information learned before and during public hearings, the Water Boards prescribe waste discharge requirements that constitute an NPDES permit. (See Wat. Code, § 13263, subd. (a).) Any “aggrieved person,” including the discharger, may petition the State Board for administrative review of the permit’s appropriateness and propriety. (See *id.*, § 13320, subd. (c); Cal. Code Regs., tit. 23, §§ 2050-2068.) A party that disagrees with the State Board’s decision may challenge it in superior court by petition for administrative mandamus. (See Wat. Code, § 13330, citing Code Civ. Proc., § 1094.5.) These application and judicial-review procedures govern MS4 permits. (See, e.g., *Rancho Cucamonga, supra*, 135 Cal.App.4th at pp. 1381-1391 [reviewing challenge to an MS4 permit].)

C. California Mandates Law

California mandates law has its origins in the late 1970's, when Proposition 13 and Proposition 4 added articles XIII A and XIII B to the California Constitution, limiting state and local governments' taxing and spending powers. (*Department of Finance v. Commission on State Mandates (Kern High School District)* (2003) 30 Cal.4th 727, 735.) Section 6 of article XIII B provides that "[w]henever the Legislature or any state agency mandates a new program or higher level of service on any local government, the State shall provide a subvention of funds to reimburse that local government for the costs of the program or increased level of service" (Cal. Const., art. XIII B, § 6.) The section prohibits "the state from shifting financial responsibility for carrying out governmental functions to local agencies, which are 'ill equipped' to assume increased financial responsibilities because of the taxing and spending limitations that articles XIII A and XIII B impose." (*County of San Diego v. State of California* (1997) 15 Cal.4th 68, 81 (*County of San Diego*).

But when federal law requires local government entities to provide a new program or higher level of service, these subvention requirements do not apply. (See, e.g., *San Diego Unified School District v. Commission on State Mandates* (2004) 33 Cal.4th 859, 881, 888 (*San Diego Unified*).

The Constitution specifically excludes "[a]ppropriations required to comply with mandates of the . . . federal government." (Cal. Const., art. XIII B, § 9.) When the State implements a federal requirement through a statute or executive order, it creates a state mandate only if "the statute or executive order mandates costs that exceed" the federal requirement. (Gov. Code, § 17556, subd. (c).)

School districts and local agencies may seek redress for an unfunded state mandate before the Commission, a quasi-judicial body that the

Legislature created to administer the statutory procedures implementing article XIII B, section 6. (See Gov. Code, § 17500.) The Commission uses a test-claim procedure to adjudicate mandates claims. (See *id.*, §§ 17521, 17553; Cal. Code Regs., tit. 2, § 1181.2, subd. (s).) A “test claim” is “the first claim filed with the commission alleging that a particular statute or executive order imposes costs mandated by the state” (Gov. Code, § 17521.) Though multiple claimants may join together in pursuing a single test claim, the Commission will not hear duplicate claims, and Commission decisions apply statewide to similarly situated school districts and local agencies. (See Cal. Code Regs., tit. 2, § 1183.1; *San Diego Unified, supra*, 33 Cal.4th at p. 872, fn. 10.) Thus, the test-claim “functions similarly to a class action and has been established to expeditiously resolve disputes affecting multiple agencies.” (Cal. Code Regs., tit. 2, § 1181.2, subd. (s).) Filing a test claim is the exclusive procedure for claiming and obtaining reimbursement for costs mandated by the State. (Gov. Code, § 17552.)

A test claim must identify the sections of statutes or executive orders that purportedly impose a mandate, explain in detail how they create new costs, and include evidentiary support. (Gov. Code, § 17553, subd. (b); Cal. Code Regs., tit. 2, § 1183.1.) The Department of Finance and any other interested state agency or interested person may submit written comments on the test claim. (Cal. Code Regs., tit. 2, §§ 1183.2, 1181.2, subds. (j), (l); see also Gov. Code, § 17533, subd. (a)(1).) Either the claimant or the State may seek judicial review of a final Commission decision by petition for administrative mandamus. (Gov. Code, § 17559, subd. (b), citing Code Civ. Proc., § 1094.5.)

If a state mandate exists, and that mandate applies to cities, counties, or special districts, the State may choose either to appropriate funds to reimburse the affected local government entities, or to suspend the

operation of the mandate. (See Cal. Const., art. XIII B, § 6, subd. (b); Gov. Code, § 17581; *California School Boards Association v. Brown* (2011) 192 Cal.App.4th 1507, 1513-1514 [“with respect to a reimbursable mandate, for each fiscal year, the Legislature is required to choose to either fully fund the annual payment toward the arrearage or suspend the operation of the mandate”].)

SUMMARY OF FACTS

A. The Regional Board Issued an MS4 Permit

In February 2001, the County of Los Angeles, the Los Angeles County Flood Control District, and 84 incorporated cities within the flood control district applied for a renewal of their MS4 permit by submitting a report of waste discharge to the Regional Board. (See 3 AR 3663-3786.) The Regional Board issued the permit later that year. (1 Clerk’s Transcript (CT) 24-95.) Among other provisions, the permit required the placement and maintenance of trash receptacles at transit stops, and inspections of various commercial, construction, and industrial facilities. At the time, 9.5 million people lived in the 3,100-square-mile area covered by the permit. (1 CT 31.) The six-part, 70-page permit was the result of a 10-month administrative process that generated an 80,000-page administrative record and included approximately 50 meetings between the Regional Board staff and interested parties. (3 CT 415; 1 CT 25.)

The Regional Board based the permit on the application, the Regional Board’s experience with implementation of the previous permit, then-current EPA guidance, and other information learned before and during the public hearing. The Regional Board determined that the permit was necessary to meet minimum federal requirements and implement the federal maximum-extent-practicable standard:

This permit, and the provisions herein, are intended to develop, achieve, and implement a timely, comprehensive,

cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the [maximum extent practicable] from the permitted areas in the County of Los Angeles to the waters of the State.

(1 CT 48; see also 1 CT 32 [making similar statement]; 1 CT 82.)

B. The Permittees Challenge the Permit

The County of Los Angeles, Los Angeles County Flood Control District, and various cities sought review of the permit, first before the State Board and then in the courts by petition for administrative mandamus. (See 3 CT 408-431.) They raised several challenges, including an argument that the Regional Board exceeded its authority “under the federal Clean Water Act and California’s Porter-Cologne Water Quality Act by imposing requirements that go beyond the ‘maximum extent practicable’ (‘MEP’) standard and/or the Porter-Cologne Act’s ‘reasonably achievable’ standard.” (3 CT 413-414.) The superior court denied the petition, ruling in part that “the administrative record contains significant evidence showing that the terms of the Permit taken, as a whole, constitute the Regional Board’s definition of MEP” and that “[t]here is significant evidence in the administrative record that the Regional Board looked to both other states and jurisdictions, and conducted its own independent studies regarding various methods for compliance with MEP.” (3 CT 418-419 & fn. 5.)

The County and cities appealed, and the Court of Appeal affirmed. (*County of Los Angeles v. California State Water Resources Control Board* (2006) 143 Cal.App.4th 985 (*State Water Board*) [complete opinion at 3 AR 3241-3268; unpublished portions at 3 AR 3257-3268].) An intervening development in the case law featured prominently in the County and cities’ argument on appeal. Within weeks of the trial court’s decision, this Court decided *City of Burbank, supra*, 35 Cal.4th 613. (See

3 CT 412.) In that case, this Court reviewed NPDES permits authorizing publicly owned water reclamation plants to discharge treated wastewater. (See *City of Burbank, supra*, 35 Cal.4th at pp. 622-623.) Those permits were subject not to the flexible maximum-extent-practicable standard, but rather to end-of-pipe effluent limitations based upon standards developed by EPA. (See *id.* at pp. 620-621.) This Court held that a state-issued NPDES permit can exceed federal Clean Water Act requirements, but it also held that the board issuing a permit that exceeds federal requirements must take into account the considerations listed in Water Code sections 13263 and 13241, including economic considerations, for those requirements that exceed federal law. (See *id.* at pp. 626-629.)

The County and cities argued that the permit issued by the Regional Board exceeded the requirements of the Clean Water Act and that because it did, *City of Burbank* required the Regional Board to consider the economic effect of the permit, which the Regional Board had not done. (See *State Water Board, supra*, 143 Cal.App.4th 985 [unpublished section G.3 at 3 AR 3259].) The Court of Appeal decided that argument had “no merit.” (*Id.* [unpublished section G.3 at 3 AR 3260].) The court denied rehearing, and this Court denied review on February 14, 2007.

C. The County and Cities File Test Claims with the Commission

In 2003, nine months after filing the petition for mandamus directly challenging the permit in superior court, the County and several cities—Bellflower, Carson, Commerce, Covina, Downey, and Signal Hill—also filed test claims with the Commission. (See, e.g., 1 AR 19, 599.) The Commission initially refused to consider the claims because the then-current version of Government Code section 17516, subdivision (c), deprived it of authority to review Water Board orders. (See 1 AR 1153-1171; 2 AR 1173-1200.) The County and cities (collectively, the County)

challenged that statute's constitutionality in superior court, which issued a writ of mandate instructing the Commission to consider the test claims. The Court of Appeal affirmed. (*County of Los Angeles v. Commission on State Mandates* (2007) 150 Cal.App.4th 898.) The Legislature later amended section 17516 to remove the language excluding Water Board orders from Commission review. (See Stats. 2010, ch. 288, § 1, p. 9.)

The County and cities pursued four test claims. (See 2 AR 1535-1755; 2 AR 1757-1950; 2 AR 2259-2451; 3 AR 2479-2670.) The four test claims challenged four discrete provisions of the permit:

- Part 4.F.5.c.3, which requires certain permittees to place and maintain trash receptacles at all transit stops (1 CT 74; 2 AR 1540);
- Part 4.C.2.a, which requires permittees to inspect restaurants, automotive service facilities, retail gasoline outlets, and automotive dealerships to verify that those businesses meet certain criteria that prevent non-stormwater discharge, like restaurant grease, from entering the MS4 (1 CT 54-56; 2 AR 1762-1766);
- Part 4.C.2.b, which requires inspection of certain industrial facilities to confirm that they are meeting several criteria, including implementing best management practices in compliance with county and municipal ordinances (1 CT 56, 87; 2 AR 1766-1769); and
- Part 4.E, which requires inspections of certain construction sites to ensure that the sites meet the permit's minimum requirements, such as using best management practices to control erosion from slopes and channels (1 CT 67-70; 2 AR 2266-2267).

The claimants contended that the specific permit provisions requiring commercial inspections, industrial inspections, and construction-site inspections, as well as the placement and maintenance of trash receptacles, imposed new programs or higher levels of service on the permittees that were not required by the Clean Water Act and for which the permittees lacked funding authority. (See, e.g., 3 AR 2488-2497.) Given the

similarity and overlap among the four test claims, the Commission consolidated them. (See 5 AR 5681-5682.) After a hearing, it found that each of the four challenged permit provisions was not required by federal law. (5 AR 5603.)

The Commission did not review the record before the Regional Board, or analyze whether the permit exceeded the federal maximum-extent-practicable standard. Instead, it reasoned that because the Clean Water Act and its implementing regulations do not expressly require either trash receptacles at transit stops or inspections, these permit provisions exceeded the requirements of federal law. (See 5 AR 5584, 5590.) Relying on the Court of Appeal's decision in *Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1564, 1593-1594 (*Hayes*), the Commission reasoned that, absent an express federal statutory or regulatory command, the State had freely chosen to impose the trash receptacle requirement on the permittees. (See 5 AR 5584 & fn. 89.) It also reasoned that under the Court of Appeal's decision in *Long Beach Unified School District v. State of California* (1990) 225 Cal.App.3d 155, 173 (*Long Beach Unified*), the trash receptacle requirement amounted to a "specified action going beyond federal law." (5 AR 5585 & fn. 92.)

With regard to the inspection requirements, the Commission also reasoned that neither the Clean Water Act nor its implementing regulations require local agencies, as opposed to the State, to conduct such inspections. (See 5 AR 5595, 5601.) The Commission noted that the State Board has issued statewide NPDES permits covering industrial facilities (GIASP) and construction facilities (GCASP) that the regional boards enforce. (See 5 AR 5594-5595, 5601; see also 3 AR 3579-3657 [GIASP]; 2 AR 2417-2444 [GCASP].) The Commission remarked that "[t]here is nothing in the federal statutes or regulations that would prevent the state (rather than the local agencies) from performing the inspections" of industrial facilities and

constructions sites, suggesting that because the Regional Board could choose to perform the same inspections under the statewide permit, it was in excess of the requirements of federal law to impose similar requirements in the MS4 permit. (5 AR 5595, 5600.) It concluded that the State freely chose to impose the industrial-facility and construction-site inspection requirements on the local agencies under *Hayes*. (See 5 AR 5595 & fn. 110, 5600 & fn. 120.) It also concluded that the construction-site inspection requirement amounted to a “specified action[] going beyond the federal requirement for inspections” (5 AR 5600 & fn. 119.)

Nevertheless, the Commission concluded that the three inspection provisions did not impose costs mandated by the State within the meaning of article XIII B, section 6 because the County and cities had fee authority to pay for the inspections. (See, e.g., 5 AR 5625.) It reached the opposite conclusion, however, with respect to the provision requiring installation and maintenance of trash receptacles, finding that it created a reimbursable state mandate. (See, e.g., 5 AR 5625.)

D. The Courts Reverse the Commission’s Decision

The Department of Finance and the Water Boards petitioned for a writ of administrative mandamus challenging, among other things, the Commission’s conclusion that the permit provisions at issue in the test claim were not required by federal law. (1 CT 11-22.) The superior court granted the petition, noting that the Commission’s “search for a comparable federal regulation as the pre-condition for finding a federal mandate utterly ignores and misapplies the flexible regulatory standard inherent in the Clean Water Act.” (See 4 CT 679.) The superior court also determined that the “Commission erred in isolating a specific requirement to conclude that the issued NPDES permit was a state mandate” and that “[o]ne permit provision cannot exceed the ‘maximum extent practicable’ standard imposed by the Clean Water Act where the permit as a whole does not.” (4

CT 680.) The County and six cities appealed, and the Court of Appeal affirmed.

The County's primary theory on appeal was that the trial court failed to properly apply *Long Beach Unified* and *Hayes*. (See Slip Op. 23-24, 26.) The County contended that the EPA's regulations were specific in some areas and flexible in others and that, where the regulations were flexible, the local agencies, as permittees, had discretion to identify and propose programs that would satisfy the maximum-extent-practicable standard. (See Slip Op. 26.) By imposing specific requirements in the permit, the County argued, the Regional Board had imposed a state mandate. (See Slip Op. 26.)

The Court of Appeal rejected that argument, explaining that "there is no precise rule or formula for determining whether a cost imposed on a local government or agency is a federal mandate." (Slip Op. 27-28, citing *City of Sacramento v. State of California* (1990) 50 Cal.3d 51, 76 (*City of Sacramento*)). The court concluded that the broad, flexible standard established by the Clean Water Act and the State's role in implementing the act distinguished this case from *Long Beach Unified* and *Hayes*. (See Slip Op. 34.) The court noted that Congress intended the maximum-extent-practicable standard to account for the "practical realities" of regulating MS4s and that Congress intended it to be a highly flexible standard. (Slip Op. 31.) It also recognized that the Water Boards act in lieu of the EPA when implementing federal NPDES permitting standards.

Against that analytical backdrop, the court took up the County's objections to the four challenged permit provisions, recognizing at the outset the strong presumption of correctness and deference that agencies receive when acting within their area of expertise. (Slip Op. 35-36.) It affirmed the trial court, holding that the trash-receptacle and inspection requirements implemented the Clean Water Act's goal of reducing the

discharge of pollutants to the maximum extent practicable and thus constituted federal mandates. (Slip Op. 35-36.) The County petitioned for, and this Court granted, review.

STANDARD OF REVIEW

Courts may set aside Commission decisions that are legally erroneous or not supported by substantial evidence. (Gov. Code, § 17559, subd. (b); Code Civ. Proc., § 1094.5, subd. (b).) “The question of whether [a law] is a state-mandated program or higher level of service under article XIII B, section 6 of the California Constitution is a question of law [that courts] review de novo.” (See *City of Richmond v. Commission on State Mandates* (1998) 64 Cal.App.4th 1190, 1195.) This Court also independently reviews “legal conclusions as to the meaning and effect of constitutional and statutory provisions.” (*Ibid.*; see also *County of San Diego, supra*, 15 Cal.4th at p. 109 [“Where . . . a purely legal question is at issue, courts exercise independent judgment,” quotation marks omitted].)

Because this Court reviews judgments, not decisions, it may affirm on any grounds in the record. (See *Davey v. Southern Pac. Co.* (1897) 116 Cal. 325, 329.) That rule applies even where the parties did not advance the theory below, so long as it presents a question of law on the facts in the record. (*Ward v. Taggart* (1959) 51 Cal.2d 736, 742 (*Ward*).)

ARGUMENT

I. THE FOUR CHALLENGED PERMIT REQUIREMENTS ARE FEDERAL MANDATES.

The courts below correctly applied federal and state law in holding that the permit and all its terms are not state mandates because they do not exceed the federal maximum-extent-practicable standard. This Court should affirm.

A. A Permit That Does Not Exceed the Federal Maximum-Extent-Practicable Standard Does Not Impose a State Mandate.

The permit and all its terms are federal mandates because they do not exceed the federal maximum-extent-practicable standard for issuance of an MS4 permit. California mandates law “preclud[es] a shift of financial responsibility for carrying out governmental functions from the state to local agencies” (See *County of Los Angeles v. California* (1987) 43 Cal.3d 46, 61, discussing Cal. Const., art. XIII B, § 6.) It does not require the State to subsidize local government compliance with federal mandates. (See, e.g., Gov. Code, § 17556, subd. (c) [providing that executive orders implementing federal requirements are state mandates only if they “exceed the mandate in [the] federal law or regulation”]; *County of Los Angeles v. Commission on State Mandates (Davis)* (1995) 32 Cal.App.4th 805, 816 (*Davis*) [“The courts have concluded that no state mandate exists if the requirements or provisions of a state statute are, nevertheless, required by federal law”].)

In *San Diego Unified*, this Court held that procedures used in discretionary expulsion proceedings “should be considered to have been adopted to implement a federal due process mandate” and they therefore constituted nonreimbursable federal mandates. (See *San Diego Unified*, *supra*, 33 Cal.4th at p. 888.) This Court’s analysis followed the Court of

Appeal's reasoning in *Davis, supra*, 32 Cal.App.4th 805. (*San Diego Unified, supra*, 33 Cal.4th at pp. 888-890.) In *Davis*, the court addressed a Penal Code statute requiring counties to provide indigent criminal defendants with investigators and experts in addition to counsel, as required by the federal Constitution. (See *Davis, supra*, 32 Cal.App.4th at pp. 814-815.) The court held that the Penal Code did not create a state mandate because it merely implemented a federal constitutional requirement. (*Id.* at p. 816.)

Together, *San Diego Unified* and *Davis* recognize that the State may enforce the requirements of federal law without creating a reimbursable state mandate. In those cases, the courts examined *state* laws enacted to implement and make specific otherwise broad federal constitutional protections. The permit challenged here provides an even stronger case for a federal mandate, because the State is directly enforcing a *federal* law, in lieu of the EPA and subject to the same federal standards that govern the EPA when it drafts NPDES permits. It is the Clean Water Act and its implementing regulations that require the State to issue permits for MS4 discharges that, at a minimum, include controls sufficient to reduce pollutant discharge to the maximum extent practicable. (See 33 U.S.C. § 1342(b), (p)(3)(B); 40 C.F.R. § 122.26.)

That Congress has delegated authority to the permitting agencies—either the EPA or state agencies—to determine the specific controls or set of controls necessary to reduce pollutant discharges to the maximum extent practicable in the unique circumstances of each MS4 (see *Natural Resources Defense Council, supra*, 966 F.2d at p. 1296; *Building Industry, supra*, 124 Cal.App.4th at p. 874), does not change the analysis. A permit that requires controls to reduce pollutant discharges to the maximum extent practicable is a bedrock requirement of federal law, and federal law also requires the permitting agency to determine the controls that are necessary

to achieve that standard. Thus, where, as here, the permit does not exceed the maximum-extent-practicable standard, it imposes only a federal mandate that does not require a subvention of funds.

B. None of the Four Challenged Requirements Causes the Permit to Exceed the Maximum-Extent-Practicable Standard.

Congress intended the maximum-extent-practicable standard to be flexible: it did not prescribe a list of approved controls, and contemplated that permits would include site-specific terms to address the unique circumstances and threats posed by each MS4. (See 55 Fed.Reg. at pp. 48037-48038; *City of Irving, supra*, 10 E.A.D. 111 [2001 WL 988723 at p. *6].) That is, federal law contemplates that permits will include terms not expressly called for by the Clean Water Act or its implementing regulations. An agency that drafts a permit—either the EPA or a state issuer—must use its expertise to determine the “controls [that will] reduce the discharge of pollutants to the maximum extent practicable” (See 33 U.S.C. § 1342(p)(3)(B)(iii).) The permit here was thus not simply authorized or permitted by federal law, it was required by the Clean Water Act. Under the Clean Water Act, the permit, not the individual requirements must, at a minimum, include “controls to reduce the discharge of pollutants to the maximum extent practicable” (33 U.S.C. § 1342(p)(3)(B).) The permittees must have an NPDES permit to operate their MS4, and that permit must implement the standards required by the Clean Water Act. Each of the challenged terms is an element of the stormwater pollution control program that carries out that federal standard. Considered individually or in combination with all the terms of the permit, those terms do not exceed, nor do they cause the permit to exceed, the requirements of federal law.

1. The Trash Receptacle Requirement Does Not Exceed the Maximum-Extent-Practicable Standard.

Requiring the County to place trash receptacles at transit stops implements the maximum-extent-practicable standard. The EPA's regulations identify "practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm systems" as one method for reducing the discharge of pollutants to the maximum extent practicable. (40 C.F.R. § 122.26(d)(2)(iv)(A)(3).) Requiring permittees to place trash receptacles at transit stops falls within that requirement, as both the trial court and Court of Appeal recognized. (See 1 CT 74.) The trial court said that putting trash receptacles at transit stops was an "obvious remedy" for stormwater pollution, noting that, "if litter and debris cannot be properly disposed of by persons waiting at transit stops, the inevitable downstream result will be the introduction of pollutants into the streets and, thereafter, into the storm drains—leading inevitably to the discharge of pollutants into nearby waterways." (4 CT 680.)

Likewise, the Court of Appeal explained that "[t]rash receptacles are a simple method of keeping stormwater clean because they prevent trash and other debris from entering storm drains and entering the ocean and local rivers and drainage canals." (Slip. Op. 35.) The EPA itself, in a 2008 letter, opined that the permit's trash-receptacle requirement fell within the maximum-extent-practicable standard. (See 3 AR 3798-3799.) And in its permit application, the County identified litter and debris on the streets as a source of pollution, and it suggested trash collection along or in improved open channels. (3 AR 3678.)

2. The Inspection Requirements Do Not Exceed the Maximum-Extent-Practicable Standard.

Similarly, requiring inspections of certain commercial and industrial facilities and construction sites implements the maximum-extent-practicable standard. Inspections are necessary to effectively control the discharge of pollutants in compliance with the Clean Water Act. “Federal law, either expressly or by implication, requires NPDES permittees to perform inspections for illicit discharge prevention and detection; landfills and other waste facilities; industrial facilities; construction sites; certifications of no discharge; non-storm water discharges; permit compliance; and local ordinance compliance.” (*Rancho Cucamonga, supra*, 135 Cal.App.4th at p. 1390.)

Commercial-Facility Inspections. The EPA’s regulations call for “inspections . . . to prevent illicit discharges to the municipal storm sewer system” (40 C.F.R. § 122.26(d)(2)(iv)(B)(1).) The permit requires inspection of certain commercial facilities, like restaurants and car-service facilities, to make sure that those businesses are not discharging food waste and motor oil, for example, into storm drains. (See 1 CT 54-55.) Both the trial court and Court of Appeal recognized that these inspections fell within the federal standard. (See 4 CT 681; Slip Op. 35.) The EPA’s 2008 letter says these inspections were “well within the scope” of the MS4 permitting regulation. (3 AR 3798.) And the County’s permit application recommended “visits” of automotive-service and food-service facilities similar to the inspections the permit ultimately required. (3 AR 3671.)

Industrial-Facility Inspections. The EPA’s regulations call for permits to “[i]dentify priorities and procedures for inspections” of industrial facilities. (40 C.F.R. § 122.26(d)(2)(iv)(C)(1).) The permit implements that requirement by, for example, having the permittees inspect certain industrial facilities to ensure the operators follow best management

practices for stormwater discharges and comply with additional controls when the facility is in an environmentally sensitive area. (See 1 CT 56-67.) The trial and appellate court recognized that these provisions fell within the federal requirement. (See 4 CT 681; Slip Op. 35.) And, as with the commercial inspections, the EPA's 2008 letter says the industrial inspections are well within the MS4 requirements. (See 3 AR 3798.) Even the County's permit application recommended an "industrial[] educational site visit program" (3 AR 3670-3671.)

Construction-Site Inspections. The EPA's regulations call for permits to describe "procedures for identifying priorities for inspecting" construction sites. (40 C.F.R. § 122.26(d)(2)(iv)(D)(3).) The permit implements that requirement by requiring inspections to ensure that, among other things, sediment and construction-related materials, wastes, spills, or residues do not end up in the MS4. (See 4 CT 67-70.) As with the other inspection requirements, the trial and appellate courts recognized that the permit's provisions fell within the federal standard. (See 4 CT 681; Slip Op. 35.) Though the EPA's 2008 letter does not discuss the construction inspection requirement, an EPA guidance manual shows that the EPA believes the MS4 permits should impose construction-inspection provisions. (See 3 AR 3394.) And the County's own permit application recommended detailed construction-site requirements that included inspections. (3 AR 3672-3775.)

C. The Regional Board's Determination of What Federal Law Requires Is Entitled to Deference.

Unlike the Regional Board, the Commission was ill-equipped to determine in the first instance whether the permit exceeded the federal standard for MS4 permits. It does not have the expertise of the Regional Board, nor did it have the record that was before the Regional Board. Accordingly, it should have deferred to the Regional Board's determination

of what the Clean Water Act and EPA regulations require in a permit to operate the permittees' MS4. This is especially important in the context of MS4 permits, which include interlocking components that collectively must reduce pollutants to the maximum extent practicable.

Congress and the EPA conferred discretion on the Water Boards to use their expertise to decide the combination of terms necessary for any given MS4 to comply with the Clean Water Act. These state agencies are authorized by federal and state law to interpret the requirements of the Clean Water Act and related EPA regulations, and to issue the permit. (See 33 U.S.C § 1342(b), (p); Wat. Code, § 13377; Cal. Code Regs., tit. 23, § 2235.2.)

Here, the Regional Board drafted the permit after overseeing a 10-month administrative process that generated an 80,000-page administrative record and included approximately 50 meetings between the Regional Board staff and interested parties. (See 3 CT 415.) In the permit, the Regional Board specifically determined that the permit and its terms implemented a stormwater pollution control program to reduce the discharge of pollutants in stormwater to the maximum extent practicable. (See 1 CT 48.) As the expert in the Clean Water Act, the evolving science and technology of pollution control, and the unique factual circumstances surrounding the County's MS4, the Regional Board should receive deference in determining what federal law requires.

1. Deference to the Regional Board's Determination of What Federal Law Requires Is Appropriate in the MS4 Permitting Context.

When an agency—either the EPA or a designated state agency such as the Regional Board—drafts a permit and develops site-specific requirements, it brings to bear its scientific, technical, and legal knowledge, as well as its experience with the success and failure of controls required in

a particular MS4, in determining the type and combination of “controls [that will] reduce the discharge of pollutants to the maximum extent practicable,” considering the unique circumstances and pollution threats posed by a particular applicant’s MS4. (See 33 U.S.C. § 1342(p)(3)(B)(iii).)

The Court of Appeal properly recognized the specialized nature of the Regional Board’s permitting process, and cited both the presumption of regularity in official acts and the doctrine of deference to agency expertise. (See Slip Op. 35, citing Evid. Code, § 664, *Fukuda v. City of Angels* (1999) 20 Cal.4th 805, 812 (*Fukuda*).) It quoted this Court’s decision in *Fukuda* for the proposition that “considerable weight should be given to the findings of experienced administrative bodies made after a full and formal hearing, especially in cases involving technical and scientific evidence.” (Slip Op. 25, quoting *Fukuda, supra*, 20 Cal.4th at p. 812.) *Fukuda* held that deference applies even where the courts exercise their independent judgment when reviewing the evidence. (*Fukuda, supra*, 20 Cal.4th at pp. 817-818; see also Wat. Code, § 13330, subd. (e).) Deference to an agency is “fundamentally situational.” (*Yamaha Corporation of America v. State Board of Equalization* (1998) 19 Cal.4th 1, 12 [italics omitted].) An agency’s interpretation of a statute should receive deference where it has a comparative interpretive advantage stemming from its application of technical or scientific expertise to entwined issues of fact, policy, and discretion. (*Ibid.*; accord *American Coatings Association, Inc. v. South Coast Air Quality District* (2012) 54 Cal.4th 446, 475 [deferring, in a rulemaking challenge, to air district’s expertise in categorizing pollutant sources under a statute requiring “best available retrofit technology” because the trade association making the challenge could neither point to an “objectively correct categorization” of pollutant sources nor show that the district acted arbitrarily in creating its categories].) The Regional Board’s

expertise gives it a tremendous advantage in interpreting the requirements of federal law for each individual MS4.

2. The Commission's Failure to Defer to the Regional Board's Decision Invited Legal Error and Inconsistent Results.

The Commission should have deferred to the Regional Board's determination of the permit terms required by federal law. Generally speaking, "[a] decision by an agency primarily qualified to determine a question is binding on another agency" (2 Pierce, Administrative Law Treatise (5th ed. 2010) § 13.4, p. 1145.) Judge Friendly, writing for the Second Circuit, put a finer point on this principle, noting that where one agency has the expertise to pass on a matter and does so, "it would be quite unseemly for [another agency] to conclude that its sister agency had been wrong on a fully litigated issue the decision of which Congress had confided to it" (See *Safir v. Gibson* (2d Cir. 1970) 432 F.2d 137, 143.)

Here, the Legislature has confided the determination of what the Clean Water Act and EPA regulations require to the Water Boards. (See, e.g., Wat. Code, § 13377.) The Commission, by contrast, is not qualified to and does not engage in the complex analysis that the Water Boards conduct to determine the requirements of federal law for operation of a particular MS4 under the Clean Water Act. The Commission did not evaluate the permit application, the historical success and failure of pollution controls, the current state of the science and technology of pollution control, or the cost in determining the set of controls that would reduce pollution to the maximum extent practicable. (See generally 5 AR 5581-5603.) Instead, the Commission misinterpreted federal law and simply looked to see whether the terms of the permit matched specific terms prescribed by federal law. (See, e.g., 5 AR 5585.) This was an inappropriate test for

determining what is required to achieve the maximum-extent-practicable standard, which does not prescribe specific permit terms.

Failure to give appropriate deference to the Regional Board creates a variety of problems. When the Commission disagrees with the Water Boards about what federal law requires, it sets up a second round of judicial review in which the burden of proof is shifted to the Water Boards. On a direct challenge to a permit, the “party challenging the scope of [the] permit . . . has the burden of showing the [Water Boards] abused [their] discretion or [their] findings were unsupported by the facts.” (*Building Industry, supra*, 124 Cal.App.4th at pp. 888-889.) Regional board determinations are subject to a strong presumption of correctness, and they receive deference in areas of policymaking and technical expertise. (See *Fukuda, supra*, 20 Cal.4th at pp. 812, 817; see also *State Water Board, supra*, 143 Cal.App.4th at p. 997 [“we defer to the regional board’s expertise in construing language which is not clearly defined in statutes involving pollutant discharge into storm drain sewer systems”].) In the direct challenge to the permit, the County and cities argued that the Regional Board exceeded the requirements of the maximum-extent-practicable standard, an argument that the Court of Appeal squarely rejected. (See *State Water Board, supra*, 143 Cal.App.4th 985 [unpublished section G.3 at 3 AR 3259-3260].) But when the Water Boards challenge a Commission decision determining what federal law requires, the burden of proof arguably shifts to the Water Boards. If the Water Boards are not given deference, they will be forced to affirmatively establish the correctness of their decision, and the party challenging the permit, as here, will argue that it is the Commission’s decision, not that of the Water Boards, that is entitled to deference and should be reviewed under the substantial evidence standard. (See Appellants’ Opening Brief (AOB) 47-50.)

These concerns dovetail with fundamental principles favoring finality of agency and judicial decisions. (See *Murray v. Alaska Airlines, Inc.* (2010) 50 Cal.4th 860, 868 (*Murray*)). It is inefficient for the parties to litigate twice, first in the permitting process and later in the mandates process, the issue of what federal law requires. And duplicative litigation could, as here, lead to inconsistent decisions and conflicting obligations under state and federal law. Under state law, a local government is not required to “implement or give effect to” any state mandate for which the State has not provided a subvention of funds. (Gov. Code, § 17581, subd. (a); see also Cal. Const., art. XIII B, § 6, subd. (b).) But under federal law, requirements in NPDES permits can be enforced in civil and criminal actions in federal court. (See 33 U.S.C. §§ 1319, 1342(i), 1365.) If the permit or one of its terms is determined to be a state mandate and the Legislature chooses to suspend the operation of the mandate rather than reimburse its costs—as it, or the Governor, through the exercise of the line-item veto, is constitutionally authorized to do (see *California School Boards Association v. Brown, supra*, 192 Cal.App.4th at 1511-1512)—the permit and all its terms arguably remain no less enforceable, under federal law.

3. Collateral Estoppel Should Ordinarily Bar Permittees from Relitigating Before the Commission Matters of Federal Law Fully Litigated and Finally Decided in the Permitting Process.

Even in the absence of deference, the related doctrines of collateral estoppel and judicial exhaustion should ordinarily limit local government’s ability to relitigate before the Commission the Water Boards’ final determinations of what federal law requires, and thus reduce the likelihood of interagency conflict and its adverse consequences.

Collateral estoppel precludes relitigation of issues argued and decided in prior proceedings. (*Lucido v. Superior Court* (1990) 51 Cal.3d 335, 341 (*Lucido*)). It applies to quasi-judicial agency decisions, just as it does to court decisions. (See *Murray, supra*, 50 Cal.4th at p. 867.) The requirements for collateral estoppel are met here:¹ (1) the issue sought to be precluded is identical to an issue actually litigated and necessarily decided in the earlier proceeding; (2) the earlier decision was final and on the merits; and (3) the party against whom preclusion is sought is identical to the party to the former proceeding. (See *Lucido, supra*, 51 Cal.3d at p. 341.) The claimants to the Commission proceeding were parties in the permitting proceedings (compare 5 AR 5557 & fn. 2, 3 AR 2480, 2 AR 2260 with 3 CT 412-413, *State Water Board, supra*, 143 Cal.App.4th at p. 989 & fn. 1); the decision on the matter became final when this Court denied review of the Court of Appeal's decision on February 14, 2007 (see Cal. Rules of Court, rule 8.532(b)(2)(A)); and the issue of whether the permit exceeds the requirements of federal law is identical to the issue of whether the Regional Board exceeded the requirements of the Clean Water

¹ In the courts below, Respondents argued that the litigation directly challenging the permit had preclusive effect. (See Respondents' Brief at pp. 33-34, filed on Oct. 26, 2012 in Case No. B237153; Petitioners' Memorandum of Points and Authorities in Support of Petitioner for Writ of Mandamus at pp. 22-23, filed on June 10, 2011 in Case No. BS130730.) They did not, however, frame the issue as one of collateral estoppel. Even if this argument were treated as newly raised on review, this Court nonetheless would have discretion to consider it because it presents issues of law that can be resolved based on facts in the record and because it presents important public policy issues. (See *Ward, supra*, 51 Cal.2d at p. 742; see also *Redevelopment Agency of the City of Berkeley v. City of Berkeley* (1978) 80 Cal.App.3d 158, 167 [applying doctrine of waiver is discretionary]; *United California Bank v. Bottler* (1971) 16 Cal.App.3d 610, 616 ["Since the [newly raised argument] is based upon public policy rather than private convenience, we cannot invoke any doctrine of waiver, but must face the issue and apply the limitation which the law imposes".])

Act, which was actually litigated and necessarily decided in the direct challenge to the Regional Board's permitting decision. On appeal in that case, the County argued that the permit "imposes conditions more stringent than required by the Clean Water Act." (*State Water Board, supra*, 143 Cal.App.4th 985 [unpublished section G.3 at 3 AR 3259].) The Court of Appeal flatly rejected that argument, saying it had no merit. (See *id.* [unpublished section G.3 at 3 AR 3260].)

The County had thus fully litigated whether the Regional Board exceeded the requirements of federal law by the time the Commission issued its decision. In these circumstances, collateral estoppel should have barred the County from relitigating that question before the Commission.²

II. THE COUNTY'S ARGUMENTS MISCONSTRUE THE CLEAN WATER ACT AND MANDATES LAW.

None of the County's arguments overcome the conclusion reached by the courts below that the permit and all its terms express a federal mandate. The County misapprehends the nature of MS4 permits, the maximum-extent-practicable standard, and the Regional Board's permit authority under the Clean Water Act and EPA regulations. The County's reliance on the Court of Appeal's decision in *Long Beach Unified* is misplaced because the permit did not exceed the requirements of federal law. Its reliance on the Court of Appeal's decision in *Hayes* is misplaced because the permit did not pass any costs associated with the State's compliance with federal

² If a permittee chooses not to challenge a regional board's determination of what federal law requires in the direct permit-review process, the doctrine of judicial exhaustion will still preclude it from relitigating that issue before the Commission. (See *Murray, supra*, 50 Cal.4th at p. 867 [judicial exhaustion recognizes that, out "respect for the administrative decisionmaking process requires," parties to the process complete it, "including exhausting any available judicial avenues for reversal of adverse findings"]; see also Wat. Code, §§ 13320, 13330.)

law to the permittees. Its argument that the Court of Appeal failed to give effect to the Commission's exclusive primary jurisdiction misapprehends the Court of Appeal's decision. And the evidence the County references does not support its argument that the permit exceeded the requirements of federal law.

A. The County Incorrectly Relies on *Long Beach Unified*.

The County mistakenly relies on *Long Beach Unified, supra*, 225 Cal.App.3d 155, to make two arguments: the County argues first, that any permit term not expressly required by federal law exceeds the requirements of federal law and creates a state mandate; and second, that the Clean Water Act gives the discharger or permittee—rather than the regional board or the EPA—discretion to determine the terms of the permit that will achieve the maximum-extent-practicable standard. (See AOB 31-35, 37-41.) The case does not support either argument.

The decision in *Long Beach Unified* addressed California Department of Education regulations that directed certain school districts to develop and adopt plans to alleviate and prevent racial and ethnic segregation. (*Long Beach Unified, supra*, 225 Cal.App.3d at pp. 164-165.) The State argued that the regulations did not constitute a new program or higher level of service because the school districts had a constitutional duty to try to desegregate schools. (*Id.* at p. 172.) The court disagreed, holding that the regulations exceeded federal constitutional and case-law desegregation requirements. (*Id.* at p. 173.) Specifically, the court held that the State regulations “require specific action” that federal case law had previously only “suggested . . . may be helpful.” (*Ibid.*, italics in original.) “[T]he point is that these steps are no longer merely being suggested as options which the local school district may wish to consider but are required acts.” (*Ibid.*)

Long Beach Unified does not support the County's argument that any permit requirement not expressly required by the Clean Water Act or its implementing regulations exceeds the Regional Board's federal permitting authority and creates a state mandate. (See, e.g., AOB 30-35.) This is because the court in *Long Beach Unified* was addressing state regulations that attempted to interpret and codify the requirements of federal law and which the court found imposed requirements in excess of federal law; it was not addressing a federal law that imposed a flexible permitting standard requiring the State to exercise discretion to determine the terms necessary to comply with that standard. In *Long Beach Unified*, the State imposed its rules despite an evolving body of case law whose hallmark was courts "wary of requiring specific steps in advance of a demonstrated need for intervention." (See *Long Beach Unified, supra*, 225 Cal.App.4th at p. 173.) By contrast, the Clean Water Act, which prohibits the discharge of all pollutants without a permit, presupposes a need for intervention by creating an elaborate regulatory scheme superintended by the EPA and implemented, in part, by states.³

Rather than looking at the four challenged permit terms in the full complexity of federal law, the County skips the essential step of determining what, exactly, federal law requires, and would have this Court adopt the Commission's approach of simply comparing the text of federal law to the text of the permit. The analysis that the County urges boils down to this: if a federal statute or regulation does not expressly require the

³ No party disputes that Water Boards may use their authority under the Porter-Cologne Act to impose requirements that exceed those of the Clean Water Act. (See *City of Burbank, supra*, 35 Cal.4th at pp. 627-628.) But that has not occurred here, and is not likely to be a common occurrence in the context of MS4 permits, where the federal standard for MS4 permitting provides a broad federal mandate.

permit term at issue, and if the permit was written by a state permitting authority rather than the EPA, then the permit term is a state, not a federal, mandate. (See AOB 31-35; see also 5 AR 5576-5603.) The upshot of that reasoning, as the trial court noted, is that “a permit requirement that is merely practicable or easy (not even practicable to the maximum extent) would be a state mandate if the U.S. EPA failed to express the requirement as a regulation.” (See 4 CT 680.)

That approach not only misconstrues federal law, it also misconstrues mandates law. When analyzing whether a particular requirement is a federal mandate, the question is not whether that requirement is imposed in any particular manner (e.g., “expressly”), but rather whether it is genuinely imposed by federal law, or is instead a creation of state law. (See *Davis, supra*, 32 Cal.App.4th at p. 816 [“no state mandate exists if the requirements or provisions of a state statute are, nevertheless, required by federal law”]; *Long Beach Unified, supra*, 225 Cal.App.3d at 173 [to constitute a federal mandate, the mandate must be required by federal law, not merely suggested]; see also *City of Sacramento, supra*, 50 Cal.3d at p. 76 [recognizing that whether a cost imposed on a local agency constitutes a federal mandate requires consideration of the specific program and deciding not to attempt a “final test for ‘mandatory’ versus ‘optional’ compliance with federal law”].)

The County’s second argument in reliance on *Long Beach Unified*, that the operator of the MS4, rather than the Regional Board, has the discretion to determine how to comply with the maximum-extent-practicable standard, is also mistaken. (See AOB 37-41.) In California, only the Water Boards are authorized by the EPA to issue the MS4 permit. Under federal law, although it may suggest permit terms sufficient to meet the maximum-extent-practicable standard, a permit application merely proposes methods for compliance. (See Cal. Code Regs., tit. 23, §§ 2235.1-

2235.2; 40 C.F.R. § 122.26(d).) The permitting agency may incorporate all or part of a permittee's application into the permit; indeed, the permitting agency may rely heavily on the application. (See *City of Irving, supra*, 10 E.A.D. 111 [2001 WL 988723 at p. *8].) But the law charges the Water Boards, as EPA-approved permit issuers, with determining what will satisfy the maximum-extent-practicable standard. (See 33 U.S.C § 1342(b), (p); Wat. Code, § 13377; Cal. Code Regs., tit. 23, § 2235.2; see also *Environmental Defense Center, supra*, 344 F.3d at pp. 854-856 [remanding rule regarding small MS4 operators to the EPA because it did not provide for agency review of permit applications and noting that "nothing prevents the operator of a small MS4 from misunderstanding or misrepresenting its own stormwater situation and proposing a set of minimum measures for itself that would reduce discharges by far less than the maximum extent practicable"].) Unlike the school districts in *Long Beach Unified*, which had discretion to choose the method adequate to comply with federal law, the County has no discretion under the Clean Water Act. It can comply in only one way: by adhering to the requirements of the permit. (See 33 U.S.C. § 1342(k); *Environmental Protection Agency, supra*, 426 U.S. at p. 205.)

B. The County Incorrectly Relies on *Hayes*.

The County's reliance on *Hayes* to argue that the Regional Board shifted state inspection requirements to the County is similarly misplaced. (See AOB 42-47.) The County's argument again misconstrues federal law. Under the act and EPA regulations, the Regional Board's MS4 permitting authority is coextensive with that of the federal government. (See, e.g., 40 C.F.R. §§ 122.1(a)(2), 122.5.) That principle has a necessary corollary: if the EPA could have drafted a permit or permit term to satisfy the federal requirement that MS4 permits implement a program to reduce the discharge of pollutants to the maximum extent practicable, then that permit or permit

term—which not only defines a permittee’s compliance with the Clean Water Act but which also may form the basis for civil liability and criminal penalties under the act—must be a federal mandate.

Hayes is inapposite because the court did not interpret the Clean Water Act or its implementing regulations in that case. In *Hayes*, the State passed laws adopting the federal Education of the Handicapped Act and requiring school districts to provide special education services to pupils in need. (See *Hayes, supra*, 11 Cal.App.4th at pp. 1574-1575.) The court ruled that the distinction between what state and federal law required the school districts to do was unclear, so it remanded the case to the trial court to determine whether the State was “freely choosing” to impose the costs it incurred in complying with federal law on school districts. (See *id.* at p. 1594.)

Both the County and the Commission reasoned that the Regional Board passed costs to the County because neither the Clean Water Act nor the EPA regulations expressly required the challenged permit terms. (See AOB 42; 5 AR 5584, 5595, 5600.) But the State does not “freely choose” to impose specific permit requirements as the court understood that idea in *Hayes*. While federal law confers discretion on the State to choose the permit terms that will meet federal standards, imposing that standard is not discretionary. Under the Clean Water Act, all MS4 operators must have a permit that, at a minimum, meets the maximum-extent-practicable standard. (33 U.S.C. § 1342(p); 40 C.F.R. § 122.26(a)(3)(i), (d)(iv).) They cannot discharge from their MS4s to waters of the United States without one. (See 33 U.S.C. § 1311.) The act thus requires all terms necessary to achieving its standard, and regardless of whether they are drafted by the EPA or a regional board acting in lieu of the EPA, the permit is a federal mandate.

The County’s contention that the evidence supported the Commission’s conclusion that the State freely chose to shift costs

associated with industrial-facility and construction-site inspections to the County is similarly incorrect. (See 5 AR 5593-5595, 5601-5602.) This evidence shows only that the Water Boards perform permit inspections of certain industrial and construction sites to determine compliance with other, statewide permits. (3 AR 3601, 3640-3641; 2 AR 2423, 2436-2437.) On that basis, the Commission concluded—and the County here argues—that “nothing in the federal statutes or regulations . . . would prevent the state, rather than the local agencies, from performing” the industrial and construction-site inspections required by the MS4 permit. (5 AR 5595, 5601; AOB 42-47.)

But federal law can, and often does, require both state and local agencies to perform inspections. (See *Rancho Cucamonga, supra*, 135 Cal.App.4th at pp. 1389-1390 [holding that state and local inspection requirements were independently required by state and local federal permits].) The mere fact that the MS4 permit required the County to assure that industrial facilities and construction site owners had documentation also required by the statewide NPDES permits is not evidence that the State was relieving itself of its own responsibility to check documentation. (See AOB 44, alluding to 1 CT 58, 69.) Two separate NPDES permits imposing related inspection requirements cannot create a state mandate under *Hayes*, because the State was not passing its costs to the County. These inspection requirements can each be required by federal law and can coexist, with the Water Boards having inspection obligations and the County having inspection obligations.

C. The County Incorrectly Argues That the Commission's Primary Jurisdiction to Adjudicate State Mandates Is Threatened by the Judgment.

The County contends that the Court of Appeal improperly substituted its judgment for that of the Commission, which has "exclusive jurisdiction" to determine state mandate claims. (See AOB 23-26.) This jurisdiction is not in question. (See generally Gov. Code, §§ 17500, 17552.) The County argues that the Commission should not defer to the Regional Board's interpretation of the Clean Water Act and EPA regulations because to do so would impair its jurisdiction to decide what a state mandate is. (AOB 24-25.) This argument fails because the Regional Board did not—and could not—determine whether the challenged permit terms impose a state mandate; it decided only what federal law requires, and, as the courts held in the direct permit challenge, the Regional Board did not impose provisions that exceeded those requirements. While the Regional Board's interpretation of what federal law requires may be binding on the County and on the Commission, it no more impinges on the Commission's jurisdiction than does a decision of this Court or the U.S. Supreme Court construing the Clean Water Act.

Alternatively, the County argues that the Commission made a factual, not legal, determination when it concluded that the challenged permit requirements were not required by federal law. (See AOB 23-24.) As a threshold matter, the Commission could not decide whether or not the permit exceeded federal law without properly construing federal law. Indeed, though its analysis was incorrect, the Commission's decision reflects legal analysis, not adjudication of facts. The portion of the Commission's decision addressing what federal law requires consists almost entirely of comparing the text of the United States Code and Code of Federal Regulations to the permit's text. (See 5 AR 5576-5603.) Unlike

the Regional Board, the Commission did not, for example, consider any scientific reports or address alternative pollution-fighting measures. It simply ruled that any permit term not expressly required by the Clean Water Act or its implementing regulations exceeded the act's requirements.

The County also compares the Regional Board's final permitting decision to cases in which the Legislature has made findings or declarations that a law it has enacted is not a state mandate in an attempt to foreclose a subvention obligation. (See AOB 25-26, citing *California School Boards Association v. State* (2009) 171 Cal.App.4th 1183, 1204, and *Davis, supra*, 32 Cal.App.4th at p. 819.) This analogy is inapt. Unlike a legislative declaration that a state law does not create a state mandate, the Regional Board's final decision does not purport to determine the ultimate constitutional issue of whether the permit imposes a new program or higher level of service. Moreover, the Regional Board's determination that the permit did not exceed the requirements of the Clean Water Act is within the Regional Board's specific area of expertise and was twice affirmed on judicial review.

D. The Evidence on Which the County Relies Does Not Support Its Argument That the Challenged Terms Exceeded the Federal Standard.

The County references evidence to support its argument that the challenged permit requirements exceed the federal maximum-extent-practicable standard. (See AOB 30-31.) But the evidence it cites—an EPA stormwater program guidance manual, permits issued by the EPA in other states, earlier permits issued to the County of Los Angeles and cities therein, and a 2001 letter from the EPA about state-wide construction and industrial permits—does not support its argument. (See AOB 30-31.) The manual says that state permit issuers should not use it as a “script or checklist” and that it is not an “enforcement ‘how to.’” (3 AR 3393.) And even though

the manual does not prescribe specific conditions, it does give some examples of what permits should contain, one of which is construction-site inspections: "EPA regulations require permittees to develop 'procedures for site inspection and enforcement' for addressing construction activities. MS4 permits will likely elaborate on this requirement in more detail, such as by specifying a minimum frequency for inspection." (3 AR 3394.)

The County's citation to other permits also does not support its position. Relying on EPA permits issued in other states ignores Congress's intent that MS4 permits contain site specific requirements. (See 55 Fed.Reg. at pp. 48037-48038; *City of Irving, supra*, 10 E.A.D. 111 [2001 WL 988723 at p. *6].) What the EPA required a permittee to do to reduce the MS4 discharge of pollutants to the maximum extent practicable in a moderately populated, landlocked area like Boise, Idaho, says little about what the Regional Board could and should require a permittee to do to meet that standard in a littoral metropolis like Los Angeles, California. (See 4 AR 3893-3898.)

Similarly, relying on earlier Los Angeles County MS4 permits ignores Congress's intent that permits evolve over time as knowledge is gained about stormwater and technology advances. (See 55 Fed.Reg. at p. 48052 ["The Permits for discharges from municipal separate storm sewer systems will be written to reflect changing conditions that result from program development and implementation and corresponding improvements in water quality"]; 3 AR 3797 ["The EPA . . . expects stormwater permits to follow an iterative process whereby each successive permit becomes more refined, detailed, and expanded as needed, based on experience under the previous permit"].) A permit condition's novelty has no relevance to determining whether the condition or the permit meets or exceeds federal law.

The County's reliance on the 2001 EPA letter is also misguided. (See 4 AR 3878-3879.) The EPA said that the State had a duty to inspect commercial and industrial sites for compliance with a state permit. (See 4 AR 3878.) But that does not mean that federal law does not also require local governments to conduct inspections. The EPA confirmed that local-government permittees may also be required to inspect and monitor commercial and industrial facilities. (See 4 AR 3878.)

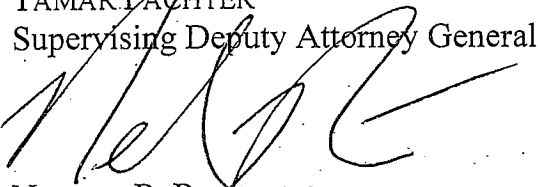

CONCLUSION

For the foregoing reasons, Respondents respectfully request that this Court affirm the judgment.

Dated: August 22, 2014

CONSTITUTIONAL PROVISIONS

California Constitution

Article XIII B, § 6	passim
Article XIII B, § 9(b)	15, 22

INTRODUCTION

The federal Clean Water Act prohibits appellants/real parties in interest the County of Los Angeles and the cities of Bellflower, Carson, Commerce, Covina, Downey, and Signal Hill (collectively referred to as the "County of Los Angeles") from discharging pollutants from their municipal storm sewer systems into waterbodies unless pursuant to a permit issued in compliance with the National Pollutant Discharge Elimination System ("NPDES"). The Commission on State Mandates erroneously determined that four specific conditions of the NPDES permit issued to the County of Los Angeles were mandates imposed by the State (rather than federal law) simply because respondent California Regional Water Quality Control Board, Los Angeles Region ("Regional Board") administers that federal permitting scheme.

The Clean Water Act and implementing federal regulations required that the County of Los Angeles obtain a NPDES permit and that it include actions to reduce the discharge of pollutants "to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods." (33 U.S.C. § 1342(p)(3)(B); see 40 C.F.R. § 122.26.) Under article XIII B, section 6 of the California Constitution, the only way this federal standard could constitute a state mandate would be if the State *voluntarily elected* to require local agencies to implement state obligations under the Clean Water Act, or if the State took action to *exceed* the Act's requirements. The trial court correctly found that neither occurred here.

Given that NPDES permits are required by federal law, the trial court correctly found that the State had "no real choice" in deciding to implement that law. Since 1973, the State has administered the NPDES program in California in place of the federal Environmental Protection Agency. Regardless of the issuing agency, however, the County of Los Angeles was

still required to obtain an NPDES permit and the same federal law governed its contents. The Regional Board's involvement added nothing to the County of Los Angeles' burdens. The State had no practical choice but to administer the Clean Water Act in lieu of direct regulation by the federal government.

Next, the trial court correctly ruled that the Commission's decision finding that four specific permit requirements are state mandates was based on a faulty reading of federal law: that unless those conditions were each specifically spelled out in a federal regulation, there was no federal mandate and they were therefore state-imposed. However; as the lower court recognized, federal law and decisions make clear that the Clean Water Act's technology-forcing requirement to reduce pollutants in storm water from the County's municipal storm waters systems "to the maximum extent practicable" is comprehensive and flexible. NPDES permitting agencies, whether federal or state, must impose specific permit conditions on a case-by-case basis to meet that federal standard for a particular municipal system. The Commission's search for specific federal regulations requiring each challenged permit condition under a "one-size-fits-all" regulatory scheme is fundamentally out of sync with the actual federal standard, both as written and as interpreted in federal regulations and judicial decisions.

And while the Commission may be an expert in state mandates, it has no expertise in the field of water quality permitting law. The Commission erroneously failed to give appropriate deference to the Regional Board's implementation of the Clean Water Act. The Commission also incorrectly ignored prior judicial review of the permit conditions and their relationship to the federal maximum extent practicable standard.

Finally, the trial court found that, based on the administrative record, the specific challenged permit requirements (related to placing and maintaining trash receptacles at transit stops and inspections of various

commercial, construction, and industrial facilities) are all within the maximum extent practicable standard and thus not state mandates as a matter of law. The Commission and the County of Los Angeles, on the other hand, have failed to cite to any evidence that actually shows how these specific requirements exceed the demanding federal standard.

Because the issue of whether the challenged permit requirements are state mandates is a matter of law, the trial court correctly remanded the matter back to the Commission with instructions to issue a new decision, holding that the challenged permit requirements are required by federal law, not state mandates, and thus not subject to state subvention under article XIII B, section 6.

Based on the foregoing, respondents and petitioners California Department of Finance, State Water Resources Control Board, and the Regional Board ask this Court to affirm the lower court's decision.

STATEMENT OF FACTS

I. FEDERAL REQUIREMENTS FOR NDPES PERMITS AT ISSUE

A. Federal Nature of NPDES Permits

In a "dramatic response to accelerating environmental degradation of rivers, lakes and streams in this country," Congress passed the Clean Water Act in 1972 to eliminate the discharge of pollution into the nation's waters. (33 U.S.C. § 1251, et. seq.; *Natural Resources Defense Council, Inc. v. Costle* (D.C. Cir. 1977) 568 F.2d 1369, 1371.) The Clean Water Act seeks to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters," and is recognized by courts as a demanding law or "strong medicine." (33 U.S.C. § 1251(a); *Texas Mun. Power Agency v. Administrator of U.S. E.P.A.* (5th Cir. 1988) 836 F.2d 1482, 1488.)

The primary means for achieving the goals of the Clean Water Act is the NPDES program. (*Arkansas v. Oklahoma* (1992) 503 U.S. 91, 101-102.) The Act prohibits pollutant discharge from "point sources" unless

provided for under the NPDES permit. (33 U.S.C. §§ 1311, 1342; see also *Communities for a Better Environment v. State Water Resources Control Bd.* (2003) 109 Cal.App.4th 1089, 1092-1093.)

NPDES permits are issued by either the United States Environmental Protection Agency (U.S. EPA) or a U.S. EPA-approved state. (33 U.S.C. § 1342(a)(1) & (b).) Congress concluded that the U.S. EPA or an approved state could issue permits for all dischargers and could translate the Clean Water Act's requirements into the conditions of individual permits for dischargers. (*Environmental Protection Agency v. California ex rel. State Water Resources Control Bd.* (1976) 426 U.S. 200, 219.) California has the U.S. EPA's approval to issue NPDES permits, as do 45 other states. (*Building Industry Association of San Diego County v. State Water Resources Control Bd.* (2004) 124 Cal.App.4th 866, 875.)

When a state issues a NPDES permit, it must generally ensure that the permit complies with many federal requirements, including effluent limitations, national standards of performance, and toxic and pretreatment effluent standards. (33 U.S.C. §§ 1342(b)(1), 1311, 1312, 1316, 1317.) States must also provide for the continued inspection and monitoring of pollutants into our nation's waters. (*Id.* § 1342(b)(2)(B).) NPDES permit requirements may be enforced as a matter of federal law by either the U.S. EPA or private citizens. (*Id.* §§ 1319(a)(1)& (3), 1365(a)(1).)

To ensure that state-authorized programs comply with the U.S. EPA's mandates and federal law, the U.S. EPA maintains oversight and supervision. The state must provide the U.S. EPA with proposed permits and notice of any action related to a discharger's permit application. (33 U.S.C. § 1342(d)(1).) The U.S. EPA may object to a permit, finding that it violates the Clean Water Act's guidelines and requirements. (*Id.* § 1342(d)(2).) Should the U.S. EPA determine that a state program does

not comply with federal NPDES program guidelines, it may withdraw approval for the state program. (*Id.* § 1342(c)(3).)

When an NPDES permit is renewed, reissued or modified, it generally must be at least as stringent as the prior permit. (33 U.S.C. § 1342(o); 40 C.F.R. § 122.44(l).) This is consistent with Congress' intent that state management programs evolve based on changing conditions from program development and implementation, and corresponding improvements in water quality. (55 Fed.Reg. 47990, 48052 (Nov. 16, 1990).)

B. Federal Law Governing NPDES Permits for Municipal Separate Storm Sewer Systems (MS4)

While many types of discharges require NPDES permits under the Clean Water Act, this case is very specific, pertaining to the discharge of pollutants through municipal separate storm sewer systems. Those systems are often referred to as "MS4" (including in materials quoted in this Brief), and respondents will use that term hereafter. Congress established a distinct technology standard that applies to NPDES permits for MS4s. (33 U.S.C. § 1342(p)(3)(B).) Further, unlike many other categories of point source discharges, U.S. EPA has not established any uniform national effluent limitation guidelines or standards for MS4 discharges. (Compare 40 C.F.R. § 122.26 [MS4 permit requirements] with 40 C.F.R. Parts 405-471 [various effluent limitation guidelines].) Instead, U.S. EPA required individual permit issuers at the federal or state level to develop the necessary MS4 controls to reduce pollutants to the federal standards. (40 C.F.R. § 122.26(d); 55 Fed.Reg. 47990, 48043 (Nov. 16, 1990).)

Controlling discharges of municipal storm water and non-storm water is important because such discharges are one of the most significant sources of water pollution in the nation. (*Environmental Defense Center, Inc. v. U.S. E.P.A.* (9th Cir. 2003) 344 F.3d 832, 840.) These discharges carry "suspended metals, sediments, algae-promoting nutrients (nitrogen and

phosphorus), floatable trash, used motor oil, raw sewage, pesticides, and other toxic contaminants into streams, rivers, lakes, and estuaries across the United States.” (*Id.* at pp. 840-841.) “Among the sources of stormwater contamination are urban development, industrial facilities, construction sites, and illicit discharges and connections to storm sewer systems.” (*Id.* at p. 841.)

The Clean Water Act requires MS4 dischargers such as the County of Los Angeles “to effectively prohibit non-stormwater discharges into the storm sewers” and “to reduce the discharge of pollutants to the *maximum extent practicable*, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.” (33 U.S.C. § 1342(p)(3)(B), emphasis added.) Congress established the maximum extent practicable standard (as opposed to the blanket effluent limitations approach, which was impractical and administratively burdensome in the context of storm water pollution) so that municipalities would have “the tools to meet the fundamental goals of the Clean Water Act.” (*Building Industry Ass’n of San Diego County, supra*, 124 Cal.App.4th at p. 884.)

The Clean Water Act’s technology-forcing requirements are designed to foster innovation. (See, e.g., *Chemical Mfrs. Ass’n v. Natural Resources Defense Council, Inc.* (1985) 470 U.S. 116, 155-56.) Permit writers (U.S. EPA and federally-approved states) identify the MS4 requirements on a permit-by-permit basis. (*Natural Resources Defense Council, Inc. v. U.S. E.P.A.* (9th Cir. 1992) 966 F.2d 1292, 1308, fn. 17; see also 55 Fed.Reg. 47990, 48043 (Nov. 16, 1990).) To implement this maximum extent practicable standard for stormwater, MS4 permits usually require “best management practices” that reflect the technology-based effluent limitation. (See *Defenders of Wildlife v. Browner* (9th Cir. 1999) 191 F.3d 1159, 1166-

1167; Administrative Record (“AR”) 2689-2690.) Federal law defines these practices to mean, in part, “schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of ‘waters of the United States.’” (40 C.F.R. § 122.2.)¹

Large MS4 operators must apply for a NPDES permit pursuant to U.S. EPA-promulgated regulations. (33 U.S.C. § 1342(p)(4)(A).) Those regulations specify the information that applicants for MS4 permits must include in their applications. (40 C.F.R. § 122.26(d).) This application is extensive and represents the applicant’s view of the required NPDES permit. (*Id.* § 122.26(d)(2)(iv).) The application, and ultimately the permit itself, must address management programs to reduce the discharge of pollutants in storm water using the maximum extent practicable standard. (*Ibid.*) These programs include practices for operating and maintaining public streets, roads and highways (*id.* § 122.26(d)(2)(iv)(A)(3)); procedures to control pollution resulting from construction activities (*id.* § 122.26 (d)(2)(iv)(D)); legal authority to control contribution of pollutants associated with industrial activity (*id.* § 122.26(d)(2)(i)(A)); programs to control illicit discharge to the MS4 (*id.* § 122.26(d)(2)(B)); and conducting inspections to determine compliance with permit conditions

¹ As noted, the Clean Water Act imposes at least three distinct obligations on municipalities subject to MS4 permitting. One is “to effectively prohibit non-stormwater discharges into the storm sewers.” (33 U.S.C. § 1342(p)(3)(B)(ii).) A second is “to reduce the discharge of pollutants to the maximum extent practicable.” (*Id.* § 1342(p)(3)(B)(iii).) The third is the requirement to include “such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.” (*Ibid.*; *Building Industry Ass’n of San Diego County, supra*, 124 Cal.App.4th at p. 887.) While each of these separate bases would provide the foundation for a federal mandate, the discussion throughout this brief focuses on the “maximum extent practicable” standard.

(§ 122.26(d)(2)(i)(F)). The management programs must address oversight of discharges into the system from the general population and from industrial and construction activities within the jurisdiction. (*Id.* § 122.26(d)(2)(iv).)

The U.S. EPA has also issued guidance documents that discuss the types of best management practices that may be included in MS4 storm water permits in order to reduce the discharge of pollutants in storm water to the maximum extent practicable. At the time that the subject test claims were considered by the Commission, the U.S. EPA had issued a Program Evaluation Guide for NPDES permits for large and medium MS4s, which addresses inspections of businesses and litter-related issues. (AR 3391-3494, 3468-3469, 3440.)

II. CALIFORNIA'S ROLE IN IMPLEMENTING FEDERAL REQUIREMENTS FOR MS4 PERMITS

“[O]n May 14, 1973, California became the first state to be approved by the EPA to administer the NPDES permit program.” (*County Sanitation Dist. No. 2 of Los Angeles County v. County of Kern* (2005) 127 Cal.App.4th 1544, 1565-1566.)² The Legislature amended the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) by adding Chapter 5.5 to implement federal law, in order to avoid direct regulation by the federal government. (Wat. Code, § 13370; see generally §§ 13370-13389.) Specifically, the legislative findings and declarations state, in relevant part:

It is in the interest of the people of the state, in order to avoid direct regulation by the federal government of persons already subject to regulation under state law pursuant to this division, to enact this chapter in order to authorize the state to *implement the provisions of the Federal Water Pollution Control Act* [Clean

² Nine regional boards administer the program, overseen by the State Water Resources Control Board. (Wat. Code, §§ 13160, 13200, et. seq.)

Water Act] and acts amendatory thereof or supplementary thereto, and federal regulations and guidelines issued pursuant thereto, provided, that the state board shall request federal funding under the Federal Water Pollution Control Act for the purpose of carrying out its responsibilities under this program.

(Wat. Code, § 13370, subd. (c), emphasis added.)

Additionally, the Porter-Cologne Act mandates that California's NPDES permit program be consistent with federal law. (Wat. Code, §§ 13372, 13377.) Section 2235.2 of title 23 of the California Code of Regulations states that "[w]aste discharge requirements for discharge from point sources to navigable waters shall be issued and administered in accordance with the currently *applicable federal regulations for the National Pollutant Discharge Elimination System (NPDES) program.*" (Emphasis added.) Moreover, there are numerous federal requirements that the State must first comply with in issuing NPDES permits or risk the U.S. EPA taking over California's NPDES program.

The federal Clean Water Act allows a state to establish more stringent requirements (33 U.S.C. § 1370) and nothing in the Porter-Cologne Act precludes the State from establishing more stringent requirements. (*City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 627.) As will be shown, however, the Regional Board applied relevant *federal* law to impose the requirements at issue. (33 U.S.C. § 1342(p)(3)(B)(iii).)

III. REGIONAL BOARD ORDER NO. 01-182 (NPDES PERMIT NUMBER CAS004001) AND RELATED APPLICATION

Starting in 1990 and pursuant to Clean Water Act amendments in 1987, the Regional Board issued MS4 permits to the County of Los Angeles. Prior to the 1987 amendments and the U.S. EPA's issuance of regulations to implement those amendments, the Regional Board did not regulate the County's MS4 discharges under either state or federal law. The permit at issue here is the third such NPDES permit issued, Regional

Order No. 01-182 (NPDES permit number CAS004001), and was adopted on December 13, 2001. (AR 3495-3576.)

Before the instant permit was issued, the County of Los Angeles submitted a permit application to the Regional Board on February 1, 2001. (33 U.S.C. § 1342(p)(4)(A); 40 C.F.R. §§ 122.26(a)(3) [requiring initial application] & 122.21(d)(2) [duty to reapply 180 days before prior NPDES permit expired].) This application is entitled "Report of Waste Discharge" and includes a "Stormwater Quality Management Plan (SQMP)." (AR 3663-3794.) The SQMP represents the County of Los Angeles' proposals for best management practices (sometimes referred to as "BMPs") that would ultimately be required in the NPDES permit. (AR 3665-3678.) The permit that was adopted was based on the SQMP, with some revisions and additions necessary to meet minimum federal requirements. The relevant provisions of the permit and SQMP are as follows:

General Permit Provisions

The Regional Board made detailed findings concerning the permit's factual and legal basis. (AR 3500-3519.) Among them are general findings about the intent and purpose of the permit, including as it relates to federal law. In section C, Permit Background, the Regional Board found in subsection 4:

The Regional Board finds that the Permittees' proposed SQMP, incorporating the additional and/or revised provisions contained in this Order would meet the minimum requirements of federal regulations.

(AR 3506.) It further found in section D, Permit Coverage, subsection 4:

This permit is intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the Maximum Extent Practicable (MEP) from the permitted areas in the County of Los Angeles to the waters of the U.S. subject to the Permittees' jurisdiction.

(AR 3507.)

Section F, Implementation, provides information concerning the objective of the permit, and its cooperative design, and flexibility to meet this objective based on the requirements of federal law. With respect to the objective of the permit, subsection 2 provides:

The objective of this Order [the permit] is to protect the beneficial uses of receiving waters in Los Angeles County. To meet this objective, this order requires that the SQMP specify BMPs that will be implemented to reduce the discharge of pollutants in storm water to the maximum extent practicable.

(AR 3516.)

Finally, subsection 4 gives the County of Los Angeles the flexibility to substitute other best management practices. It states:

This Order provides flexibility for Permittees to petition the Regional Board Executive Officer to substitute a BMP, if they can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed BMP in meeting the objectives of this Order.

(AR 3517.)

Permit Provisions Challenged in the State Mandates Claim

Part 4 (Special Provisions) of the permit contains activities that the County of Los Angeles claims are state mandates and not required by federal law. (AR 3531-3536.) Specifically, these provisions pertain to: (1) the inspections of commercial and industrial facilities, (2) containment of runoff at construction sites, and (3) the placement and maintenance of trash receptacles at transit stops.

The commercial and industrial inspection requirements are found in Subsection C of Part 4 and pertain to inspections at commercial facilities, including restaurants, automotive service facilities, retail gasoline outlets, and automotive dealerships. (AR 3531-3538.) While each commercial property has unique inspection requirements tailored to its business activity,

the permit requires that all facilities are inspected on a regular basis, twice during the 5-year permit period, to confirm that best management practices are being effectively implemented in compliance with the law. (AR 3533-3535.) Similarly, subdivision 2b requires the inspection of certain industrial facilities referred to in the permit as Phase 1 Facilities. (AR 3535-3536.)

Construction runoff is covered by Subsection E of Part 4 and provides that “[e]ach Permittee shall implement a program to control runoff from construction activity to storm drains at all construction sites within its jurisdiction.” (AR 3546.) This generally includes implementing best management practices related to the control and containment of construction-related materials, waste, and erosion, as well as the inspection of construction sites and related employee training. (AR 3546-3549.)

The requirement for trash receptacles is found at Subsection F of Part 4 and requires that trash receptacles be placed at all transit stops within the Permittee’s jurisdiction and that they be maintained as necessary. (AR 3553.)

Part 4 of the order, which imposes these and the other Special Conditions on the County of Los Angeles, reiterates the general findings elsewhere that the permit is intended to reduce the discharge of pollutants in storm water to the maximum extent practicable under the Clean Water Act. (AR 3527.) It states:

This permit, and the provisions herein, are intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the MEP [maximum extent practicable] from the permitted areas in the County of Los Angeles to the waters of the State.

(AR 3527.) The maximum extent practicable standard is defined in the permit to mean: “the standard for implementation of storm water

management programs to reduce pollutants in storm water” under the Clean Water Act. (AR 3561-3562.)

Relevant Terms of the County of Los Angeles’ SQMP

The County of Los Angeles’ application included a Storm Water Quality Management Program (“SQMP”) with proposals for best management practices that would ultimately be included in the NPDES permit. (AR 3665-3678.) It included best management practices related to the inspections of commercial, construction, and industrial facilities, and goals of minimizing street litter from entering the waterbodies. (AR 3670-3675.)

Inspection requirements for industrial/commercial businesses are found in subsection A2 of Part 4. Subdivision b provides that “Permittees shall visit automotive services and food service facilities as outlined in the SQMP in its jurisdiction once every two years.” (AR 3671.) Site visits include consultation with a representative of the facility, discussion of best management practices, and a site walk-through. (AR 3671.) Subdivision c states that “Permittees shall revisit automotive and food service facilities where evidence of illicit discharge is found within six months of the date of the initial visit.” (AR 3671.) Subdivision e provides that “Permittees shall provide an annual update to the visited automotive service, food service, and other target facilities to the Regional Board in the annual report. (AR 3671.)

Requirements to prevent runoff from constructions sites into nearby waters are found in subsection C of Part 4. (AR 3672-3674.) As with the conditions ultimately included in the permit, these requirements include implementing best management practices relating to the control and containment of construction-related materials, waste, and erosion, as well as the inspection of construction sites and related employee training. (AR 3672-3674.)

The removal of trash and other pollutants transported in runoff to the storm drain system from landscape and recreational facilities is addressed in the executive summary. (AR 3677.) “The goal of the program for landscape and recreational facilities management is to make the storm water quality a consideration when conducting operation and maintenance activities.” (AR 3677.) This includes minimizing trash from entering recreational water bodies, removing trash from open channels, and controlling litter and debris in the streets. (AR 3677-3578.) Also, under subsection D of Part 4, “Permittees shall conduct trash collection along, or in improved open channels within their jurisdiction” and are encouraged to establish other voluntary programs for trash collection in natural stream channels. (AR 3675.)

IV. OVERVIEW OF THE COMMISSION AND PRINCIPLES OF SUBVENTION AS IT PERTAINS TO FEDERAL REQUIREMENTS

The Commission is a quasi-judicial agency vested with the sole and exclusive authority to adjudicate all disputes over the existence and reimbursement of state-mandated programs within the meaning of article XIII B, section 6 of the California Constitution. (*Kinlaw v. State of California* (1991) 54 Cal.3d 326; Gov. Code, §§ 17551, 17552.) Article XIII B, section 6 of the California Constitution and Government Code section 17514 provide for the reimbursement of local government costs of carrying out new programs or higher levels of service that are mandated by the State. Article XIII B, section 6 provides, in part, as follows:

Whenever the Legislature or any state agency mandates a new program or higher level of service on any local government, the state shall provide a subvention of funds to reimburse such local government for the costs of such program or increased level of service. . . .

Government Code section 17514 defines “[c]osts mandated by the state” to mean:

. . . any increased costs which a local agency or school district is required to incur . . . which mandates a new program or higher level of service of an existing program within the meaning of Section 6 of Article XIII B of the California Constitution.

But constitutional subvention is not required when the costs are from implementing federal law. “[A]rticle XIII B, section 6, and the implementing statutes . . . provide for reimbursement only of state-mandated costs, not federally-mandated costs.” (*San Diego Unified School Dist. v. Commission on State Mandates* (2004) 33 Cal.4th 859, 880.)³

This constitutional limitation on providing state reimbursement for activities imposed by federal law is specifically spelled out in Government Code section 17556, subdivision (c). (*Redevelopment Agency of the City of San Marcos v. Commission on State Mandates* (1996) 55 Cal.App.4th 976, 984 [article XIII B, section 6 creates “several classes of state-mandated programs for which no state reimbursement of local agencies is required”].) Subdivision (c) states that the Commission shall not find “costs mandated by the state” if “[t]he statute or executive order imposes a requirement that is mandated by a federal law or regulation and results in costs mandated by the federal government, unless the statute or executive order mandates costs that exceed the mandate in that federal law or regulation.” Government Code section 17513 defines “costs mandated by the federal government” to mean, in relevant part “. . . any increased costs incurred by a local agency or school district after January 1, 1973, in order to comply with the requirements of a federal statute or regulation.”

³ State reimbursement is not required because local governments are not subject to constitutional spending constraints in the face of federal mandates. Article XIII B, section 9, subdivision (b), excludes from the state or local spending limit any “appropriations required for purposes of complying with mandates of the . . . federal government.” (See *City of Sacramento v. State of California* (1990) 50 Cal.3d 51, 57-58.)

V. SUMMARY OF THE COMMISSION'S DECISION

Local agencies file claims with the Commission for reimbursement of state-mandated costs. (Gov. Code, §§ 17551, 17560.) The first claim filed by a local agency alleging that a statute or an executive order imposes a reimbursable state-mandated program is a “test claim.” (Gov. Code, § 17521.) The County of Los Angeles filed multiple test claims with the Commission addressing “various activities related to placement and maintenance of trash receptacles at transit stops and inspection of restaurants, automotive service facilities, retail gasoline outlets, automotive dealerships, phase I industrial facilities (as defined) and construction sites to reduce stormwater pollution in compliance with a permit issued by the Los Angeles Regional Water Quality Control Board, a state agency.” (AR 5557.)

The test claims were consolidated, and the Commission “originally refused jurisdiction over the permits based on Government Code section 17516’s definition of ‘executive order,’ which excluded permits issued by the State Water Resources Control Board and regional boards from state mandate review.” (AR 5557.) In *County of Los Angeles v. Commission on State Mandates* (2007) 150 Cal.App.4th 898, the Court found that this part of section 17516 excluding such permits was unconstitutional. The Court issued a writ directing the Commission to consider the claims on their merits. (AR 5557.)

On remand, the Commission found that the permit requirement related to the placement and maintenance of trash receptacles at transit stops was a reimbursable state mandate. (AR 5584.) With respect to the other permit requirements (related to inspections of commercial and industrial facilities and pollution containment at construction sites), the Commission found that these requirements are not reimbursable as costs mandated by the state,

because the claimants have fee authority sufficient to pay for the permit requirements. (AR 5625.)

The Commission's statement of decision is lengthy and can be found in the administrative record at pages 5555-5625. This appeal only addresses the Commission's findings that the claimed activities are not federal mandates. (AR 5576-5602.) The Commission's analysis of that issue is long, but is based primarily on the theory that the specific permit activities are not federal mandates because they go beyond the requirements of the Clean Water Act. (AR 5578, 5584, 5591, 5595, 5601.)

STATEMENT OF THE CASE

I. RELEVANT PROCEDURAL HISTORY IN LOWER COURT

The respondents filed a petition for writ of mandate against the Commission and the County of Los Angeles. (Clerk's Transcript ("CT") Volume ("V") 1, pp. 000011-000013.)⁴ As relevant to this appeal, the petition challenges the Commission's findings that the permit requirements related to placing and maintaining trash receptacles at transit stops, and the inspection of commercial facilities, Phase I industrial facilities, and construction sites are state mandates. (CT V1, pp. 000016-000020.) More specifically, the petition alleges that these findings are contrary to law because the permit requirements are federal mandates, not state mandates. (*Ibid.*) The County of Los Angeles filed a cross-petition challenging the part of the Commission's decision finding that obligations related to

⁴ The cities of Artesia, Azusa, Bellflower, Beverly Hills, Carson, Commerce, Covina, Downey, Monterey Park, Norwalk, Rancho Palo Verdes, Signal Hill, Vernon, and Westlake Village were named as Real Parties in Interest. (CT V1, pp. 000011-000013.) Artesia, Azusa, Beverly Hills, Monterey Park, Norwalk, Rancho Palo Verdes, Vernon, and Westlake Village have not appealed the judgment. The Commission filed a notice of appearance in the Superior Court, but did not brief the matter or appear at the hearing in the lower court, nor did the Commission appeal.

inspections of various facilities were not reimbursable state mandates because real parties have the ability to levy fees for these programs. (CT V4, pp. 000270-000275.)

II. LOWER COURT'S STATEMENT OF DECISION

The trial court's ruling focused on whether the challenged permit requirements are federal mandates and thus not subject to state subvention. (CT V4, pp. 000678-000682.) The first part of the decision found the State had "no real choice" in deciding to comply with federal NPDES program, noting that the Clean Water Act "clearly dictates that NPDES permits – issued by either the U.S. EPA or a qualified state agency – are not voluntary." (CT V4, p. 000678.) The court explained that "[f]ederal law requires the County of Los Angeles to have an NPDES permit for municipal storm water discharges." (*Ibid.*) "And, if California did not administer its own water quality program through the Porter-Cologne Act, California dischargers, both private and governmental, would still have to comply with federal law - and be directly regulated by the federal government." (CT V4, p. 000678-000679.)

The second part of the court's analysis examined whether the permit requirements related to placing and maintaining trash receptacles at transit stops, and the inspection of commercial facilities, Phase I industrial facilities, and construction sites each exceeded the requirements of federal law. (CT V4, p. 000678.) The trial court found that federal law required that the challenged permit requirements reduce the discharge of pollutants to the maximum extent practicable and that the individual permit requirements did not exceed this standard for multiple reasons. (CT V4, pp. 000678-000682.)

To start with, the trial court found that "there is no substantial evidence in the administrative record to support the Commission's conclusion that the state's mandate in this instance was inconsistent with or

more stringent than the Clean Water Act's 'maximum extent practicable' requirement." (CT V4, p. 000679.) "Rather, the Commission simply concluded that the claimed permit requirements were in excess of federal mandates because they could not be located in certain identified federal regulations." (*Ibid.*) According to the court, "[t]he search for a comparable federal regulation as the pre-condition for a finding a federal mandate utterly ignores and misapplies the flexible regulatory standard '[maximum extent practicable]' inherent in the Clean Water Act." (*Ibid.*) To "ignore this flexible standard imposed and mandated under the Clean Water Act, and instead to require a comparable federal regulatory dictate, is legally erroneous." (CT V4, p. 000680.)

Next, the lower court found that "the Commission erred in isolating a specific requirement to conclude that the NPDES permit was a state mandate." (CT V4, p. 000680.) In the trial court's view, "[o]ne permit provision cannot exceed the 'maximum extent practicable standard imposed by the Clean Water [Act] where the permit as a whole does not.'" (*Ibid.*)

More specifically, the trial court found that the permit requirements related to placing and maintaining trash receptacles at transit stops, and the inspection of commercial facilities, Phase I industrial facilities, and construction sites are all within the maximum extent practicable standard. (CT V4, p. 000680.)

Trash Receptacles: The trial court explained that "[i]t cannot be seriously doubted that the placement and maintenance of trash receptacles at transit stops will help prevent the introduction of these known contaminants into the water. As the trash receptacle requirement is an obvious remedy [to control litter and debris at transit stops], it is clearly within the maximum extent practicable standard." (CT V4, p. 000680-000681.) Thus, the court held that the trash requirement in the permit "is

imposed by federal law and is not subject to reimbursement under article XIII B, section 6 of the California Constitution.” (*Ibid.*)

Inspections: The trial court found that “[a]s with the receptacle requirement, these inspection mandates are clearly pursuant to the maximum extent practicable standard under the Clean Water Act.” (CT V4, p. 000681.) “[T]here is nothing in the record to suggest that they exceed this standard, [and] the Commission’s conclusion to the contrary must fail.” (*Ibid.*) Thus, the court held that “the inspection requirements are federal, not state, mandates and are not subject to reimbursement under article XIII B, section 6 of the California Constitution.” (CT V4, pp. 000682.)

Finally, the lower court did not address the County of Los Angeles’ cross-petition challenging the Commission’s determination that the inspection requirements were state mandates, but not reimbursable because local agencies could recoup their costs through fees. (CT V2, p. 000676, fn. 8.) However, the court noted that the cross-petition would fail for the same reasons supporting the petition (i.e., that the inspection requirements are not state mandates in the first place). (*Ibid.*)

III. JUDGMENT AND WRIT OF ADMINISTRATIVE MANDAMUS

Consistent with the above Statement of Decision, the lower court entered judgment in favor of the State and granted the writ of mandate. (CT V4, pp. 000702- 00703.) The court also issued a writ consistent with the judgment and the Commission filed a timely return. (CT V4, pp. 000731-000736.)

STANDARD OF REVIEW

Pursuant to Government Code section 17559, subdivision (b), a proceeding may be brought under Code of Civil Procedure section 1094.5 “to set aside a decision of the commission on the ground that the commission’s decision is not supported by substantial evidence.” Code of Civil Procedure section 1094.5, in turn, provides that the court’s inquiry

“shall extend to the questions whether the respondent has proceeded without, or in excess of jurisdiction; whether there was a fair trial; and whether there was any prejudicial abuse of discretion. Abuse of discretion is established if the respondent has not proceeded in the manner required by law, the order or decision is not supported by the findings, or the findings are not supported by the evidence.” (*Id.* subd. (b).)

“[T]he scope of review in the trial court is whether the administrative decision is supported by substantial evidence,” and the scope of review on appeal is generally the same. (*City of Richmond v. Commission on State Mandates* (1998) 64 Cal.App.4th 1190, 1195.) On appeal, the Court reviews “the agency’s actions and decisions to determine whether they were in compliance with the procedures required by law and were supported by findings which themselves were supported by substantial evidence in light of the entire administrative record. In so doing, “[the Court’s] review is de novo, and not bound by the trial court’s conclusions.” (*San Franciscans Upholding the Downtown Plan v. City & County of San Francisco* (2002) 102 Cal.App.4th 656, 674.) The appellate court independently reviews the superior court’s legal conclusions as to the meaning and effect of constitutional and statutory provisions. (*Ibid.*) Whether a statute (or in this case, a permit requirement) creates a reimbursable state mandate is a pure question of law. (*Connell v. Superior Court* (1997) 59 Cal.App.4th 382, 395.) Questions of law are subject to de novo review. (*City of Richmond, supra*, 64 Cal.App.4th at p. 1195.)

ARGUMENT

I. THE TRIAL COURT CORRECTLY FOUND THAT THE CHALLENGED PERMIT REQUIREMENTS ARE FEDERAL MANDATES AND NOT SUBJECT TO STATE SUBVENTION.

The California Constitution is clear that state subvention is not required when the federal government imposes new costs on local

governments. (Cal. Const., art. XIII B, § 9, subd. (b); Gov. Code, §§ 17556, subd. (c), 17513.) This is because federal costs are exempt from local agencies' taxing and spending limitations and is true "even though the state has adopted an implementing statute or regulation pursuant to the federal mandate so long as the state had no 'true choice' in the manner of implementation of the federal mandate. [Citation omitted.]" (*Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1564, 1593.) State subvention only comes into play when the state is required "to reimburse local governments for their costs *resulting from state laws* 'which mandate . . . new program[s] or . . . increased level[s] of service' at the local level." (*City of Sacramento, supra*, 50 Cal.3d 51, 57-58, emphasis added.)

The overriding question in this case is whether the NPDES program and the challenged permit requirements are federal mandates and not subject to state subvention. In making this determination, the Court must consider whether the federal program imposes a mandate on the State and whether the State, in turn, has mandated a federal program on the local governments. (*City of Sacramento, supra*, 50 Cal.3d 51; *Hayes, supra*, 11 Cal.App.4th 1564.) Most relevant to this case, the Court must also consider whether there are state-mandated activities that exceed federal requirements. (*Long Beach Unified School Dist. v. State of California* (1990) 225 Cal.App.3d 155; *San Diego Unified School Dist., supra*, 33 Cal.4th 859; Gov. Code, § 17556, subd. (c).)

As explained in detail below, the trial court correctly found that the NPDES program is a mandatory federal program and that the challenged permit requirements are part of one aspect of the Clean Water Act, the federally-required maximum extent practicable standard. (CT V4, pp. 000678-000682.) As such, they are not subject to state subvention under article XIII B, section 6 of the California Constitution.

II. THE TRIAL COURT CORRECTLY FOUND THAT CALIFORNIA'S ADMINISTRATION OF THE NPDES PERMIT PROGRAM DOES NOT TRANSFORM CLEAN WATER ACT REQUIREMENTS INTO STATE MANDATES.

“The test for determining whether there is a federal mandate is whether compliance with federal standards ‘is a matter of true choice,’ that is, whether participation in the federal program ‘is truly voluntary.’” (*City of Sacramento, supra*, 50 Cal.3d at p. 76.) A federal mandate exists, even if “the state has adopted an implementing statute or regulation pursuant to the federal mandate so long as the state had no ‘true choice’ in the manner of implementation of the federal mandate.” (*Hayes, supra*, 11 Cal.App.4th at p. 1593.) But “[t]his reasoning would not hold true where the manner of implementation of the federal program was left to the true discretion of the state.” (*Ibid.*)

In the present case, the trial court correctly found that the State had “no real choice” in deciding to comply with the federal NPDES program, holding that the Clean Water Act “clearly dictates that NPDES permits issued – by either the U.S. EPA or a qualified state agency – are not voluntary.” (CT V4, p. 000678.) The County of Los Angeles does not seem to be challenging this finding, instead noting only that the Commission’s determination that “a state’s choice to issue NPDES permits is a voluntary one under the [Clean Water Act] [citation omitted].” (Appellants’ Brief (AB), pp. 20-21, fn. 7.) The County does not develop this argument and disavows its importance, contending that “[t]his fact [] did not form the basis for the Commission’s decision.” (*Ibid.*)

Regardless of how the County characterizes this part of the trial court’s decision, the NPDES program is not optional; it is coercive on states, local governments, and private parties in every legal and practical sense. As a preliminary matter, the Commission found that because California “voluntarily adopts the [NPDES] permitting program” and

because federal law “does not expressly require states to have this program, the state has freely chosen to effect the stormwater permit program.”

(AR 5581.) What the Commission overlooked is given the complex, coordinated, and wide-ranging nature of the rules governing federal, state, and local agencies and private parties under the Clean Water Act, California had no practical choice but to administer the NPDES program, rather than have the federal government issue those permits.

In any event, regardless of which entity implements NPDES, *neither the requirement for a permit nor the actions required to meet the required standard for reduction in discharges was voluntary*. The Clean Water Act requires the County of Los Angeles to have an NPDES permit for MS4 discharges and compels those permits to effectively prohibit non-storm-water discharges to the storm sewers, to reduce the discharge of pollutants in storm water to the maximum extent practicable, and to comply with any other requirements the Regional Board may deem appropriate to control pollutants. Neither the State nor the County of Los Angeles has any choice in complying with those requirements. (*City of Sacramento, supra*, 50 Cal.3d at p. 76.) Further, unlike the situation discussed in *Hayes*, the State is not “shift[ing] state costs to local agencies,” but instead implementing federal law that MS4 owners and operators obtain an NPDES permit that reduces pollutants in storm water to the maximum extent practicable. (Cf. *Hayes, supra*, 11 Cal.App.4th at p. 1593.)

If California did not issue NPDES permits, California’s dischargers, both private and governmental, would still have to comply with the same federal law, just administered then by direct regulation from the federal government. California’s decision to take on administration of the federal law added nothing by way of additional requirements. “It is in the interest of the people of the state, in order to avoid direct regulation by the federal government of persons already subject to regulation under state law

pursuant to this division, to enact this chapter in order to authorize the state to implement the provisions of the Federal Water Pollution Control Act [Clean Water Act].” (Wat. Code, § 13370, subd. (c).) Faced with the federal requirements to obtain NPDES permits, 46 of the 50 states (including California) have implemented NPDES through a federally-approved state agency process.

Moreover, the California Supreme Court has rejected the Commission’s narrow analysis that a state mandate is created when a state enacts its own laws to implement federal law. In *City of Sacramento, supra*, the Supreme Court found that the joint federal-state operation of a system of unemployment compensation was not a state mandate, but rather a federal one. (50 Cal.3d at pp. 75-76.) The Court rejected the idea that “California could have chosen to terminate its own unemployment insurance system, thus leaving the state’s employers faced only with the federal tax.” (*Id.* at p. 74.) The Court stated that “we cannot imagine the drafters and adopters of article XIII B intended to force the state to such draconian ends.” (*Ibid.*) The Court explained that “the state simply did what was necessary to avoid certain and severe federal penalties upon its resident businesses. The alternatives were so far beyond the realm of practical reality that they left the state ‘without discretion’ to depart from federal standards.” (*Ibid.*)

Under *City of Sacramento*, a federal mandate exists where the federal government leaves the State with little or no practical choice. The Commission’s analysis here eviscerates that rule. Under the Commission’s analysis, a state mandate would exist anytime federal law gives the state any potential role in administering or enforcing federal requirements.

Accordingly, the trial court correctly found that the State had “no real choice” in deciding to comply with the federal NPDES program and the

County of Los Angeles had not offered any argument to the contrary.
(CT V4, p. 000678.)

III. THE TRIAL COURT PROPERLY HELD THAT THE COMMISSION'S FINDINGS THAT THE CHALLENGED PERMIT REQUIREMENTS ARE STATE MANDATES APPLIED THE WRONG LEGAL STANDARD AND ARE NOT SUPPORTED BY SUBSTANTIAL EVIDENCE.

Government Code section 17556, subdivision (c), states that the Commission shall not find "costs mandated by the state" if "[t]he statute or executive order imposes a requirement that is mandated by a federal law or regulation and results in costs mandated by the federal government, unless the statute or executive order mandates costs that exceed the mandate in that federal law or regulation." (*San Diego Unified School Dist.*, *supra*, 33 Cal.4th at p. 880.) Under this statutory standard, the Commission was tasked with reviewing the applicable federal law (the maximum extent practicable standard) and determining whether each challenged permit requirement exceeded this standard. The Commission did not even attempt to meet this burden. The Commission completely disregarded the maximum extent practicable standard, the Regional Board's expertise in the area of water quality law, and a prior court decision finding that the permit in question was within the federal maximum extent practicable standard.

A. The Commission Disregarded the Maximum Extent Practicable Standard.

The Clean Water Act prohibits the County of Los Angeles from discharging pollutants from its MS4, except pursuant to an NPDES permit. One requirement of the Clean Water Act is that such permits must include "controls to reduce the discharge of pollutants to the *maximum extent practicable*, including management practices, control techniques and system, design and engineering methods, and such other provisions as the

Administrator or the State determines appropriate for the control of such pollutants.” (33 U.S.C. § 1342(p)(3)(B), emphasis added.)⁵

The Commission’s analysis ignored the maximum extent practicable standard altogether. Instead, the Commission looked only to whether federal law specifically required certain individual measures be in the County of Los Angeles’ permit. However, the Clean Water Act’s NPDES permit program requires the permit issuer, at a minimum, to determine controls that will reduce discharges to the maximum extent practicable from MS4s based on the unique conditions of particular waterbodies. On its face, the maximum extent practicable standard is necessarily flexible, rather than a one-size-fits-all standard imposed by specific numeric effluent limits. (*Building Industry Ass’n of San Diego County, supra*, 124 Cal.App.4th at p. 874.) The Commission’s analysis erroneously assumes that whenever federal regulations impose a standard that is flexible, any act taken by the state to implement that federal requirement is a state mandate. As the trial court explained, this type of analysis is legally incorrect:

The search for a comparable federal regulation as the pre-condition for finding a federal mandate utterly ignores and misapplies the flexible regulatory standard inherent in the Clean Water Act. The “maximum extent practicable standard” is designed to provide administrative bodies the “tools to meet the fundamental goals of the Clean Water Act in the context of storm water pollution.” [Citation omitted.] That flexible standard was designed to allow permit writers to use a combination of pollution controls that

⁵ In the lower court, the County of Los Angeles argued that the State Water Resources Control Board previously determined that the maximum extent practicable standard does not apply to permit requirements that address the entry of pollutants into MS4s. The lower court agreed that the Board made no such broad-based determination. (CT V4, p. 000679, fn. 11.) In any event, the County has not raised this issue here and it is not properly before the Court on appeal.

may be different in different permits. [Citation omitted.] And, the flexible standard provides an agency to tailor permits to the “site-specific nature of MS4” and the ability to direct permit requirements “at the sources of pollution in the MS4 rather than solely at the end of the pipe.” [Citation omitted.]

(CT V4, pp. 000679-000680.)

Despite the foregoing ruling by the trial court, the County of Los Angeles asserts that “[t]he Commission did consider the [maximum extent practicable] standard.” (AB p. 17.) To the contrary, even a cursory review of the Commission’s findings shows that instead of applying the maximum extent practicable standard, the Commission simply concluded that the permit requirements exceeded federal law because they were not expressly stated in regulations. With respect to the trash receptacle requirement, the Commission found:

- “[T]he plain language of the federal statute (33 U.S.C. § 1342(p)(3)(B)) [maximum extent practicable standard] and regulation (40 C.F.R. § 122.26(d)(2)(iv)(A)(3)) does not require the permittees [sic] to install and maintain trash receptacles at transit stops.” (AR 5584.)
- “Because installing and maintaining trash receptacles at transit stops is not expressly required of cities and counties or municipal separate storm sewer dischargers in the federal statutes or regulations, these are activities that ‘mandate costs that exceed the mandate in the federal law or regulation.’” (AR 5584.)

The Commission came to the same legal conclusion when it analyzed the inspection requirements for commercial facilities, certain industrial facilities, and construction sites. It found:

- There is no express requirement in federal law to inspect restaurants, automotive service facilities, retail gasoline outlets, or automotive dealerships. (AR 5590.) The Commission “cannot read a requirement into a statute or regulation that is not on its face or its legislative history.” (AR 5591.)

- “Based on the plain language of the federal regulations that are silent on the types of facilities at issue in the permit, the Commission finds that performing inspections at restaurants, automotive service facilities, retail gasoline outlets, or automotive dealerships, as specified in the permit, is not a federal mandate.” (AR 5591.)
- “[T]he Commission finds that there is no federal mandate on the claimants to perform inspections of phase I facilities as specified in part 4C2b of the permit.” (AR 5595.)
- “[T]he Commission finds that the requirement for local-agency permittees to inspect constructions sites in section 4E of the permit is not a federal mandate.” (AR 5601.)

The County of Los Angeles tries to sidestep the Commission’s erroneous analysis by essentially arguing quantity over quality. In the County’s view, the Commission analyzed the maximum extent practicable standard because the decision was lengthy (over one hundred pages) and because the decision restated relevant federal law, state law, and the parties’ positions. (AB pp. 17-18.) Providing background information is not a substitute for analysis. As outlined above, the Commission did not analyze (and in fact ignored) the maximum extent practicable standard and simply found that state mandates exist because the challenged permit requirements are not explicitly called out in federal law. The trial court correctly held that to “ignore this flexible standard imposed and mandated under the Clean Water Act, and instead to require a comparable federal regulatory dictate, is legally erroneous.” (CT V4, p. 000680.) The trial court decision should be affirmed.

B. The Clean Water Act Required the Regional Board to Specify the Permit's Comprehensive Measures to Reduce Pollutants In Storm Water to the Maximum Extent Practicable.

The Commission failed to consider and recognize the Regional Board's federal legal duty to prescribe controls to reduce the discharge of pollutants in storm water to the maximum extent practicable under the Clean Water Act. Congress established the maximum extent practicable standard because municipal storm water runoff, unlike other pollutant discharges, could not be adequately addressed by blanket effluent limitations. (*Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at p. 884.) Numeric effluent limitations may be infeasible and administratively burdensome when addressing municipal storm water runoff because of physical differences from other types of pollutant discharges. (*Ibid.*) Congress determined that the maximum extent practicable standard was a "necessary and workable enforcement mechanism to achieving the goals of the Clean Water Act." (*Ibid.*)

In issuing Clean Water Act large MS4 permits, "[t]he permitting agency has discretion to decide what practices, techniques, methods and other provisions are appropriate and necessary to control the discharge of pollutants [citation omitted]." (*City of Rancho Cucamonga v. Regional Water Quality Control Bd.-Santa Ana Region* (2006) 135 Cal.App.4th 1377, 1389.) However, the "Regional Board must comply with federal law requiring detailed conditions for NPDES permits." (*Ibid.*) Further, the U.S. EPA expects individual permit writers to develop the practices that reflect the maximum extent practicable standard on a permit-by-permit basis. (*Natural Resources Defense Council, Inc. v. U.S. E.P.A., supra*, 966 F.2d at p. 1308, fn. 17; see also 55 Fed.Reg. 47990, 48043 (Nov. 16, 1990).)

Consistent with federal law, the permit at issue makes clear that the challenged permit requirements are intended to reduce the discharge of

pollutants in storm water in the County of Los Angeles to the maximum extent practicable under the Clean Water Act. (AR 3527.) The permit states:

[T]he provisions herein, are intended to develop, achieve, and implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water to the MEP [maximum extent practicable] from the permitted areas in the County of Los Angeles to the waters of the State.

(AR 3527.)

The permit provides the County of Los Angeles the flexibility to substitute another best management practice, “if it can provide information and documentation on the effectiveness of the alternative, equal to or greater than the prescribed” practice in meeting the objectives of the permit. (AR 3517.) It is up to the County’s implementation of the permit to show that it is not the best measure of what is required to comply with the maximum extent practicable standard.

The lower court in this case agreed, noting both the flexible and comprehensive nature of NPDES permit conditions required to satisfy the maximum extent practicable standard for MS4s. (CT V4, p. 000679-80.) The trial court correctly found that the Commission’s search for a federal mandate specifically requiring imposition of the particular permit conditions “utterly ignores and misapplies the flexible regulatory standard.” (CT V4, p. 000679.) Moreover, that standard requires consideration of the permit as a whole, and the trial court ruled that “the Commission erred in isolating a specific requirement to conclude that the NPDES permit was a state mandate.” (CT V4, p. 000680.) In the lower court’s view here, “[o]ne permit provision cannot exceed the ‘maximum extent practicable’ standard imposed by the Clean Water [Act] where the permit as a whole does not.”

(*Ibid.*)⁶ Unlike the Commission, the trial court correctly interpreted federal law as requiring a flexible, comprehensive set of permit conditions. Building off this foundation, the trial court correctly ruled that state mandate claims must be analyzed against this federal mandate, not the presence or absence of federal regulations specifically requiring particular permit conditions.

C. The Commission Should Have Deferred to Both the Regional Board's Findings When the Board Implemented the Clean Water Act and to Prior Judicial Review of Those Findings.

The Regional Board's findings that the permit reflects the maximum extent practicable standard are not idle ruminations from an administrative agency. Instead, those findings and requirements are the expert conclusions of the principal state agency charged with implementing the NPDES program in the Los Angeles region. (Wat. Code, §§ 13001, 13200.) Courts have recognized that the regional boards are entitled to considerable deference in applying the statutes they implement, especially in the area of MS4 regulation. (*County of Los Angeles v. California State Water Resources Control Bd.* (2006) 143 Cal.App.4th 985, 997 ["we defer to the regional board's expertise in construing language which is not clearly defined in statutes involving pollutant discharge into storm drain sewer systems"]; *City of Rancho Cucamonga, supra*, 135 Cal.App.4th at p. 1384; *Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at

⁶ The State is not arguing that the Commission is precluded from reviewing the individual challenged permit requirements to determine if they are within the maximum extent practicable standard in the context of state mandate cases. (See *County of Los Angeles, supra*, 150 Cal.App.4th 898 and *City of Burbank, supra*, 35 Cal.4th 613.) However, the Commission cannot simply disregard the very nature of the flexible and comprehensive federal standard and, as explained in the following section, the findings and conclusions of the Regional Board and reviewing courts on those points.

p. 879.) The Commission, while an expert in mandates, is not an expert in water quality law and should have afforded appropriate deference to the Regional Board's findings (summarized *ante* pp. 10-11) that the challenged permit requirements are within the federal requirements of the Clean Water Act.

Moreover, the County of Los Angeles previously challenged in court various aspects of the permit as exceeding the Clean Water Act's maximum extent practicable standard. (*County of Los Angeles v. California State Water Resources Control Bd.* (2006) 143 Cal.App.4th 985.) In the unpublished portion of the opinion, the County challenged various parts of the permit (not at issue here) as exceeding that federal standard. (AR 3257-3268.) The County also challenged the requirement of trash receptacles at transit stops under the Water Code. (AR 3261-3262.) The Court rejected that contention, ruling that state law arguments were preempted by the Clean Water Act's requirement that the NPDES permit contain detailed conditions. (AR 3262.) The County likewise challenged certain inspection requirements in the permit, and the court similarly ruled that federal regulations required that the Regional Board consider those conditions. (AR 3266-3267.)

The Commission wrongly rejected the Regional Board's arguments that it should look to the *County of Los Angeles* opinion. (AR 5579-5580.) In doing so, the Commission incorrectly determined that judicial opinion did not discuss the particular permit requirements at issue in the test claim. (AR 5579.) As explained above, the Court's ruling did address, and reject, the County of Los Angeles' arguments regarding the requirement of trash receptacles and certain inspection requirements. (AR 3261-3262, 3266-3267.)

The Commission also missed another key point, that even if the County had not raised the precise arguments there that are now at issue in

this test claim, the County of Los Angeles could have done so. The Regional Board's decision was judicial in nature, subject to procedural protections of the Administrative Procedures Act, and had a clear process for administrative and judicial resolution. (See *City of Rancho Cucamonga v. Regional Water Quality Control Bd.-Santa Ana Region, supra*, 135 Cal.App.4th at p. 1385; Wat. Code, § 13330.) The doctrine of exhaustion of judicial remedies prevents an aggrieved party from being able to avoid the preclusive effects of an adverse administrative action by simply forgoing the right to judicial review. (*Y.K.A. Industries, Inc. v. Redevelopment Agency of City of San Jose* (2009) 174 Cal.App.4th 339, 356.) The County of Los Angeles could have argued (and, to some degree, did argue) that the permit requirements at issue in this appeal exceeded federal requirements. To the extent that the County did not raise those claims then, they were not entitled to a second bite at the apple here.

In summary, the Commission's decision here ignored two fundamental rules governing review of administrative decisions. First, it failed to afford the Regional Board the appropriate deference due when that expert agency imposed the permit conditions at issue as being required under federal law. (*County of Los Angeles v. California State Water Resources Control Bd., supra*, 143 Cal.App.4th 985, 997.) Second, the County forfeited any arguments it had on that point when they failed to raise them (or did raise them and lost) during judicial review of the Regional Board's permit decision under the applicable regulatory laws. (*Y.K.A. Industries, Inc. v. Redevelopment Agency of City of San Jose, supra*, 174 Cal.App.4th 339, 356.) Instead, the Commission allowed the County to attempt to second guess both the Regional Board's permit findings and judicial review of that decision. Either ground supports affirmance of the trial court's decision.

D. The Trial Court Correctly Found That the Commission's Application of *Long Beach School Dist. v. State of California* Was Misplaced.

In support of its erroneous state mandates determination, the Commission relied incorrectly (and almost exclusively) on *Long Beach School Dist. v. State of California, supra*, 225 Cal.App.3d 155. In *Long Beach*, the court considered whether a state executive order setting forth specific measures to desegregate schools constituted a state mandate. The executive order required school districts to provide a higher level of service than required by judicial decisions recognizing a general federal constitutional duty to desegregate schools, an area in which courts "have been wary of requiring specific steps." (*Id.* at p. 173.) A state mandate was found based on the absence of any federal law that specified how the schools should implement their desegregation plans. (*Ibid.*)

Here, as explained by the trial court, there is specific federal statute, the Clean Water Act, including its maximum extent practicable standard for MS4 permits, that directly applies to the County of Los Angeles. (CT V4, p. 000679, fn. 12.) Moreover, unlike in *Long Beach*, this federal statutory standard must be implemented more specifically when applied to NPDES permits issued to the municipalities. In contrast, in *Long Beach*, there was no even remotely analogous explicit constitutional or federal requirement that a federal agency or a state intercede and develop specific desegregation procedures.

The County of Los Angeles, like the Commission, simply ignores that in *Long Beach* there was no specific federal standard and that here there is: the Clean Water Act, including its flexible maximum extent practicable standard and its implementing regulations. The fact that the means of meeting the federal requirement to ultimately reduce pollutants in storm water to the specified level is flexible, requiring implementation by the

permit issuer, does not wipe out the standard and create a state mandate. (See AB p. 20.)

And while the Regional Board has some flexibility in implementing the maximum extent practicable standard, it is guided by the Clean Water Act and the U.S. EPA. The Clean Water Act explicitly imposes the maximum extent practicable standard and states that it will include “management practices, control techniques and system, design and engineering methods . . .” (33 U.S.C. § 1342(p)(3)(B).) Federal law further defines these practices to mean, in part, “schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of ‘waters of the United States.’” (40 C.F.R. § 122.2.) And the U.S. EPA has provided substantial guidance on how that federal law is to be implemented and specifically required permitting agencies to specify in NPDES permits the controls necessary to implement the federal standard. (40 C.F.R. § 122.26; *Natural Resources Defense Council, Inc. v. U.S. E.P.A.*, *supra*, 966 F.2d at p. 1308, fn. 17; see also 55 Fed.Reg. 47990, 48043 (Nov. 16, 1990.)

Moreover, California administers the NPDES program to follow federal requirements. Federal law extensively governs the contents of applications for MS4 permits. (33 U.S.C. § 1342(p)(4)(A); 40 C.F.R. § 122.26(d).) And federal law requires that the U.S. EPA be provided with the proposed permit and notice of any action related to the same, such as a hearing on the proposed requirements. (33 U.S.C. § 1342(d)(1).) The U.S. EPA may object to a permit and find that it is inconsistent with federal law. (*Id.* § 1342(d)(2).) It can determine that a state program does not comply with federal NPDES program guidelines and withdraw approval for the state program. (*Id.* § 1342(c)(3).) In short, the “Regional Board must comply with federal law requiring detailed conditions for NPDES permits.” (*City of Rancho Cucamonga, supra*, 135 Cal.App.4th at p. 1389.)

At most, the teachings of *Long Beach* tell us that the Commission should have compared the permit requirements to the federal Clean Water Act standards and then determined whether they went beyond federal law. While the Commission provided a lengthy discussion of whether various permit conditions are expressed verbatim in federal law, it failed to consider whether the requirements were within the federally-required maximum extent practicable standard set forth in the federal statute and regulations.

This true “comparative” approach was endorsed by the Supreme Court in *San Diego Unified School Dist. v. Commission on State Mandates*, *supra*, 33 Cal.4th 859, where the Commission was required to determine if state procedures requiring a hearing when a student was being expelled exceeded federal due process requirements. While the Supreme Court sympathized with the challenge presented to the Commission in attempting to resolve the extent of imprecise federal law in the context of a state mandates proceeding, the Court nonetheless stated that such an analysis was required. (*Id.* at pp. 889-890.) The Commission was likewise required to here, but its task was easier, given the more explicit, detailed, and comprehensive federal law on permitting MS4s under the Clean Water Act. Indeed, the lower court did undertake this analysis and concluded as a matter of law that the challenged permit requirements did not exceed federal law, and thus were not state mandates.

IV. THE TRIAL COURT PROPERLY CONCLUDED THAT THE TRASH RECEPTACLE REQUIREMENT IS A FEDERAL MANDATE, NOT SUBJECT TO SUBVENTION, AS A MATTER OF LAW.

The trial court found that the trash receptacle requirement in the permit is within the scope of the maximum extent practicable standard imposed on the County of Los Angeles under the Clean Water Act. (CT V4, pp. 000680-000681.) As already explained, the maximum extent practicable standard requires flexible, best management practices, to

eliminate or reduce the discharge of pollutants in storm water runoff through MS4s. The Clean Water Act need not mention trash receptacles specifically to mandate their use in a given permit under the maximum extent practicable standard.

Relying on the Regional Board's expertise, the trial court explained that "if litter and debris cannot be properly disposed of by persons waiting at transit stops, the inevitable downstream result will be the introduction of pollutants into the streets and, thereafter, into the storm drains – leading inevitably to the discharge of pollutants into nearby waterways." (CT V4, p. 000680.) Without question, the placement and maintenance of trash receptacles at transit stops will help prevent this known source of pollutants from escaping into the water. To claim otherwise defies common sense. The trash receptacles condition is an obvious remedy for the problem. (Cf *Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at p. 889 ["practicable does not necessarily mean the most that can possibly be done"].) And it is not the Commission's place to determine what activities meet the maximum extent practicable standard. As already noted, that expertise lies with the Regional Board. (*County of Los Angeles v. California State Water Resources Control Bd., supra*, 143 Cal.App.4th at p. 997; *Divers' Environmental Conservation Organization* (2006) 145 Cal.App.4th 246, 252.)

The relevant management practices required include "practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems." (40 C.F.R. § 122.26 (d)(2)(iv)(A)(3).) The County of Los Angeles has implicitly conceded such impacts include litter and that the Clean Water Act requires that steps be taken to keep trash out of its waterbodies. In its own SQMP submitted in its permit application, the County recommended minimizing trash from entering recreational

waterbodies, removing trash from open channels, and controlling litter and debris in the streets. (AR 3677-3578.) It also suggested conducting trash collection along, or in improved open channels, and encouraged establishing voluntary programs for trash collection in natural stream channels. (AR 3675.)

Thus, the trial court correctly concluded that because “the trash receptacle requirement of the NPDES permit is within the maximum extent practicable standard under the mandatory provisions of the Clean Water Act, it is imposed by federal law and not subject to reimbursement under article XIII B, section 6 of the California Constitution.” (CT V4, p. 000681.)

Neither the Commission (nor the County here) cited any contradictory evidence indicating that the trash receptacle requirement is beyond federal law. Instead, the County of Los Angeles, in summary form, simply lists four grounds that purportedly show that the trash receptacle requirement is a state mandate. None of the four reasons is supported by the record.

First, the County of Los Angeles restates its fallback argument that the trash receptacle requirement goes beyond federal law because it is not specifically required under federal law. (AB p. 22.) As explained throughout this Brief, the Clean Water Act’s NPDES permit system requires states to develop standards based on the specific conditions of particular waterways and, as whole, reduce pollutants. Thus, the maximum extent practicable standard is necessarily flexible and comprehensive, rather than a one-size-fits-all standard that specifies individual actions. (*Building Industry Ass’n of San Diego County, supra*, 124 Cal.App.4th at p. 874.)

Second and similarly, the County of Los Angeles claims that the trash receptacle requirement is not required by federal law because it is not specifically referenced in one U.S. EPA guidance document. (AB p. 22.) As above, there is nothing to support this theory. The relied upon document is simply a guide to “assist State and NPDES permitting

authority.” (AR 3393) Specifically, it states that “[t]he questions and issues addressed in this MS4 Evaluation Guidance are intended to be used as a reference during an MS4 program evaluation, not as a checklist during review. [¶] Each evaluation should be customized to the issues and requirements specific to that MS4.” (*Ibid.*)

Third, the County of Los Angeles hypothesizes that “[i]f the trash receptacle requirement were a federal requirement, it would have been present in USEPA-issued permits.” (AB p. 23.) Not so. NPDES permits “‘evolve and mature over time’ and must be flexible to reflect changing conditions that result from program development and implementation and corresponding improvements in water quality.” (55 Fed.Reg. 47990, 48052 (Nov. 16, 1990); see also *In re City of Irving, Texas, Municipal Separate Storm Sewer System* (July 16, 2001) 10 E.A.D. 111 at *6, CT V4, p. 000660.) Under federal law, each NPDES permit must be tailored to the particular characteristics of the surrounding waterbodies. Thus, requirements in one permit could logically be different than the requirements in other permits (unless, of course, the surrounding circumstances were identical). As the U.S. EPA stated when establishing the MS4 permitting regulations: “[t]he language of [Clean Water Act] section 402(p)(3) contemplates that, because of the fundamentally different characteristics of many municipalities, municipalities will have permits tailored to meet particular geographical, hydrological, and climatic conditions.” (55 Fed.Reg. 47990, 48053 (Nov. 16, 1990).)

It is fair to say that, at least in this context, there is no other place identical to the Los Angeles region. The five states in which NPDES permits were issued by the U.S. EPA as of 2008 included Massachusetts, New Hampshire, Idaho, Alaska, and New Mexico. (AR 3895.) Water quality issues in southern California cannot realistically be the same or similar to water quality issues in Alaska or Idaho. As such, the NPDES

permits will be different, yet all consistent with federal law. It is of no consequence that U.S. EPA-issued permits, or any other state-issued permits, do not include a specific requirement regarding placement and maintenance of trash receptacles. The only relevant considerations are the best management practices that implement the maximum extent practicable standard for the County of Los Angeles' MS4.

The County of Los Angeles also incorrectly infers that the U.S. EPA considers the trash receptacle requirement to be outside the scope of the maximum extent practicable standard because the requirement is not present in U.S. EPA-issued NPDES permits. (See AB p. 23.) This is wrong. According to the U.S. EPA, the trash receptacle requirement is well within the maximum extent practicable standard. (AR 3797-3799.) Neither the Commission nor the County of Los Angeles refute this unequivocal statement of the federal agency charged with overseeing the NPDES program.

Finally, the County of Los Angeles speculates that because the trash receptacle requirement was not part of the previous permits issued to the County, the obligation is not required by federal law. (AB pp. 23-24.) Once again, the County seems to misunderstand the NPDES program and the Clean Water Act's MS4 permitting requirements. When an NPDES permit is renewed, reissued or modified, it generally must be at least as stringent as the prior permit. (33 U.S.C. § 1342 (o); 40 C.F.R. § 122.44(l).) The U.S. EPA "anticipates that storm water management programs will evolve and mature over time . . . [t]he permits for discharges from municipal separate storm sewer systems will be written to reflect changing conditions that result from program development and implementation and corresponding improvements in water quality." (55 Fed.Reg. 48052 (Nov. 16, 1990.)) Thus, federal law anticipates that MS4 permit requirements will change over time and become more stringent. A new

requirement in a permit alone does not mean that the requirement is beyond the maximum extent practicable standard in federal law.

There is no evidence that even remotely suggests that the trash receptacle requirement is a state mandate, and the County's claim otherwise should be disregarded.

V. THE TRIAL COURT PROPERLY CONCLUDED THAT CHALLENGED PERMIT REQUIREMENTS RELATED TO INSPECTIONS ARE FEDERAL MANDATES, NOT SUBJECT TO SUBVENTION, AS A MATTER OF LAW.

Inspections are necessary to effectively control the discharge of pollutants in compliance with the Clean Water Act and assure compliance with water quality standards. "Federal law, either expressly or by implication, requires NPDES permittees to perform inspections for illicit discharge prevention and detection; landfills and other waste facilities; industrial facilities; construction sites; certifications of no discharge; non-storm water discharges; permit compliance; and local ordinance compliance." (*City of Rancho Cucamonga, supra*, 135 Cal.App.4th at p. 1390.) Thus, the trial court properly found that "[a]s with the receptacle requirement, these inspection mandates are clearly pursuant to the maximum extent practicable standard under the Clean Water Act." (CT V4, p. 000681.)

A. The Challenged Permit Requirements for Inspections Are Within the Maximum Extent Practicable Standard.

Commercial Facilities

The permit requires inspections of commercial facilities, including restaurants, automotive service facilities, and retail gasoline outlets, and automotive dealerships. While each commercial property has unique inspection requirements tailored to its business activity, the permit requires that all facilities are inspected on a regular basis, twice during the five-year

permit period, to confirm that best management practices are being effectively implemented in compliance with the law. (AR 3533-3535.)

Federal regulations implementing the Clean Water Act's requirement of "controls to reduce the discharge of pollutants to the maximum extent practicable" clarify that management practices generally include site inspections "to prevent illicit discharges to the municipal storm water system. (40 C.F.R. § 122.26 (d)(2)(iv)(B)(1).) Such inspections confirm that best management practices are being effectively implemented in compliance with federal law. The County disagrees, arguing that the federal regulation is not specific enough because it does not expressly and specifically call out inspections of commercial, industrial, and construction sites. (AB p. 27.) Again, the County of Los Angeles misunderstands the flexible nature of the Clean Water Act's maximum extent practicable standard and its implementing regulations.

The County of Los Angeles must have understood that site inspections are within this flexible maximum extent practicable standard because they recommend inspections in their permit application as well. According to the proposed permit, "Permittees shall visit automotive services and food service facilities as outlined in the SQMP in its jurisdiction once every two years. During site visits, Permittees shall: [¶] i. Consult with a representative of the facility to explain applicable stormwater regulations; [¶] ii. Distribute and discuss applicable BMP and educational materials; and, [¶] iii. Conduct a site walk-through to verify for, at a minimum, evidence of BMP implementation." (AR 3671.) The County also proposed that "Permittees shall revisit automotive and food service facilities where evidence of illicit discharge is found within six months of the date of the initial visit." (AR 3671.) As with the trash receptacle requirement, the Regional Board was not required to adopt the

less stringent suggested alternative, but rather determine what actions are required to reduce pollutants to the maximum extent practicable.

Phase I Industrial Facilities

This portion of the permit relates to the inspection of certain industrial facilities referred to in the permit as Phase I Facilities. (AR 3535-3536.) Federal regulations require that actions designed to comply with the Clean Water Act include management practices or controls that “identify priorities and procedures for inspections” of industrial facilities. (40 C.F.R. § 122.26 (d)(2)(iv)(B)(C)(1) & (G).) The County of Los Angeles specifically included these inspections in its SQMP by stating that “Permittees shall implement an industrial/commercial educational site visit program.” (AR 3670-3671.) The fact that the permit is more specific than SQMP does not mean the requirement exceeds the maximum extent practicable standard. Inspections are required under federal law, and the State has no obligation to adopt the least stringent requirement. (See *City of Rancho Cucamonga, supra*, 135 Cal.App.4th at p. 1390.)

Construction Sites

This portion of the permit provides that “[e]ach Permittee shall implement a program to control runoff from construction activity to storm drains at all construction sites within its jurisdiction.” (AR 3546.) This generally includes implementing best management practices related to the control and containment of construction-related materials, waste, and erosion, as well as the inspection of construction sites and related employee training. (AR 3546-3549.) The County of Los Angeles’ SQMP is extensive and includes detailed requirements to prevent runoff from construction sites into nearby waters. (AR 3672-3674.) These requirements include implementing best management practices relating to the control and containment of construction-related materials, waste, and erosion, as well as the inspection of construction sites and related employee

training. (AR 3672-3674.) To achieve the maximum extent practicable standard imposed as one of the requirements of the Clean Water Act, federal regulations require the inspections of construction sites. (40 C.F.R. § 122.26 (d)(2)(iv)(D).)

The Commission and the County do not dispute the above, but relied on their fallback position that the inspections and related activities at construction sites are not federal mandates because they are not expressly specified in federal law. (AR 5600; AB p. 28.) As discussed above, a federal mandate does not require explicit mention of every mandated activity. Accordingly, the challenged inspection requirements in the permit do not exceed the maximum extent practicable standard under the Clean Water Act and are federal mandates not subject to state subvention.

B. Federal Law Required Imposition of the Challenged Inspection Provisions on the Local Permittees.

The County generally argues that under *Hayes, supra*, the State Water Board shifted state inspection requirements to the County through the permit, thus creating state mandates. (11 Cal.App.4th at p. 1593; AB pp. 29-32, see also Section II [shifting argument].) Specifically, the County asserts that the State has various mandatory inspection obligations under the Water Code and two state-issued general permits and has voluntarily shifted these burdens to the County. (AB pp. 29-32.) The County is wrong and ignores that existing state inspection obligations are separate and distinct from the challenged inspection requirements in the permit.

Turning to the Water Code first, the County of Los Angeles claims that the State has the obligation to inspect the facilities identified in the permit to prevent the discharges of waste that could affect the quality of the waters of the State under Water Code section 13267, subdivisions (b) and (c). (AB p. 30.) In the County's view, the Regional Board freely chose to

shift those obligations to the County and cities and created a state mandate. (AB p. 32.) The County has somehow equated the State's general authority to inspect "facilities" under section 13267 to the County's separate and distinct obligations under the permit and the Clean Water Act.

Water Code section 13267, subdivision (a), provides authority generally for state investigations: "[a] regional board . . . may investigate the quality of any waters of the state within its region." And during this investigation, "the regional board may inspect the facilities of any person to ascertain whether the purposes of this division are being met and waste discharge requirements are being complied with." (Wat. Code, § 13267, subd. (c).) The inspection must "be made with the consent of the owner or possessor of the facilities or, if the consent is withheld, with a warrant," with the exception of an "emergency affecting the public health or safety." (*Ibid.*)

A regional board's general authority to inspect "facilities" does not substitute for the County of Los Angeles' obligations as an NPDES permittee to inspect certain facilities under the Clean Water Act. "The Regional Board may conduct its own inspections but permittees must still enforce their own laws at these sites." (*City of Rancho Cucamonga, supra*, 135 Cal.App.4th at p. 1390.) The issue is whether the inspections can be required of a permittee under the Clean Water Act's maximum extent practicable standard, and not whether the State can also conduct inspections generally under section 13267.

Indeed, taken to its logical conclusion, dischargers like the County of Los Angeles could argue that they are relieved of their federal law obligations to conduct inspections under Clean Water Act permits (or related permit requirements) merely because the State has some general investigatory authority over water quality issues. This is contrary to both the express requirements of the Clean Water Act and its implementing

regulations, as well as its overall intent to task dischargers with reducing discharge of pollutants through MS4s.

Next, while it is true that the State Water Board issued two general state-wide permits, one for certain industrial facilities (GIASP) and one for construction sites (GCASP) requiring certain site inspections, the County once again fails to understand that the state's inspection obligations under these permits are separate and apart from the County's inspection obligations included in the permit at issue here.

The County of Los Angeles claims that under the GIASP and GCASP the regional boards must perform various "compliance" inspections. (AB pp. 31-32.) According to the County and the Commission, the inspections requirements in the permit are state mandates because the Regional Board "could have continued to perform these inspections itself as directed by the State Water Board in the GIASP and GCASP, but chose to shift those obligations to the permittees." (AB p. 32.) As with the County's prior argument, this makes no sense. The state-issued general permits are simply not relevant to this inquiry. (See *City of Rancho Cucamonga, supra*, 135 Cal.App.4th at p. 1390.) A state-wide general permit can coexist with the permit issued to the County of Los Angeles, and there is no evidence to the contrary. The issue is whether the inspections are required by the Clean Water Act and not whether the inspections are required under the State's general permitting authority. The County impermissibly attempts to blur the line between its permit obligations as the discharger of pollutants through its storm sewers and the State's separate obligations, to create one large, amorphous state obligation.

The last argument presented by the County of Los Angeles can be quickly disregarded for the reasons just stated in the preceding two paragraphs. The County's statement that the State Board can collect a fee for state inspections required under the state-issued permits is not relevant.

(See AB p. 32.) These inspections are independent from the obligations imposed on the County as a discharger under the permit.

The County of Los Angeles asserts that the trial court did not consider the above shifting argument. (AB pp. 24, 27, 29.) This is not true. Most of the hearing was directed at whether the State shifted its inspections obligations to the County under this permit. (Reporter's Transcript pp. A6-41.) The trial court simply disagreed with the County's theory, finding that "[a]lthough extensively argued to the Court, the existence of mutual inspection schemes does not constitute a derogation of state responsibilities to the real parties, in violation of *Hayes*." (CT V4, p. 000681, fn. 16.) In any event, whether the inspection requirements are state mandates is subject to de novo review and properly before this Court.

C. There Is No Evidence That the Challenged Permit Requirements for Inspections Are Beyond the Maximum Extent Practicable Standard.

As with the trash receptacle requirement, the County of Los Angeles provides a list of short statements that allegedly support its claim that the permit requirements for inspections challenged in this litigation are state mandates. (AB pp. 33-35.) Because the arguments have been fully addressed above, they are repeated here only in summary form.

First, the County of Los Angeles repeats its claim that federal law does not expressly provide for the required inspections, so the inspections are not mandated by federal law. (AB p. 33.) As explained throughout this Brief, this argument is legally erroneous.

Second, the County of Los Angeles also repeats its argument that the guidance document issued by the U.S. EPA does not generally provide for inspections. (AB p. 33.) The relied-upon document is simply a guide, not a checklist and is not dispositive. (AR 3393.)

Third, the County argues that U.S. EPA-issued permits do not include the inspection of commercial facilities. (AB p. 34.) As already explained,

different permits have different requirements based on the unique circumstances of each permit. The absence of certain commercial inspections in other permits does not mean that such a requirement is beyond the maximum extent practicable standard with respect to this permit. Indeed, the U.S. EPA has concluded that the inspection requirement is within the maximum extent practicable standard. (AR 3797-3800.)

Fourth, the County of Los Angeles claims that “[t]he former USEPA Administrator and the still head of the Water Division for USEPA Region IX” has stated “that the inspection obligation of a municipality under an MS4 permit imposed by federal law is only an inspection to assure compliance with local ordinances; *the state retains responsibility to inspect for compliance with state law, including state-issued permits.*” (AB p. 34, emphasis in original.) This statement is based on a July 21, 2001 letter from the U.S. EPA to Congressman David Dreier responding to his concern that local governments would be forced to pay for inspections at industrial and commercial sites that were the responsibility of the State. (AR 3878.) The letter generally explains that there may be some “shared responsibilities” between the State and the local government but that the State is responsible for its own permit obligations, not those of the actual dischargers. (AR 3878.) By no means does this letter suggest the State, as opposed to the actual MS4 discharger, is solely responsible for inspections at commercial and industrial facilities, as claimed by the County.

Finally, the County of Los Angeles claims that there were some negotiations between the County and the Regional Board regarding contracting state inspections to the County. (AB p. 34.) Again, this improperly attempts to equate inspections obligations imposed on an NPDES permittee with the State’s general authority to regulate water quality. Even if true, that assertion is not relevant to the question of whether the permit activity for industrial inspections is a state mandate.

Based on the foregoing, there is no evidence that even remotely suggests that the specific permit requirements exceed federal law, just speculation and conjecture on the part of the County of Los Angeles. The permit requirements are based on federal law and thus are not state mandates. Consequently, the trial court properly found that the challenged permit requirements are not subject to reimbursement under article XIII B, section 6 of the California Constitution, and the trial court's decision should be upheld.

VI. THE TRIAL COURT ACTED WITHIN ITS AUTHORITY TO REMAND THE MATTER BACK TO THE COMMISSION TO SET ASIDE ITS DECISION AND ISSUE A NEW DECISION CONSISTENT WITH THE TRIAL COURT'S ORDER.

The trial court properly remanded the case back to the Commission to set aside its decision and issue a new decision consistent with the court's order. (CT V4, pp. 000702-00703.) Specifically, the court ordered that the Commission issue a new decision stating, in relevant part:

That the challenged permit provisions in permit number CAS004001, consisting of part 4F5c3 (placing and maintaining trash receptacles at transit stops), part 4C2a (inspecting commercial facilities), part 4C2b (inspecting Phase I industrial facilities); and part 4E (inspecting construction sites), are within the maximum extent practicable standard under the mandatory provisions of the Clean Water Act and are federal mandates not subject to reimbursement under article XIII B, section 6, of the California Constitution.

(CT V4, p. 000703.)

Code of Civil Procedure section 1094.5, subdivision (f), gives the trial court the above authority to remand a case with specific instructions so long as it does not invade the discretion legally vested with the Commission.

Subdivision (f) provides:

The court shall enter judgment either commanding respondent to set aside the order or decision, or denying the writ. Where the judgment commands that the order or decision be set aside, it

may order the reconsideration of the case in light of the court's opinion and judgment and may order respondent to take such further action as is specially enjoined upon it by law, but the judgment shall not limit or control in any way the discretion legally vested in the respondent.

Here, the trial court did not encroach on the Commission's discretion when it found that the challenged permit requirements were federal mandates and not subject to subvention under article XIII B, section 6. The court simply disagreed with the Commission's ultimate findings. Whether a statute, or in this case a permit requirement, creates a reimbursable state mandate is a pure question of law. (*Connell, supra*, 59 Cal.App.4th at p. 395.)

In support of its effort to remand this case to the Commission (apparently to get yet another bite at the apple), the County of Los Angeles claims that the trial court "substituted its own judgment for that of the Commission" when it found that substantial evidence in the record shows that the challenged permit requirements were federal, not state mandates and not subject to state subvention. (AB pp. 17, 35-36.) The County mistakes the extent of the lower court's authority with respect to administrative mandate writs. The trial court acted within its discretion when it granted the writ and entered judgment ordering the Commission to set aside its decision and enter a new decision finding that the challenged permit provisions were not state mandates. (CT V4, p. 000703.) The Commission had jurisdiction over the matter, conducted a hearing, and made findings. After reviewing the administrative record, the trial court disagreed with the Commission's decision and came to a contrary conclusion, based on the law. The court merely rendered a judgment ordering the Commission to discharge its legal obligation. Because there is nothing left for the Commission to exercise discretion over, the remand directed by the trial court is appropriate.

The two cases relied on by the County of Los Angeles do not support its claim that matter should be remanded to the Commission for further proceedings. (See AB p. 36.) In *National Auto. & Cas. Ins. Co. v. Downey* (1950) 98 Cal.App.2d 586, 594, the court remanded the matter because the proceeding under review had not been heard by a properly qualified person and thus the agency did not have jurisdiction. This is not the case here.

In *Carson Gardens, L.L.C. v. City of Carson Mobilehome Park Rental Review Bd.* (2006) 135 Cal.App.4th 856, 867, the court remanded the case for further consideration to the board because the court could not determine if the calculation used for a rental increase for a mobilehome park was fair. Again, this is not the case here, the Commission's findings are clear and unambiguous; again, the trial court simply disagreed with the agency's legal conclusions.

Finally, the County of Los Angeles asserts that an across-the-board exception applies to the de novo standard of review in water quality permit cases based on *County of Los Angeles, supra*, 150 Cal.App.4th 898, which addressed the Clean Water Act's maximum extent practicable requirement in the context of a state mandates claim. (AB pp. 16-17.) The County has misread this case. There, the Court noted that questions regarding whether permit requirements are state mandates must first be resolved by the Commission and may present factual issues. (*Id.* at pp. 917-918.) The County of Los Angeles reads this statement to mean that in *all* cases where permit requirements are alleged to be a state mandate, the analysis involves pure factual questions subject to substantial evidence review. (AB pp. 16-17.) Not so. The Court merely acknowledged that factual issues *may* be present. (*County of Los Angeles, supra*, 150 Cal.App.4th 918.) This statement does not wipe out the de novo standard of review for determining whether a statute, regulation, or executive order is a state mandate.

At most, a NPDES permit may give rise to mixed question of law and fact. However, when such questions are predominantly legal, which they are here, they are reviewed independently. (*Crocker National Bank v. City and County of San Francisco* (1989) 49 Cal.3d 881.) As explained by our Supreme Court: “If [] the inquiry requires critical consideration, in a factual context, of legal principles and their underlying values, the question is predominantly legal and its determination is reviewed independently. [Citations omitted.]” (*Id.* at p. 887.)

Accordingly, the scope of the remand issued by the trial court was entirely appropriate under the circumstances and should not be disturbed. The challenged permit requirements are not state mandates under article XIII B, section 6 and the trial court had authority to require the Commission to enter that decision.

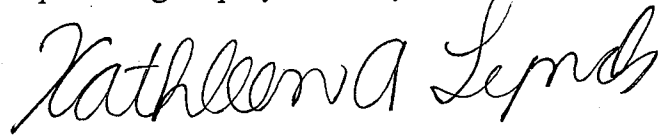

CONCLUSION

The trial court correctly found that the challenged permit requirements are not state mandates because California must implement the federal NPDES program and because the permit as a whole, and the challenged permit requirements, do not exceed the maximum extent practicable standard in federal law. As such, the trial court’s decision should be affirmed.

INTRODUCTION

This case is about the Commission on State Mandates treating a mandatory federal pollutant discharge requirement under the Clean Water Act as a state mandate simply because the state administers the Act. The Commission's decision is contrary to California law prohibiting state subvention for federal mandates and should be reversed.

The Clean Water Act prohibits real parties in interest County of Los Angeles and several cities named in the petition (referred to below collectively as the "County of Los Angeles") from discharging pollutants from their municipal storm sewer systems into nearby waterways unless they do so under a permit issued in compliance with the National Pollutant Discharge Elimination System ("NPDES"). The Clean Water Act requires the County of Los Angeles' NPDES permit to reduce the discharge of pollutants from its storm drains to the *maximum extent practicable*. Under article XIII B, section 6, of the California Constitution, the only way this federal standard could constitute a state mandate would be if the state *voluntarily elected* to require local agencies to implement state obligations under the Clean Water Act, or if the state took action to *exceed* the Act's "maximum extent practicable" standard. Neither occurred here.

Since 1973, the state¹ has administered the Clean Water Act's NPDES program in California, so it was the state that issued the NPDES permit to the County of Los Angeles. However, with or without state action, the County of Los Angeles had no choice but to comply with the Clean Water Act, and its maximum extent practicable standard, and the state added nothing to the County of Los Angeles' burdens. As such, the state had little practical choice but to implement the Clean Water Act in lieu of direct regulation from the federal government.

The permit as a whole, including the more particular requirements of trash cans and site inspections merely applied the federal standard. While the Commission may be an expert in state mandates, it has no expertise in the field of water law. The Commission erroneously failed to defer to the Los Angeles Regional Water Quality Control Board's ("Regional Board")

¹ "State" refers collectively to the State Water Resources Control Board and the Los Angeles Regional Water Quality Control Board, and "petitioners" refers to the two Boards as well as the State of California Department of Finance.

1 implementation of federal water quality law. More specifically, the Commission failed to defer to
2 the Regional Board's determination that the permit as a whole and the more particular permit
3 requirements implement the Clean Water Act's maximum extent practicable standard.

4 Consequently, petitioners ask the court to reverse the Commission's findings of state mandates.

5 Finally, because the federal maximum extent practicable standard is not new, there is no
6 new program or higher level of service. The Commission's decision to the contrary should be
7 reversed as well.

8 BACKGROUND

9 I. FEDERAL REQUIREMENTS FOR STORM WATER PERMITS

10 A. Federal Nature of NPDES Permits

11 In a "dramatic response to accelerating environmental degradation of rivers, lakes and
12 streams in this country," Congress passed the Clean Water Act in 1972 to eliminate the discharge
13 of pollution into the nation's waters by 1985. (33 U.S.C. § 1251, et. seq.; *Natural Resources*
14 *Defense Council, Inc. v. Costle* (D.C. Cir. 1977) 568 F.2d 1369, 1371.) The Clean Water Act
15 seeks to "restore and maintain the chemical, physical, and biological integrity of the Nation's
16 waters." (33 U.S.C. § 1251(a).) It prohibits the discharge of pollutants from "point sources" to
17 waters of the United States unless provided for under the NPDES.² (33 U.S.C. §§ 1311, 1342;
18 see also *Communities for a Better Environment v. State Water Resources Control Bd.* (2003).
19 109 Cal.App.4th 1089, 1092-1093.)

20 Either the United States Environmental Protection Agency ("U.S. EPA") or a U.S. EPA-
21 approved state may issue NPDES permits. (33 U.S.C. § 1342(a)(1) & (b).) Congress concluded
22 that the U.S. EPA could issues permits for all dischargers and translate the Clean Water Act's
23 requirements into the conditions of individual permits for individual dischargers, but states may
24 elect to take on that federal responsibility. (*Environmental Protection Agency v. California ex rel.*

25 ² "The term 'point source' means any discernible, confined and discrete conveyance,
26 including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure,
27 container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft,
28 form which pollutants are or may be discharged. This term does not include agricultural
stormwater dischargers and return from irrigated agriculture." (33 U.S.C. § 1362(14).)

1 *State Water Resources Control Bd.* (1976) 426 U.S. 200, 219.) California has the U.S. EPA's
2 approval to issue NPDES permits, as do 45 other states.³ (*Building Industry Association of San*
3 *Diego County v. State Water Resources Control Bd.* (2004) 124 Cal.App.4th 866, 875.)

4 If a state elects to issue NPDES permits, it must ensure that the permits comply with many
5 federal requirements, including effluent limitations, national standards of performance, and toxic
6 and pretreatment effluent standards. (33 U.S.C. §§ 1342(b)(1), 1311, 1312, 1316, 1317.) States
7 must also provide for the continued inspection and monitoring of pollutants into our nation's
8 waters. (33 U.S.C. § 1342(b)(2)(B).) NPDES permit requirements, including those that
9 implement state water quality standards, may be enforced as a matter of federal law by either the
10 U.S. EPA or private citizens. (33 U.S.C. § 1319(a)(1), (3); 1365(a)(1).)

11 To ensure that state-authorized programs comply with the U.S. EPA's mandates and federal
12 law, the U.S. EPA maintains oversight and supervision of these programs. The state must provide
13 the U.S. EPA with proposed permits and notice of any action related to a discharger's permit
14 application. (33 U.S.C. § 1342(d)(1).) The U.S. EPA may object to a permit, finding that it
15 violates the Clean Water Act's guidelines and requirements. (*Id.*, § 1342(d)(2).) Should the U.S.
16 EPA determine that a state program does not comply with federal NPDES program guidelines, it
17 may withdraw approval for the state program. (*Id.*, § 1342(c)(3).)

18 When an NPDES permit is renewed, reissued or modified, it generally must be at least as
19 stringent as the prior permit. (33 U.S.C. § 1342 (o); 40 C.F.R. 122.44 (l).) This is consistent with
20 Congress' intent that state management programs evolve based on changing conditions from
21 program development and implementation and corresponding improvements in water quality.
22 (55 Fed.Reg. 47990, 48,052.)

23 ///

24 ///

25 ///

27 ³ The list of states with the U.S. EPA approval to issue NPDES permits can be found at
28 http://cfpub1.epa.gov/npdes/statestats.cfm?program_id=12

1 **B. State Required Compliance with Federal Law With Respect to Municipal**
2 **Separate Storm Sewer Systems.**

3 While many types of discharges require NPDES permits under the Clean Water Act, this
4 case is very specific, pertaining to the discharge of pollutants through municipal separate storm
5 sewer systems (referred to as either “MS4” or storm sewer systems).

6 Controlling municipal urban storm water runoff is important, because it is one of the most
7 significant sources of water pollution in the nation. (*Environmental Defense Center, Inc. v. EPA*
8 (9th Cir. 2003) 344 F.3d 832, 840.) It carries “suspended metals, sediments, algae-promoting
9 nutrients (nitrogen and phosphorus), floatable trash, used motor oil, raw sewage, pesticides, and
10 other toxic contaminants into streams, rivers, lakes, and estuaries across the United States.” (*Id.*
11 at pp. 840-841.) “Among the sources of stormwater contamination are urban development,
12 industrial facilities, construction sites, and illicit discharges and connections to storm sewer
13 systems.” (*Id.* at p. 841.)

14 The Clean Water Act requires dischargers such as the County of Los Angeles “to reduce the
15 discharge of pollutants to the *maximum extent practicable*, including management practices,
16 control techniques and system, design and engineering methods, and such other provisions as the
17 Administrator or the State determines appropriate for the control of such pollutants.”
18 (33 U.S.C. § 1342(p)(3)(B), emphasis added.) Congress established this flexible maximum extent
19 practicable standard so that administrative bodies would have “the tools to meet the fundamental
20 goals of the Clean Water Act in the context of storm water pollution.” (*Building Industry Ass'n of*
21 *San Diego County, supra*, 124 Cal.App.4th at p. 884.)

22 The maximum extent practicable standard is one of the Clean Water Act’s technology-
23 forcing requirements designed to foster innovation. (See, e.g., *Chemical Mfrs. Ass'n v. Natural*
24 *Resources Defense Council, Inc.* (1985) 470 U.S. 116, 155-56 [discussing technology-forcing
25 aspects of the Clean Water Act].) Unlike many, other technology-based requirements, though,
26 the U.S. EPA articulated that permit writers would identify the municipal storm water
27 requirements on a permit-by-permit basis. (*Natural Resources Defense Council, Inc. v. U.S.*
28 *E.P.A.* (9th Cir. 1992) 966 F.2d 1292, 1308, n. 17; see also, 55 Fed.Reg. 47990, 48043 (Nov. 16,

1 1990).) To implement this maximum extent practicable standard, municipal storm water permits
2 usually require “best management practices” that reflect the technology-based effluent limitation.
3 (See *Natural Resources Defense Council, supra*, 568 F.2d at p. 1380; Administrative Record
4 (“AR”) 2689-2690.) Federal law defines these practices to mean, in part, “schedules of activities,
5 prohibitions of practices, maintenance procedures, and other management practices to prevent or
6 reduce the pollution of ‘waters of the United States.’” (40 C.F.R. § 122.2.)

7 In order to legally discharge pollutants from point sources under an NPDES permit, entities,
8 both public and private, must file an application with the permitting authority.

9 (33 U.S.C. § 1342(B)(3).) The U.S. EPA regulations specify the information that applicants for
10 MS4 permits must include in their applications. (40 C.F.R. § 122.26(a)(4).) This application is
11 extensive and represents the applicant’s view of the required NPDES permit. (*Id.*,
12 § 122.26(d)(2)(iv).) Relevant to our case, federal regulations require that an application, and
13 ultimately the permit itself, address management programs to reduce the discharge of pollutants
14 using the maximum extent practicable standard (*id.*, § 122.26(d)(2)(iv)) and includes procedures
15 to control pollution resulting from construction activities (*id.*, § 122.26 (d)(1)(v)); legal authority
16 to control pollution contribution of pollutants associated with industrial activity (*id.*,
17 § 122.26(d)(2)(i)(A)); programs to control illicit discharge to the MS4 (*id.*, § 122.26(d)(1)(v));
18 and conducting inspections to determine compliance with permit conditions. (*id.*,
19 § 122.26(d)(2)(i)(F)). The management programs must address oversight of discharges into the
20 system from the general population and from industrial and construction activities within its
21 jurisdiction. (*Id.*, § 122.26 (d)(2)(iv).)

22 The U.S. EPA has also issued guidance documents that discuss the types of best
23 management practices that must be included in municipal storm water permits in order to reduce
24 the discharge of pollutants in storm water to the “maximum extent practicable.” At the time that
25 the subject test claims were considered by the Commission, the U.S. EPA had issued an MS4
26 Program Evaluation Guide, which addresses inspections of businesses and litter related issues.
27 (AR 3391-3494, at 3468-3469, 3440.) Most recently, in April of 2010, the U.S. EPA issued an
28 updated guide, MS4 Permit Improvement Guide, that also provides guidance to federal and state

1 permit writers on the requirements for permitting discharges from municipal storm sewer systems
2 under an NPDES permit.⁴

3 **II. CALIFORNIA'S ROLE IN IMPLEMENTING FEDERAL REQUIREMENTS FOR STORM**
4 **WATER PERMITS**

5 “[O]n May 14, 1973, California became the first state to be approved by the EPA to
6 administer the NPDES permit program.” (*County Sanitation Dist. No. 2 of Los Angeles County v.*
7 *County of Kern* (2005) 127 Cal.App.4th 1544, 1565-1566.)⁵ The Legislature amended the Porter-
8 Cologne Water Quality Control Act (Porter-Cologne Act) by adding Chapter 5.5 to implement
9 federal law in order to avoid direct regulation by the federal government. (Wat. Code, § 13370;
10 see generally Wat. Code, §§ 13370-13389.) Specifically, the legislative findings and declarations
11 state, in relevant part:

12 It is in the interest of the people of the state, in order to avoid direct regulation by the
13 federal government of persons already subject to regulation under state law pursuant
14 to this division, to enact this chapter in order to authorize the state *to implement the*
15 *provisions of the Federal Water Pollution Control Act* [Clean Water Act] and acts
16 amendatory thereof or supplementary thereto, and federal regulations and guidelines
issued pursuant thereto, provided, that the state board shall request federal funding
under the Federal Water Pollution Control Act for the purpose of carrying out its
responsibilities under this program.

17 (Wat. Code, § 13370, subd. (c), emphasis added.)

18 Additionally, the Porter-Cologne Act mandates that California's NPDES permit program be
19 consistent with federal law. (Wat. Code, § 13372.) Section 2235.2 of title 23 of the California
20 Code of Regulations implements the Act stating that “[w]aste discharge requirements for
21 discharge from point sources to navigable waters shall be issued and administered in accordance
22 with the currently *applicable federal regulations for the National Pollutant Discharge*
23 *Elimination System (NPDES) program.*” (Emphasis added.) While the federal Clean Water Act
24 allows a state to establish more stringent requirements (33 U.S.C. § 1370) and nothing in the
25 Porter-Cologne Act precludes the state from establishing more stringent requirements (*City of*

26 ⁴ The Guide is available at www.epa.gov/npdes/pubs/ms4permit_improvement_guide.pdf.

27 ⁵ Nine regional boards administer the program, overseen by the State Water Resources
28 Control Board. (Wat. Code, §§ 13140, 13200, et. seq.)

1 *Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 627), this case does not
2 involve more stringent requirements than federal law. As explained in detail above, there are
3 numerous federal requirements that the state must comply with in issuing NPDES permits or risk
4 the U.S. EPA taking over California's NPDES program. Among the federal requirements is the
5 mandate that NPDES permits for municipal storm sewers "require controls to reduce the
6 discharge of pollutants to the maximum extent practicable." (33 U.S.C. § 1342(p)(3)(B)(iii).)

7 **III. REGIONAL BOARD ORDER NO. 01-182 (NPDES PERMIT NUMBER CAS004001) AND**
8 **RELATED APPLICATION**

9 Starting in 1990 and pursuant to the Clean Water Act amendments of 1987, the permitting
10 agency, the Regional Board, issued municipal storm water permits to the County of Los Angeles.
11 Prior to the Clean Water Act amendments of 1987 and U.S. EPA's issuance of regulations to
12 implement those amendments, the Regional Board did not regulate the County's storm water
13 discharges under either state or federal law. The permit that is the subject of this litigation is the
14 third permit, Regional Order No. 01-182, NPDES permit number CAS004001, and was adopted
15 on December 13, 2001.⁶ (AR 3495-3576.)

16 Before the above permit was issued, and pursuant to federal law, the County of Los
17 Angeles submitted a permit application to the Regional Board on February 1, 2001.
18 (33 U.S.C. § 1342(b)(2)(B)(3); 40 C.F.R. §§ 122.26(a)(4) [requiring initial application] &
19 122.21(d)(2) [duty to reapply 180 days before prior NPDES permit expired].) This application is
20 entitled "Report of Waste Discharge (ROWD)" and includes a "Stormwater Quality Management
21 Plan (SQMP)." (AR 3663-3794.) The SQMP represents the County of Los Angeles' proposals
22 for best management practices (sometimes referred to as "BMPs") that would ultimately be
23 required in the NPDES permit. The permit that was adopted was based on the SQMP, with some
24 revisions and additions necessary to meet minimum federal requirements. Because both the

25 ⁶ Before the relevant permit was adopted, Los Angeles County discharges were covered
26 under permit number 96-054 issued on July 15, 1995, which served as the NPDES permit for the
27 discharge of municipal storm water. The 1995 permit replaced the previous permit, number 90-
28 079, adopted on June 18, 1990. (AR 3501.) In addition, the State Water Resources Control
Board has issued two general NPDES permits for storm water discharges; one for storm water
from industrial sites, and the other for storm water from construction sites. (AR 3511.)

1 permit and SQMP are voluminous, stating the conditions necessitating the permit and applying
2 the mandatory federal requirements, we have summarized the relevant provisions below.

3 Permit

4 Before addressing the claimed mandates in the permit (i.e., the inspections of certain
5 facilities and the placement and maintenance of trash receptacles at transit stops), there are a few
6 sections of the permit discussing its implementation that are worth noting.

7 The Regional Board made 66-detailed findings concerning the permit's factual and legal
8 basis.⁷ (AR 3500-3519.) Among those findings are general findings about the intent and purpose
9 of the permit, including as it relates to federal law. In section C, Permit Background, the
10 Regional Board found in subsection 4:

11 The Regional Board finds that the Permittees' proposed SQMP, incorporating the
12 additional and/or revised provisions contained in this Order would meet *the minimum*
requirements of federal regulations.

13 (AR 3506, emphasis added.) It further found in section D, Permit Coverage, subsection 4:

14 This permit is intended to develop, achieve, and implement a timely, comprehensive,
15 cost-effective storm water pollution control program to reduce the discharge of
16 pollutants in storm water to the *Maximum Extent Practicable (MEP)* from the
permitted areas in the County of Los Angeles to the waters of the U.S. subject to the
Permittees' jurisdiction.

17 (AR 3507, emphasis added.)

18 Section F, Implementation, provides information concerning the objective of the permit,
19 and its cooperative design and flexibility to meet this objective based on the requirements of
20 federal law. With respect to the objective of the permit, subsection 2 provides:

21 The objective of this Order [the permit] is to protect the beneficial uses of receiving
22 waters in Los Angeles County. To meet this objective, this order requires that the
SQMP specify BMPs that will be implemented to reduce the discharge of pollutants
23 in storm water to the *maximum extent practicable*. Further, Permittees are to assure
24 that storm water discharges from MS4 shall neither cause nor contribute to the
exceedance of water quality standards and objectives nor create conditions of
25 nuisance in the receiving waters, and that the discharge of non-storm water to the
MS4 has been effectively prohibited.

26 (AR 3516, emphasis added.)

27 ⁷ The number of findings reflected in the administrative record is higher because of
28 subsequent amendments not germane to the test claim.

1 Subsection 3, speaks to the continued cooperative design of the permit as follows:

2 The SQMP required in this Order builds upon the programs established in Order Nos.
3 90-079, and 96-054 [prior permits], consists of the components recommended in the
4 USEPA guidance manual, and was developed with the cooperation of representatives
5 from the regulated community and environmental groups. The SQMP includes
6 provisions that promote customized initiatives, both on a countywide and watershed
7 basis, in developing and implementing cost-effective measures to minimize discharge
8 of pollutants to the receiving water. The various components of the SQMP, taken as
9 a whole rather than individually, are expected to reduce pollutants in storm water
10 and urban runoff to the *maximum extent practicable*. Provisions of the SQMP are
11 fully enforceable under provision of this Order.

12 (AR 3517, emphasis added.)

13 Subsection 4 gives the County of Los Angeles the flexibility to substitute another best
14 management practice. It states:

15 This Order provides flexibility for Permittees to petition the Regional Board
16 Executive Officer to substitute a BMP, if they can provide information and
17 documentation on the effectiveness of the alternative, equal to or greater than the
18 prescribed BMP in meeting the objectives of this Order.

19 (AR 3517.)

20 Part 4, Special Provisions, of the permit contains the claimed mandated activities relevant
21 to this litigation. (AR 3531-3536.) Specifically, these provisions pertain to the inspections of
22 commercial and industrial facilities, containment of runoff at construction sites, and the
23 placement and maintenance of trash receptacles at transit stops.

24 Subsection C of Part 4, Industrial/Commercial Facilities Control Program, subdivision 2a,
25 Inspect Critical Sources, pertains to inspections at commercial facilities, including restaurants,
26 automotive service facilities, and retail gasoline outlets, and automotive dealerships. While each
27 commercial property has unique inspection requirements tailored to its business activity, the
28 permit requires that all facilities are inspected on a regular basis, twice during the 5-year permit
29 period, to confirm that BMPs are being effectively implemented in compliance with the law.
30 (AR 3533-3535.) Similarly, subdivision 2b requires the inspection of certain industrial facilities
31 referred to in the permit as Phase 1 Facilities. (AR 3535-3536.)

32 Subsection E of Part 4, Development Construction Program, provides that “[e]ach
33 Permittee shall implement a program to control runoff from construction activity to storm drains

1 at all construction sites within its jurisdiction.” (AR 3546.) This generally includes
2 implementing BMPs related to the control and containment of construction-related materials,
3 waste, and erosion, as well as the inspection of construction sites and related employee training.
4 (AR 3546-3549.)

5 Subsection F of Part 4, Public Agency Activities Program, subdivision c3, requires that
6 trash receptacles be placed at all transit stops within the Permittee’s jurisdiction and that they be
7 maintained as necessary.

8 Buttressing the Regional Board’s findings, Part 4 reiterates that the permit is intended to
9 reduce the discharge of pollutants in storm water in the County of Los Angeles to the maximum
10 extent practicable under the Clean Water Act. (AR 3527.) It states:

11 This permit, and the provisions herein, are intended to develop, achieve, and
12 implement a timely, comprehensive, cost-effective storm water pollution control
13 program to reduce the discharge of pollutants in storm water to the MEP [maximum
14 extent practicable] from the permitted areas in the County of Los Angeles to the
15 waters of the State.

16 (AR 3527.) The maximum extent practicable standard is defined in the permit to mean: “the
17 standard for implementation of storm water management programs to reduce pollutants in storm
18 water” under the Clean Water Act. (AR 3561-3562.)

19 SQMP

20 Part 4, Special Provisions, includes management practices proposed by the County of Los
21 Angeles in its SQMP as well as additional management practices added by the Regional Board to
22 achieve the maximum extent practicable reduction required by the Clean Water Act. The SQMP
23 must include several proposed best management practices that relate to the inspections of
24 commercial and industrial facilities and the placement and maintenance of trash receptacles.
25 (AR 3670-3675.)

26 Subsection A2 of Part 4, Programs for Industrial/Commercial Businesses, subdivision b,
27 states that “Permittees shall visit automotive services and food service facilities as outlined in the
28 SQMP in its jurisdiction once every two years. During site visits, Permittees shall: [¶] i. Consult
with a representative of the facility to explain applicable stormwater regulations; [¶] ii. Distribute

1 and discuss applicable BMP and educational materials; and, [¶] iii. Conduct a site walk-through
2 to verify for, at a minimum, evidence of BMP implementation.” (AR 3671.)

3 Subdivision c states that “Permittees shall revisit automotive and food service facilities
4 where evidence of illicit discharge is found within six months of the date of the initial visit.”
5 (AR 3671.)

6 Subdivision e provides that “Permittees shall provide an annual update to the visited
7 automotive service, food service, and other target facilities to the Regional Board in the annual
8 report. The database shall include at a minimum; facility name, site address, applicable Standard
9 Industrial Classification (SIC) codes(s), and NPDES stormwater permit coverage.” (AR 3671.)

10 Subsection C of Part 4, Programs for Development Construction, is extensive and includes
11 detailed requirements to prevent runoff from constructions sites into nearby waters. (AR 3672-
12 3674.) As above with the permit, these requirements include implementing best management
13 practices relate to the control and containment of construction-related materials, waste, and
14 erosion, as well as the inspection of construction sites and related employee training. (AR 3672-
15 3674.)

16 The Executive Summary addresses the removal of trash and other pollutants transported in
17 runoff to the storm drain system from landscape and recreational facilities. (AR 3677.) “The
18 goal of the program for landscape and recreational facilities management is to make the storm
19 water quality a consideration when conducting operation and maintenance activities.” (AR 3677.)
20 This includes minimizing trash from entering recreational water bodies, removing trash from
21 open channels, and controlling litter and debris in the streets. (AR 3677-3578.) Also, under
22 subsection D of Part 4, “Permittees shall conduct trash collection along, or in improved open
23 channels within their jurisdiction” and are encouraged to establish other voluntary programs for
24 trash collection in natural stream channels. (AR 3675.)

25 **IV. PRINCIPLES OF SUBVENTION AS IT PERTAINS TO FEDERAL LAW**

26 “In 1972, and again in 1973, the Legislature enacted comprehensive schemes for local
27 property tax relief. Though frequently amended thereafter, these statutes retained three principal
28 features. First, they placed a limit on the local property tax rate. Second, they required the state

1 to reimburse local governments for their costs resulting from state laws ‘which mandate ... new
2 program[s] or ... increased level[s] of service’ at the local level. Finally, they allowed local
3 governments to exceed their property taxation limits to fund certain other nondiscretionary
4 expenses, including ‘costs mandated by the federal government.’” (*City of Sacramento v. State of*
5 *California* (1990) 50 Cal.3d 51, 57 -58.)

6 In November 1979, the voters adopted Proposition 4, adding article XIII B to the state
7 Constitution. “Article XIII B - the so-called “Gann limit” - restricts the amounts state and local
8 governments may appropriate and spend each year from the ‘proceeds of taxes’ [citations
9 omitted].” (*City of Sacramento, supra*, 50 Cal.3d at pp. 57 -58.) Section 6 of article XIII B calls
10 for state subvention by requiring the state to pay for any new governmental programs, or for
11 higher levels of service under existing programs, that it imposes upon local governmental
12 agencies. (*County of Los Angeles v. State of California* (1987) 43 Cal.3d 46, 56.) “[M]andatory
13 state subventions are excluded from the local agency’s spending limit, but included within the
14 state’s.” (*City of Sacramento, supra*, 50 Cal.3d at p. 59.) This does not mean that the state is
15 required to reimburse local agencies for all incidental costs that may result from the enactment of
16 a state law. Rather, the subvention requirement is restricted to governmental services which the
17 local agency is required to provide by state law as opposed to federal law. (*Id.* at p. 76.)

18 Article XIII B, section 6 of the California Constitution and Government Code section
19 17514, provide for the reimbursement of local government’s costs of carrying out new programs
20 or higher levels of service that are mandated by the State. Article XIII B, section 6 provides, in
21 part, as follows:

22 Whenever the Legislature or any state agency mandates a new program or higher
23 level of service on any local government, the state shall provide a subvention of funds
24 to reimburse such local government for the costs of such program or increased level
of service. . . .

25 (Cal. Const., art. XIII B, § 6.)

26 ///

27 ///

28 ///

1 Government Code section 17514 defines “[c]osts mandated by the state” to mean:

2 . . . any increased costs which a local agency or school district is required to incur
3 after July 1, 1980, as a result of any statute enacted on or after January 1, 1975, or any
4 executive order implementing any statute enacted on or after January 1, 1975, which
5 mandates a new program or higher level of service of an existing program within the
6 meaning of Section 6 of Article XIII B of the California Constitution.

7 But constitutional subvention is not required when the costs implement federal law. Article
8 XIII B, section 9, subdivision (b), excludes from the state or local spending limit any
9 “appropriations required for purposes of complying with mandates of the ... federal government.”
10 As the California Supreme Court stated recently, “article XIII B, section 6, and the implementing
11 statutes ... provide for reimbursement only of state-mandated costs, not federally mandated costs.”
12 (*San Diego Unified School Dist. v. Commission on State Mandates* (2004) 33 Cal. 4th 859, 880.)

13 This constitutional prohibition against providing state reimbursement for activities imposed
14 by federal law is specifically spelled out in Government Code section 17556, subdivision (c).
15 (*Redevelopment Agency of the City of San Marcos v. Commission on State Mandates* (1996)
16 55 Cal. App. 4th 976, 984 [article XIII B, section 6 creates “several classes of state-mandated
17 programs for which no state reimbursement of local agencies is required”].) Subdivision (c)
18 states that the Commission shall not find “costs mandated by the state” if “[t]he statute or
19 executive order imposes a requirement that is mandated by a federal law or regulation and results
20 in costs mandated by the federal government, unless the statute or executive order mandates costs
21 that exceed the mandate in that federal law or regulation.” Section 17514 defines “costs
22 mandated by the federal government” to mean, in relevant part “. . . any increased costs incurred
23 by a local agency or school district after January 1, 1973, in order to comply with the
24 requirements of a federal statute or regulation.”

25 **V. OVERVIEW OF THE COMMISSION ON STATE MANDATES**

26 The Commission is a quasi-judicial agency vested with the sole and exclusive authority to
27 adjudicate all disputes over the existence and reimbursement of state-mandated programs within
28 the meaning of article XIII B, section 6 of the California Constitution. (*Kinlaw v. State of
California* (1991) 54 Cal.3d 326; Gov. Code, §§ 17551, 17552.)

1 Local agencies and school districts file claims with the Commission for reimbursement of
2 state-mandated costs under article XIII B, section 6. (Gov. Code, §§ 17551, 17560.) The first
3 claim filed by a local agency or school district alleging that a statute or an executive order
4 imposes a reimbursable state-mandated program is a “test claim.” (Gov. Code, § 17521.) A
5 public hearing is held on the test claim, at which time evidence may be presented by the claimant,
6 the Department of Finance, any other state department or agency affected by the claim, and any
7 interested organization or individual. (Gov. Code, § 17555.)

8 The Commission must first determine if a state-mandated program exists. (Gov. Code,
9 § 17551.) If so, the Commission adopts parameters and guidelines for the reimbursement of
10 claims submitted by eligible claimants. (Gov. Code, § 17557, subd. (a).) The Commission
11 submits the adopted parameters and guidelines to the Controller, and the Controller issues
12 claiming instructions for each mandate that requires reimbursement. (Gov. Code, § 17558, subds.
13 (a),(c).) Judicial review of a final Commission decision is available through a petition for writ of
14 mandate filed pursuant to Code of Civil Procedure section 1094.5. (Gov. Code, § 17559.)

15 **VI. SUMMARY OF THE COMMISSION’S DECISION**

16 The County of Los Angeles filed multiple test claims alleging “various activities related to
17 placement and maintenance of trash receptacles at transit stops and inspection of restaurants,
18 automotive service facilities, retail gasoline outlets, automotive dealerships, phase I industrial
19 facilities (as defined) and construction sites to reduce stormwater pollution in compliance with a
20 permit issued by the Los Angeles Regional Water Quality Control Board, a state agency.”
21 (AR 5557.) The test claims were consolidated by the Commission, and the Commission
22 “originally refused jurisdiction over the permits based on Government Code section 17516’s
23 definition of ‘executive order’ that excluded permits issued by the State Water Resources Control
24 Board” and regional boards. (AR 5557.) In the *County of Los Angeles v. Commission on State*
25 *Mandates* (2007) 150 Cal.App.4th 898, the court found that this part of 17516 excluding permits
26 issued by the state water boards from the definition of “executive order” was unconstitutional.
27 The court issued a writ directing the Commission to set aside its decision rejecting the test claims
28 and to consider the claims on their merits. (AR 5557.)

1 The Commission found that the permit requirement related to the placement and
2 maintenance of trash receptacles at transit stops was a reimbursable state mandate. However,
3 with respect to the other permit requirements related to inspections of commercial and industrial
4 facilities and pollution containment at construction sites, the Commission found that these
5 requirements did not impose costs mandated by the state within the meaning of article XIII B,
6 section 6, because the claimants have fee authority sufficient to pay for the permit requirements.
7 (AR 5625.)

8 The Commission's statement of decision is lengthy and can be found in the administrative
9 record at pages 5555-5625. This case does not address the entire statement of decision but only
10 two parts:

- 11 (1) The Commission's findings that the claimed activities are not federal mandates. (AR
12 5576-5602; Petition for Writ of Administrative Mandate ("Pet.") ¶ 33, subsections (a)-
13 (g).)
- 14 (2) The Commission's findings that the permit activities impose new programs or higher
15 level of services on the County of Los Angeles. (AR 5603-5604; ¶ 34, subsections (a)-
16 (b).)

17 With respect to the federal mandate findings, the Commission's analysis is long but is
18 based primarily on the theory that the specific permit activities are not federal mandates because
19 they go beyond the requirements of the Clean Water Act. (AR 5578, 5584, 5591, 5595, 5601.)
20 The findings that the permit activities are new programs or higher level of services are based on
21 the assertion that the activities were not contained in prior permits issued to the County of Los
22 Angeles and that the activities were only imposed on local agencies and not the general public.
23 (AR 5603-5604.)

24 STANDARD OF REVIEW

25 Pursuant to Government Code section 17559, subdivision (b), a proceeding may be brought
26 under Code of Civil Procedure section 1094.5 "to set aside a decision of the commission on the
27 ground that the commission's decision is not supported by substantial evidence." Code of Civil
28 Procedure section 1094.5, in turn, provides that the court's inquiry "shall extend to the questions

1 whether the respondent has proceeded without, or in excess of jurisdiction; whether there was a
2 fair trial; and whether there was any prejudicial abuse of discretion. Abuse of discretion is
3 established if the respondent has not proceeded in the manner required by law, the order or
4 decision is not supported by the findings, or the findings are not supported by the evidence.”

5 The review of the Commission’s factual determinations proceeds under the substantial
6 evidence test. (*City of Richmond v. Commission on State Mandates* (1998) 64 Cal.App.4th 1190,
7 1194-95.) Where the substantial evidence test applies, the court is under a duty to see that
8 findings are legally relevant as well as supported by the evidence in order to support agency
9 action. (*City and County of San Francisco v. Board of Permit Appeals* (1989) 207 Cal.App.3d
10 1099, 1110.) Substantial evidence review also includes a duty to determine whether the agency
11 committed errors of law in applying the facts before it. (*Id.* at p. 1111.) Whether a statute creates
12 a reimbursable state mandate is a pure question of law. (*Connell v. Superior Court* (1997)
13 59 Cal.App.4th 382, 395.) Questions of law are subject to de novo review. (*City of Richmond*,
14 *supra*, 64 Cal.App.4th at p. 1105.)

15 LEGAL ANALYSIS

16 I. THE PERMIT IS A FEDERAL MANDATE AND NOT SUBJECT TO REIMBURSEMENT 17 UNDER ARTICLE XIII B, SECTION 6, OF THE CALIFORNIA CONSTITUTION.

18 The California Constitution is clear that state subvention is not required when the federal
19 government imposes new costs on local governments. (Cal. Const., art. XIII B, § 9, subd. (b);
20 Gov. Code, §§ 17556, subd. (c), 17514.) There is a two-step process to determine whether a
21 program is mandated by federal law and thus not subject to state subvention. First, did the state
22 have “no real choice in deciding whether to comply with the federal act.” (*Hayes v. Commission*
23 *on State Mandates*, 11 Cal.App.4th 1594, 1594.) Second, did the program exceed the
24 requirements of federal law. (Gov. Code, § 17556; *San Diego Unified School Dist, supra*, 33
25 Cal.4th at p. 880.) As explained below, the answer to both of these questions shows that the
26 permit is a federal mandate and not subject to state subvention.

27 //

28 //

1 **II. CALIFORNIA’S ADMINISTRATION OF THE NPDES PERMIT PROGRAM DOES NOT**
2 **TRANSFORM CLEAN WATER ACT REQUIREMENTS INTO A STATE MANDATE.**

3 “The test for determining whether there is a federal mandate is whether compliance with
4 federal standards ‘is a matter of true choice,’ that is, whether participation in the federal program
5 ‘is truly voluntary.’” (*City of Sacramento, supra*, 50 Cal.3d at p. 76.) A federal mandate exists,
6 even if “the state has adopted an implementing statute or regulation pursuant to the federal
7 mandate so long as the state had no ‘true choice’ in the manner of implementation of the federal
8 mandate.” (*Hayes, supra*, 11 Cal.App.4th at p. 1593.) But “[t]his reasoning would not hold true
9 where the manner of implementation of the federal program was left to the true discretion of the
10 state.” (*Ibid.*)

11 In *City of Sacramento, supra*, the state extended mandatory coverage under the state’s
12 unemployment insurance law to local governments and others. (50 Cal.3d 51.) The lower court
13 and the Court of Appeal found that the program was not so coercive as to constitute a federal
14 mandate, even though failure to implement the law would result in the potential loss of federal
15 funds and tax credits. (*Id.* at pp. 59 -60.) The California Supreme Court reversed, explaining that
16 “the drafters and adopters of article XIII B must have understood [that] certain regulatory
17 standards imposed by the federal government under ‘cooperative federalism’ schemes are
18 coercive on the states and localities in every practical sense.” (*Id.* at pp. 73-74.) Thus, federal
19 mandates are not limited to programs or activities resulting from “strict legal compulsion by the
20 federal government.” (*Id.* at p. 73.) Moreover, there is “no final test for ‘mandatory’ versus
21 ‘optional’ compliance with federal law.” (*Id.* at p. 76.) Rather, the standard is flexible and
22 depends on a number of factors such as “as the nature and purpose of the federal program;
23 whether its design suggests an intent to coerce; when state and/or local participation began; the
24 penalties, if any, assessed for withdrawal or refusal to participate or comply; and any other legal
25 and practical consequences of nonparticipation, noncompliance, or withdrawal.” (*Ibid.*)

26 The NPDES program is not optional; it is coercive on the states and localities in every legal
27 and practical sense. The Commission did not find otherwise. Instead, the Commission found that
28 because California “voluntarily adopts the [NPDES] permitting program” and because federal law

1 “does not expressly require states to have *this* program, the state has freely chosen to effect the
2 stormwater permit program.” (AR 5581, emphasis added.) What the Commission overlooked is
3 that given the complex, coordinated, and interactive nature of the rules governing federal, state,
4 and local agencies under the Clean Water Act, California had little practical choice.

5 Initially, the Commission’s analysis distorts the holdings of *Hayes* and *City of Sacramento*.
6 Regardless of whether the state or the U.S. EPA issues an NPDES permit, the permit was not
7 voluntary. (*City of Sacramento, supra*, 50 Cal.3d at p. 76.) The federal Clean Water Act requires
8 the County of Los Angeles to have an NPDES permit for municipal storm water discharges and
9 compels those permits to reduce the discharge of pollutants to the maximum extent practicable.
10 Neither the state nor the County of Los Angeles has a true choice in the permit or the requirement
11 to reduce pollutants to the maximum extent practicable. (*City of Sacramento, supra*, 50 Cal.3d at
12 p. 76.) Further, unlike the situation discussed in *Hayes*, the state is not “shift[ing] state costs to
13 local agencies,” but instead the federal municipal storm water program requires the County of Los
14 Angeles to obtain an NPDES permit that reduces pollutants to the maximum extent practicable.
15 (Cf. *Hayes, supra*, 11 Cal.App.4th at p. 1593.)⁸

16 California administers the NPDES program to follow federal requirements as closely as
17 possible. For example, the federally required permit process starts with the discharger submitting
18 a proposed application to the permitting authority, which must comply with all federal
19 requirements, including effluent limitations, national standards of performance, and toxic and
20 pretreatment effluent standards. (33 U.S.C. §§ 1342 (b)(1), 1311, 1312, 1316, 1317.) And
21 Federal law requires that the U.S. EPA be provided with the proposed permit and notice of any
22 action related to the same, such as a hearing on the proposed requirements.

23 ⁸ By way of contrast, the federal definition of municipal separate storm sewer system also
24 requires state agencies, such as CalTrans to obtain a municipal storm water permit for their
25 separate storm sewer discharges. (40 C.F.R. § 122.26(b)(8).) The State Water Resources Control
26 Board issues a municipal storm water permit to CalTrans for all of its storm sewers subject to the
27 Clean Water Act. (State Board Order No. 99-06-DWQ available at:
28 http://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/caltrans/caltranspmt.pdf.)
Hayes and *City of Sacramento* would yield the result sought by the County of Los Angeles, if the
state freely choose to either (1) require the County to administer the NPDES program (something
the state does), or (2) require the County to implement the CalTrans permit (something the state
does).

1 (33 U.S.C. § 1342(d)(1).) The U.S. EPA may object to a permit and find that it is inconsistent
2 with federal law. (*Id.*, § 1342(d)(2).) This type of finding could result in the U.S. EPA
3 determining that a state program does not comply with federal NPDES program guidelines and
4 could be a reason for the U.S. EPA to withdraw approval for the state program. (*Id.*,
5 § 1342(c)(3).)

6 These federal laws would mandate NPDES permitting even if California took no action at
7 all. Furthermore, if California did not administer its own water quality program through the
8 Porter-Cologne Act, California's dischargers, both private and governmental, would still have to
9 comply with federal law, but would also be subject to direct regulation from the federal
10 government. This result would be directly contrary to the intent of the California Legislature. As
11 explained by the Legislature: "It is in the interest of the people of the state, in order *to avoid*
12 *direct regulation by the federal government* of persons already subject to regulation under state
13 law pursuant to this division, to enact this chapter in order to authorize the state *to implement the*
14 *provisions of the Federal Water Pollution Control Act* [Clean Water Act]." (Wat. Code, § 13370,
15 subd. (c), emphasis added.) The lack of any practical alternative explains why 46 of the 50 states,
16 including California, have implemented the Clean Water Act by creating a program to issue
17 NPDES permits.

18 The California Supreme Court has rejected the Commission's narrow analysis that a state
19 mandate exists when a state enacts its own laws consistent with federal law. In *City of*
20 *Sacramento, supra*, the Supreme Court found that the joint federal-state operation of a system of
21 unemployment compensation was not a state-mandate, but a federal mandate. (50 Cal.3d at
22 pp. 75-76.) The Court rejected the idea that "California could have chosen to terminate its own
23 unemployment insurance system, thus leaving the state's employers faced only with the federal
24 tax." (*Id.* at p. 74.) The Court stated that "we cannot imagine the drafters and adopters of article
25 XIII B intended to force the state to such draconian ends." (*Ibid.*) The Court explained that "the
26 state simply did what was necessary to avoid certain and severe federal penalties upon its resident
27 businesses. The alternatives were so far beyond the realm of practical reality that they left the
28 state 'without discretion' to depart from federal standards." (*Ibid.*)

1 Thus, under *City of Sacramento*, a federal mandate exists where the federal government
2 leaves the state with little or no practical choice. The Commission's analysis eviscerates that rule.
3 Under the Commission's analysis, a state mandate would exist anytime federal law gives the state
4 any options at all.

5 Since the state has no true choice but to comply with the Clean Water Act in issuing
6 NPDES permits, such permits are based on federal requirements and are not state mandates. The
7 Commission's decision holding to the contrary was erroneous and should be reversed.

8 **III. THE NPDES PERMIT DOES NOT GO BEYOND THE REQUIREMENTS OF THE CLEAN**
9 **WATER ACT.**

10 The second part of the analysis in determining if a program is a state mandate versus a
11 federal mandate focuses on whether the program goes beyond the requirements of federal law.
12 Government Code section 17556, subsection (c), states that the Commission shall not find "costs
13 mandated by the state" if "[t]he statute or executive order imposes a requirement that is mandated
14 by a federal law or regulation and results in costs mandated by the federal government, unless the
15 statute or executive order mandates costs that exceed the mandate in that federal law or
16 regulation." (*San Diego Unified School Dist.*, *supra*, 33 Cal.4th at p. 880.) As explained below,
17 the permit in question does not exceed the applicable federal standard.

18 **A. The Clean Water Act Required the Regional Board to Specify the Permit's**
19 **Pollutant Reduction Requirements.**

20 The Clean Water Act prohibits the County of Los Angeles from discharging pollutants from
21 its MS4 unless it does so through an NPDES permit. And under the Clean Water Act, the permit
22 must include "controls to reduce the discharge of pollutants to the *maximum extent practicable*,
23 including management practices, control techniques and system, design and engineering methods,
24 and such other provisions as the Administrator or the State determines appropriate for the control
25 of such pollutants." (33 U.S.C. § 1342(p)(3)(B), *emphasis added*.)

26 "The permitting agency has discretion to decide what practices, techniques, methods and
27 other provisions are appropriate and necessary to control the discharge of pollutants [citation
28 omitted]." (*City of Rancho Cucamonga v. Regional Water Quality Control Bd.-Santa Ana Region*

1 (2006) 135 Cal.App.4th 1377, 1389.) However, the “Regional Board must comply with federal
2 law requiring detailed conditions for NPDES permits.” (*Ibid.*) Further, it is the unique nature of
3 the federal municipal storm water program that the U.S. EPA expects individual permit writers to
4 develop the practices that reflect the maximum extent practicable standard on a permit-by-permit
5 basis. (*Natural Resources Defense Council, Inc. v. U.S. E.P.A.*, *supra*, 966 F.2d at p. 1308, n. 17;
6 see also, 55 Fed.Reg. 47990, 48043.)

7 The NPDES permit that was actually issued to the County of Los Angeles is the best
8 measure of what is required to comply with the maximum extent practicable standard. Consistent
9 with federal law, the permit makes clear that it is intended to reduce the discharge of pollutants in
10 storm water in the County of Los Angeles to the maximum extent practicable under the Clean
11 Water Act. (AR 3527.) The permit states:

12 This permit, and the provisions herein, are intended to develop, achieve, and
13 implement a timely, comprehensive, cost-effective storm water pollution control
14 program to reduce the discharge of pollutants in storm water to the MEP [maximum
extent practicable] from the permitted areas in the County of Los Angeles to the
waters of the State.

15 (AR 3527.) The maximum extent practicable standard is defined in the permit to mean: “the
16 standard for implementation of storm water management programs to reduce pollutants in storm
17 water” under the Clean Water Act. (AR 3561-3562.)

18 The permit requirements, “taken as a whole rather than individually, are expected to reduce
19 pollutants in storm water and urban runoff to the maximum extent practicable.” (AR 3517.) The
20 permit is designed “to protect the beneficial uses of receiving waters in Los Angeles County”
21 through best management practices established by the County of Los Angeles, again “to reduce
22 the discharge of pollutants in storm water to the maximum extent practicable.” (AR 3516.) The
23 permit provides the County of Los Angeles the flexibility to substitute another best management
24 practice, “if it can provide information and documentation on the effectiveness of the alternative,
25 equal to or greater than the prescribed” practice in meeting the objectives of the permit.

26 (AR 3517.)

27 ///

28 ///

1 **B. The Regional Board's Findings and Conclusions as to Implementing the**
2 **Federal Requirements Have Already Been Litigated and the Regional**
3 **Board Prevailed.**

4 The foregoing findings that the permit reflects the maximum extent practicable standard are
5 not idle ruminations from an administrative agency. Instead, those findings and requirements are
6 the expert conclusions of the principal state agency charged with implementing the NPDES
7 program in Los Angeles. (Wat. Code, §§ 13001, 13200.) Courts have recognized that the
8 regional boards are entitled to considerable deference on the statutes they implement, especially
9 in the area of storm water regulation. (*County of Los Angeles v. California State Water*
10 *Resources Control Bd.* (2006) 143 Cal.App.4th 985, 997 [“we defer to the regional board’s
11 expertise in construing language which is not clearly defined in statutes involving pollutant
12 discharge into storm drain sewer systems”]; *City of Rancho Cucamonga, supra*, 135 Cal.App.4th
13 at p. 1384; *Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at p. 879.)

14 Importantly, the Regional Board’s findings concerning, and requirements implementing; the
15 Clean Water Act’s maximum extent practicable standard have been already been upheld by the
16 courts. (Statement of Decision From Phase I Trial on Petitions for Writ of Mandate (Mar. 24,
17 2005), *In Re Los Angeles County Municipal Storm Water Permit Litigation*, Los Angeles County
18 Super. Ct., Lead Case No. BS080548⁹ affirmed by *County of Los Angeles v. California State*
19 *Water Resources Control Bd., supra*, 143 Cal.App.4th 985, attached as Exhibit A to Petitioners’
20 Request for Judicial Notice.) The County of Los Angeles, along with the other test claimants,
21 was party to that litigation. The court’s finding that the permit taken as a whole reflects the
22 maximum extent practicable standard is entitled to preclusive effect on whether or not the permit
23 exceeds the requirements of federal law. (*Y.K.A. Industries, Inc. v. Redevelopment Agency of City*

24 ⁹ The Court found:

25 As noted, *even if the* Permit did exceed the MEP standard, the Regional Board was
26 within its authority in requiring more stringent standards. *However*, the Court finds
27 that the administrative record contains significant evidence showing that the terms of
28 the Permit taken, as a whole, constitute the Regional Board’s definition of MEP,
 including, but not limited to, the challenged Permit provisions.

(Statement of Decision at 7:25-8:2, emphasis added.)

1 of *San Jose* (2009) 174 Cal.App.4th 339, 356.) The Regional Board made quasi-judicial findings
2 that the permit reflected the Clean Water Act's maximum extent practicable requirements;
3 permittees challenged that permit and those findings; and a trial court and court of appeal rejected
4 the permittees' arguments and upheld the permit. At the County's behest, the Commission cannot
5 disregard the Regional Board's conclusions and find that the permit exceeds the federal
6 requirements.

7 **C. Regardless of the Prior Litigation, the Commission Incorrectly Construed**
8 **the Nature of the Federal Mandate.**

9 Congress established the maximum extent practicable standard because municipal storm
10 water runoff, unlike other pollutant discharges, could not be adequately addressed by blanket
11 effluent limitations. (*Building Industry Ass'n of San Diego County, supra*, 124 Cal.App.4th at
12 p. 884.) Numeric effluent limitations may be infeasible and administratively burdensome when
13 addressing municipal urban storm water runoff due to the physical difference between runoff and
14 other pollutants. (*Ibid.*) Congress determined that the maximum extent practicable standard is a
15 "necessary and workable enforcement mechanism to achieving the goals of the Clean Water Act."
16 (*Ibid.*)

17 Rather than addressing whether the NPDES permit exceeded the maximum extent
18 practicable standard imposed by federal law, the Commission's analysis ignored that standard
19 altogether. Instead, the Commission looked only to whether federal law required the particular
20 measures specified in the County of Los Angeles' permit. However, the Clean Water Act's
21 NPDES permit system requires states to develop standards based on the unique conditions of
22 particular waterways. Thus, the maximum extent practicable standard is necessarily flexible,
23 rather than a one-size-fits-all standard. (*Building Industry Ass'n of San Diego County, supra*,
24 124 Cal.App.4th at p. 874 .) The Commission's analysis erroneously assumes that whenever the
25 federal government imposes a standard that is flexible, there can be no federal mandate, and any
26 act taken by the state to implement the flexible federal standard is a state mandate. The law is
27 otherwise.
28

1 While the Commission may be considered an expert in mandates law, it is certainly not an
2 expert in applying and interpreting the Clean Water Act. The court should defer to the Regional
3 Board's determination that the permit is consistent with the maximum extent practicable standard.
4 (*Divers' Environmental Conservation Organization v. State Water Resources Control Bd.* (2006)
5 145 Cal.App.4th 246, 252 [courts must defer to an administrative agency's interpretation of a
6 statute or regulation involving its area of expertise]; see also *ante*, pp. 22-23 [discussing prior
7 litigation].)

8 Finally, the Commission's reliance on *Long Beach School Dist. v. State of California* (1990)
9 225 Cal.App.3d 155 is misplaced. In *Long Beach*, the court considered whether a state executive
10 order involving school desegregation constituted a state mandate. The court held that the
11 executive order required school districts to provide a higher level of service than required by the
12 federal constitution or case law because state requirements went beyond federal requirements. (*Id.*
13 at p. 173.) This reasoning was based on the absence of any federal law that specified how the
14 schools should implement their desegregation plans. (*Ibid*) Here, there is federal applicable law,
15 the maximum extent practicable standard, that directly applies to the County of Los Angeles.
16 Moreover, the U.S. EPA has provided substantial guidance on how that federal law is to be
17 implemented and specifically required NPDES permitting agencies to specify in NPDES permits
18 the controls necessary to implement the federal standard. (40 C.F.R. § 122.26; *Natural Resources*
19 *Defense Council, Inc. v. U.S. E.P.A.*, *supra*, 966 F.2d at p. 1308, n. 17; see also,
20 55 Fed.Reg. 47990, 48043.)

21 The same is true in *San Diego Unified School Dist.*, *supra*, where the Supreme Court found
22 that the state law exceeded federal due process requirements, because the state law required
23 expulsion recommendations or expulsion for firearm possession beyond federal law.
24 (33 Cal.4th at p. 880.)

25 Based on the foregoing, it is clear that the maximum extent practicable standard is imposed
26 on the County of Los Angeles under federal statute -- the Clean Water Act -- and the permit
27 issued pursuant to it is thus not reimbursable under article XIII B, section 6. The Commission
28 decision in this regard should be reversed.

1 **IV. THE CLAIMED ACTIVITIES DO NOT EXCEED THE MAXIMUM EXTENT PRACTICABLE**
2 **STANDARD.**

3 **A. Placement and Inspection of Trash Receptacles**

4 The trash receptacle requirement in the permit is within the scope of the maximum extent
5 practicable standard imposed on the County of Los Angeles under the Clean Water Act, and the
6 Commission has not cited any contradicting evidence. Instead, the Commission claims that
7 because the trash requirement is not expressly found in federal law, it must somehow exceed the
8 maximum extent practicable standard. (AR 5584-5586.) However, as explained above, the
9 maximum extent practicable standard requires flexible, best management practices, to eliminate
10 or reduce the discharge of pollutants in storm water or runoff through MS4.
11 (33 U.S.C. § 1342(p)(3)(B).) The Clean Water Act need not mention trash cans specifically to
12 mandate their use under the maximum extent practicable standard.

13 If litter and debris are left to pile up at transit stops, the downstream effect is the
14 introduction of pollutants into the MS4 or drain systems, leading to the discharges of pollutants in
15 the nearby waterways. The Regional Board reached this conclusion in its quasi-judicial
16 permitting proceeding, specifically finding that the permit requirements, taken as a whole, reflect
17 the maximum extent practicable standard. (AR 3506-3507, 3516-3516.) Without question, the
18 placement and maintenance of trash receptacles at transit stops will help prevent this known
19 source of pollutants from escaping into the water. To claim otherwise defies common sense. The
20 trash receptacles activity is an obvious remedy for the problem. (*Building Industry Ass'n of San*
21 *Diego County, supra*, 124 Cal.App.4th at p. 889 [“practicable does not necessarily mean the most
22 that can possibly be done”].) And, as discussed above, it is not the Commission’s place to
23 determine what activities meet the maximum extent practicable standard. That expertise lies with
24 the Regional Board. (*County of Los Angeles v. California State Water Resources Control Bd.*,
25 *supra*, 143 Cal.App.4th at p. 997; *Divers’ Environmental Conservation Organization, supra*,
26 145 Cal.App.4th at p. 252.)

27 The management practices required under federal law include “practices for operating and
28 maintaining public streets, roads and highways and procedures for reducing the impact on

1 receiving waters of discharges from municipal storm sewer systems,”
2 (40 C.F.R. § 122.26 (d)(2)(iv)(A)(3).) The County has implicitly conceded that the Clean Water
3 Act requires that steps be taken to keep trash out of our waterways. In fact, the County of Los
4 Angeles’ own proposal or permit application recommended minimizing trash from entering
5 recreational water bodies, removing trash from open channels, and controlling litter and debris in
6 the streets. (AR 3677-3578.) It also suggested conducting trash collection along, or in improved
7 open channels, and encouraged establishing voluntary programs for trash collection in natural
8 stream channels. (AR 3675.)

9 The *County of Los Angeles v. Commission on State Mandates* (1995) 32 Cal.App.4th 805
10 presented similar circumstances regarding the effect of federal law on local government. In that
11 case, the county asserted that funds expended under Penal Code section 987.9, which required
12 counties to provide indigent criminal defendants with defense funds for ancillary investigation
13 services, constituted a reimbursable state mandates. The Court of Appeal disagreed, finding
14 instead that the Penal Code section merely implements the requirements of federal constitutional
15 law, and that “even in the absence of [Penal Code] section 987.9, ... counties would be
16 responsible for providing ancillary services under the constitutional guarantees of due process ...
17 and under the Sixth Amendment...” (*Id.* at p. 815.)

18 Since the trash receptacle requirement in the permit is within the maximum extent
19 practicable standard under the Clean Water Act, it is imposed on the County of Los Angeles by
20 federal law, not state law, and is not subject to reimbursement under article XIII B, section 6 of
21 the California Constitution.

22 **B. The other claimed permit requirements are also imposed on the County of**
23 **Los Angeles under federal law and thus not subject to state subvention.**

24 The remaining claimed permit activities relate to the inspection of certain commercial and
25 industrial facilities and construction sites. Many of the above arguments with respect to trash
26 receptacles apply equally to these activities. Thus, these remaining activities can be addressed in
27 summary fashion.

1 Inspections of Commercial Facilities

2 This portion of the permit pertains to inspections of commercial facilities, including
3 restaurants, automotive service facilities, and retail gasoline outlets, and automotive dealerships.
4 While each commercial property has unique inspection requirements tailored to its business
5 activity, the permit requires that all facilities are inspected on a regular basis, twice during the
6 five-year permit period, to confirm that best management practices are being effectively
7 implemented in compliance with the law. (AR 3533-3535.)

8 As discussed in detail above, the Clean Water Act requires that an NPDES permit for the
9 discharge of pollutants from the County's municipal storm sewer must include "controls to reduce
10 the discharge of pollutants to the maximum extent practicable (33 U.S.C. § 1342(p)(3)(B).)
11 These management practices generally include site inspections "to prevent illicit discharges to
12 the" MS4. (40 C.F.R. § 122.26 (d)(2)(iv)(B)(1).) Requiring regular inspections of business
13 facilities is within the maximum extent practicable standard imposed on the County of Los
14 Angeles by the Clean Water Act. Such inspections confirm that best management practices are
15 being effectively implemented in compliance with federal law. That the permit requirements are
16 more particular than federal law makes no difference. The inspection requirements are within the
17 federal standard and are not state mandates.

18 The County of Los Angeles must have understood that site inspections are within this
19 flexible maximum extent practicable standard because they recommend inspections in their
20 permit application as well. According to the proposed permit, "Permittees shall visit automotive
21 services and food service facilities as outlined in the SQMP in its jurisdiction once every two
22 years. During site visits, Permittees shall: [¶] i. Consult with a representative of the facility to
23 explain applicable stormwater regulations; [¶] ii. Distribute and discuss applicable BMP and
24 educational materials; and, [¶] iii. Conduct a site walk-through to verify for, at a minimum,
25 evidence of BMP implementation." (AR 3671.) The County also proposed that "Permittees shall
26 revisit automotive and food service facilities where evidence of illicit discharge is found within
27 six months of the date of the initial visit." (AR 3671.) As with the trash receptacle requirement,
28

1 the state is not required to adopt the less stringent practicable standard, but rather the maximum
2 extent practicable.

3 Rather than addressing whether these inspections exceed the federal maximum extent
4 practicable standard, the Commission simply found that these inspection requirements are not
5 expressly stated in federal law and thus must be a state mandate. (AR 5591.) For the reasons
6 explained above, the Commission's analysis is bad reasoning and bad policy and must be
7 reversed.

8 Inspection of Industrial Facilities

9 This portion of the permit requires the inspection of certain industrial facilities referred to in
10 the permit as Phase 1 Facilities. (AR 3535-3536.) Like the commercial inspections above, the
11 Clean Water Act requires an NPDES permit for the discharge of pollutants from the County's
12 municipal storm sewer to include "controls to reduce the discharge of pollutants to the maximum
13 extent practicable (33 U.S.C. § 1342(p)(3)(B).) Federal regulations require that these
14 management practices or controls "identify priorities and procedures for inspections" of industrial
15 facilities. (40 C.F.R. § 122.26 (d)(2)(iv)(B) & (C)(1) & (G).) The Commission does not disagree
16 with this federal requirement. (AR 5593.) And the County of Los Angeles specifically included
17 these inspections in its SQMP by stating that "Permittees shall implement an industrial/commercial
18 educational site visit program." (AR 3670-3671.) Thus, both federal law and the County of Los
19 Angeles in its SQMP required inspections of industrial facilities.

20 In addition, there is no evidence that the permit requirement calling for the inspection of
21 industrial facilities is beyond the maximum extent practicable standard imposed on the County of
22 Los Angeles by the Clean Water Act. Again, the Commission failed to address this federal
23 standard and concluded that no federal mandated exist because "the state had issued a statewide
24 general industrial permit (GIASP) that is enforced through the regional boards." (AR 5594.)
25 However, the issue is whether the inspections are required under the Clean Water Act, and not
26 whether any inspections are required under the GIASP permit. At most, the GIASP permit may
27 add additional inspections at the time and expense of the state.

1 Inspection of Construction Sites

2 This portion of the permit provides that “[e]ach Permittee shall implement a program to
3 control runoff from construction activity to storm drains at all construction sites within its
4 jurisdiction.” (AR 3546.) This generally includes implementing best management practices
5 related to the control and containment of construction-related materials, waste, and erosion, as
6 well as the inspection of construction sites and related employee training. (AR 3546-3549.) The
7 County of Los Angeles’ SQMP is extensive and includes detailed requirements to prevent runoff
8 from constructions sites into nearby waters. (AR 3672-3674.) These requirements include
9 implementing best management practices relating to the control and containment of construction-
10 related materials, waste, and erosion, as well as the inspection of construction sites and related
11 employee training. (AR 3672-3674.) And, in addition to the maximum extent practicable
12 standard under the Clean Water Act, federal regulations also require the inspections of
13 construction sites. (40 C.F.R. § 122.26 (d)(2)(iv)(D).)

14 The Commission did not dispute the above, but relied on its fallback position that the
15 inspections and related activities at construction sites are not federal mandates because they are
16 not expressly specified in federal law. (AR 5600.) As discussed above, a federal mandate does
17 not require explicit mention of every mandated activity. Thus, the claimed construction activities
18 do not exceed the maximum extent practicable standard under the Clean Water Act.

19 Based on the foregoing, the permit as a whole and the individual claimed activities do not
20 exceed the maximum extent practicable standard in the Clean Water Act and are thus federal
21 mandates, not state mandates. Consequently, they are not subject to reimbursement under article
22 XIII B, section 6 of the California Constitution, and the Commission decision should be reversed.

23 **V. THE PERMIT AS A WHOLE AND THE CLAIMED MANDATED ACTIVITIES DO NOT**
24 **IMPOSE A NEW PROGRAM OR HIGHER LEVEL OF SERVICE.**

25 The Commission essentially found that the claimed mandated activities were new because
26 they were not required by the previous permit issued to the County of Los Angeles and that they
27 were a program because the requirements were only imposed on the County of Los Angeles.
28 (AR 5603-5604; see *Carmel Valley Fire Protection v. State of California* (1987) 190 Cal.App.3d,

1 521, 537.) While the specific requirements are new to this permit and are only required on the
2 County of Los Angeles, this focus is too narrow for this case. The relevant "activity" for purpose
3 of state mandates law is the federal requirement that the discharge of pollutants from a MS4 for a
4 population the size of Los Angeles County requires an NPDES permit that includes "controls to
5 reduce the discharge of pollutants to the maximum extent practicable."

6 (33 U.S.C. §1342 (p)(3)(B).) This requirement is not new and is imposed on all entities that own
7 or operate a municipal separate storm sewer system. (*Ibid.*) Thus, there is no new program or
8 higher level of service and no state mandate. As discussed above, the Commission's decision to
9 the contrary should be reversed.

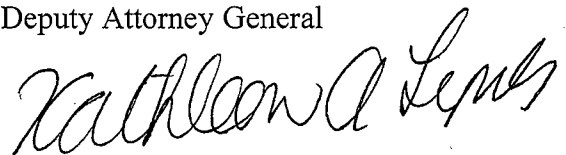

10 CONCLUSION

11 The Commission's decision finding that the claimed mandated activities should be reversed
12 because the NPDES permit is based on federal law, not state law, and is this not subject to
13 subvention. For the same reason, there is no new program or higher level of service and the
14 Commission's finding to the contrary should also be reversed.

Building Industry Ass'n of San Diego County v. State Water Resources Control Board

INTRODUCTION

The County of Los Angeles is prohibited from discharging pollutants from their municipal storm sewer systems into nearby waterways unless they do so under a permit issued in compliance with the National Pollutant Discharge Elimination System (NPDES). The Clean Water Act requires the County of Los Angeles' NPDES permit to reduce the discharge of pollutants from its storm drains to the *maximum extent practicable*. Under article XIII B, section 6, of the California Constitution, the only way this maximum extent practicable standard could constitute a state mandate would be if the state *voluntarily elected* to require local agencies to implement state obligations under the Clean Water Act, or if the state took action to *exceed* the Act's maximum extent practicable standard. As explained in great detail in petitioners' opening brief, neither occurred here.

The Commission's decision finding that the specific permit requirements are state mandates must be reversed. Its analysis was based on a faulty assumption: that unless federal regulations reduced the maximum extent practicable standard to an explicit requirement, there was no federal mandate. Federal regulations and decisions make clear that the Clean Water Act's technology-forcing requirements for municipal storm water permits are flexible. The specific requirements are derived on a case-by-case basis to reflect pollutant reductions to the maximum extent practicable. The Regional Board previously made its determination that the permit taken as a whole reflected the federal requirement. A superior court found likewise and was affirmed on appeal.

While the Commission may be an expert in state mandates, it has no expertise in the field of water law. The Commission erroneously failed to defer to the Regional Board's implementation of federal water quality law. More specifically, the Commission failed to defer to the Regional Board's determination that the permit as a whole and the more particular permit requirements implement the Clean Water Act's maximum extent practicable standard. Further, even if issue preclusion and deference to the water board's interpretation was not required or appropriate, the Commission failed to articulate how the specific requirements exceeded the demanding *maximum extent practicable* pollutant reduction.

LEGAL ANALYSIS

I. THE COMMISSION'S FINDINGS THAT THE CHALLENGED PERMIT REQUIREMENTS ARE STATE MANDATES PRESENT QUESTIONS OF LAW AND ARE SUBJECT TO DE NOVO REVIEW.

Whether a statute or executive order, which includes water permits, creates a reimbursable state mandate is a pure question of law. (*Connell v. Superior Court* (1997) 59 Cal.App.4th 382, 395; see also, *Long Beach Unified School Dist. v. State of California* (1990) 225 Cal.App.3d 155, 174.) And questions of law are subject to de novo review. (*City of Richmond v. Commission on State Mandates* (1998) 64 Cal.App.4th 1190, 1105.)

The County of Los Angeles does its best to avoid this well-established standard of review, claiming that it is “inapposite here” because petitioners are not challenging whether a *statute* imposes a state mandate, but are instead challenging whether the requirements of a *permit* impose a state mandate. (Opp. p. 17, ll. 7-14.) It is true that in some cases, findings of fact may be necessary before resolving the ultimate legal issue of whether a state mandate exists. (See *County of Los Angeles v. Commission on State Mandates* (2007) 150 Cal.App.4th 898, 917-918.) However, this does not mean that the court should defer to the Commission’s legal findings or assumptions. In the absence of evidence that the Regional Board somehow exceeded the maximum extent practicable standard, the court should defer to the Regional Board and conclude as a matter of law that the permit and its specific requirements are federal mandates and not state mandates. While review of the Commission’s factual determinations proceeds under the substantial evidence test, whether a state mandate exists is still a pure question of law. (See *City of Richmond, supra*, 64 Cal.App.4th at pp. 1194-95.)

In *County of Los Angeles, supra*, the court noted that questions regarding whether permit requirements are state mandates must first be resolved by the Commission and may present factual issues. (*Id.* at pp. 917-918.) The County of Los Angeles reads this statement to mean that in *all* cases where permit requirements are alleged to be a state mandates, the analysis involves pure factual questions subject to substantial evidence review. This interpretation is wrong. The County is taking the phrase “presents factual issues” out of context. The court in *County of Los Angeles* did not suggest that *all* mandate determinations related to permits turn on factual issues.

1 The court merely acknowledged that factual issues *may* be present. (*County of Los Angeles,*
2 *supra*, 150 Cal.App.4th 918.) This statement does not wipe out the de novo standard of review
3 for determining whether a statute, regulation, or executive order is a state mandate.

4 In any event, these claimed “factual findings” on the part of the Commission are pure
5 fiction created by the County of Los Angeles in an attempt to apply a less stringent standard of
6 review. *The Commission made no factual findings as to whether the claimed permit requirements*
7 *go beyond the maximum extent practicable standard found in the Clean Water Act or its*
8 *implementing regulations.* It simply concluded as a matter of law that the claimed permit
9 requirements were state mandates because they were not expressly provided for in federal law.

10 For example, with respect to the trash receptacle requirement, the Commission found:

- 11 • “[T]he plain language of the federal statute (33 U.S.C. § 1342(p)(3)(B))
12 [maximum extent practicable standard] and regulation (40 C.F.R.
13 § 122.26(d)(2)(iv)(A)(3)) does not require the permittees [sic] to install and
14 maintain trash receptacles at transit stops.” (AR 5584.)
- 15 • “Because installing and maintaining trash receptacles at transit stops is not
16 expressly required of cities and counties or municipal separate storm sewer
17 dischargers in the federal statutes or regulations, these are activities that
18 ‘mandate costs that exceed the mandate in the federal law or regulation.’”
19 (AR 5584.)

20 And the Commission came to the same legal conclusion when it analyzed the inspection
21 requirements in the permit for commercial facilities, certain industrial facilities, and construction
22 sites. As above, the Commission found that the permit requirements were not expressly provided
23 for in federal law and were thus state mandates. It found:

- 24 • There is no express requirement in federal law to inspect restaurants,
25 automotive service facilities, retail gasoline outlets, or automotive dealerships.
26 (AR 5590.) The Commission “cannot read a requirement into a statute or
27 regulation that is not on its face or its legislative history.” (AR 5591.)
- 28 • “Based on the plain language of the federal regulations that are silent on the
types of facilities at issue in the permit, the Commission finds that performing
inspections at restaurants, automotive service facilities, retail gasoline outlets,
or automotive dealerships, as specified in the permit, is not a federal mandate.”
(AR 5591.)
- “[T]he Commission finds that there is no federal mandate on the claimants to
perform inspections of phase I facilities as specified in part 4C2b of the
permit.” (AR 5595.)

- 1 • “[T]he Commission finds that the requirement for local-agency permittees to inspect
2 constructions sites in section 4E of the permit is not a federal mandate.” (AR 5601.)

3 The County disregards that the Commission refused to make any factual findings even
4 though evidence was submitted by the claimants and interested parties. The Commission simply
5 concluded as a matter of law that the challenged permit requirements were state mandates
6 because they were not expressly provided for in federal law. Whether a statute, regulation, or
7 executive order is a state mandate is a pure question of law, and the County’s argument to the
8 contrary goes nowhere. (*Connell, supra*, 59 Cal.App. at p. 395.)

9 **II. THE PERMIT IS NOT A STATE MANDATE, BECAUSE CALIFORNIA MUST IMPLEMENT
10 THE FEDERAL NPDES PROGRAM AND BECAUSE THE PERMIT DOES NOT EXCEED
11 THE MAXIMUM EXTENT PRACTICABLE STANDARD IN FEDERAL LAW.**

11 **A. The NPDES Program Is Mandated By Federal Law.**

12 There is a two-step process to determine whether a program, or in this case, the permit, is
13 mandated by federal law. The first part of the analysis considers whether the state had “no real
14 choice in deciding whether to comply with the federal act.” (*Hayes v. Commission on State
15 Mandates* (1992) 11 Cal.App.4th 1563.) Relying on the Commission’s analysis, the County of
16 Los Angeles concludes that state compliance with the Clean Water Act’s NPDES program was
17 voluntarily. (Opp. p. 19, ll. 13-21, p. 20, ll. 1-2.) As explained in petitioners’ opening brief, the
18 Commission and the County are mistaken. The NPDES program is not optional; it is coercive on
19 the states and localities in every legal and practical sense.

20 The federal Clean Water Act requires the County of Los Angeles to have an NPDES permit
21 for municipal storm water discharges and compels the County to reduce the discharge of
22 pollutants to the maximum extent practicable. Neither the state nor the County of Los Angeles
23 has a true choice in the permit or the requirement to reduce pollutants to the maximum extent
24 practicable. (*City of Sacramento v. State of California* (1990) 50 Cal.3d 51, 76.) If California did
25 not administer its own water quality program through the Porter-Cologne Act, California’s
26 dischargers, both private and governmental, would still have to comply with federal law, but
27 would also be subject to direct regulation from the federal government. (See 33 U.S.C.
28

1 § 1362(4)-(5) [defining “person” to include “municipality,” and “municipality” to include public
2 entities like the flood control district, county, and cities] & § 1342(p)(iii) [establishing technology
3 standard of “maximum extent practicable” for municipal separate storm sewer systems].)

4 Since the state has no true choice but to comply with the Clean Water Act in establishing
5 NPDES permits that require pollutant reductions to the maximum extent practicable, such permits
6 are based on federal requirements and are not state mandates. (*San Diego Unified School Dist. v.*
7 *Commission on State Mandates* (2004) 33 Cal.4th 859, 880.)

8 **B. The Mere Flexibility of the Maximum Extent Practicable Standard Does**
9 **Not Mean that the NPDES Permit Exceeds This Standard.**

10 The second part of the federal mandates analysis focuses on whether the permit goes
11 beyond the requirements of federal law. (Gov. Code, § 17556; *San Diego Unified School Dist,*
12 *supra*, 33 Cal.4th at p. 880.) The federal requirement applicable to the discharge of pollutants
13 through municipal storm sewer systems is the maximum extent practicable standard.
14 (33 U.S.C. § 1342(p)(3)(B).) Congress established this flexible maximum extent practicable
15 standard so that administrative bodies would have “the tools to meet the fundamental goals of the
16 Clean Water Act in the context of storm water pollution.” (*Building Industry Ass'n of San Diego*
17 *County v. State Water Resources Control Board* (2004) 124 Cal.App.4th 866, 884.) It was
18 “designed to allow permit writers to use a combination of pollution controls that, as Congress
19 noted, ‘may be different in different permits.’” (*In re City of Irving, Texas, Municipal Separate*
20 *Storm Sewer System* (July 16, 2001) 10 E.A.D. 111 (E.P.A.), *6, attached as Exhibit A to
21 Petitioners’ Request for Judicial Notice in Support of Reply Brief.) And it includes the flexibility
22 “to tailor permits to the site-specific nature of MS4,” and the flexibility “to direct permit
23 requirements at the sources of pollution in the MS4 rather than solely at the end of the pipe.”
24 (*Ibid.*) As explained by the U.S. EPA:

25 *Congress therefore created the “maximum extent practicable” (“MEP”) standard*
26 *and the requirement to “effectively prohibit non-storm water discharges” into the*
27 *MS4 in an effort to allow permit writers the flexibility necessary to tailor permits to*
28 *the site-specific nature of MS4 discharges. Legis. Hist. at 646; House Committee on*
Public Works and Transportation, Section-by-Section Analysis (100th Sess. 1987),
reprinted in 1987 U.S.C.C.A.N. (101 Stat. 7) 5, 38-39; see also 55 Fed. Reg. at
48,038. Included in that flexibility was the capacity to direct permit requirements at

1 *the sources of pollution in the MS4 rather than solely at the end of the pipe.* 55 Fed.
2 Reg. at 48,038. Thus, the MS4 permit requirements set forth under *CWA*
3 § 402(p)(3)(iii) were designed to allow permit writers to use a combination of
4 pollution controls that, as Congress noted, “may be different in different permits;”
5 not all of the types of controls listed in § 402(p)(3)(iii) are required to be incorporated
6 into each MS4 permit. 1987 U.S.C.C.A.N. at 39.

7 (*Ibid*, emphasis added.)

8 The County of Los Angeles disregards the very nature of this flexible maximum extent
9 practicable standard and simply concludes, as the Commission did, that if the permit requirements
10 are not expressly provided for in the Clean Water Act or its implementing regulations, then there
11 is no federal mandate. (Opp. p. 24, ll. 3-8.) However, by definition, a flexible standard is not
12 intended to be applied in the same manner under different circumstances.

13 Likewise, a flexible standard does not lend itself to the monolithic federal regulations that
14 the Commission would say establishes a federal mandate. In this respect, the Commission was on
15 a quixotic quest doomed to relegate virtually any federal municipal storm water permit
16 requirement to a state mandate. Under the Commission’s analysis, a permit requirement that was
17 merely practicable or easy (not even practicable to the “maximum extent”) would be a state
18 mandate if U.S. EPA failed to express the requirement in a regulation. Such a result is contrary to
19 the California Supreme Court’s teachings in *City of Sacramento*, which looks to the federal nature
20 of the requirement. (50 Cal.3d 51, 76.)

21 The County of Los Angeles also ignores the administrative and judicial proceedings that
22 have found this very permit to be within the maximum extent practicable standard. The Regional
23 Board made quasi-judicial findings that the permit reflected the Clean Water Act’s maximum
24 extent practicable requirements; permittees challenged that permit and those findings; and a trial
25 court and court of appeal rejected the permittees’ arguments and upheld the permit. (Statement of
26 Decision From Phase I Trial on Petitions for Writ of Mandate (Mar. 24, 2005), *In Re Los Angeles*
27 *County Municipal Storm Water Permit Litigation*, Los Angeles County Super. Ct., Lead Case
28 No. BS080548 affirmed by *County of Los Angeles v. California State Water Resources Control*
Bd. (2006) 143 Cal.App.4th 985, attached as Exhibit A to Petitioners’ Request for Judicial Notice
in Support of Opening Brief.) The trial court’s finding that the permit taken as a whole reflects

1 the maximum extent practicable standard is entitled to preclusive effect on whether or not the
2 permit exceeds the requirements of federal law. (*Y.K.A. Industries, Inc. v. Redevelopment Agency*
3 *of City of San Jose* (2009) 174 Cal.App.4th 339, 356.)

4 In its opposition, the County of Los Angeles attempts to avoid this result by indicating that
5 the Court of Appeal in *County of Los Angeles v. Commission on State Mandates, supra*,
6 150 Cal.App.4th 898, 914 indicated that the Commission must make a determination in the first
7 instance and that there could be provisions of a permit that exceeded federal requirements. (Opp.
8 at p. 25-26.) The water boards do not deny that they *could* impose requirements in excess of
9 federal law. (See Opening Brief pp. 6-7.)¹ This case is not about requirements in excess of
10 federal law though. The Commission failed to recognize and afford deference to the prior
11 administrative and judicial decisions finding that the permit taken as a whole reflected the federal
12 maximum extent practicable standard.

13 Further, the County of Los Angeles attempts to avoid the result by arguing that the specific
14 requirements subject to the test claim exceed the federal requirements. First, this argument fails
15 because the County advances no authority to demonstrate that one permit provision can require
16 more than the maximum extent practicable, when the permit as a whole does not. The federal
17 standard is flexible and may require more in some areas and less in others. (See, e.g.,
18 55 Fed.Reg. 47990, 48052-54 (Nov. 16, 1990); see also *In re City of Irving, supra*, 10 E.A.D. 111
19 at *6.) Second, neither the County of Los Angeles, nor the Commission, provided evidence or
20 made findings that the modest effort to place receptacles at transit stops is not practicable, let

21 ¹ The County's argument regarding the State Water Resources Control Board's
22 precedential decision (Water Quality Order WQ 2001-015) is irrelevant to this larger point. (See
23 Opp. at pp. 22-23.) The issue in that petition concerned an attempted *prohibition* that required all
24 discharges *into* the municipal storm sewer system to have had their pollutants reduced to the
25 maximum extent practicable. The State Board's decision speaks to allowing flexibility to decide
26 on a mix of pollutant reductions before reaching the storm sewer system and after, so long as the
27 overall pollutant reductions are to the maximum extent practicable. Water quality order WQ
28 2001-015 does not undermine U.S. EPA's recognition that the municipal storm water program
will include programs and requirements that reduce pollutants prior to reaching the storm sewer.
(*In re City of Irving, supra*, 10 E.A.D. 111 at *6 ["Included in that flexibility was the capacity to
direct permit requirements at the sources of pollution in the MS4 rather than solely at the end of
the pipe. 55 Fed. Reg. at 48,038."]) Further, nothing undermines the Superior Court's prior
decision that the permit taken as a whole reflects the federal requirement to reduce pollutant
discharges to the maximum extent practicable. See also discussion at Section III, post.

1 alone not practicable to the maximum extent. Instead, the Commission merely looked for an
2 absence of an identical requirement spelled out in federal regulations.

3 The Clean Water Act's maximum extent practicable standard is the key to understanding
4 the NPDES permit requirements. Simply because a federal law is flexible does not mean there is
5 no federal mandate. The permit as a whole, including the challenged provisions, is based on the
6 Clean Water Act's maximum extent practicable standard and is not a state mandate.

7 **C. There Is No Evidence That the Claimed Permit Requirements Go Beyond**
8 **Federal Law.**

9 The County of Los Angeles claims that certain evidence in the administrative record relied
10 on by the Commission shows that the specific permit requirements for trash and inspections
11 exceed federal law and are state mandates. (Opp. p. 18, ll. 8-19, p. 27, ll. 13-18.) However, as
12 discussed above, the Commission did not make any factual findings. It merely concluded as a
13 matter of law that the specific permit requirements were not expressly provided for in federal law
14 and thus were not federal mandates. In any event, the evidence does not show or even suggest
15 that the specific permit requirements exceed federal law.

16 **1. Placement and Maintenance of Trash Receptacles at Transit Stops**

17 The trash receptacle requirement in the permit is within the scope of the maximum extent
18 practicable standard imposed on the County of Los Angeles under the Clean Water Act, and the
19 Commission has not cited any contradicting evidence. Management practices required under
20 federal law include "practices for operating and maintaining public streets, roads and highways
21 and procedures for reducing the impact on receiving waters of discharges from municipal storm
22 sewer systems," (40 C.F.R. § 122.26 (d)(2)(iv)(A)(3).) Despite these federal requirements, the
23 County of Los Angeles claims that the trash receptacle requirement is a state mandate.

24 The County of Los Angeles first hypothesizes that "[i]f installation and maintenance of
25 trash receptacles were a federal requirement, by reason of the MEP standard or otherwise, this
26 requirement would have been present in EPA-issued permits." (Opp. p. 26, ll. 18-21.) Not so.
27 The Clean Water Act requires dischargers such as the County of Los Angeles "to reduce the
28 discharge of pollutants to the maximum extent practicable." (33 U.S.C. § 1342(p)(3)(B).)

1 NPDES permits “ ‘evolve and mature over time’ and must be flexible to reflect changing
2 conditions that result from program development and implementation and corresponding
3 improvements in water quality.” (55 Fed.Reg. 47990, 48052; see also *In re City of Irving, supra*,
4 10 E.A.D. 111 at *6.) Under federal law, each NPDES permit must be tailored to the unique
5 characteristics of the surrounding water ways. Thus, requirements in one permit would logically
6 be different then the requirements in other permits unless of course the surrounding circumstances
7 were identical. As U.S. EPA stated when establishing the municipal storm water permitting
8 regulations: “The language of [Clean Water Act] section 402(p)(3) contemplates that, because of
9 the fundamentally different characteristics of many municipalities, municipalities will have
10 permits tailored to meet particular geographical, hydrological, and climatic conditions.” (55
11 Fed.Reg. 47990, 48053.)

12 The five states in which NPDES permits were issued by the U.S. EPA as of 2008 included
13 Massachusetts, New Hampshire, Idaho, Alaska, and New Mexico.² (AR 3895.) Water quality
14 issues in southern California cannot realistically be the same or similar to water quality issues in
15 Alaska or Idaho. As such, the NPDES permits are all different and unique and consistent with
16 federal law. Thus, it is of no consequence that U.S EPA-issued permits, or any other state-issued
17 permits, do not include a specific requirement regarding placement and maintenance of trash
18 receptacles. The only relevant considerations are the best management practices that implement
19 the maximum extent practicable standard for the County of Los Angeles’ discharges through its
20 storm systems.

21 And the County of Los Angeles incorrectly infers that the U.S. EPA considers the trash
22 receptacle requirement to be outside the scope of the maximum extent practicable standard
23 because the requirement is not present in U.S. EPA issued NPDES permits. (Opp. p. 26, ll. 20-
24 23, p. 27, ll. 1-2.) This inference is wrong. According to the U.S. EPA, the trash receptacle
25 requirement is well within the maximum extent practicable standard. (AR 3797-3799.) Neither

26 ² This list is based on a letter from the County of Los Angeles’ consultant dated June 17,
27 2008 and does not represent the current state of affairs. Alaska now issues NPDES permits. The
28 list of states with the U.S. EPA approval to issue NPDES permits can be found at
http://cfpub1.epa.gov/npdes/statestats.cfm?program_id=12

1 the Commission nor the County of Los Angeles refute this unequivocal statement of the federal
2 agency charged with overseeing the NPDES program. The County of Los Angeles' inference to
3 the contrary cannot reasonably override this express statement from the U.S. EPA.

4 Next, the County of Los Angeles speculates that because the trash receptacle requirement
5 was not part of the previous permits issued to the County, the obligation is not required by federal
6 law. (Opp. p. 27, ll. 3-6.) Once again, the County seems to misunderstand the NPDES program
7 and the Clean Water Act. When an NPDES permit is renewed, reissued or modified, it generally
8 must be at least as stringent as the prior permit. (33 U.S.C. § 1342 (o); 40 C.F.R. 122.44 (l).)
9 The U.S EPA "anticipates that storm water management programs will evolve and mature over
10 time. The permits for discharges from municipal separate storm sewer systems will be written to
11 reflect changing conditions that result from program development and implementation and
12 corresponding improvements in water quality." (55 Fed.Reg. 48052.) Thus, federal law
13 anticipates that permit requirements will change over time and become more stringent. A new
14 requirement in a permit alone does not mean that the requirement is beyond the maximum extent
15 practicable standard in federal law.

16 Last, the County of Los Angeles, similar to the Commission, concludes that the trash
17 receptacle requirement goes beyond federal law because it is not specifically required under the
18 Clean Water Act or its implementing regulations. As explained in this reply and the opening
19 brief, the Clean Water Act's NPDES permit system requires states to develop standards based on
20 the unique conditions of particular waterways. Thus, the maximum extent practicable standard is
21 necessarily flexible, rather than a one-size-fits-all standard. (*Building Industry Ass'n of San*
22 *Diego County, supra*, 124 Cal.App.4th at p. 874.)

23 **2. Inspection Provisions for Commercial and Industrial Facilities and**
24 **Construction Sites**

25 Inspections are *necessary* to effectively control the discharge of pollutants to the maximum
26 extent practicable and assure compliance with water quality standards. "Federal law, either
27 expressly or by implication, requires NPDES permittees to perform inspections for illicit
28 discharge prevention and detection; landfills and other waste facilities; industrial facilities;

1 construction sites; certifications of no discharge; non-stormwater discharges; permit compliance;
2 and local ordinance compliance.” (*City of Rancho Cucamonga v. Regional Water Quality*
3 *Control Bd.-Santa Ana Region* (2006) 135 Cal.App.4th 1377, 1390.) Thus, the County of Los
4 Angeles’ claim that the inspections requirements are state mandates is without merit.

5 **a. Inspection of Commercial Facilities**

6 The County lists five reasons why the requirement for inspection of commercial facilities
7 goes beyond the maximum extent practicable standard.

8 First, the County argues that the U.S EPA issued permits do not include the inspection of
9 commercial facilities. (Opp. p. 28, ll. 13-15.) This argument goes nowhere. As explained above,
10 different permits have different requirements based on the unique circumstances of each permit.
11 The absence of certain commercial inspections in other permits does not mean that such a
12 requirement is beyond the maximum extent practicable standard with respect to this permit.
13 Indeed, the U.S. EPA has concluded that the inspection requirement is within the maximum
14 extent practicable standard. (AR 3797-3800.)

15 Second, the County of Los Angeles argues that the inspection requirements were not in
16 previous permits and thus are beyond the maximum extent practicable standard. (Opp. p. 28,
17 ll. 15-18.) As explained above, federal law anticipates that permit requirements will change over
18 time and become more stringent. A new requirement in a permit alone does not mean that the
19 requirement is beyond the maximum extent practicable standard in federal law. Moreover, as
20 explained by U.S. EPA, these requirements evolve over time based on site-specific data
21 indicating water quality problems. (See 55 Fed.Reg. 48052 [“permits for discharges from
22 municipal separate storm sewer systems will be written to reflect changing conditions that result
23 from program development and implementation and corresponding improvements in water
24 quality.”]) In this case, the additional requirements were developed after the permittees
25 developed information identifying certain activities that were the greatest source of storm water
26 pollution in Los Angeles County. (AR 3503.) This is exactly the program evolution expected by
27 the Clean Water Act.

28

1 Third, the County of Los Angeles claims that since 1969 the state has had the “obligation”
2 to inspect the commercial facilities identified in the permit “to prevent the discharges of waste
3 that could affect the quality of the waters of the state” under Water Code section 13267,
4 subdivision (c). (Opp. p. 28, ll. 18-21.) According to the County, the Regional Board “freely
5 chose to shift those obligations to the Cities” and created a state mandate. (Opp. p. 28, ll. 21-23.)
6 The County has somehow equated the state’s general authority to inspect “facilities” under
7 section 13267 to the County’s separate and distinct obligations under the permit and the Clean
8 Water Act.

9 Under Water Code section 13267, subdivision (a), “[a] regional board . . . may investigate
10 the quality of any waters of the state within its region.” And during this investigation, “the
11 regional board may inspect the facilities of any person to ascertain whether the purposes of this
12 division are being met and waste discharge requirements are being complied with.” (Wat. Code,
13 § 13267, subd. (c).) The inspection must “be made with the consent of the owner or possessor of
14 the facilities or, if the consent is withheld, with a warrant,” with the exception of an “emergency
15 affecting the public health or safety.” (*Ibid.*)

16 A regional board’s general authority to inspect “facilities” is in no way related to the
17 County of Los Angeles’ obligations to inspect certain commercial facilities under the Clean
18 Water Act. “The Regional Board may conduct its own inspections but permittees must still
19 enforce their own laws at these sites.” (*City of Rancho Cucamonga, supra*, 135 Cal.App.4th at
20 p. 1390.) The issue is whether the inspections are required under the Clean Water Act, and not
21 whether any inspections are required under section 13267. At most, section 13267, subdivision
22 (c), adds additional inspections at the time and expense of the state.

23 Indeed, if you take the County’s argument to its logical conclusion, then dischargers like
24 the County of Los Angeles could avoid inspections or other permit requirements merely because
25 the state has some similar, general authority in the same area. This is contrary to the Clean Water
26 Act and its implementing regulations that place the burdens of discharging pollutants through
27 storm sewers on the discharger.

28

1 Fourth, the County of Los Angeles claims that “[t]he Administrator of the U.S. EPA, and
2 the head of the water division for U.S. EPA Region IX, ‘have specifically stated that a
3 municipality has an obligation under a stormwater permit to assure compliance with local
4 ordinances; *the state retains responsibility to inspect for compliance with state law, including*
5 *state-issued permits.’”* (Opp. p. 28, ll. 23-26, p. 29, ll. 1-2, emphasis in original.) This quote is
6 from the Commission’s statement of decision, which simply paraphrases one of the County of
7 Los Angeles’ arguments. It is not a formal order from the U.S. EPA.

8 This statement is based on a July 21, 2001 letter from the U.S. EPA to Congressman David
9 Dreier responding to his concern that local governments would be forced to pay for inspections at
10 industrial and commercial sites that were the responsibility of the state. (AR 3878.) The letter
11 generally explains that there may be some “shared responsibilities” between the state and the
12 local government but that the state is responsible for its own permit obligations, not those of the
13 actual dischargers. (AR 3878) By no means does this letter suggest the state, as opposed to the
14 actual discharger, is solely responsible for inspections at commercial and industrial facilities as
15 claimed by the County.

16 In any event, as discussed above in response to the County’s third point, the issue is
17 whether the inspections are required under the Clean Water Act, and not whether the inspections
18 are required under a state’s general permitting authority. At most, this general authority adds
19 additional inspections at the time and expense of the state.

20 Last, the County of Los Angeles repeats its claim that federal law does not expressly
21 provide for the required inspections, so the inspections are not mandated by federal law. (Opp.
22 p. 29, ll. 3-5.) As explained throughout petitioners’ opening brief and this reply, this argument is
23 contrary to the law and goes nowhere.

24 **b. Phase I Industrial Facilities**

25 In the County of Los Angeles’ view, there are eight grounds supporting its theory that the
26 permit requirement for the inspection of industrial facilities is a state mandate. (Opp. p. 29, ll. 24-
27 27, p. 30, ll. 1-22.) The County is wrong and none of the purported grounds support a state
28 mandate. Grounds five through eight simply repeat the arguments presented by the County above

1 concerning the trash and commercial facilities inspections. Since the arguments and petitioners'
2 responses are the same, petitioners will not repeat them in this section.

3 The County of Los Angeles claims that the inspection requirement in the permit is a state
4 mandate because “[t]he state, through the State Board, chose the alternative of having a state-
5 wide general permit (the GIASP) as opposed to requiring such facilities to obtain individual
6 permits.” (Opp. p. 29, ll. 24-27.) This makes no sense. A state-wide general permit can coexist
7 with the permit issued to the County of Los Angeles, and there is no evidence to the contrary.
8 The issue is whether the inspections are required under the Clean Water Act, and not whether the
9 inspections are required under a state’s general permitting authority. At most, this general
10 authority adds additional inspections at the time and expense of the state. It does not shift a state
11 obligation to the County and is does not create a state mandate.

12 Next, the County of Los Angeles claims that when the State Water Resources Control
13 Board (State Board) adopted the general industrial permit it stated that the Regional Boards
14 should enforce its provisions. (Opp. p. 30, ll. 1-3.) This is just another recycled version of the
15 argument that the state is shifting its obligations under general state-issued permits to the County
16 by way of the inspection requirement in the permit. The general industrial state-wide permit has
17 nothing to do with County of Los Angeles’ responsibilities under the permit at issue in this
18 litigation. The County is trying to blur the line between its permit obligations as the discharger of
19 pollutants through its storm sewers and the state’s obligations and create one large state
20 obligation. The County’s responsibilities under the permit are separate and distinct from the
21 duties imposed on the state by state-issued general permits. The relevant question here is whether
22 the industrial inspection requirement in the permit is required under the Clean Water Act or its
23 implementing regulations. The state-issued general permit is simply not relevant to this inquiry.
24 (See *City of Rancho Cucamonga, supra*, 135 Cal.App.4th at p. 1390.)

25 The last two arguments presented by the County of Los Angeles can be quickly disregarded
26 for the reasons in the preceding two paragraphs. The County’s statement that the State Board can
27 collect a fee for state inspections required under the state-issued permit is not relevant. (Opp.
28 p. 30, ll. 4-6.) These inspections are independent from the obligations imposed on the County as

1 a discharger under the permit. And the claim that there were some negotiations between the
2 County and the Regional Board regarding contracting to the County state inspections has no
3 bearing on whether the permit activity for industrial inspections is a state mandate. (Opp. p. 30,
4 ll. 7-12.)

5 **c. Inspection of Construction Sites**

6 As with the other challenged permit requirements, the County of Los Angeles provides a
7 list of short statements that allegedly support its claim that the permit requirement for inspecting
8 construction sites is a state mandate. (Opp. p. 31, ll. 14-26, p. 32, ll. 1-5.) Because every
9 statement has been presented in the context of the other challenged permit requirements,
10 petitioners will not repeat them here but refers the court to the preceding analysis.

11 Based on the foregoing, there is no evidence that even remotely suggests that the specific
12 permit requirements exceed federal law, just speculation and conjecture on the part of the County
13 of Los Angeles. The permit requirements are based on federal law and thus are not state
14 mandates.

15 **III. THE PERMIT LAWFULLY REGULATES DISCHARGES TO REDUCE THE**
16 **INTRODUCTION OF POLLUTANTS INTO THE MUNICIPAL STORM DRAIN SYSTEM.**

17 In an effort to get around the above administrative and judicial findings that the permit as a
18 whole does not exceed the maximum extent practicable standard, the County of Los Angeles
19 claims that the specific trash and inspection requirements in the permit are not subject to the
20 maximum extent practicable standard. (Opp. p. 22, ll. 1-10.) According to the County, the State
21 Board has made a broad-based determination that the maximum extent practicable standard does
22 not apply to the “entry of pollutants *into* the storm sewer system.” (Opp. p. 22, ll. 1-10, emphasis
23 in original.) The State Board made no such broad-based determination: the County has
24 misinterpreted the State Board’s ruling.

25 This claimed administrative proclamation by the State Board was part of a 2001
26 administrative decision involving different circumstances and different permit requirements. In
27 that case, the challengers claimed that permit provision A.3, Discharge Prohibition, requiring that
28 “treatment and control discharges must always occur prior to entry in the MS4” is too broad.

1 (Exh. 1, p. 9, attached to the County of Los Angeles' Request for Judicial Notice.) The State
2 Board agreed, finding that the "specific language in this prohibition too broadly restricts all
3 discharges 'into' an MS4, and does not allow flexibility to use regional solutions, where they
4 could be applied in a manner that fully protects receiving waters." (*Id.* at p. 10.) The State Board
5 went on to explain that "[i]t is important to emphasize that dischargers into MS4s continue to be
6 required to implement a full range of BMPs, including source control." (*Ibid.*) Consistent with
7 the maximum extent practicable standard, the State Board was critical of an absolute standard that
8 did not provide the Regional Board with the flexibility to determine the appropriate best
9 management practices, including source control. The decision did not consider the broad issue of
10 whether the Clean Water Act prohibits control of discharges into a municipal storm sewer system.
11 To interpret this determination to mean that the maximum extent practicable standard does not
12 apply to trash, inspections, or other source control mechanism is absurd and inconsistent with
13 U.S. EPA and court decisions.

14 And while the County of Los Angeles is required to obtain an NPDES permit to discharge
15 pollutants *from* their municipal storm sewer systems, by no stretch of the imagination does this
16 mean that the Clean Water Act exempts from municipal permit requirements the discharge of
17 pollutants *into* the system. The maximum extent practicable standard includes the flexibility to
18 "*direct permit requirements at the sources of pollution in the MS4 rather than solely at the end of*
19 *the pipe* [citation omitted]." (*In re City of Irving, supra*, 10 E.A.D. 111 at *6, emphasis added.)

20 The Clean Water Act itself uses the words "in" or "into," not just "from." Section
21 1342(p)(3)(B)(ii) requires that permits, like the one at issue before this court, "shall include a
22 requirement to effectively prohibit non-stormwater discharges into the storm sewers." Also,
23 federal regulations require information about discharges "into" storm drains (see e.g.,
24 40 C.F.R. § 122.26(d)(1)(iv)), including a program "to reduce pollutants in storm runoff from
25 construction sites to the municipal storm sewer system" (40 C.F.R. § 122.26(d)(2)(iv)(D);
26 programs "to identify illicit connections to the municipal storm sewer system,"
27 (40 C.F.R. § 122.26(d)(1)(v)(B)); and programs that specify "source control measures to reduce
28 pollutants from runoff from commercial and residential areas" as well as a comprehensive

1 “master plan to develop, implement and enforce controls to reduce the discharge of pollutants
2 from municipal storm sewers which receive discharges from areas of new development and
3 significant redevelopment.” (40 C.F.R. § 122.26(d)(2)(iv)(A).)

4 And on a common sense level, controlling pollution at the source before it reaches the
5 storm sewer system allows for less expensive controls—like public education, street cleaning, and
6 screens—at the beginning of the system and avoids the difficulties of cleaning up a massive
7 amount of pollutants once they are in the system and receiving waters.

8 Thus, neither the Clean Water Act nor its implementing regulations limits the contents of
9 permits and their programs to discharges “from” storm sewer systems. Instead, the Clean Water
10 Act requires the permitting agency to “require controls to reduce the discharge of pollutants,”
11 including, inter alia, management practices and control techniques to prevent pollution at the
12 source. (33 U.S.C. § 1342(p)(3)(B)(iii).)

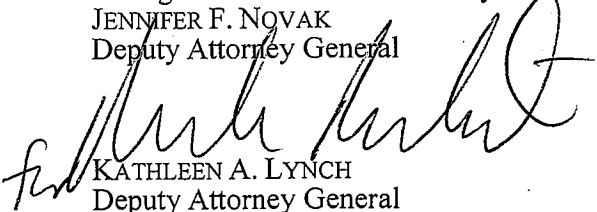

13 CONCLUSION

14 The permit is not a state mandate, because California must implement the federal NPDES
15 program and because the permit does not exceed the maximum extent practicable standard in
16 federal law. The Commission’s decision finding that the permit and the claimed mandated
17 activities are state mandates should be reversed.

Water Boards	The State Water Resources Control Board and nine regional water quality control boards

INTRODUCTION

Respondents Department of Finance, Regional Board, and State Board submit this consolidated answer to the amicus briefs submitted by the California Counties Amici, the Stormwater Association Amici, the San Diego Amici, the Orange County Amici, and the Alameda Amici.¹

The thrust of the amicus briefs is that the decisions below are at odds with the California Constitution and imperil the Commission's jurisdiction. But the Constitution does not require the State to pay for local government compliance with federal mandates. The central issue in this case is how the Commission should have decided what federal law requires when it considered whether the County's MS4 permit requirements at issue are federal or state mandates. The amicus briefs offer no analysis that answers that question.

ARGUMENT

I. THE COUNTY'S PERMIT DID NOT IMPOSE REQUIREMENTS THAT EXCEEDED THOSE IMPOSED BY THE CLEAN WATER ACT.

Courts have long held that the California Constitution does not require the State to fund local government entities' compliance with federal mandates. (See, e.g., *San Diego Unified School Dis. v. Com. on State Mandates* (2004) 33 Cal.4th 859, 888; *County of Los Angeles v. Com. on State Mandates (Davis)* (1995) 32 Cal.App.4th 805, 816; see also Gov. Code, § 17556, subd. (c).) Here, the Regional Board determined in a quasi-judicial proceeding that the County's MS4 permit did not exceed the federal maximum-extent-practicable standard—that is, the permit and its specific terms were required by federal law. (See 1 CT 48; *City of Rancho*

¹ A Glossary following the Table of Authorities sets forth the full names of each group of amici curiae as well as other abbreviations used in this brief.

Cucamonga v. Regional Water Quality Control Bd. – Santa Ana Region (2006) 135 Cal.App.4th 1377, 1385 [NPDES permitting process is quasi-judicial].) The Court of Appeal affirmed that decision, holding that the challenged permit did not exceed federal requirements. (*County of Los Angeles v. California State Water Resources Control Bd.* (2006) 143 Cal.App.4th 985 (*State Water Board*) [unpublished section G.3 at 3 AR 3259-3260].) Indeed, four courts have now made the same ruling.² (*Ibid.* [Court of Appeal decision in direct permit challenge]; 3 CT 418-419 [trial court decision in direct permit challenge]; Slip Op. 35-36 [Court of Appeal decision reviewing Commission decision]; 4 CT 679-682 [trial court decision reviewing Commission decision].) Thus, in this case, the permit is a federal mandate and not subject to the Constitution’s subvention requirements.

The amici, like the County, cannot avoid the Constitution’s limitations. The Alameda Amici argue that “the scope and application of the federal mandate exception to subvention requirements must be construed narrowly to effectuate Proposition 4’s purposes.” (Alameda Br. 15.) To support their argument, they recount the origins of Proposition 4, which added article XIII B to the Constitution. (See Alameda Br. 15-19.) The salient fact from that background, however, is that the voters explicitly said that the spending limits in article XIII B do not apply to federal mandates. (See Cal. Const., art. XIII B, § 9, subd. (b).) And Proposition 4 did not, as the Alameda Amici suggest, license the Commission to interpret federal law differently than it would be interpreted in court or, indeed, in any judicial or quasi-judicial proceeding.

² Those decisions comport with the EPA’s views, which it expressed in a 2008 letter. (See 3 AR 3798-3799.) Tellingly, out of the seven substantive briefs arguing for reversal in this case, not one mentions the EPA’s position.

Various other amici contend that the County's MS4 permit was issued under the state Porter Cologne Act and not the federal Clean Water Act, and that the Court of Appeal therefore erred by holding that the challenged permit terms were required by federal law. (See San Diego Br. 6-8; California Counties Br. 10-11; see also Orange County Br. 7.) The County has not made that argument, no court below has heard it or decided it, and it is incorrect. State laws that implement federal mandates are themselves federal mandates. (See, e.g., *Davis, supra*, 32 Cal.App.4th at p. 816 [“The courts have concluded that no state mandate exists if the requirements or provisions of a state statute are, nevertheless, required by federal law”].)

The fact that a state agency issued the permit does not transform a federal mandate into a state mandate because the requirement for a NPDES permit stems from federal law. Pollutant dischargers, like the County and other MS4 operators, must comply with the Clean Water Act. (See 33 U.S.C. §§ 1311(a), 1342.) All large and medium MS4 operators must obtain a permit that complies with the federal act's requirements. This is true whether a state or the federal government administers the NPDES permitting program. (See, e.g., 40 C.F.R. §§ 122.26(a)(3)(i), 123.25(a)(9).) A permit must effectively prohibit non-stormwater discharges into the MS4 and also, at a minimum, contain controls designed to reduce the discharge of pollutants to the maximum extent practicable. (See 33 U.S.C. § 1342(p)(3)(B)(ii)-(iii).) The Water Boards have no authority to relax that requirement. (See *City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 626-627 (*City of Burbank*) [noting that principles of federal supremacy prohibit Water Boards from relaxing federal permitting standards].) To ensure that state permit issuers meet these requirements, the EPA retains control over the state issuer's program; it may review permits, veto them, enforce them, and rescind a state issuer's authority to issue them. (See 33 U.S.C. § 1342(c), (d), (i); 40 C.F.R. § 123.44.) And

the Clean Water Act authorizes citizens to enforce permits in federal court. (See 33 U.S.C. § 1365.)

When the Water Boards draft a permit, they are not, as some amici suggest, exercising unfettered discretion. (See, e.g., Alameda Br. 22 [arguing that “a state agency’s exercise of discretion cannot be equated with a mandate imposed by the federal government”].) Although the Water Boards do exercise some discretion in designing a set of controls to reduce the discharge of pollutants to the maximum extent practicable, that discretion is circumscribed by the Clean Water Act and subject to EPA and judicial review.

Some amici voice practical concerns regarding the costs of complying with the federal MS4 permitting program. (See Alameda Br. 3-8; Stormwater Assn. Br. 2.) Respondents recognize the potentially significant resources that permittees may need to expend to implement the important and demanding environmental protections of that program, but the magnitude of those costs of compliance are not relevant to whether the permit terms are required by the Clean Water Act and its implementing regulations. The federal act sets a demanding floor that requires public agencies that own or operate MS4s to, among other things, reduce the discharge of pollutants to the maximum extent practicable. Here, the MS4 permitting requirements are federal mandates and excluded from article XIII B’s subvention requirements.³

³ The San Diego Amici also venture three constitutional arguments that no party and no other amici have raised. (See San Diego Br. 9-12.) These arguments disregard “the general rule that an amicus curiae accepts the case as he finds it and may not launch out upon a juridical expedition of [his] own unrelated to the appellate record” (See *E.L. White, Inc. v. City of Huntington Beach* (1978) 21 Cal.3d 497, 510-511, quotation marks and citations omitted.) Although there are limited exceptions to that rule (see *id.* at p. 511), the San Diego Amici do not contend, nor could they
(continued...)

II. THE COMMISSION’S JURISDICTION TO DETERMINE STATE MANDATES IS UNIMPAIRED BY DEFERENCE TO THE WATER BOARDS’ EXPERTISE IN CONSTRUING THE CLEAN WATER ACT, OR BY THE BAR OF COLLATERAL ESTOPPEL.

Several amici argue that the decisions below allow the Water Boards to usurp the Commission’s jurisdiction to determine state mandates. (Stormwater Assn. Br. 12-14; San Diego Br. 13-16; Alameda Br. 23-24; see also Reply 5-8.) This perceived threat to the integrity of the Commission’s jurisdiction, however, is unjustified. When a Water Board issues an NPDES permit, it does not—and cannot—decide whether the permit or a permit term is a reimbursable state mandate. It decides what permit terms are required for the particular discharge to comply with the federal Clean Water Act for issuance of that permit, subject to judicial review. In addition, the Water Board may decide that other provisions are required or authorized by state law. (See *City of Burbank*, *supra*, 35 Cal.4th at p. 627.) The Commission alone decides whether any permit term is a reimbursable mandate, subject to judicial review. (See Gov. Code, §§ 17552, 17559.) But in making that decision, the Commission must properly apply federal law, and where the Water Board has made a determination of what the Clean Water Act requires in a formal proceeding, the Commission, like the courts, should defer to that determination of federal law. Similarly, where the Water Boards have made a quasi-judicial decision that the Clean Water Act requires certain permit terms, and that decision becomes final or a reviewing court affirms it, the Commission, like the courts, should recognize its preclusive effect. (See Answer Br. 25-32.)

(...continued)

contend, that their theories fall within one of them (see San Diego Br. 9-12).

Of course, not all NPDES permitting test claims will require the Commission to defer to the Water Boards' expertise or apply collateral estoppel to a permittee's test claim. For example, where a Water Board exceeds the federal NPDES permitting requirements and imposes additional terms after weighing the considerations in Water Code sections 13263 and 13241—a possibility recognized by this Court's decision in *City of Burbank*—the Commission could find a reimbursable state mandate, after considering all the relevant provisions of mandates law. But here the Commission should have deferred to the Water Boards' determination that the permit did not exceed the requirements of federal law. (See 1 CT 48.) The Commission also should have applied collateral estoppel because the Court of Appeal ruled, on substantial evidence review, that the permit did not exceed federal law. (*State Water Board, supra*, 143 Cal.App.4th 985 [unpublished section G.3 at 3 AR 3259-3260].)

A. Deference to the Water Boards' Expertise on the Interpretation and Application of the Clean Water Act Does Not Impinge on the Commission's Jurisdiction.

The Commission may defer to the Regional Board's determination of what permit terms were necessary to satisfy the federal maximum-extent-practicable standard without ceding its jurisdiction to resolve unfunded mandates claims. The maximum-extent-practicable standard requires the Water Boards to address a complex mixture of legal, factual, scientific, technical, and policy questions to which there is typically no single correct answer. These are exactly the circumstances in which courts, including this one, have deferred to agency expertise. (See, e.g., *American Coatings Assn., Inc. v. South Coast Air Quality Dist.* (2012) 54 Cal.4th 446, 475 [deferring to agency where group challenging regulations could not identify an "objectively correct categorization" of pollutant sources].) Deference acknowledges the Water Boards' expertise in determining what the Clean

Water Act requires—their scientific knowledge, their deep familiarity with clean-water law and policy, and their practical experience with various methods for controlling pollution in MS4 discharges, including the unique problems of specific MS4s. (See *State Water Board, supra*, 143 Cal.App.4th at p. 997 [“we defer to the regional board’s expertise in construing language which is not clearly defined in statutes involving pollutant discharge into storm drain sewer systems”].) Deferring to that expertise does not, as amici and the County argue, intrude upon the Commission’s jurisdiction, just as deferring to agency expertise does not intrude upon the constitutional jurisdiction of the courts to decide cases.

Amici counter the argument for deference by suggesting that the Water Boards may abuse their Clean Water Act authority, for example, by asserting that certain terms in an MS4 permit were necessary to satisfy the federal maximum-extent-practicable standard when, in fact, they were not. (See Stormwater Assn. Br. 13-14 [asserting that Water Boards have “an inherent conflict of interest with respect to determining whether subvention is warranted”]; Alameda Br. 23-24 [arguing that Respondents’ position gives a state agency “carte blanche to exempt its own regulatory programs from the Proposition 4 spending restrictions”].) This reasoning fails because Water Board permitting decisions are subject to judicial review, and it is the role of the courts on direct review of a permit to determine whether the Water Boards abused their discretion in issuing the permit or exceeded federal requirements. As this case shows, NPDES permittees can and do challenge permit requirements as exceeding federal law in direct permit challenges. (See *State Water Board, supra*, 143 Cal.App.4th 985 [unpublished section G.3 at 3 AR 3259-3260].)

B. Collateral Estoppel Does Not Impinge on the Commission's Jurisdiction.

As with deference, enforcing the bar of collateral estoppel does not interfere with the Commission's jurisdiction to resolve unfunded mandates claims. (See Answer Br. 30-32.) The Court of Appeal's decision in *State Water Board* fully and finally resolved the question of whether the permit exceeded the Clean Water Act's requirements, holding that it did not. (See Answer Br. 31-32 [discussing *State Water Board, supra*, 143 Cal.App.4th 985, unpublished section G.3 at 3 AR 3259-3260].) Neither the amici nor the County have squarely addressed the preclusive effect of the court's determination on direct review of the permit. (See, e.g., Reply 18-20.) Instead, they argue that the Commission has primary exclusive jurisdiction to adjudicate claims for reimbursement. (See, e.g., Reply 7.) Respondents do not dispute that point. (See Gov. Code, § 17552.) But primary exclusive jurisdiction to adjudicate the remedies for unfunded mandates does not license the Commission to ignore the bar of collateral estoppel when a test claim raises technical issues of compliance with a federal regulatory scheme that have been fully and finally litigated by the parties. Applying standard legal principles to recognize when the courts have fully and finally determined that a permit does not exceed the requirements of federal law does not impinge on the Commission's jurisdiction, any more than it would impinge on the jurisdiction of a court applying those same principles.

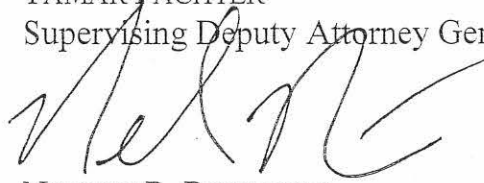

CONCLUSION

This Court should affirm the judgment.

Dated: February 9, 2015

INTRODUCTION

The Court of Appeal held that four specific requirements in a stormwater sewer permit were federal mandates, not state mandates. In its opinion, the court said, “our decision is limited to the specific mandates addressed here”—that is, to permit terms requiring trash receptacles at transit stops and inspections of commercial, industrial, and construction sites. (*State Department of Finance v. Commission on State Mandates* (2013) 220 Cal.App.4th 740, 767-768, 774 (*Finance*)). This narrow decision offers no grounds for review by this Court. No other Court of Appeal has ruled on the issue, so review is not appropriate to secure uniformity. Nor is there a need to settle an important question of law: the court, in a well-reasoned and thorough decision, followed this Court’s mandate precedent.

STATEMENT OF THE CASE

The Los Angeles Regional Water Quality Control Board issued the Los Angeles County Flood Control District, the County of Los Angeles, and 84 cities a 72-page stormwater sewer permit pursuant to a complex federal statutory and regulatory framework. (See *Finance, supra*, 220 Cal.App.4th at pp. 747-750 [explaining federal and state clean water scheme].) The federal Clean Water Act—whose purpose is “to restore and maintain the chemical, physical, and biological integrity of the Nation’s waters”—sits at the center of that framework. (33 U.S.C. § 1251(a).) “The Clean Water Act anticipates a partnership between the States and the Federal Government” (*Finance, supra*, 220 Cal.App.4th at p. 749, quoting *Arkansas v. Oklahoma* (1992) 503 U.S. 91, 101.) In California, the State Water Resources Control Board, together with nine regional water quality control boards, administers the federal National Pollutant Discharge Elimination System (NPDES) permitting scheme under the state’s Porter-

Cologne Water Quality Control Act. (*Id.* at pp. 749-750, citing Wat. Code, § 13000 et seq., § 13370 et seq.)

The Clean Water Act prohibits pollutant discharges from “point sources” unless permitted under a NPDES permit. (33 U.S.C. §§ 1311, 1342.) It requires that permits for discharges from municipal separate storm sewers contain “controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.” (*Id.* § 1342(p)(3)(B)(iii).) The federal maximum extent practicable requirement is what this dispute is about.

After the Los Angeles Water Board issued the permit to Petitioners in 2001, they filed a test claim with the Commission on State Mandates. Petitioners argued that four permit requirements—installation of trash receptacles at transit stops and inspections of commercial, industrial, and construction sites—were state mandates entitling them to a subvention of funds under article XIII B, section 6, subdivision (a) of the California Constitution. (See *Finance, supra*, 220 Cal.App.4th at pp. 756-760.) The Commission agreed, concluding that all four requirements were state mandates because: (1) federal law did not expressly call for them; and (2) they were new programs or higher levels of service in that they were not required before the 2001 permit issued. (*Id.* at pp. 758-761 [describing Commission’s decision].) The Department of Finance, the Los Angeles Water Board, and State Water Board successfully petitioned the Superior Court for an administrative writ of mandate. (*Id.* at pp. 760-762.) The court held that the Commission had erred as a matter of law by failing to consider the Clean Water Act’s maximum extent practicable standard and the evolving nature of the statute’s requirements. (*Id.* at p. 762.)

On appeal, the Second District affirmed the trial court. The court engaged in a thorough discussion of the maximum extent practicable standard, explaining that it is a “highly flexible concept that depends on balancing numerous factors” and that it was “designed to require states to meet their Clean Water Act obligations.” (*Finance, supra*, 220 Cal.App.4th at pp. 768-773.) The Second District observed that the federal Clean Water Act establishes a flexible standard requiring municipalities to reduce pollution in their stormwater discharges, but that ultimately, the regulating entity—whether the U.S. Environmental Protection Agency or the state—is responsible for ensuring that the permit satisfies Clean Water Act requirements. (*Id.* at pp. 771-772, citing *Environmental Defense Center, Inc. v. U.S.E.P.A.* (9th Cir. 2003) 344 F.3d 832.) It concluded that the federal statute enacting the standard “is a unique statute” that “imposes a broad standard in recognition of developing clean water technology.” (*Id.* at p. 772, citing 33 U.S.C. § 1342(p)(3)(B)(iii).)

Petitioners now seek review of that decision.

REASONS TO DENY THE PETITION

The petition fails to show that review is necessary to decide important legal questions or to secure uniformity.¹ The petition also mischaracterizes the Court of Appeal’s decision in three significant ways.

¹ Similarly, the December 5, 2013 letter submitted to this Court by the Building Industry Legal Defense Foundation as amicus curiae makes no attempt to meet the standard for granting review. It argues that the Court of Appeal should have engaged in a preemption analysis. But it does not explain how the court’s refusal to do so either rose to the level of an important legal question meriting review by this Court, or created disuniformity among the Courts of Appeal. In any event, the Court of Appeal offered a compelling rejection of the argument. (See *Finance, supra*, 220 Cal.App.4th at pp. 774-775.)

I. CONTRARY TO PETITIONERS' ASSERTION, THE COURT OF APPEAL DID NOT EXEMPT CLAIMS RELATING TO CLEAN WATER FROM CALIFORNIA'S MANDATE JURISPRUDENCE

Petitioners contend that the court disregarded “mandate jurisprudence in cases in the area of clean water law” and “exempted an entire area of substantive law from mandate jurisprudence.” (Pet. at p. 3; see also Pet. at p. 21.) There are several fundamental errors in those contentions. First, Petitioners fail to explain how a case limited to four specific permit requirements could operate to exempt “an entire area of substantive law” from mandate jurisprudence. (See Pet. at 3.) Not only did the court confine its decision to the four permit requirements before it, but it also analyzed each permit requirement by “balanc[ing] numerous factors, including the particular requirement’s technical feasibility, cost, public acceptance, regulatory compliance, and effectiveness.” (See *Finance, supra*, 220 Cal.App.4th at p. 773.) That approach allows courts reviewing other NPDES permit requirements in future cases to find them to be state mandates, if appropriate, in accord with the cases that Petitioners cite. (See, e.g., Pet. at p. 18, citing *City of Burbank v. State Water Resources Control Bd.* (2005) 35 Cal.4th 613, 627–628.) Thus, the claim that the decision generally exempts NPDES permits from state mandate scrutiny is incorrect.

Second, Petitioners ignore the court’s discussion of mandate jurisprudence, which applied the analysis set forth in this Court’s decision in *City of Sacramento v. State of California* (1990) 50 Cal.3d 51 (*City of Sacramento*). In that case, this Court explained that the variety of federal-state-local programs made the type of one-size-fits-all argument urged by Petitioners impossible. The Court of Appeal followed that guidance, saying:

there is no precise rule or formula for determining whether a cost imposed on a local government or agency is a federal mandate. “Given the variety of cooperative federal-state-local programs, we here attempt no final test for ‘mandatory’ versus ‘optional’ compliance with federal law. A determination in each case must depend on such factors as the nature and purpose of the federal program”

(See *Finance, supra*, 220 Cal.App.4th at p. 767, quoting *City of Sacramento, supra*, 50 Cal.3d at p. 76.) Tellingly, Petitioners do not cite *City of Sacramento*, discuss how the outcome they urge comports with this Court’s holding in that case, or explain how the Court of Appeal’s reliance on it creates any rift with other cases.

Third, Petitioners cite no California case ruling on the merits of mandate issues in the context of the Clean Water Act, and Respondents are aware of no such decision.² One other case has been fully briefed and is awaiting decision in the Third District: *Department of Finance v. Commission on State Mandates* (C070357). That case addresses whether seven NPDES permit requirements, which are different from the ones at issue here, are federal or state mandates. Unless the Third District issues an opinion at odds with the Second District’s opinion, there will continue to be no conflict among the appellate districts, and therefore no lack of uniformity for this Court to address.

² The Second District issued an earlier decision in this case. (See *County of Los Angeles v. Commission on State Mandates* (2007) 150 Cal.App.4th 898.) But that decision did not reach the merits. It addressed the constitutionality of Government Code section 17516, subdivision (b), and whether the Commission on State Mandates could review test claims involving certain water board orders.

II. CONTRARY TO PETITIONERS' ASSERTION, THE COURT OF APPEAL DID NOT "DECLINE TO FOLLOW" EARLIER COURT OF APPEAL DECISIONS

Petitioners contend that the court "declined to follow" earlier Court of Appeal decisions in *Long Beach Unified School Dist. v. State of California* (1990) 225 Cal.App.3d 155 (*Long Beach Unified*) and *Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1564 (*Hayes*). (Pet. at p. 2; see also Pet. at pp. 17, 19, 25.) That description does not accurately characterize the decision. The court discussed those cases at length, explaining that it "did not disagree" with their holdings. (See *Finance, supra*, 220 Cal.App.4th at pp. 758-759, 764-768, 772.) *Long Beach Unified* and *Hayes* dealt with federal laws significantly different from the Clean Water Act. (See *Long Beach Unified, supra*, 225 Cal.App.3d at pp. 172-173 [considering state executive order regarding desegregation]; *Hayes, supra*, 11 Cal.App.4th at pp. 1593-1594 [considering implementation of the Education for the Handicapped Act].) The Court of Appeal harmonized its decision with those two cases, comparing and contrasting the "maximum extent practical" standard and the federal laws considered in those cases, and demonstrated the ways in which their differences required a different result. (See *Finance, supra*, 220 Cal.App.4th at p. 772.) That careful analysis was exactly what this Court contemplated in *City of Sacramento*.

III. CONTRARY TO PETITIONERS' ASSERTION, THE COURT OF APPEAL DID NOT SUBSTITUTE ITS JUDGMENT FOR THAT OF THE COMMISSION

Petitioners contend that the Court of Appeal "substituted its judgment for that of the Commission." (Pet. at pp. 3, 21-24.) Petitioners style this purported error as an "important and recurring issue[]"—a claim they fail to substantiate. (See Pet. at p. 21.) Moreover, the argument is legally incorrect. The Court of Appeal did not substitute its judgment for the Commission's. Rather, it held that "the Permit's requirements are not state

mandates as a matter of law,” correcting the Commission’s erroneous legal analysis. (*Finance, supra*, 220 Cal.App.4th at p. 774; see also *id.* at p. 772 [“we conclude the Permit’s requirements for the trash receptacles and inspection of commercial, industrial, and construction sites as a matter of law constitute federal mandates”].) Making such legal determinations is a core function of the Courts of Appeal. (See, e.g., *id.* at p. 763 [“We examine the interpretation of legal matters utilizing a de novo standard of review”].)

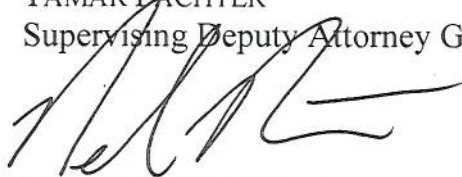

CONCLUSION

For the foregoing reasons, the Respondents respectfully request that the Court deny the Petition for Review.

Dated: December 23, 2013

DECLARATION OF SERVICE BY U.S. MAIL

Case Name: **Department of Finance, et al. v. Commission on State Mandates (County of Los Angeles)**

No.: **S214855**

I declare:

I am employed in the Office of the Attorney General, which is the office of a member of the California State Bar, at which member's direction this service is made. I am 18 years of age or older and not a party to this matter. I am familiar with the business practice at the Office of the Attorney General for collection and processing of correspondence for mailing with the United States Postal Service. In accordance with that practice, correspondence placed in the internal mail collection system at the Office of the Attorney General is deposited with the United States Postal Service with postage thereon fully prepaid that same day in the ordinary course of business.

On December 23, 2013, I served the attached **ANSWER TO THE PETITION FOR REVIEW** by placing a true copy thereof enclosed in a sealed envelope in the internal mail collection system at the Office of the Attorney General at 455 Golden Gate Avenue, Suite 11000, San Francisco, CA 94102-7004, addressed as follows:

<p><i>Representing Real Party in Interest County of Los Angeles:</i></p> <p>John F. Krattli, County Counsel Judith A. Fries, Principal Deputy Office of Los Angeles County Counsel 500 West Temple Street, Room 653 Los Angeles, CA 90012</p>	<p><i>Representing Real Party in Interest City of Monterey Park:</i></p> <p>Christi Hogin Jenkins & Hogin LLP Manhattan Towers 1230 Rosecrans Avenue, Suite 110 Manhattan Beach, CA 90266</p>

INTRODUCTION

Respondents have reviewed the Court's opinion in this case and are committed to using its guidance to shape their future decisions and conduct. Respondents understand that federal municipal separate storm sewer system (MS4) permits issued by the State's Water Boards to local governments now must expressly state which controls are required by federal law, and that the Water Boards bear the burden of establishing that such terms are necessary to control pollutant discharges to meet the federal standard.¹

Respondents are concerned, however, that certain broad language could be misread by those implementing the opinion, including the Commission on State Mandates (Commission) and lower courts, to mean that it is effectively impossible for the State to issue MS4 permits without imposing state mandates. The Clean Water Act and United States Environmental Protection Agency (US EPA) regulations provide the required standard: control of discharges to the "maximum extent practicable." That federal standard is met, in turn, by a set of specific permit conditions tailored to local conditions. Under a misreading of the Court's opinion, the State could never show that the contents of an MS4 permit are mandated by federal law because the permit will always reflect decisions made by the regional boards, exercising their expert judgment, about the mix of terms necessary to meet this federal standard in light of local conditions.

If the Commission or lower courts were to adopt that misreading, the resulting uncertainties raise significant questions about California's ability to continue administration of the MS4 permitting program. These uncertainties have already prompted US EPA to ask how California's

¹ "Water Boards" means the State Water Resources Control Board and nine Regional Water Quality Control Boards.

Water Boards can continue administering the MS4 permit program consistent with federal law. And there is at least a possibility that US EPA could take back the program if it believes there is substantial regulatory uncertainty. In addition, if a misreading of the opinion resulted in a common understanding that the State is compelled to fund typical permit terms that constitute ordinary municipal functions—such as street sweeping and maintaining storm sewer systems—the State might find that cost prohibitive and relinquish the program to US EPA.

To avoid unnecessary uncertainty and future litigation about the Court's intent, and to help preserve this important example of cooperative federalism, Respondents respectfully request that the Court clarify its opinion in three respects. First, the Court should confirm that in a mandates challenge to an MS4 permit, the determination of what federal law requires continues to be case-specific, and necessitates an examination of the evidence and issues unique to each MS4 permit and geographic location. Second, the Court should clarify its statement that in reviewing future cases, the Commission must give weight to the regional boards' determination of what the Clean Water Act requires, so long as its determination is both express and supported by substantial evidence. Finally, the Court should delete the word "fatally" from page 27 to clarify that the terms appearing in permits issued by US EPA in a small number of out-of-state jurisdictions do not constitute an exclusive list of the controls required to meet the federal standard.

ARGUMENT

I. AN OVERBROAD READING OF THE OPINION RAISES SERIOUS QUESTIONS ABOUT CALIFORNIA'S CONTINUED PARTICIPATION IN MS4 PERMITTING.

California was the first State in the nation to obtain US EPA approval to administer its own permitting program under the National Pollutant

Discharge Elimination System. (*Environmental Protection Agency v. California ex rel. State Water Resources Control Board* (1976) 426 U.S. 200, 209 (*Environmental Protection Agency*).) Since 1973, the Legislature has authorized the State to assume responsibility for issuing permits to dischargers to implement that federal program.

The State's role as a federally authorized NPDES permitting agency serves a number of important state objectives. Among other things, it avoids duplication of effort by federal and state regulators; avoids the logistical difficulties of two regulators coordinating their conduct; allows for regional boards drawn from the communities they serve to draft permits, rather than federal officials located elsewhere (see Wat. Code, § 13201); allows for a single avenue of judicial review in state court for water quality permits (40 C.F.R. § 123.30; Wat. Code, § 13330); and allows the State to receive federal grants (see 33 U.S.C. § 1256). Local governments avoid having to obtain two different permits from different regulators (one to comply with federal law, one to comply with state law), and they negotiate permit terms with agency officials who have local ties to, and knowledge of, the relevant community and conditions. (See Wat. Code, § 13201, subd. (a) [providing that members of regional boards must "reside or have a principal place of business within the region"].) And California's citizens who use the State's waters for drinking, fishing, swimming, municipal, agricultural, recreational, and other purposes affected by water pollution can more meaningfully participate in localized decisions affecting their water quality.

These sound reasons have motivated the State to administer federal NPDES permitting for over 40 years. (See Wat. Code, § 13370.) Similar reasoning led Congress to encourage States across the country to do the same. (See 33 U.S.C. § 1251(b).) It is not surprising, then, that 46 States have obtained NPDES program approval in order to realize the benefits of

cooperative federalism. (See <https://www.epa.gov/npdes/npdes-state-program-information> [as of Sep. 9, 2016].)

Congress amended the Clean Water Act in 1987 to require NPDES permits for MS4s. MS4 permits are expressly required of and issued to local governments, not States; they are direct federal regulation of local governments. (See 33 U.S.C. §§ 1311, 1319, 1342(i), (p)(3)(B), 1365.) This means that local governments in California would incur compliance costs associated with these requirements even if the State never administered the MS4 permitting program. Those requirements are enforceable by the US EPA (33 U.S.C. § 1342(d)(2)-(4); 40 C.F.R. § 123.44) and by third party judicial challenges. (40 C.F.R. § 123.30; Wat. Code, § 13330.)²

Permits set out the specific requirements that allow MS4 operators to comply with the Clean Water Act. (See 33 U.S.C. § 1342(k); *Environmental Protection Agency, supra*, 426 U.S. at p. 205 [NPDES permits define “a preponderance of a discharger’s obligations” under the act]; cf. *City of Burbank v. State Water Resources Control Bd.* (2005) 35

² Cases where federal law applies to local governments only because of state action; where the state has imposed conditions that exceed what federal law requires; and where federal requirements imposed on the State are passed down to local government are distinguishable. For example, in *Division of Occupational Safety & Health v. State Bd. of Control* (1987) 189 Cal.App.3d 794, 798-800, 803, to avoid federal preemption, the State adopted OSHA regulations requiring local fire departments to use three-person firefighting teams instead of the two-person teams. Absent state action, no one could have used federal law to compel those departments to use three-person teams. In contrast, the Clean Water Act’s requirements apply to MS4 operators regardless of whether the State administers the permitting program, and US EPA, or a third party, could force operators to obtain permits or compel the inclusion of specific, more stringent MS4 permit requirements to reflect the federal standard in 33 U.S.C. § 1342(p)(3)(B)(iii).

Cal.4th 613, 626-627 [noting that principles of federal supremacy prohibit Water Boards from relaxing federal permitting standards].) Terms may include, for example, street sweeping and maintaining storm sewer systems, which the municipality would perform in any event. Standing alone, these types of terms would not satisfy the federal standard, but are included to provide a complete picture of all the actions the municipality will take that contribute to meeting the federal standard.

As a practical matter, the State could not participate in the MS4 permitting program if those permit conditions were treated, for the purposes of state mandates law, as state rather than federal mandates. While this case involves trash receptacles and inspections of certain facilities, the opinion will be applied to a host of other core municipal functions commonly included as MS4 permit terms. The collective cost of every California MS4 operator's compliance with its permit, or large portions of its permit, would reach into the billions of dollars within a few years' time. One county, for instance, estimates that the cost of compliance will "be in the hundreds of millions of dollars" for the governments covered by its permit. (County of Orange Amicus Br. 3.)

Faced with a risk of unanticipated state outlays on that order of magnitude, the State could either revise the law to require the State Board to return MS4 permitting to US EPA, or simply choose to not fund the mandates. (See Cal. Const., art. XIII B, § 6, subd. (b); Gov. Code, § 17581; *California School Boards Association v. Brown* (2011) 192 Cal.App.4th 1507, 1513-1514 ["with respect to a reimbursable mandate, for each fiscal year, the Legislature is required to choose to either fully fund the annual payment toward the arrearage or suspend the operation of the mandate"].) As Justice Cuéllar notes in his concurring and dissenting opinion, "if the state knows ex ante that it will be unable to pass along the expenses to the local areas that experience the most costs and benefits from the mandate at

issue” it “would be unduly discouraged from participating” in the program, even where such participation would “otherwise be in California’s interest[.]” (Conc. & Dis. Slip Op. 6-7.)

The Regional Administrator for US EPA Region 9, which has jurisdiction over California, has informed the State Board that US EPA has concerns about California’s ability to continue implementing the MS4 permitting program. (Request for Judicial Notice in Support of Respondents’ Petition for Rehearing (RJN), Ex. A.) And US EPA’s concern is of significant concern to the State. If the opinion as written creates regulatory uncertainty, even for a period of time, US EPA could preemptively take back the MS4 permitting program, or it could be petitioned by members of the public to withdraw its approval. (33 U.S.C. § 1342(c)(3); 40 C.F.R. § 123.64(b)(1); see generally 40 C.F.R. § 123.64.) Federal law requires that the State administering an NPDES permitting program have authority to enforce the terms of the permits it issues. (See 33 U.S.C. § 1342(b)(7); 40 C.F.R. § 123.37 [requiring that agencies have “immediate[] and effective[]” authority to prevent violations of permits]; see also 40 C.F.R. § 123.23(c) [requiring that, as a condition of administering the federal program, the state attorney general must confirm that the State has “adequate authority to carry out the program,” including enforcement authority].) Similarly, federal law narrowly limits the circumstances under which permits can be modified once final. (See 40 C.F.R. § 122.62; see also Wat. Code, § 13330, subd. (d) [noting that if a permit is not challenged by an aggrieved party, the permit “shall not be subject to review by any court”].) US EPA is concerned that an MS4 permit or many of its terms may become unenforceable by the Water Boards, if deemed to be state mandates and the State fails to guarantee funds. If so, the Water Boards may no longer be able to enforce MS4

permit terms as required by federal law, which could amount to impermissible permit modifications. (See RJN, Ex. A, at p. 3.)

Respondents believe that it is in Californians' best interests for the Water Boards to continue administering the MS4 permitting program—as the Legislature and Congress decided long ago. (See Wat. Code, § 13370; 33 U.S.C. § 1251(b).) They respectfully request that the Court modify its opinion in the limited ways described below to avoid any unintended interference with that goal. These modifications would clarify, without requiring further litigation about the Court's intent and a potentially extended period of uncertainty, that the opinion in this case does not hold that all future MS4 permit terms are state mandates. That clarification would do much to ensure the continued vitality of a program that for more than 40 years has allowed Californians to have a prominent role in deciding exactly how best to implement the broad requirements of the Clean Water Act in California communities.

II. RESPONDENTS ASK THE COURT TO CLARIFY THAT THE COMMISSION MUST EVALUATE EACH MS4 PERMIT TEST CLAIM ON A CASE-BY-CASE BASIS, CONSIDERING MULTIPLE SOURCES OF EVIDENCE OF WHAT FEDERAL LAW REQUIRES.

Respondents ask the Court to clearly state that the opinion in this case is not dispositive of all the future MS4 permit test claims, and that the Commission must evaluate future test claims and permit terms in light of the facts and evidence in each case to determine whether they are state or federal mandates. In particular, Respondents request three modifications: first, to confirm that in future mandates proceedings, the determination of what federal law requires in particular circumstances remains a case-by-case inquiry; second, and relatedly, to confirm that the Commission and lower courts should accord some deference (Slip Op. 22) to adequately supported and express determinations by the regional boards on whether permit terms are required to meet the federal standard; and finally, to

remove the word “fatally” from the final sentence of section II.B.2.b. (Slip Op. 27.) These clarifications would be consistent with, and follow from, pages 24 through 27 of the opinion, in which the Court reviewed the evidence before the Commission in this case.

These clarifications would prevent the Court’s opinion from being misconstrued to make the result of every future MS4 mandates proceeding a foregone conclusion simply because regional boards exercise expertise in selecting the suite of controls necessary to meet the federally mandated maximum-extent-practicable standard in a particular MS4, and would eliminate the substantial uncertainties and harm resulting from that misreading.

A. The combination of permit terms required to control the discharge of pollutants to the maximum extent practicable is a case-by-case inquiry.

MS4 permitting poses unique regulatory challenges. Municipal stormwater pollution is “one of the most significant sources of water pollution in the nation.” (*Environmental Defense Center, Inc. v. United States Environmental Protection Agency* (9th Cir. 2003) 344 F.3d 832, 840.) Over the years, effectively regulating the stormwater system source has posed a vexing regulatory problem because it allows pollutants to enter the waterways from “possibly millions of diverse point sources.” (See *Building Industry Association of San Diego County v. State Water Resources Control Board* (2004) 124 Cal.App.4th 866, 874 (*Building Industry*)). It took well over two decades—and Congress’s enactment of the Water Quality Act of 1987—to develop a workable approach. (*Id.*, at pp. 872-875 [recounting history of stormwater regulation]; see also *Natural Resources Defense Council, Inc. v. United States Environmental Protection Agency* (9th Cir. 1992) 966 F.2d 1292, 1296 [explaining that the Water Quality Act was a response to “both the environmental threat posed by

storm water runoff and EPA's problems in implementing regulations"].) This long struggle yielded the flexible maximum-extent-practicable standard. (See 33 U.S.C. § 1342(p)(3)(B); 40 C.F.R. § 122.26(d).)

Successful implementation of that standard requires permits to be “developed in a flexible manner to allow site-specific permit conditions to reflect the wide range of impacts that can be associated with [stormwater] discharges.” (55 Fed.Reg. 48037-48038 (Nov. 16, 1990).) When developing controls to meet that standard, permit-writers must “balanc[e] numerous factors, including [a] particular control’s technical feasibility, cost, public acceptance, regulatory compliance, and effectiveness.” (*Building Industry, supra*, 124 Cal.App.4th at p. 889.) The standard was also designed to evolve over time to account for advances in technology and regulators’ understanding of pollution controls. (See 55 Fed.Reg. 48052 (Nov. 16, 1990) [“The Permits for discharges from municipal separate storm sewer systems will be written to reflect changing conditions that result from program development and implementation and corresponding improvements in water quality”]; 3 AR 3797 [“The EPA . . . expects stormwater permits to follow an iterative process whereby each successive permit becomes more refined, detailed, and expanded as needed, based on experience under the previous permit”].) This means that although federal law mandates the standard municipalities must meet, it does not specify the particularized set of terms that must appear in a permit; indeed, the US EPA has cautioned against using its guidance documents as scripts, checklists, or enforcement “how to’s.” (3 AR 3393.)

At the same time, when regional boards draft permits to implement the federal maximum-extent-practicable standard, several interrelated factors constrain what they may do. Regional boards rely on the permit applications submitted by MS4 operators to formulate permit terms. (Wat. Code, §§ 13260, 13374.) An MS4 operator that believes the regional board

has abused its discretion may seek relief before the State Board and in state court. (*Id.*, §§ 13320, 13330.) US EPA also reviews all permits, and may block a permit's issuance if it does not comply with federal law. (33 U.S.C. § 1342(d)(2)-(4); 40 C.F.R. § 123.44.) If the state agency does not fix the objection and following a federally specified process, US EPA may issue the MS4 permit. (33 U.S.C. § 1342(d)(4); 40 C.F.R. § 123.44(h)(2).) The public plays a role, too, and may participate in the permitting process and challenge a permit in state court. (See 40 C.F.R. § 124.11 [requiring that public be allowed to comment on permit applications]; *id.*, § 124.12 [requiring that public be allowed to participate in permit hearings]; *id.*, § 123.30 [requiring an opportunity for judicial review in state court]; Cal. Code Regs., tit. 23, § 2235.2 [incorporating federal rules into California permitting process]; see also Wat. Code, § 13330 [allowing “any aggrieved party” to file a petition in superior court].)

So while federal law does not prescribe the precise terms that must appear in an MS4 permit, there is a body of evidence—permit applications, US EPA guidance documents, US EPA-issued permits, US EPA suggestions or input during the permitting process, and permits issued in other States, among other things—that can be evaluated to determine whether a term is federally required.

B. The Court should clarify that if substantial evidence supports the regional board's findings about the need for specific controls to meet the federal standards, some deference is appropriate.

The opinion states that a regional board should receive deference as to what federal law requires when it has concluded that the disputed terms it chooses are the “only means by which the maximum extent practicable standard could be implemented.” (Slip Op. 22.) Respondents understand this to mean that, to be entitled to deference, regional boards must make an express finding that the particular set of permit conditions finally embodied

in a given permit is required to meet that federal standard, and must support that finding with evidence. And Respondents understand the opinion to be consistent with the State's reading of the Clean Water Act that, where a regional board has devised a set of conditions to ensure local governments' compliance with federal law, the board does not have a choice to impose some other, overall less rigorous, set of conditions. (See *ibid.*; see also Slip Op. 18 ["if federal law gives the state discretion whether to impose a particular implementing requirement, and the state exercises its discretion to impose the requirement by virtue of a 'true choice,' the requirement is not federally mandated"].) Respondents are concerned, however, that this language might be misunderstood and used to support an argument that the regional boards must make an impossible finding to receive deference—because there is no single term, or set of terms, that will ever be the *only* way to comply with the inherently flexible federal standard.

Affording some deference or weight to an agency's determination is appropriate where there is no one right answer to a question, and legislators in Congress or the Legislature have either expressly or implicitly authorized an expert agency to work out the specifics. (See, e.g., *American Coatings Association, Inc. v. South Coast Air Quality District* (2012) 54 Cal.4th 446, 475 [deferring to expert agency because there was no "objectively correct categorization" under a pollution-control statute]; see also *Larkin v. Workers' Comp. Appeals Bd.* (2015) 62 Cal.4th 152, 163 [where statute was susceptible to more than one interpretation, Court gave "great weight to the Board's interpretation because of its expert knowledge of complex workers' compensation statutes, and its role as the agency accountable for implementing the statutory scheme"].) Federal administrative law principles that would control construction of the Clean Water Act are similar. (See *United States v. Mead* (2001) 533 U.S. 218, 229 [discussing *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.* (1984) 467

U.S. 837 and noting that deference applies when an expert agency interprets an ambiguous statute].) These general principles apply with special force when what is at issue is the application of a purposefully flexible standard to a particular set of local circumstances. And an expert agency's properly articulated and supported interpretation of what federal law requires, reached after a permitting process involving dozens of hearings and tens-of-thousands of pages of administrative record (see 3 CT 415; 1 CT 25), should receive appropriate deference. By enacting the Water Quality Act of 1987 and adding the maximum-extent-practicable standard to the law, Congress left it to the permit-issuing agency's expert judgment to choose a set of terms that meet the Clean Water Act requirements for a particular MS4—a quintessential example of when deference is appropriate.

Respondents ask the Court to clarify that traditional deference principles apply when a regional board determines what federal law requires of local governments operating MS4s and its determination is supported by substantial evidence. Applied in this context, deference, which is “fundamentally situational” (*Yamaha Corporation of America v. State Board of Equalization* (1998) 19 Cal.4th 1, 12), would recognize the practical challenges of Clean Water Act permitting, and allow regional boards to bring their expertise to bear in this notoriously difficult area of regulation (see *Fukuda v. City of Angels* (1999) 20 Cal.4th 805, 812 [“considerable weight should be given to the findings of experienced administrative bodies made after a full and formal hearing, especially in cases involving technical and scientific evidence”]).

C. Removing the word “fatally” would ensure that the Commission considers all the evidence bearing on what the Clean Water Act requires.

Finally, Respondents ask the Court to strike out one word in its opinion that Respondents fear could be misread to suggest that if the EPA

has not included a term in a permit that it has issued in the past, that fact is “fatal” to Respondents’ ability to show that a term is a federal mandate in a different context. (Slip Op. 27.) Because the specific terms in a permit emerge from a collaborative process that involves the MS4 operators, the regional board, the public, and US EPA, terms that are appropriate for a particular California MS4 permit may not find counterparts in existing, US EPA-issued permits addressing conditions in other States. If the regional boards were forced to limit permit conditions to those already found in existing US EPA-issued permits, the resulting California permits would be unduly constrained in implementing—and, indeed, might be unable to satisfy—the federal maximum-extent-practicable standard. Proper application of that standard depends on a host of factors unique to a particular location—including, but not limited to, the region’s topography, population and population density, annual rainfall, frequency of rainfall, and land uses. It also depends on constructing a particular permit with a number of locally tailored, individual terms working together to achieve compliance with the federal standard. Limiting new permits to terms that have already been used in the four States and handful of federal jurisdictions where US EPA issues permits would also preclude California and its localities from taking advantage of emerging best practices or innovative approaches and technologies. A rule that treats any term not among the terms in past US EPA-issued permits as a state mandate, even where such terms are necessary to meet the maximum-extent-practicable standard in the future, would jeopardize California’s continued administration of the MS4 permitting program for the reasons discussed in Section I.

Certainly, a US EPA-issued permit from another jurisdiction may provide some evidence of what federal law requires. Treating US EPA-issued permits as one piece of evidence among many—such as US EPA

guidance documents, site-specific reports, etc.—will allow the regional boards appropriate flexibility to select a set of controls that will reliably and efficiently meet the federal standard, while enabling the Commission to determine in an informed way whether the permit contains terms that are in fact state mandates. Respondents believe this approach is fully consistent with the intent of this Court’s opinion. Removing the adverb “fatally” from the opinion would achieve that goal.

CONCLUSION

For the foregoing reasons, Respondents respectfully request that the Court grant rehearing and make minor changes to its opinion clarifying that the federal mandates question in MS4 permit test claims remains a case-by-case inquiry.

DECLARATION OF SERVICE BY U.S. MAIL

Case Name: *Department of Finance v. Commission on State Mandates (County of Los Angeles)*

No.: **S214855**

I declare:

I am employed in the Office of the Attorney General, which is the office of a member of the California State Bar, at which member's direction this service is made. I am 18 years of age or older and not a party to this matter. I am familiar with the business practice at the Office of the Attorney General for collection and processing of correspondence for mailing with the United States Postal Service. In accordance with that practice, correspondence placed in the internal mail collection system at the Office of the Attorney General is deposited with the United States Postal Service with postage thereon fully prepaid that same day in the ordinary course of business.

On September 13, 2016, I served the attached

PETITION FOR REHEARING

by placing a true copy thereof enclosed in a sealed envelope in the internal mail collection system at the Office of the Attorney General at 455 Golden Gate Avenue, Suite 11000, San Francisco, CA 94102-7004, addressed as follows:

(See attached service list.)

I declare under penalty of perjury under the laws of the State of California the foregoing is true and correct and that this declaration was executed on September 13, 2016, at San Francisco, California.

A. Bermudez

The California Regional Water Quality Control Board, San Diego Region (hereinafter Regional Board), finds that:

A. BASIS FOR THE ORDER

1. This Order is based on the federal Clean Water Act (CWA), the Porter-Cologne Water Quality Control Act (Division 7 of the Water Code, commencing with Section 13000), applicable State and federal regulations, all applicable provisions of statewide Water Quality Control Plans and Policies adopted by the State Water Resources Control Board (State Board), the Water Quality Control Plan for the San Diego Basin adopted by the Regional Board, the California Toxics Rule, and the California Toxics Rule Implementation Plan.
2. This Order reissues National Pollutant Discharge Elimination System (NPDES) Permit No. CAS0108740, which was first adopted by the Regional Board on July 16, 1990 (Order No. 90-38), and then reissued on August 8, 1996 (Order No. 96-03) and February 13, 2002 (Order No. R9-2002-01). On August 21, 2006, in accordance with Order No. R9-2002-01, the County of Orange, as the Principal Copermittee, submitted a Report of Waste Discharge (ROWD) for reissuance of the municipal separate storm sewer system (MS4) Permit.
3. This Order is consistent with the following precedential Orders adopted by the State Water Resources Control Board (State Board) addressing MS4 NPDES Permits: Order 99-05, Order WQ-2000-11, Order WQ 2001-15, Order WQO 2002-0014, and Order WQ-2009-0008 (*SWRCB/OCC FILE A-1780*).
4. The Fact Sheet / Technical Report for the Order No. R9-2009-0002, NPDES No. CAS0108740, Waste Discharge Requirements for Discharges of Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds of the County of Orange, the Incorporated Cities of Orange County, and the Orange County Flood Control District Within the San Diego Region includes cited regulatory and legal references and additional explanatory information and data in support of the requirements of this Permit. This information, including any supplements thereto, and any response to comments on the Tentative Orders, is hereby incorporated by reference into these findings.

B. REGULATED PARTIES

1. Each of the persons in Table 1 below, hereinafter called Copermittees or dischargers, owns or operates an MS4, through which it discharges runoff into waters of the United States within the San Diego Region. These MS4s fall into one or more of the following categories: (1) a medium or large MS4 that services a population of greater than 100,000 or 250,000 respectively; or (2) a small MS4 that is "interrelated" to a medium or large MS4; or (3) an MS4 which contributes to a

violation of a water quality standard; or (4) an MS4 which is a significant contributor of pollutants to waters of the United States (waters of the U.S).

Table 1. Municipal Copermitttees

1. City of Aliso Viejo	8. City of Mission Viejo
2. City of Dana Point	9. City of Rancho Santa Margarita
3. City of Laguna Beach	10. City of San Clemente
4. City of Laguna Hills	11. City of San Juan Capistrano
5. City of Laguna Niguel	12. County of Orange
6. City of Laguna Woods	13. Orange County Flood Control District
7. City of Lake Forest	

C. DISCHARGE CHARACTERISTICS

1. Runoff discharged from an MS4 contains waste, as defined in the California Water Code (CWC), and pollutants that adversely affect the quality of the waters of the State. The discharge of runoff from an MS4 is a “discharge of pollutants from a point source” into waters of the U.S. as defined in the CWA.
2. MS4 storm water and non-storm water discharges are likely to contain pollutants that cause or threaten to cause a violation of water quality standards, as outlined in the Regional Board’s Water Quality Control Plan for the San Diego Basin (Basin Plan). Storm water and non-storm water discharges from the MS4 are subject to the conditions and requirements established in the San Diego Basin Plan for point source discharges. These surface water quality standards must be complied with at all times, irrespective of the source and manner of discharge.
3. The most common categories of pollutants in runoff include total suspended solids, sediment, pathogens (e.g., bacteria, viruses, protozoa); heavy metals (e.g., copper, lead, zinc and cadmium); petroleum products and polynuclear aromatic hydrocarbons; synthetic organics (e.g., pesticides, herbicides, and PCBs); nutrients (e.g., nitrogen and phosphorus fertilizers); oxygen-demanding substances (decaying vegetation, animal waste); detergents; and trash.
4. The discharge of pollutants and/or increased flows from MS4s may cause or threaten to cause the concentration of pollutants to exceed applicable receiving water quality objectives and/or impair or threaten to impair designated beneficial uses resulting in a condition of pollution (i.e., unreasonable impairment of water quality for designated beneficial uses), contamination, or nuisance.
5. Pollutants in runoff can threaten and adversely affect human health. Human illnesses have been clearly linked to recreating near storm drains flowing to coastal waters. Also, runoff pollutants in receiving waters can bioaccumulate in the tissues of invertebrates and fish, which may be eventually consumed by humans.

6. Runoff discharges from MS4s often contain pollutants that cause toxicity to aquatic organisms (i.e., adverse responses of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies). Toxic pollutants impact the overall quality of aquatic systems and beneficial uses of receiving waters.
7. The Copermitttees discharge runoff into lakes, drinking water reservoirs, rivers, streams, creeks, bays, estuaries, coastal lagoons, the Pacific Ocean, and tributaries thereto within one of the eleven hydrologic units (San Juan Hydrologic Unit) comprising the San Diego Region as shown in Tables 2a and 2b. Some of the receiving water bodies have been designated as impaired by the Regional Board and the United States Environmental Protection Agency (USEPA) in 2006 pursuant to CWA section 303(d). Also shown in the Tables are the watershed management areas (WMAs) as defined in the Regional Board report, Watershed Management Approach, January 2002.

Table 2a. Common Watersheds and CWA Section 303(d) Impaired Waters

Regional Board Watershed Management Area (WMA)	Hydrologic Area (HA) or Hydrologic Subarea (HSA) of the San Juan Hydrologic Unit	Major Receiving Water Bodies	303(d) Pollutant(s)/stressor or Water Quality Effect¹
Laguna Coastal Streams	Laguna HA, excluding Aliso HSA and Dana Point HSA	Laguna Canyon Creek, Pacific Ocean	Bacterial indicators Sediment toxicity
Aliso Creek	Aliso HSA	Aliso Creek, English Canyon, Pacific Ocean	Toxicity Phosphorus Bacterial indicators Benzo[b]fluoranthene Dieldrin Sediment Toxicity
Dana Point Coastal Streams	Dana Point HSA	Dana Point Harbor, Salt Creek, Pacific Ocean	Bacterial indicators
San Juan Creek	Mission Viejo HA	San Juan Creek, Trabuco Creek, Oso Creek, Canada Gobernadora, Bell Canyon, Verdugo Canyon, Pacific Ocean	Bacterial indicators DDE Chloride Sulfates Total dissolved solids

¹ The listed 303(d) pollutant(s) do not necessarily reflect impairment of the entire corresponding WMA or all corresponding major surface water bodies. The specific impaired portions of each WMA are listed in the State Water Resources Control Board's 2006 Section 303(d) List of Water Quality Limited Segments.

* Municipality also includes areas within watersheds of the Santa Ana Regional Board that are outside the scope of this Order

8. Trash is a persistent pollutant which can enter receiving waters from the MS4 resulting in accumulation and transport in receiving waters over time. Trash poses a serious threat to the Beneficial Uses of the receiving waters, including, but not limited to, human health, rare and endangered species, navigation and human recreation.
9. The Copermittees' water quality monitoring data submitted to date documents persistent violations of Basin Plan water quality objectives for various runoff-related pollutants (fecal coliform bacteria, total suspended solids, turbidity, metals, etc.) at

various watershed monitoring stations. Persistent toxicity has also been observed at some watershed monitoring stations. In addition, bioassessment data indicates that the majority of urbanized receiving waters have Poor to Very Poor Index of Biotic Integrity ratings. In sum, the above findings indicate that runoff discharges are causing or contributing to water quality impairments, and are a leading cause of such impairments in Orange County.

10. When natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops, and parking lots, the natural absorption and infiltration abilities of the land are lost. Therefore, runoff leaving a developed area is significantly greater in runoff volume, velocity, and peak flow rate than pre-development runoff from the same area. Runoff durations can also increase as a result of flood control and other efforts to control peak flow rates. Increased volume, velocity, rate, and duration of runoff, and decreased natural clean sediment loads, greatly accelerate the erosion of downstream natural channels. Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as a 3-5 percent conversion from natural to impervious surfaces. The increased runoff characteristics from new development must be controlled to protect against increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force.
11. Development creates new pollution sources as human population density increases and brings with it proportionately higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, trash, etc. which can either be washed or directly dumped into the MS4. As a result, the runoff leaving the developed urban area is significantly greater in pollutant load than the pre-development runoff from the same area. These increased pollutant loads must be controlled to protect downstream receiving water quality.
12. Development and urbanization especially threaten environmentally sensitive areas (ESAs), such as water bodies designated as supporting a RARE beneficial use (supporting rare, threatened or endangered species) and CWA 303(d)-impaired water bodies. Such areas have a much lower capacity to withstand pollutant shocks than might be acceptable in other areas. In essence, development that is ordinarily insignificant in its impact on the environment may become significant in a particularly sensitive environment. Therefore, additional control to reduce storm water pollutants from new and existing development may be necessary for areas adjacent to or discharging directly to an ESA.
13. Although dependent on several factors, the risks typically associated with properly managed infiltration of runoff (especially from residential land use areas) are not significant. The risks associated with infiltration can be managed by many techniques, including (1) designing landscape drainage features that promote infiltration of runoff, but do not "inject" runoff (injection bypasses the natural processes of filtering and transformation that occur in the soil); (2) taking reasonable

steps to prevent the illegal disposal of wastes; (3) protecting footings and foundations; (4) ensuring that each drainage feature is adequately maintained in perpetuity; and (5) pretreatment.

14. Non-storm water (dry weather) discharge from the MS4 is not considered a storm water (wet weather) discharge and therefore is not subject to regulation under the Maximum Extent Practicable (MEP) standard from CWA 402(p)(3)(B)(iii), which is explicitly for “Municipal ... *Stormwater Discharges* (emphasis added)” from the MS4. Non-storm water discharges, per CWA 402(p)(3)(B)(ii), are to be effectively prohibited. Such dry weather non-storm water discharges have been shown to contribute significant levels of pollutants and flow in arid, developed Southern California watersheds and are to be effectively prohibited under the Clean Water Act.
15. Non-storm water discharges to the MS4 granted an influent exception [i.e., which are exempt from the effective prohibition requirement set forth in CWA section 402(p)(3)(B)(ii)] under 40 CFR 122. 26 are included within this Order. Any exempted discharges identified by Copermittees as a source of pollutants are subsequently required to be *addressed* (emphasis added) as illicit discharges through prohibition and incorporation into existing IC/ID programs. The Copermittees have identified landscape irrigation, irrigation water and lawn water, previously exempted discharges, as a source of pollutants and conveyance of pollutants to waters of the United States.

D. RUNOFF MANAGEMENT PROGRAMS

1. General

- a. This Order specifies requirements necessary for the Copermittees to reduce the discharge of pollutants in storm water runoff to the maximum extent practicable (MEP). However, since MEP is a dynamic performance standard, which evolves over time as runoff management knowledge increases, the Copermittees’ runoff management programs must continually be assessed and modified to incorporate improved programs, control measures, best management practices (BMPs), etc. in order to achieve the evolving MEP standard. Absent evidence to the contrary, this continual assessment, revision, and improvement of runoff management program implementation is expected to ultimately achieve compliance with water quality standards in the Region.
- b. The Copermittees have generally been implementing the jurisdictional runoff management programs required pursuant to Order No. 2002-01 since February 13, 2003. Prior to that, the Copermittees were regulated by Order No. 96-03 since August 8, 1996. Runoff discharges, however, continue to cause or contribute to violations of water quality standards as evidenced by the Copermittees monitoring results.

- c. This Order contains new or modified requirements that are necessary to improve Copermittees' efforts to reduce the discharge of pollutants in storm water runoff to the MEP and achieve water quality standards. Some of the new or modified requirements, such as the revised Watershed Runoff Management Program section, are designed to specifically address high priority water quality problems. Other new or modified requirements address program deficiencies that have been noted during audits, report reviews, and other Regional Board compliance assessment activities.
- d. Updated Jurisdictional Runoff Management Plans (JRMPs) and Watershed Runoff Management Plans (WRMPs), which describe the Copermittees' runoff management programs in their entirety, are needed to guide the Copermittees' runoff management efforts and aid the Copermittees in tracking runoff management program implementation. It is practicable for the Copermittees to update the JRMPs and WRMPs within one year, since significant efforts to develop these programs have already occurred.
- e. Pollutants can be effectively reduced in storm water runoff by the application of a combination of pollution prevention, source control, and treatment control BMPs. Pollution prevention is the reduction or elimination of pollutant generation at its source and is the best "first line of defense." Source control BMPs (both structural and non-structural) minimize the contact between pollutants and flows (e.g., rerouting run-on around pollutant sources or keeping pollutants on-site and out of receiving waters). Treatment control BMPs remove pollutants that have been mobilized by wet-weather or dry-weather flows.
- f. Runoff needs to be addressed during the three major phases of urban development (planning, construction, and use) in order to reduce the discharge of pollutants from storm water to the MEP, effectively prohibit non-storm water discharges and protect receiving waters. Development which is not guided by water quality planning policies and principles can unnecessarily result in increased pollutant load discharges, flow rates, and flow durations which can negatively impact receiving water beneficial uses. Construction sites without adequate BMP implementation result in sediment runoff rates which greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters. Existing development generates substantial pollutant loads which are discharged in runoff to receiving waters.
- g. Annual reporting requirements included in this Order are necessary to meet federal requirements and to evaluate the effectiveness and compliance of the Copermittees' programs.
- h. This Order establishes Storm Water Action Levels (SALs) for selected pollutants based on USEPA Rain Zone 6 (arid southwest) Phase I MS4 monitoring data for pollutants in storm water. The SALs were computed as the 90th percentile of the data set, utilizing the statistical based population approach, one of three

approaches recommended by the California Water Board's Storm Water Panel in its report, 'The Feasibility of Numerical Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities (June 2006). SALs are identified in Section D of this Order. Copermittees shall implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water from the permitted areas so as not to exceed the SALs. Exceedance of SALs may indicate inadequacy of programmatic measures and BMPs required in this Order.

2. Development Planning

- a. The Standard Storm Water Mitigation Plan (SSMP) requirements contained in this Order are consistent with Order WQ-2000-11 adopted by the State Water Resources Control Board (State Board) on October 5, 2000. In the precedential order, the State Board found that the design standards, which essentially require that runoff generated by 85 percent of storm events from specific development categories be infiltrated or treated, reflect the MEP standard. The order also found that the SSMP requirements are appropriately applied to the majority of the Priority Development Project categories contained in Section D.1 of this Order. The State Board also gave Regional Water Quality Control Boards the needed discretion to include additional categories and locations, such as retail gasoline outlets (RGOs), in SSMPs.
- b. Controlling runoff pollution by using a combination of onsite source control and site design BMPs augmented with treatment control BMPs before the runoff enters the MS4 is important for the following reasons: (1) Many end-of-pipe BMPs (such as diversion to the sanitary sewer) are typically ineffective during significant storm events. Whereas, onsite source control BMPs can be applied during all runoff conditions; (2) End-of-pipe BMPs are often incapable of capturing and treating the wide range of pollutants which can be generated on a sub-watershed scale; (3) End-of-pipe BMPs are more effective when used as polishing BMPs, rather than the sole BMP to be implemented; (4) End-of-pipe BMPs do not protect the quality or beneficial uses of receiving waters between the pollutant source and the BMP; and (5) Offsite end-of-pipe BMPs do not aid in the effort to educate the public regarding sources of pollution and their prevention.
- c. Use of Low-Impact Development (LID) site design BMPs at new development, redevelopment and retrofit projects can be an effective means for minimizing the impact of storm water runoff discharges from the development projects on receiving waters. LID is a site design strategy with a goal of maintaining or replicating the pre-development hydrologic regime through the use of design techniques. LID site design BMPs help preserve and restore the natural hydrologic cycle of the site, allowing for filtration and infiltration which can greatly reduce the volume, peak flow rate, velocity, and pollutant loads of storm water runoff. Current runoff management, knowledge, practices and technology have

resulted in the use of LID BMPs as an acceptable means of meeting the storm water MEP standard.

- d. Retail Gasoline Outlets (RGOs) are significant sources of pollutants in storm water runoff. RGOs are points of convergence for motor vehicles for automotive related services such as repair, refueling, tire inflation, and radiator fill-up and consequently produce significantly higher loadings of hydrocarbons and trace metals (including copper and zinc) than other developed areas.
- e. Industrial sites are significant sources of pollutants in runoff. Pollutant concentrations and loads in runoff from industrial sites are similar or exceed pollutant concentrations and loads in runoff from other land uses, such as commercial or residential land uses. As with other land uses, LID site design, source control, and treatment control BMPs are needed at industrial sites in order to meet the MEP standard. These BMPs are necessary where the industrial site is larger than 10,000 square feet. The 10,000 square feet threshold is appropriate, since it is consistent with requirements in other Phase I NPDES storm water regulations throughout California.
- f. If not properly designed or maintained, certain BMPs implemented or required by municipalities for runoff management may create a habitat for vectors (e.g. mosquitoes and rodents). Proper BMP design and maintenance to avoid standing water, however, can prevent the creation of vector habitat. Nuisances and public health impacts resulting from vector breeding can be prevented with close collaboration and cooperative effort between municipalities, the Orange County Vector Control District, and the California Department of Public Health during the development and implementation of runoff management programs.
- g. The increased volume, velocity, frequency and discharge duration of storm water runoff from developed areas has the potential to greatly accelerate downstream erosion, impair stream habitat in natural drainages, and negatively impact beneficial uses. Development and urbanization increase pollutant loads in storm water runoff and the volume of storm water runoff. Impervious surfaces can neither absorb water nor remove pollutants and thus lose the purification and infiltration provided by natural vegetated soil. Hydromodification measures for discharges to hardened channels are needed for the future restoration of the hardened channels to their natural state, thereby restoring the chemical, physical, and biological integrity and Beneficial Uses of local receiving waters.

3. Construction and Existing Development

- a. In accordance with federal NPDES regulations and to ensure the most effective oversight of industrial and construction site discharges, discharges of runoff from industrial and construction sites are subject to dual (State and local) storm water regulation. Under this dual system, each Copermitttee is responsible for enforcing its local permits, plans, and ordinances, and the Regional Board is

responsible for enforcing the General Construction Activities Storm Water Permit, State Board Order 99-08 DWQ, NPDES No. CAS000002 (General Construction Permit) and the General Industrial Activities Storm Water Permit, State Board Order 97-03 DWQ, NPDES No. CAS000001 (General Industrial Permit) and any reissuance of these permits. NPDES municipal regulations require that municipalities develop and implement measures to address runoff from industrial and construction activities. Those measures may require the implementation of additional BMPs than are required under the statewide general permits for activities subject to both State and local regulation.

- b. Identification of sources of pollutants in runoff (such as municipal areas and activities, industrial and commercial sites/sources, construction sites, and residential areas), development and implementation of BMPs to address those sources, and updating ordinances and approval processes are necessary for the Copermittees to ensure that discharges of pollutants from its MS4 in storm water are reduced to the MEP and that non-storm water discharges are not occurring. Inspections and other compliance verification methods are needed to ensure minimum BMPs are implemented. Inspections are especially important at high risk areas for pollutant discharges.
- c. Historic and current development makes use of natural drainage patterns and features as conveyances for runoff. Urban streams used in this manner are part of the municipalities MS4 regardless of whether they are natural, anthropogenic, or partially modified features. In these cases, the urban stream is both an MS4 and receiving water.
- d. As operators of the MS4s, the Copermittees cannot passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or control. These discharges may cause or contribute to a condition of contamination or a violation of water quality standards.
- e. Waste and pollutants which are deposited and accumulate in MS4 drainage structures will be discharged from these structures to waters of the U.S. unless they are removed. These discharges may cause or contribute to, or threaten to cause or contribute to, a condition of pollution in receiving waters. For this reason, pollutant discharges from storm water into MS4s must be reduced using a combination of management measures, including source control, and an effective MS4 maintenance program must be implemented by each Copermittee.
- f. Enforcement of local runoff related ordinances, permits, and plans is an essential component of every runoff management program and is specifically required in the federal storm water regulations and this Order. Each Copermittee is individually responsible for adoption and enforcement of ordinances and/or policies, implementation of identified control measures/BMPs needed to prevent

or reduce pollutants in storm water runoff, and for the allocation of funds for the capital, operation and maintenance, administrative, and enforcement expenditures necessary to implement and enforce such control measures/BMPs under its jurisdiction. Education is an important aspect of every effective runoff management program and the basis for changes in behavior at a societal level. Education of municipal planning, inspection, and maintenance department staffs is especially critical to ensure that in-house staffs understand how their activities impact water quality, how to accomplish their jobs while protecting water quality, and their specific roles and responsibilities for compliance with this Order. Public education, designed to target various urban land users and other audiences, is also essential to inform the public of how individual actions affect receiving water quality and how adverse effects can be minimized.

- g. Public participation during the development of runoff management programs is necessary to ensure that all stakeholder interests and a variety of creative solutions are considered.
- h. Retrofitting existing development with storm water treatment controls, including LID, is necessary to address storm water discharges from existing development that may cause or contribute to a condition of pollution or a violation of water quality standards. Although SSMP BMPs are required for redevelopment, the current rate of redevelopment will not address water quality problems in a timely manner. Cooperation with private landowners is necessary to effectively identify, implement and maintain retrofit projects for the preservation, restoration, and enhancement of water quality.

4. Watershed Runoff Management

- a. Since runoff within a watershed can flow from and through multiple land uses and political jurisdictions, watershed-based runoff management can greatly enhance the protection of receiving waters. Such management provides a means to focus on the most important water quality problems in each watershed. By focusing on the most important water quality problems, watershed efforts can maximize protection of beneficial use in an efficient manner. Effective watershed-based runoff management actively reduces pollutant discharges and abates pollutant sources causing or contributing to watershed water quality problems. Watershed-based runoff management that does not actively reduce pollutant discharges and abate pollutant sources causing or contributing to watershed water quality problems can necessitate implementation of the iterative process outlined in section A.3 of the Tentative Order. Watershed management of runoff does not require Copermittees to expend resources outside of their jurisdictions. Watershed management requires the Copermittees within a watershed to develop a watershed-based management strategy, which can then be implemented on a jurisdictional basis.

- b. Some runoff issues, such as general education and training, can be effectively addressed on a regional basis. Regional approaches to runoff management can improve program consistency and promote sharing of resources, which can result in implementation of more efficient programs.
- c. It is important for the Copermittes to coordinate their water quality protection and land use planning activities to achieve the greatest protection of receiving water bodies. Copermittie coordination with other watershed stakeholders, especially the State of California Department of Transportation, the United States Department of Defense, and water and sewer districts, is also important.

E. STATUTE AND REGULATORY CONSIDERATIONS

1. The Receiving Water Limitations (RWL) language specified in this Order is consistent with language recommended by the USEPA and established in State Board Water Quality Order 99-05, *Own Motion Review of the Petition of Environmental Health Coalition to Review Waste Discharge Requirements Order No. 96-03, NPDES Permit No. CAS0108740*, adopted by the State Board on June 17, 1999. The RWL in this Order require compliance with water quality standards, which for storm water discharges is to be achieved through an iterative approach requiring the implementation of improved and better-tailored BMPs over time. Compliance with receiving water limits based on applicable water quality standards is necessary to ensure that MS4 discharges will not cause or contribute to violations of water quality standards and the creation of conditions of pollution.
2. The Water Quality Control Plan for the San Diego Basin (Basin Plan), identifies the following beneficial uses for surface waters in Orange County: Municipal and Domestic Supply (MUN)², Agricultural Supply (AGR), Industrial Process Supply (PROC), Industrial Service Supply (IND), Ground Water Recharge (GWR), Contact Water Recreation (REC1), Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Cold Freshwater Habitat (COLD), Wildlife Habitat (WILD), Rare, Threatened, or Endangered Species (RARE), Freshwater Replenishment (FRSH), Hydropower Generation (POW), and Preservation of Biological Habitats of Special Significance (BIOL). The following additional beneficial uses are identified for coastal waters of Orange County: Navigation (NAV), Commercial and Sport Fishing (COMM), Estuarine Habitat (EST), Marine Habitat (MAR), Aquaculture (AQUA), Migration of Aquatic Organisms (MIGR), Spawning, Reproduction, and/or Early Development (SPWN), and Shellfish Harvesting (SHELL).
3. This Order is in conformance with State Board Resolution No. 68-16, *Statement of Policy with Respect to Maintaining High Quality Waters in California*, and the federal Antidegradation Policy described in 40 CFR 131.12.

² Subject to exceptions under the "Sources of Drinking Waters" Policy (Resolution No. 89-33)

4. Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA addresses five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This NPDES permit addresses the management measures required for the urban category, with the exception of septic systems. The adoption and implementation of this NPDES permit relieves the Copermittee from developing a non-point source plan, for the urban category, under CZARA. The Regional Board addresses septic systems through the administration of other programs.
5. Section 303(d)(1)(A) of the CWA requires that “Each state must identify those waters within its boundaries for which the effluent limitations...are not stringent enough to implement any water quality standard (WQS) applicable to such waters.” The CWA also requires states to establish a priority ranking of impaired water bodies known as Water Quality Limited Segments and to establish Total Maximum Daily Loads (TMDLs) for such waters. This priority list of impaired water bodies is called the Section 303(d) List. The current Section 303(d) List was approved by the State Board on October 25, 2006. On June 28, 2007 the 2006 303(d) list for California was given final approval by the United States Environmental Protection Agency (USEPA).
6. This Order does not constitute an unfunded local government mandate subject to subvention under Article XIII B, Section (6) of the California Constitution for several reasons, including, but not limited to, the following. First, this Order implements federally mandated requirements under federal Clean Water Act section 402. (33 U.S.C. § 1342(p)(3)(B).) Second, the local agency Copermittees’ obligations under this Order are similar to, and in many respects less stringent than, the obligations of non-governmental and new dischargers who are issued NPDES permits for storm water and non-storm water discharges. Third, the local agency Copermittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Order. Fourth, the Copermittees have requested permit coverage in lieu of compliance with the complete prohibition against the discharge of pollutants contained in federal Clean Water Act section 301, subdivision (a) (33 U.S.C. § 1311(a)) and in lieu of numeric restrictions on their storm water discharges. Fifth, the local agencies’ responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under State law predates the enactment of Article XIII B, Section (6) of the California Constitution. Likewise, the provisions of this Order to implement total maximum daily loads (TMDLs) are federal mandates. The federal Clean Water Act requires TMDLs to be developed for water bodies that do not meet federal water quality standards. (33 U.S.C. sec. 1313(d).) Once the U.S. Environmental Protection Agency or a state develops a TMDL, federal law requires that permits must contain effluent limitations consistent with the assumptions of any applicable wasteload allocation. (40 C.F.R. sec. 122.44(d)(1)(vii)(B).)

7. Runoff treatment and/or mitigation must occur prior to the discharge of runoff into receiving waters. Treatment BMPs must not be constructed in waters of the U.S. or State unless the runoff flows are sufficiently pretreated to protect the values and functions of the water body. Federal regulations at 40 CFR 131.10(a) state that in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S. Authorizing the construction of an runoff treatment facility within a water of the U.S., or using the water body itself as a treatment system or for conveyance to a treatment system, would be tantamount to accepting waste assimilation as an appropriate use for that water body. Furthermore, the construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body. Without federal authorization (e.g., pursuant to Clean Water Act Section 404), waters of the U.S. may not be converted into, or used as, waste treatment or conveyance facilities. Similarly, waste discharge requirements pursuant to California Water Code Section 13260 are required for the conversion or use of waters of the State as waste treatment or conveyance facilities. Diversion from waters of the U.S./State to treatment facilities and subsequent return to waters of the U.S. is allowable, provided that the effluent complies with applicable NPDES requirements.
8. The issuance of waste discharge requirements and an NPDES permit for the discharge of runoff from MS4s to waters of the U.S. is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (CEQA) (Public Resources Code, Division 13, Chapter 3, section 21000 et seq.) in accordance with the CWC section 13389.
9. Multiple water bodies in Orange County have been identified as impaired and placed on the 303(d) list. In 2004, Bacteria Impaired Waters TMDL Project II included six bacteria impaired shorelines in Dana Point Harbor and San Diego Bay: Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park, B Street, G Street Pier, Tidelands Park, and Chula Vista Marina in San Diego Bay. Since then, only Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay can be confirmed as still impaired by indicator bacteria. On June 11, 2008 the Regional Board adopted a Basin Plan amendment to incorporate *Bacteria Impaired Waters TMDL Project II for San Diego Bay and Dana Point Harbor Shorelines*. On June 16, 2009, the State Board approved the Basin Plan amendment. This action meets requirements of section 303(d) of the Clean Water Act (CWA). The Basin Plan amendment process is authorized under section 13240 of the Water Code. The State's Office of Administrative Law (OAL) approved the TMDLs on September 15, 2009. The effective date of the TMDLs is the date of OAL approval. USEPA approved the TMDLs on October 26, 2009.
10. Storm water discharges from developed and developing areas in Orange County are significant sources of certain pollutants that cause, may be causing, threatening to cause or contributing to water quality impairment in the waters of Orange County.

Furthermore, as delineated in the CWA section 303(d) list in Table 3, the Regional Board has found that there is a reasonable potential that municipal storm water and non-storm water discharges from MS4s cause or may cause or contribute to an excursion above water quality standards for the following pollutants: Indicator Bacteria, Phosphorous, Toxicity and Turbidity. In accordance with CWA section 303(d), the Regional Board is required to establish Total Maximum Daily Loads (TMDLs) for these pollutants to these waters to eliminate impairment and attain water quality standards. Therefore, certain early pollutant control actions and further pollutant impact assessments by the Copermitttees are warranted and required pursuant to this Order.

Table 3. 2006 Section 303(d) Listed Waterbodies in So. Orange County

Waterbody	Pollutant
Aliso Creek	Indicator Bacteria, Phosphorus, Toxicity
Aliso Creek Mouth	Indicator Bacteria
Dana Point Harbor	Indicator Bacteria
English Canyon Creek	Benzo[b]fluoranthene, Dieldrin, Sediment Toxicity
Laguna Canyon Channel	Sediment Toxicity
Oso Creek (at Mission Viejo Golf Course)	Chloride, Sulfates, Total Dissolved Solids
Pacific Ocean Shoreline, Aliso HSA	Indicator Bacteria
Pacific Ocean Shoreline, Dana Point HSA	Indicator Bacteria
Pacific Ocean Shoreline, Laguna Beach HSA	Indicator Bacteria
Pacific Ocean Shoreline, Lower San Juan HSA	Indicator Bacteria
Pacific Ocean Shoreline, San Clemente HA	Indicator Bacteria
Pacific Ocean Shoreline, San Joaquin Hills HSA	Indicator Bacteria
Prima Deshecha Creek	Phosphorus, Turbidity
San Juan Creek	DDE, Indicator Bacteria
San Juan Creek (mouth)	Indicator Bacteria
Segunda Deshecha Creek	Phosphorus, Turbidity

11. This Order incorporates only those MS4 Waste Load Allocations (WLAs) developed in TMDLs that have been adopted by the Regional Water Board and have been approved by the State Board, Office of Administrative Law and U.S. EPA. Approved TMDL WLAs are to be addressed using water quality-based effluent limitations (WQBELs) calculated as numeric limitations (either in the receiving waters and/or at the point of MS4 discharge) and/or as BMPs. In most cases, the numeric limitation must be achieved to ensure the adequacy of the BMP program. Waste load

allocations for storm water and non-storm water discharges have been included within this Order only if the TMDL has received all necessary approvals. This Order establishes WQBELs and conditions consistent with the requirements and assumptions of the WLAs in the TMDLs as required by 40 CFR 122.44(d)(1)(vii)(B).

A TMDL is the total amount of a particular pollutant that a water body can receive and still meet Water Quality Standards (WQSS), which are comprised of Water Quality Objectives (WQOs), Beneficial Uses and the States Policy on Maintaining High Quality Waters³. The WQOs serve as the primary basis for protecting the associated Beneficial Use. The Numeric Target of a TMDL interprets and applies the numeric and/or narrative WQOs of the WQSS as the basis for the WLAs. This Order addresses TMDLs through Water Quality Based Effluent Limitations (WQBELs) that must be consistent with the assumptions and requirements of the WLA⁴. Federal guidance⁵ states that when adequate information exists, storm water permits are to incorporate numeric water quality based effluent limitations. In most cases, the numeric target(s) of a TMDL are a component of the WQBELs. When the numeric target is based on one or more numeric WQOs, the numeric WQOs and underlying assumptions and requirements will be used in the WQBELs as numeric effluent limitations by the end of the TMDL compliance schedule, unless additional information is required. When the numeric target interprets one or more narrative WQOs, the numeric target may assess the efficacy and progress of the BMPs in meeting the WLAs and restoring the Beneficial Uses by the end of the TMDL compliance schedule.

This Order fulfills a component of the TMDL Implementation Plan adopted by this Regional Board on June 11, 2008 for indicator bacteria in Baby Beach by establishing WQBELs expressed as both BMPs to achieve the WLAs and as numeric limitations⁶ for the City of Dana Point and the County of Orange. The establishment of WQBELs expressed as BMPs should be sufficient to achieve the WLA specified in the TMDL. The Waste Load Allocations (WLAs) and Numeric Targets are the necessary metrics to ensure that the BMPs achieve appropriate concentrations of bacterial indicators in the receiving waters.

³ State Water Resources Control Board, Resolution No. 68-16

⁴ 40 CFR 122.44(d)(1)(vii)(B)

⁵ USEPA, *Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits*, 61 FR 43761, August 26, 1996

⁶ The Waste Load Allocations are defined in Resolution No. R9-2008-0027, A Resolution to Adopt an Amendment to the *Water Quality Control Plan for the San Diego Basin (9)* to Incorporate Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay.

12. This Order requires each Copermitttee to effectively prohibit all types of unauthorized discharges of non-storm water into its MS4. However, historically pollutants have been identified as present in dry weather non-storm water discharges from the MS4s through 303(d) listings, monitoring conducted by the Copermitttees under Order No. R9-2002-0001, and there are others expected to be present in dry weather non-storm water discharges because of the nature of these discharges. This Order includes action levels for pollutants in non-storm water, dry weather, discharges from the MS4 designed to ensure that the requirement to effectively prohibit all types of unauthorized discharges of non-storm water in the MS4 is being complied with. Action levels in the Order are based upon numeric or narrative water quality objectives and criteria as defined in the Basin Plan, the Water Quality Control Plan for Ocean Waters of California (Ocean Plan), and the State Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP). An exceedance of an action level requires specified responsive action by the Copermitttees. This Order describes what actions the Copermitttees must take when an exceedance of an action level is observed. Exceedances of non-storm water action levels do not alone constitute a violation of this Order but could indicate non-compliance with the requirement to effectively prohibit all types of unauthorized non-storm water discharges into the MS4 or other prohibitions established in this Order. Failure to undertake required source investigation and elimination action following an exceedance of 2a non-storm water action level (NAL or action level) is a violation of this Order. The Regional Board recognizes that use of action levels will not necessarily result in detection of all unauthorized sources of non-storm water discharges because there may be some discharges in which pollutants do not exceed established action levels. However, establishing NALs at levels appropriate to protect water quality standards is expected to lead to the identification of significant sources of pollutants in dry weather non-storm water discharges.
13. In addition to federal regulations cited in the Fact Sheet / Technical Report for the Order NO. R9-2009-0002, monitoring and reporting required under Order No. R9-2009-0002 is required pursuant to authority under CWC section 13383.

F. PUBLIC PROCESS

1. The Regional Board has notified the Copermitttees, all known interested parties, and the public of its intent to consider adoption of an Order prescribing waste discharge requirements that would serve to renew an NPDES permit for the existing discharge of runoff.
2. The Regional Board has held public hearings on April 11, 2007, February 13, 2008, July 1, 2009, and November 18, 2009 and heard and considered all comments pertaining to the terms and conditions of this Order.

IT IS HEREBY ORDERED that the Copermittees, in order to meet the provisions contained in Division 7 of the California Water Code (CWC) and regulations adopted thereunder, and the provisions of the Clean Water Act (CWA) and regulations adopted thereunder, must each comply with the following:

A. PROHIBITIONS AND RECEIVING WATER LIMITATIONS

1. Discharges into and from municipal separate storm sewer systems (MS4s) in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance (as defined in CWC section 13050), in waters of the state are prohibited.
2. Storm water discharges from MS4s containing pollutants which have not been reduced to the maximum extent practicable (MEP) are prohibited.⁷
3. Discharges from MS4s that cause or contribute to the violation of water quality standards (designated beneficial uses, water quality objectives developed to protect beneficial uses, and the State policy with respect to maintaining high quality waters) are prohibited.
 - a. Each Copermittee must comply with section A.3 and section A.4 as it applies to Prohibition 5 in Attachment A of this Order through timely implementation of control measures and other actions to reduce pollutants in storm water discharges in accordance with this Order, including any modifications. If exceedance(s) of water quality standards persist notwithstanding implementation of this Order, the Copermittee must assure compliance with section A.3 and section A.4 as it applies to Prohibition 5 in Attachment A of this Order by complying with the following procedure:
 - (1) Upon a determination by either the Copermittee or the Regional Board that storm water MS4 discharges are causing or contributing to an exceedance of an applicable water quality standard, the Copermittee must notify the Regional Board within 30 days and thereafter submit a report to the Regional Board that describes best management practices (BMPs) that are currently being implemented and additional BMPs that will be implemented to prevent or reduce any pollutants that are causing or contributing to the exceedance of water quality standards. The report may be incorporated in the Annual Report unless the Regional Board directs an earlier submittal. The report must include an implementation schedule. The Regional Board may require modifications to the report;

⁷ This prohibition does not apply to MS4 discharges which receive subsequent treatment to reduce pollutants to the MEP prior to entering receiving waters (e.g., low flow diversions to the sanitary sewer).

- (2) Submit any modifications to the report required by the Regional Board within 30 days of notification;
 - (3) Within 30 days following approval of the report described above by the Regional Board, the Copermittee must revise its Jurisdictional Runoff Management Program and monitoring program to incorporate the approved modified BMPs that have been and will be implemented, the implementation schedule, and any additional monitoring required; and
 - (4) Implement the revised Jurisdictional Runoff Management Program and monitoring program in accordance with the approved schedule.
- b. The Copermittee must repeat the procedure set forth above to comply with the receiving water limitations for continuing or recurring exceedances of the same water quality standard(s) unless directed to do otherwise by the Regional Board Executive Officer.
 - c. Nothing in section A.3 must prevent the Regional Board from enforcing any provision of this Order while the Copermittee prepares and implements the above report.
4. In addition to the above prohibitions, discharges from MS4s are subject to all Basin Plan prohibitions cited in Attachment A to this Order.

B. NON-STORM WATER DISCHARGES

1. Each Copermittee must effectively prohibit all types of non-storm water discharges into its MS4 unless such discharges are either authorized by a separate National Pollutant Discharge Elimination System (NPDES) permit; or not prohibited in accordance with sections B.2 and B.3 below.
2. The following categories of non-storm water discharges are not prohibited unless a Copermittee or the Regional Board identifies the discharge category as a source of pollutants to waters of the U.S. Where the Copermittee(s) have identified a category as a source of pollutants, the category shall be addressed as an illicit discharge and prohibited through ordinance, order or similar means. The Regional Board may identify categories of discharge that either requires prohibition or other controls. For such a discharge category, the Copermittee, under direction of the Regional Board, must either prohibit the discharge category or develop and implement appropriate control measures to prevent the discharge of pollutants to the MS4 and report to the Regional Board pursuant to Section K.1 and K.3 of this Order.
 - a. Diverted stream flows;
 - b. Rising ground waters;
 - c. Uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to

- MS4s;
- d. Uncontaminated pumped ground water⁸;
 - e. Foundation drains⁸;
 - f. Springs;
 - g. Water from crawl space pumps⁸;
 - h. Footing drains⁸;
 - i. Air conditioning condensation;
 - j. Flows from riparian habitats and wetlands;
 - k. Water line flushing^{9,10};
 - l. Discharges from potable water sources not subject to NPDES Permit No. CAG679001, other than water main breaks;
 - m. Individual residential car washing; and
 - n. Dechlorinated swimming pool discharges¹¹.
3. Emergency fire fighting flows (i.e., flows necessary for the protection of life or property) do not require BMPs and need not be prohibited. As part of the Jurisdictional Runoff Management Plan (JRMP), each Copermittee must develop and implement a program to address pollutants from non-emergency fire fighting flows (i.e., flows from controlled or practice blazes and maintenance activities) identified by the Copermittee to be significant sources of pollutants to waters of the United States.
- a. Building fire suppression system maintenance discharges (e.g. sprinkler line flushing) contain waste. Therefore, such discharges are to be prohibited by the Copermittees as illicit discharges through ordinance, order, or similar means.
4. Each Copermittee must examine all dry weather effluent analytical monitoring results collected in accordance with section F.4 of this Order and Receiving Waters and MS4 Discharge Monitoring and Reporting Program No. R9-2009-0002 to identify water quality problems which may be the result of any non-prohibited discharge category(ies) identified above in section B.2. Follow-up investigations must be conducted as necessary to identify and control, pursuant to section B.2, any non-prohibited discharge category(ies) listed above.

⁸ Requires enrollment under Order R9-2008-002. Discharges into the MS4 require authorization from the owner and operator of the MS4 system.

⁹ This exemption does not include fire suppression sprinkler system maintenance and testing discharges. Those discharges may be regulated under Section B.3.

¹⁰ Requires enrollment under Order R9-2002-0020.

¹¹ Including saline swimming pool discharges directly to a saline water body.

C. NON-STORM WATER DRY WEATHER ACTION LEVELS

1. Each Copermittee, beginning no later than May 1, 2011, shall implement the non-storm water dry weather action level (NAL) monitoring as described in Attachment E of this Order.
2. In response to an exceedance of an NAL, each Copermittee must investigate and identify the source of the exceedance in a timely manner. However, if any Copermittee identifies exceedances of NALs that prevent them from adequately conducting source investigations in a timely manner, then the Copermittees may submit a prioritization plan and timeline that identifies the timeframe and planned actions to investigate and report their findings on all of the exceedances. Following the source investigation and identification, the Copermittees must submit an action report dependant on the source of the pollutant exceedance as follows:
 - a. If the Copermittee identifies the source of the exceedance as natural (non-anthropogenically influenced) in origin and in conveyance into the MS4; then the Copermittee shall report their findings and documentation of their source investigation to the Regional Board within fourteen days of the source identification.
 - b. If the Copermittee identifies the source of the exceedance as an illicit discharge or connection, then the Copermittees must eliminate the discharge to their MS4 and report the findings, including any enforcement action(s) taken, and documentation of the source investigation to the Regional Board within fourteen days of the source identification. If the Copermittee is unable to eliminate the source of discharge within fourteen days, then the Copermittee must submit, as part of their action report, their plan and timeframe to eliminate the source of the exceedance. Those dischargers seeking to continue such a discharge must become subject to a separate NPDES permit prior to continuing any such discharge.
 - c. If the Copermittee identifies the source of the exceedance as an exempted category of non-storm water discharge, then the Copermittees must determine if this is an isolated circumstance or if the category of discharges must be addressed through the prevention or prohibition of that category of discharge as an illicit discharge. The Copermittee must submit their findings in including a description of the steps taken to address the discharge and the category of discharge, to the Regional Board for review with the next subsequent annual report. Such description shall include relevant updates to or new ordinances, orders, or other legal means of addressing the category of discharge. The Copermittees must also submit a summary of their findings with the Report of Waste Discharge.
 - d. If the Copermittee identifies the source of the exceedance as a non-storm water discharge in violation or potential violation of an existing separate NPDES permit

- (e.g. the groundwater dewatering permit), then the Copermittee must report, within three business days, the findings to the Regional Board including all pertinent information regarding the discharger and discharge characteristics.
- e. If the Copermittee is unable to identify the source of the exceedance after taking and documenting reasonable steps to do so, then the Copermittee must identify the pollutant as a high priority pollutant of concern in the tributary subwatershed, perform additional focused sampling and update their programs within a year to reflect this priority. The Copermittee's annual report shall include these updates to their programs including, where applicable, updates to their watershed workplans (Section G.2), retrofitting consideration (Section F.3.d) and program effectiveness work plans (Section J.4).
 - f. The Copermittees or any interested party, may evaluate existing NALs and propose revised NALs for future Board consideration.
3. An exceedance of an NAL does not alone constitute a violation of the provisions of this Order, but an exceedance of an NAL may indicate lack of compliance with the requirement that Copermittees effectively prohibit all types of unauthorized non-storm water discharges into the MS4 or other prohibitions set forth in Sections A and B of this Order. Failure to timely implement required actions specified in this Order following an exceedance of an NAL constitutes a violation of this Order. However, neither compliance with NALs nor compliance with required actions following observed exceedances, excuses any non-compliance with the requirement to effectively prohibit all types of unauthorized non-storm water discharges into the MS4s or any non-compliance with the prohibitions in Sections A and B of this Order. NALs provide an assessment of the effectiveness of the prohibition of non-storm water discharges and of the appropriateness of exempted non-storm water discharges. During any annual reporting period in which one or more exceedances of NALs have been documented the Copermittee must submit with their next scheduled annual report, a report describing whether and how the observed exceedances did or did not result in a discharge from the MS4 that caused, or threatened to cause or contribute to a condition of pollution, contamination, or nuisance in the receiving waters.
4. Monitoring of effluent will occur at the end-of-pipe prior to discharge into the receiving waters, with a focus on Major Outfalls, as defined in 40 CFR 122.26(B 5-6) and Attachment E of this Order. The Copermittees must develop their monitoring plans to sample a representative percentage of major outfalls and identified stations within each hydrologic subarea. At a minimum, outfalls that exceed any NALs once during any year must be monitored in the subsequent year. Any station that does not exceed an NAL for 3 years may be replaced with a different station.

5. Each Copermittee shall monitor for the non-storm water dry weather action levels, which are incorporated into this Order as follows:

a. Action levels for discharges to inland surface waters:

Table 4.a.1: General Constituents

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Fecal Coliform	MPN/ 100 ml	200 ^A 400 ^B	-		BPO
Enterococci	MPN/ 100 ml	33	-	104 ^C	BPO/OP
Turbidity	NTU	-	20		BPO
pH	Units	Within limit of 6.5 to 8.5 at all times			BPO
Dissolved Oxygen	mg/L	Not less than 5.0 in WARM waters and not less than 6.0 in COLD waters			BPO
Total Nitrogen	mg/L	-	1.0	See MDEL	BPO
Total Phosphorus	mg/L	-	0.1	See MDEL	BPO
Methylene Blue Active Substances	mg/L	-	0.5	See MDEL	BPO

A – Based on a minimum of not less than five samples for any 30-day period

B – No more than 10 percent of total samples may exceed 400 per 100 ml during any 30 day period

C – This Value has been set to Ocean Plan Criteria for Designated Beach Areas

BPO – Basin Plan Objective

OP – Ocean Plan

MDAL – Maximum Daily Action Level

AMAL – Average Monthly Action Level

Table 4.a.2: Priority Pollutants

Parameter	Units	Freshwater (CTR)		Saltwater (CTR)	
		MDAL	AMAL	MDAL	AMAL
Cadmium	ug/L	*	*	16	8
Copper	ug/L	*	*	5.8	2.9
Chromium III	ug/L	*	*	-	-
Chromium VI (hexavalent)	ug/L	16	8.1	83	41
Lead	ug/L	*	*	14	2.9
Nickel	ug/L	*	*	14	6.8
Silver	ug/L	*	*	2.2	1.1
Zinc	ug/L	*	*	95	47

CTR – California Toxic Rule

* - Action Levels developed on a case-by-case basis (see below)

The NALs for Cadmium, Copper, Chromium (III), Lead, Nickel, Silver and Zinc will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data (receiving water hardness). For these priority pollutants, the following equations (40 CFR 131.38.b.2) will be required:

$$\begin{aligned} \text{Cadmium (Total Recoverable)} &= \exp(0.7852[\ln(\text{hardness})] - 2.715) \\ \text{Chromium III (Total Recoverable)} &= \exp(0.8190[\ln(\text{hardness})] + .6848) \\ \text{Copper (Total Recoverable)} &= \exp(0.8545[\ln(\text{hardness})] - 1.702) \\ \text{Lead (Total Recoverable)} &= \exp(1.273[\ln(\text{hardness})] - 4.705) \end{aligned}$$

$$\begin{aligned} \text{Nickel (Total Recoverable)} &= \exp(.8460[\ln(\text{hardness})] + 0.0584) \\ \text{Silver (Total Recoverable)} &= \exp(1.72[\ln(\text{hardness})] - 6.52) \\ \text{Zinc (Total Recoverable)} &= \exp(0.8473[\ln(\text{hardness})] + 0.884) \end{aligned}$$

b. Action levels for discharges to bays, harbors and lagoons/estuaries:

Table 4.b: General Constituents

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Total Coliform	MPN/100 ml	1,000	-	10,000	BPO
Fecal Coliform	MPN/100 ml	200 ^A , 400 ^B	-		BPO
Enterococci	MPN/100 ml	35	-	104 ^C	BPO
Turbidity	NTU	75	-	225	OP
pH	Units	Within limit of 6.0 to 9.0 at all times			OP
Priority Pollutants	ug/L	See limitations in Table 4.a.2			

A – Based on a minimum of not less than five samples for any 30-day period

B – No more than 10 percent of total samples may exceed 400 per 100 ml during any 30 day period

C – Designated Beach Areas

OP – California Ocean Plan 2005

BPO – Basin Plan Objective

MDAL – Maximum Daily Action Level

AMAL – Average Monthly Action Level

c. Action levels for discharges to the surf zone:

Table 4.c: General Constituents

Parameter	Units	AMAL	MDAL	Instantaneous Maximum	Basis
Total Coliform	MPN/100 ml	1,000	-	10,000 1,000 ^A	OP
Fecal Coliform	MPN/100 ml	200 ^B	-	400	OP
Enterococci	MPN/100 ml	35	-	104 ^C	OP

A – Total coliform density shall not exceed 1,000 per 100 ml when the ratio of fecal/total coliform exceeds 0.1

B – During any 30 day period

C – Designated Beach Areas

OP – California Ocean Plan 2005

D. STORM WATER ACTION LEVELS

1. Beginning Year 3 after Order adoption date, a running average of twenty percent or greater of exceedances of any discharge of storm water from the MS4 to waters of the United States that exceed the Storm Water Action Levels (SALs) for the pollutants listed in Table 5 (below) will require each Copermitttee to affirmatively augment and implement all necessary storm water controls and measures to reduce the discharge of the associated class of pollutant(s) to the MEP standard. The Copermitttees must utilize the exceedance information when adjusting and executing annual work plans, as required by this Order. Copermitttees shall take the magnitude, frequency, and number of constituents exceeding the SAL(s), in addition to receiving water quality data and other information, into consideration when reacting to SAL exceedances in an iterative manner. Failure to appropriately consider and react to SAL exceedances in an iterative manner creates a presumption that the Copermitttee(s) have not complied with the MEP standard.

Table 5. Storm Water Action Levels

Pollutant	Action Level
Turbidity (NTU)	126
Nitrate & Nitrite total (mg/L)	2.6
P total (mg/L)	1.46
Cd total (µg/L)	3.0
Cu total (µg/L)	127
Pb total (µg/L)	250
Ni total (µg/L)	54
Zn total (µg/L)	976

2. The end-of-pipe assessment points for the determination of SAL compliance are all major outfalls, as defined in 40 CFR 122.26(b)(5) and (b)(6). The Copermitttees must develop their monitoring plans to sample a representative percent of the major outfalls within each hydrologic subarea. At a minimum, outfalls that exceed SALs must be monitored in the subsequent year. Any station that does not exceed an SAL for 3 years may be replaced with a different station. SAL samples must be 24 hour time weighted composites.
3. The absence of SAL exceedances does not relieve the Copermitttees from implementing all other required elements of this Permit.
4. This Permit does not regulate natural sources and conveyances of constituents listed in Table 5. To be relieved of the requirements to prioritize pollutant/watershed combinations for BMP updates and to continue monitoring a station, the Copermitttee must demonstrate that the likely and expected cause of the SAL exceedance is not anthropogenic in nature.
5. The SALs will be reviewed and updated at the end of every permit cycle. The data collected pursuant to D.2 above can be used to create SALs based upon local data.

It is the goal of the SALs, through the iterative and MEP process, to have outfall storm water discharges meet all applicable water quality standards.

E. LEGAL AUTHORITY

1. Each Copermittee must establish, maintain, and enforce adequate legal authority to control pollutant discharges into and from its MS4 through ordinance, statute, permit, contract or similar means. Nothing herein shall authorize a Co-Permittee or other discharger regulated under the terms of this order to divert, store or otherwise impound water if such action is reasonably anticipated to harm downstream water right holders in the exercise of their water rights. This legal authority must, at a minimum, authorize the Copermittee to:
 - a. Control the contribution of pollutants in discharges of runoff associated with industrial and construction activity to its MS4 and control the quality of runoff from industrial and construction sites. This requirement applies both to industrial and construction sites which have coverage under the statewide general industrial or construction storm water permits, as well as to those sites which do not. Grading ordinances must be updated and enforced as necessary to comply with this Order;
 - b. Prohibit all identified illicit discharges not otherwise allowed pursuant to section B.2;
 - c. Prohibit and eliminate illicit connections to the MS4;
 - d. Control the discharge of spills, dumping, or disposal of materials other than storm water to its MS4;
 - e. Require compliance with conditions in Copermittee ordinances, permits, contracts or orders (i.e., hold dischargers to its MS4 accountable for their contributions of pollutants and flows);
 - f. Utilize enforcement mechanisms to require compliance with Copermittee storm water ordinances, permits, contracts, or orders;
 - g. Control the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements among Copermittees. Control of the contribution of pollutants from one portion of the shared MS4 to another portion of the MS4 through interagency agreements with other owners of the MS4 such as the State of California Department of Transportation, the United States Department of Defense, or Native American Tribes is encouraged;
 - h. Carry out all inspections, surveillance, and monitoring necessary to determine compliance and noncompliance with local ordinances and permits and with this Order, including the prohibition on illicit discharges to the MS4. This means the Copermittee must have authority to enter, monitor, inspect, take measurements, review and copy records, and require regular reports from industrial facilities discharging into its MS4, including construction sites;
 - i. Require the use of BMPs to prevent or reduce the discharge of pollutants into MS4s from storm water to the MEP; and

- j. Require documentation on the effectiveness of BMPs implemented to reduce the discharge of storm water pollutants to the MS4 to the MEP.
- 2.** Each Copermitee must submit within 365 days of adoption of this Order, a statement certified by its chief legal counsel that the Copermitee has taken the necessary steps to obtain and maintain full legal authority to implement and enforce each of the requirements contained in 40 CFR 122.26(d)(2)(i)(A-F) and this Order except for the updated requirements for low impact development and hydromodification in section F.1. Each Copermitee must submit as part of its updated SSMP, a statement certified by its chief legal counsel that the Copermitee has taken the necessary steps to obtain and maintain full legal authority to implement and enforce the low impact development and hydromodification requirements in section F.1. These statements must include:
- a. Identification of all departments within the jurisdiction that conduct runoff related activities, and their roles and responsibilities under this Order. Include an up to date organizational chart specifying these departments and key personnel.
 - b. Citation of runoff related ordinances and the reasons they are enforceable;
 - c. Identification of the local administrative and legal procedures available to mandate compliance with runoff related ordinances and therefore with the conditions of this Order;
 - d. A description of how runoff related ordinances are implemented and appealed; and
 - e. Description of whether the municipality can issue administrative orders and injunctions or if it must go through the court system for enforcement actions.

F. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM (JRMP)

Each Copermittee must implement all requirements of section F of this Order no later than 365 days after adoption of the Order, unless otherwise specified in this Order.

Prior to 365 days after adoption of the Order, each Copermittee must at a minimum implement its Jurisdictional RMP document, as the document was developed and amended to comply with the requirements of Order No. R9-2002-001.

Each Copermittee must develop and implement an updated JRMP for its jurisdiction.

Each updated JRMP must meet the requirements of section F of this Order, reduce the discharge of storm water pollutants from the MS4 to the MEP, and prevent runoff discharges from the MS4 from causing or contributing to a violation of water quality standards.

1. DEVELOPMENT PLANNING COMPONENT

Each Copermittee must implement a program which meets the requirements of this section and (1) reduces Development Project discharges of storm water pollutants from the MS4 to the MEP; (2) prevents Development Project discharges from the MS4 from causing or contributing to a violation of water quality standards; (3) prevents illicit discharges into the MS4; and (4) manages increases in runoff discharge rates and durations from Development Projects that are likely to cause increased erosion of stream beds and banks, silt pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force.

a. GENERAL PLAN

Each Copermittee must revise as needed its General Plan or equivalent plan (e.g., Comprehensive, Master, or Community Plan) for the purpose of providing effective water quality and watershed protection principles and policies that direct land-use decisions and require implementation of consistent water quality protection measures for all development and redevelopment projects.

b. ENVIRONMENTAL REVIEW PROCESS

Each Copermittee must revise as needed its current environmental review processes to accurately evaluate water quality impacts and cumulative impacts and identify appropriate measures to avoid, minimize and mitigate those impacts for all Development Projects.

c. APPROVAL PROCESS CRITERIA AND REQUIREMENTS FOR ALL DEVELOPMENT PROJECTS

For all proposed Development Projects, each Copermittee during the planning process, and prior to project approval and issuance of local permits, must prescribe the necessary requirements so that Development Project discharges of storm water pollutants from the MS4 will be reduced to the MEP, will not cause or

contribute to a violation of water quality standards, and will comply with Copermittee's ordinances, permits, plans, and requirements, and with this Order. Performance Criteria: Discharges from each approved development project must be subject to the following management measures:

- (1) Source control BMPs that reduce storm water pollutants of concern in runoff, including prevention of illicit discharges into the MS4; prevention of irrigation runoff; storm drain system stenciling or signage; properly designed outdoor material storage areas; properly designed outdoor work areas; and properly designed trash storage areas;
- (2) The following LID BMPs listed below shall be implemented at all Development Projects where applicable and feasible.
 - (a) Conserve natural areas, including existing trees, other vegetation, and soils.
 - (b) Construct streets, sidewalks, or parking lot aisles to the minimum widths necessary, provided that public safety is not compromised.
 - (c) Minimize the impervious footprint of the project.
 - (d) Minimize soil compaction to landscaped areas.
 - (e) Minimize disturbances to natural drainages (e.g., natural swales, topographic depressions, etc.)
 - (f) Disconnect impervious surfaces through distributed pervious areas.
- (3) Buffer zones for natural water bodies, where feasible. Where buffer zones are infeasible, require project proponent to implement other buffers such as trees, access restrictions, etc;
- (4) Measures necessary so that grading or other construction activities meet the provisions specified in section F.2 of this Order; and
- (5) Submittal of proof of a mechanism under which ongoing long-term maintenance of all structural post-construction BMPs will be conducted.
- (6) Infiltration and Groundwater Protection

To protect groundwater quality, each Copermittee must apply restrictions to the use of treatment control BMPs that are designed to primarily function as centralized infiltration devices (such as large infiltration trenches and infiltration basins). Such restrictions must be designed so that the use of such infiltration treatment control BMPs must not cause or contribute to an exceedance of groundwater quality objectives. At a minimum, each treatment control BMP designed to primarily function as a centralized infiltration device must meet the restrictions below, unless it is demonstrated that a restriction is not necessary to protect groundwater quality. The Copermittees may collectively or individually develop alternative restrictions on the use of

- treatment control BMPs which are designed to primarily function as centralized infiltration devices. Alternative restrictions developed by the Copermittees can partially or wholly replace the restrictions listed below. The restrictions are not intended to be applied to small infiltration systems dispersed throughout a development project.
- (a) Runoff must undergo pretreatment such as sedimentation or filtration prior to infiltration;
 - (b) All dry weather flows containing significant pollutant loads must be diverted from infiltration devices and treated through other BMPs;
 - (c) Pollution prevention and source control BMPs must be implemented at a level appropriate to protect groundwater quality at sites where infiltration treatment control BMPs are to be used;
 - (d) Infiltration treatment control BMPs must be adequately maintained so that they remove storm water pollutants to the MEP;
 - (e) The vertical distance from the base of any infiltration treatment control BMP to the seasonal high groundwater mark must be at least 10 feet. Where groundwater basins do not support beneficial uses, this vertical distance criteria may be reduced, provided groundwater quality is maintained;
 - (f) The soil through which infiltration is to occur must have physical and chemical characteristics (such as appropriate cation exchange capacity, organic content, clay content, and infiltration rate) which are adequate for proper infiltration durations and treatment of runoff for the protection of groundwater beneficial uses;
 - (g) Infiltration treatment control BMPs must not be used for areas of industrial or light industrial activity; areas subject to high vehicular traffic (25,000 or greater average daily traffic on main roadway or 15,000 or more average daily traffic on any intersecting roadway); automotive repair shops; car washes; fleet storage areas (bus, truck, etc.); nurseries; and other high threat to water quality land uses and activities as designated by each Copermittee unless first treated or filtered to remove pollutants prior to infiltration and a comprehensive site-specific evaluation has been conducted; and
 - (h) Infiltration treatment control BMPs must be located a minimum of 100 feet horizontally from any water supply wells.
- (7) Where feasible, landscaping with native or low water species shall be preferred in areas that drain to the MS4 or to waters of the United States.

**d. STANDARD STORM WATER MITIGATION PLANS (SSMPs) – APPROVAL PROCESS
CRITERIA AND REQUIREMENTS FOR PRIORITY DEVELOPMENT PROJECTS**

Within two years of adoption of this Order, the Copermittees must submit an updated model SSMP, to the Regional Board's Executive Officer for a 30 day public review and comment period. The Regional Board's Executive Officer has the discretion to determine the necessity of a public hearing. Within 180 days of determination that the Model SSMP is in compliance with this Permit's provisions, each Copermittee must update their own local SSMP, and amended ordinances consistent with the model SSMP, and shall submit both (local SSMP and amended ordinances) to the Regional Board. The model SSMP must meet the requirements of section F.1.d of this Order to (1) reduce Priority Development Project discharges of storm water pollutants from the MS4 to the MEP, and (2) prevent Priority Development Project runoff discharges from the MS4 from causing or contributing to a violation of water quality standards.¹²

(1) Definition of Priority Development Project (PDP):

Priority Development Projects are:

- (a) All new Development Projects that fall under the project categories or locations listed in section F.1.d.(2), and
- (b) Those redevelopment projects that create, add, or replace at least 5,000 square feet of impervious surfaces on an already developed site and the existing development and/or the redevelopment project falls under the project categories or locations listed in section F.1.d.(2). Where redevelopment results in an increase of less than fifty percent of the impervious surfaces of a previously existing development, and the existing development was not subject to SSMP requirements, the numeric sizing criteria discussed in section F.1.d.(6) applies only to the addition or replacement, and not to the entire development. Where redevelopment results in an increase of more than fifty percent of the impervious surfaces of a previously existing development, the numeric sizing criteria applies to

¹² Updated SSMP and hydromodification requirements must apply to all priority projects or phases of priority projects which have not yet begun grading or construction activities at the time any updated SSMP or hydromodification requirement commences. If lawful prior approval of a project exists, whereby application of an updated SSMP or hydromodification requirement to the project is illegal, the updated SSMP or hydromodification requirement need not apply to the project. Updated Development Planning requirements set forth in Sections F.1. (a) through (h) of this Order must apply to all projects or phases of projects, unless, at the time any updated Development Planning requirement commences, the projects or project phases meet any one of the following conditions: (i) the project or phase has begun grading or construction activities; or (ii) a Copermittee determines that lawful prior approval rights for a project or project phase exist, whereby application of the Updated Development Planning requirement to the project is legally infeasible. Where feasible, the Permittees must utilize the SSMP and hydromodification update periods to ensure that projects undergoing approval processes include application of the updated SSMP and hydromodification requirements in their plans.

the entire development.

- (c) One acre threshold: In addition to the Priority Development Project Categories identified in section F.1.d.(2), Priority Development Projects must also include all other pollutant-generating Development Projects that result in the disturbance of one acre or more of land within three years of adoption of this Order.¹³ As an alternative to this one-acre threshold, the Copermittees may collectively identify a different threshold, provided the Copermittees' threshold is at least as inclusive of Development Projects as the one-acre threshold.

(2) Priority Development Project Categories

Where a new Development Project feature, such as a parking lot, falls into a Priority Development Project Category, the entire project footprint is subject to SSMP requirements.

- (a) New development projects that create 10,000 square feet or more of impervious surfaces (collectively over the entire project site) including commercial, industrial, residential, mixed-use, and public projects. This category includes development projects on public or private land which fall under the planning and building authority of the Copermittees.
- (b) Automotive repair shops. This category is defined as a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.
- (c) Restaurants. This category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812), where the land area for development is greater than 5,000 square feet. Restaurants where land development is less than 5,000 square feet must meet all SSMP requirements except for structural treatment BMP and numeric sizing criteria requirement F.1.d.(6) and hydromodification requirement F.1.h.
- (d) All hillside development greater than 5,000 square feet. This category is defined as any development which creates 5,000 square feet of impervious surface which is located in an area with known erosive soil conditions, where the development will grade on any natural slope that is twenty-five percent or greater.
- (e) Environmentally Sensitive Areas (ESAs). All development located within or directly adjacent to or discharging directly to an ESA (where discharges

¹³ Pollutant generating Development Projects are those projects that generate pollutants at levels greater than natural background levels.

from the development or redevelopment will enter receiving waters within the ESA), which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition. "Directly adjacent" means situated within 200 feet of the ESA. "Discharging directly to" means outflow from a drainage conveyance system that is composed entirely of flows from the subject development or redevelopment site, and not commingled with flows from adjacent lands.

- (f) Parking lots 5,000 square feet or more or with 15 or more parking spaces and potentially exposed to runoff. Parking lot is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce.
- (g) Street, roads, highways, and freeways. This category includes any paved surface that is 5,000 square feet or greater used for the transportation of automobiles, trucks, motorcycles, and other vehicles.
- (h) Retail Gasoline Outlets (RGOs). This category includes RGOs that meet the following criteria: (a) 5,000 square feet or more or (b) a projected Average Daily Traffic (ADT) of 100 or more vehicles per day.

(3) Pollutants of Concern

As part of its local SSMP, each Copermittee must implement an updated procedure for identifying pollutants of concern for each Priority Development Project. The procedure must address, at a minimum: (1) Receiving water quality (including pollutants for which receiving waters are listed as impaired under CWA section 303(d)); (2) Land-use type of the Development Project and pollutants associated with that land use type; and (3) Pollutants expected to be present on site.

(4) Low Impact Development BMP Requirements

Each Copermittee must require each Priority Development Project to implement LID BMPs which will collectively minimize directly connected impervious areas, limit loss of existing infiltration capacity, and protect areas that provide important water quality benefits necessary to maintain riparian and aquatic biota, and/or are particularly susceptible to erosion and sediment loss.

(a) The following LID BMPs must be implemented:

- (i) Each Copermittee must require LID BMPs or make a finding of infeasibility for each Priority Development Project in accordance with the LID waiver program in Section F.1.d.(8);

- (ii) Each Copermittee must incorporate formalized consideration, such as thorough checklists, ordinances, and/or other means, of LID BMPs into the plan review process for Priority Development Projects;
 - (iii) The review of each Priority Development Project must include an assessment of potential collection of storm water for on-site or off-site reuse opportunities;
 - (iv) The review of each Priority Development Project must include an assessment of techniques to infiltrate, filter, store, evaporate, or retain runoff close to the source of runoff; and
 - (v) Within 2 years after adoption of this Order, each Copermittee must review its local codes, policies, and ordinances and identify barriers therein to implementation of LID BMPs. Following the identification of these barriers to LID implementation, where feasible, the Copermittee must take, by the end of the permit cycle, appropriate actions to remove such barriers.
- (b) The following LID BMPs must be implemented at all Priority Development Projects where technically feasible as required below:
- (i) Maintain or restore natural storage reservoirs and drainage corridors (including depressions, areas of permeable soils, swales, and ephemeral and intermittent streams.
 - (ii) Projects with landscaped or other pervious areas must, where feasible, drain runoff from impervious areas (rooftops, parking lots, sidewalks, walkways, patios, etc) into pervious areas prior to discharge to the MS4. The amount of runoff from impervious areas that is to drain to pervious areas shall not exceed the total capacity of the project's pervious areas to infiltrate or treat runoff, taking into consideration the pervious areas' geologic and soil conditions, slope, and other pertinent factors.
 - (iii) Projects with landscaped or other pervious areas must, where feasible, properly design and construct the pervious areas to effectively receive and infiltrate or treat runoff from impervious areas, prior to discharge to the MS4. Soil compaction for these areas shall be minimized. The amount of the impervious areas that are to drain to pervious areas must be based upon the total size, soil conditions, slope, and other pertinent factors.
 - (iv) Projects with low traffic areas and appropriate soil conditions must construct walkways, trails, overflow parking lots, alleys, or other low-traffic areas with permeable surfaces, such as pervious concrete, porous asphalt, unit pavers, and granular materials.
- (c) To protect ground water resources any infiltration LID BMPs must comply with Section F.1.(c)(6).

(d) LID BMPs sizing criteria:

- (i) LID BMPs shall be sized and designed to ensure onsite retention without runoff, of the volume of runoff produced from a 24-hour 85th percentile storm event, as determined from the County of Orange's 85th Percentile Precipitation Map¹⁴ ("design capture volume");
- (ii) If onsite retention LID BMPs are technically infeasible per section F.1.d.(7)(b), LID biofiltration BMPs may treat any volume that is not retained onsite by the LID BMPs. The LID biofiltration BMPs must be designed for an appropriate surface loading rate to prevent erosion, scour and channeling within the BMP. Due to the flow through design of biofiltration BMPs, the total volume of the BMP, including pore spaces and prefilter detention volume, must be sized to hold at least 0.75 times the design storm volume that is not retained onsite by LID retention BMPs;
- (iii) If it is shown to be technically infeasible to treat the remaining volume up to and including the design capture volume using LID BMPs (retention or biofiltration), the project must implement conventional treatment control BMPs in accordance with Section F.1.d.(6) below and must participate in the LID waiver program in Section F.1.d.(7).

- (e) All LID BMPs shall be designed and implemented with measures to avoid the creation of nuisance or pollution associated with vectors, such as mosquitoes, rodents, and flies.

(5) Source Control BMP Requirements

Each Copermittee must require each Priority Development Project to implement source control BMPs. The source control BMPs to be required must:

- (a) Prevent illicit discharges into the MS4;
- (b) Minimize storm water pollutants of concern in runoff;
- (c) Eliminate irrigation runoff;
- (d) Include storm drain system stenciling or signage;
- (e) Include properly designed outdoor material storage areas;
- (f) Include properly designed outdoor work areas;
- (g) Include properly designed trash storage areas;
- (h) Include water quality requirements applicable to individual priority project categories.

¹⁴ The isopluvial map is available from the County of Orange. The map can also be found as Figure A-1 Exhibit 7.II in the Model WQMP (September 2003), page 5 of 57 at http://www.ocwatersheds.com/documents/2003_DAMP_Exhibit_7_II_Model_WQMP_Attachments.pdf

(6) Treatment Control BMP Requirements¹⁵

Each Copermittee must require each Priority Development Project to implement treatment control BMPs that meet the following requirements:

- (a) All treatment control BMPs for a single Priority Development Project must collectively be sized to comply with the following numeric sizing criteria:
 - (i) Volume-based treatment control BMPs must be designed to mitigate (infiltrate, filter, or treat) the volume of runoff produced from a 24-hour 85th percentile storm event, as determined from the County of Orange's 85th Percentile Precipitation Isopluvial Map¹⁶; or
 - (ii) Flow-based treatment control BMPs must be designed to mitigate (infiltrate, filter, or treat) either: a) the maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour, for each hour of a storm event; or b) the maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity (for each hour of a storm event), as determined from the local historical rainfall record, multiplied by a factor of two.
- (b) Treatment control BMPs for all Priority Development Projects must mitigate (treat through infiltration, settling, filtration or other unit processes) the required volume or flow of runoff from all developed portions of the project, including landscaped areas.
- (c) All treatment control BMPs must be located so as to remove pollutants from runoff prior to its discharge to any waters of the U.S. Multiple Priority Development Projects may use shared treatment control BMPs as long as construction of any shared treatment control BMP is completed prior to the use or occupation of any Priority Development Project from which the treatment control BMP will receive runoff.
- (d) All treatment control BMPs for Priority Development Projects must, at a minimum:
 - (i) Be ranked with high or medium pollutant removal efficiency for the project's most significant pollutants of concern, as the pollutant removal efficiencies are identified in the Copermittees' Model

¹⁵ This section only applies to those PDPs not implementing LID capable of meeting the design storm criteria for the entire site and meeting technical infeasibility eligibility. Low-Impact Development (LID) and other site design BMPs that are correctly designed to effectively remove pollutants from runoff are considered treatment control BMPs.

¹⁶ The isopluvial map is available from the County of Orange. The map can also be found as Figure A-1 Exhibit 7.II in the Model WQMP (September 2003), page 105 of 157 at http://www.ocwatersheds.com/StormWater/PDFs/2003_DAMP/2003_DAMP_Section_7_New_Development_Significant_Redevelopment.pdf.

SSMP. Treatment control BMPs with a low removal efficiency ranking must only be approved by a Copermittee when a feasibility analysis has been conducted which exhibits that implementation of treatment control BMPs with high or medium removal efficiency rankings are infeasible for a Priority Development Project or portion of a Priority Development Project.

- (ii) Be correctly sized and designed so as to remove storm water pollutants to the MEP.
- (e) Target removal of pollutants of concern from runoff.
- (f) Be implemented close to pollutant sources, and prior to discharging into waters of the U.S.
- (g) Not be constructed within a waters of the U.S. or waters of the State.
- (h) Include proof of a mechanism under which ongoing long-term maintenance will be conducted to ensure proper maintenance for the life of the project. The mechanisms may be provided by the project proponent or Copermittee.
- (i) Be designed and implemented with measures to avoid the creation of nuisance or pollution associated with vectors, such as mosquitoes, rodents, and flies.

(7) Low Impact Development (LID) BMP Waiver Program

The Copermittees must develop, collectively or individually, a LID waiver program for incorporation into local SSMPs, which would allow a Priority Development Project to substitute implementation of all or a portion of required LID BMPs in section F.1.d(4) with implementation of treatment control BMPs and a mitigation project, payment into an in-lieu funding program, and/or watershed equivalent BMP(s) consistent with Section F.1.d.(11). The Copermittees shall submit the LID waiver program as part of their updated model SSMP. At a minimum, the program must meet the requirements below:

- (a) Prior to implementation, the LID waiver program must clearly exhibit that it will not allow PDPs to result in a net impact (after consideration of any mitigation and in-lieu payments) from pollutant loadings over and above the impact caused by projects meeting LID requirements;
- (b) For each PDP participating, a technical feasibility analysis must be included demonstrating that it is technically infeasible to implement LID BMPs that comply with the requirements of Section F.1.(d)(4). The

Copermittee(s) must develop criteria for the technical feasibility analysis including a cost benefit analysis, examination of LID BMPs considered and alternatives chosen. Each PDP participating must demonstrate that LID BMPs were implemented as much as feasible given the site's unique conditions. Analysis must be made of the pollutant loading for each project participating in the LID substitution program. The estimated impacts from not implementing the required LID BMPs in section F.1.d.(4) must be fully mitigated. Technical infeasibility may result from conditions including, but not limited to:

- (i) Locations that cannot meet the infiltration and groundwater protection requirements in section F.1.c.(6). Where infiltration is technically infeasible, the project must still examine the feasibility of other onsite retention LID BMPs;
 - (ii) Smart growth and infill or redevelopment locations where the density and/or nature of the project would create significant difficulty for compliance with the onsite volume retention requirements; and
 - (iii) Other site, geologic, soil or implementation constraints identified in the Copermittees updated local SSMP document.
- (c) The LID waiver program must include mechanisms to verify that each Priority Development Project participating in the program is in compliance with all applicable SSMP requirements;
- (d) The LID waiver program must develop and implement a review process verifying that the BMPs to be implemented meet the designated design criteria. The review process must also verify that each Priority Development Project participating in the program is in compliance with all applicable SSMP requirements.
- (e) The LID waiver program must include performance standards for treatment control BMPs specified in compliance with section F.1.(d)(6).
- (f) Each PDP that participates in the LID waiver program must mitigate for the pollutant loads expected to be discharged due to not implementing the LID BMPs in section F.1.d.(4). Mitigation projects must be implemented within the same hydrologic subarea as the PDP. Mitigation projects outside of the hydrologic subarea but within the same hydrologic unit may be approved provided that the project proponent demonstrates that mitigation projects within the same hydrologic subarea are infeasible and that the mitigation project will address similar beneficial use impacts as expected from the PDPs pollutant load types and amount. Offsite mitigation projects may include green streets projects, existing development retrofit projects, retrofit incentive programs, regional BMPs and stream restoration. Project applicants seeking to utilize these

alternative compliance provisions may propose other offsite mitigation projects, which the Copermittees may approve if they meet the requirements of this subpart.

- (g) A Copermittee may choose to implement a pollutant credit system as part of the LID waiver program provided that such a credit system clearly exhibits that it will not allow PDPs to result in a net impact from pollutant loadings over and above the impact caused by projects meeting LID requirements. Any credit system that a Copermittee chooses to implement must be submitted to the Executive Officer for review and approval as part of the waiver program.
- (h) The LID waiver program shall include a storm water mitigation fund developed by the Copermittee(s) to be used for water quality improvement projects which may serve in lieu of the PDP's required mitigation in section F.1.d.(8)(e). The LID waiver program's storm water mitigation fund shall, at a minimum, identify;
 - (i) The entity or entities that will manage the storm water mitigation fund (i.e., assume full responsibility);
 - (ii) The range and types of acceptable projects for which storm water mitigation funds may be expended;
 - (iii) The entity or entities that will assume full responsibility for each water quality improvement project, including its successful completion; and
 - (iv) How the dollar amount of storm water mitigation fund contributions will be determined. In-lieu payments must be proportional to the additional pollutant load discharged by not fully implementing LID.
- (i) Each Copermittee must notify the Regional Board in their annual report of each PDP choosing to participate in the LID waiver program. The annual report must include the following information:
 - (i) Name of the developer of the participating PDP;
 - (ii) Site location;
 - (iii) Reason for LID waiver including technical feasibility analysis;
 - (iv) Description of BMPs implemented;
 - (v) Total amount deposited, if any, into the storm water mitigation fund described in section F.1.d.(8)(f);
 - (vi) Water quality improvement project(s) proposed to be funded; and
 - (vii) Timeframe for implementation of water quality improvement projects.

(8) Site Design and Treatment Control BMP Design Standards

As part of its local SSMP, each Copermittee must develop and require Priority

Development Projects to implement siting, design, and maintenance criteria for each site design and treatment control BMP listed in its local SSMP to determine feasibility and applicability and so that implemented site design and treatment control BMPs are constructed correctly and are effective at pollutant removal, runoff control, and vector minimization. LID techniques, such as soil amendments, must be incorporated into the criteria for appropriate treatment control BMPs. Development of BMP design worksheets which can be used by project proponents is encouraged.

(9) Implementation Process

As part of its local SSMP, each Copermittee must implement a process to verify compliance with SSMP requirements. The process must identify at what point in the planning process Priority Development Projects will be required to meet SSMP requirements and at a minimum, the Priority Development Project must implement the required post-construction BMPs prior to occupancy and/or the intended use of any portion of that project. The process must also include identification of the roles and responsibilities of various municipal departments in implementing the SSMP requirements, as well as any other measures necessary for the implementation of SSMP requirements.

(10) Treatment BMP Review

- (a) The Copermittees must review and update the BMPs that are listed in their local SSMPs as options for treatment control during the third year of implementation of this Order. At a minimum, the update must include removal of obsolete or ineffective BMPs and addition of LID BMPs that can be used for treatment, such as bioretention cells, bioretention swales, etc. The update must also add appropriate LID BMPs to any tables or discussions in the local SSMPs addressing pollutant removal efficiencies of treatment control BMPs. In addition, the update must include review and revision where necessary of treatment control BMP pollutant removal efficiencies.
 - (b) The update must incorporate findings from BMP effectiveness studies conducted by the Copermittees for projects funded wholly or in part by the State Board or Regional Board.
 - (c) Each Copermittee must implement a mechanism for annually incorporating findings from local treatment BMP effectiveness studies (e.g., ones conducted by, or on-behalf of, public agencies in Orange County) into SSMP project reviews and permitting
- (11) Where a development project, greater than 100 acres in total project size or smaller than 100 acres in size yet part of a larger common plan of

development that is over 100 acres, has been prepared using watershed and/or sub-watershed based water quality, hydrologic, and fluvial geomorphologic planning principles that implement regional LID BMPs in accordance with the sizing and location criteria of this Order and acceptable to the Regional Board, such standards shall govern review of projects with respect to Section F.1 of this Order and shall be deemed to satisfy this Order's requirements for LID site design, buffer zone, infiltration and groundwater protection standards, source control, treatment control, and hydromodification control standards. Regional BMPs must clearly exhibit that they will not result in a net impact from pollutant loadings over and above the impact caused by capture and retention of the design storm. Regional BMPs may be used provided that the BMPs capture and retain the volume of runoff produced from the 24-hour 85th percentile storm event as defined in section F.1.d.(6)(a)(i) and that such controls are located upstream of receiving waters. Any volume that is not retained by the LID BMPs, up to the design capture volume, must be treated using LID biofiltration. Where regional LID implementation has been shown to be technically infeasible (per section F.1.d.7.b) any volume up to and including the design capture volume, not retained by LID BMPs, nor treated by LID biofiltration, must be treated using conventional treatment control BMPs in accordance with Section F.1.d.(6) and participation in the LID waiver program in Section F.1.d.(7).

e. BMP CONSTRUCTION VERIFICATION

Prior to occupancy and/or intended use of any portion of the Priority Development Project subject to SSMP requirements, each Copermittee must inspect the constructed site design, source control, and treatment control BMPs to verify that they have been constructed and are operating in compliance with all specifications, plans, permits, ordinances, and this Order.

f. BMP MAINTENANCE TRACKING

- (1) Each Copermittee must develop and maintain a watershed-based database to track and inventory all approved post-construction BMPs and BMP maintenance within its jurisdiction since July 2001. LID BMPs implemented on a lot by lot basis at a single family residential home, such as rainbarrels, are not required to be tracked or inventoried. At a minimum, the database must include information on BMP type, location, watershed, date of construction, party responsible for maintenance, maintenance certifications or verifications, inspections, inspection findings, and corrective actions, including whether the site was referred to the Vector Control District.
- (2) Each Copermittee must establish a mechanism not only to track post-construction BMPs, but also to ensure that appropriate easements and ownerships are properly recorded in public records and the information is

conveyed to all appropriate parties when there is a change in project or site ownership.

- (3) Each Copermittee must verify that approved post-construction BMPs are operating effectively and have been adequately maintained by implementing the following measures:
- (a) An annual inventory of all approved BMPs within the Copermittee's jurisdiction. LID BMPs implemented on a lot by lot basis at a single family residential home, such as rainbarrels, are not required to be tracked or inventoried. The inventory must also include all BMPs approved for Priority Development Projects since July 2001;
 - (b) The designation of high priority BMPs. High-priority designation must include consideration of BMP size, recommended maintenance frequency, likelihood of operational and maintenance issues, location, receiving water quality, and other pertinent factors;
 - (c) Verify implementation, operation, and maintenance of BMPs by inspection, self-certification, surveys, or other equally effective approaches with the following conditions:
 - (i) The implementation, operation, and maintenance of at least 90 percent of approved and inventoried final project public and private SSMPs (a.k.a. WQMPs) must be verified annually. All post-construction BMPs shall be verified within every four year period;
 - (ii) Operation and maintenance verifications must be required prior to each rainy season;
 - (iii) All (100 percent) projects with BMPs that are high priority must be inspected by the Copermittee annually prior to each rainy season;
 - (iv) All (100 percent) public agency projects with BMPs must be inspected by the Copermittee annually;
 - (v) At least 50 percent of projects with drainage insert treatment control BMPs must be inspected by the Copermittee annually;
 - (vi) Appropriate follow-up measures (including re-inspections, enforcement, maintenance, etc.) must be conducted to ensure the treatment BMPs continue to reduce storm water pollutants as originally designed;
 - (vii) All inspections must verify effective operation and maintenance of the treatment control BMPs, as well as compliance with all ordinances, permits, and this Order; and
 - (viii) Inspections must note observations of vector conditions, such as mosquitoes. Where conditions are identified as contributing to mosquito production, the Copermittee must notify the Orange County Vector Control District.

g. ENFORCEMENT OF DEVELOPMENT SITES

Each Copermittee must enforce its storm water ordinance for all Development Projects and at all development sites as necessary to maintain compliance with this Order. Copermittee ordinances or other regulatory mechanisms must include appropriate sanctions to achieve compliance. Sanctions must include the following or their equivalent: Non-monetary penalties, fines, bonding requirements, and/or permit or occupancy denials for non-compliance.

h. HYDROMODIFICATION – LIMITATIONS ON INCREASES OF RUNOFF DISCHARGE RATES AND DURATIONS¹⁷

Each Copermittee shall collaborate with the other Copermittees to develop and implement a Hydromodification Management Plan (HMP) to manage increases in runoff discharge rates and durations from all Priority Development Projects. The HMP shall be incorporated into the local SSMP and implemented by each Copermittee so that estimated post-project runoff discharge rates and durations shall not exceed pre-development discharge rates and durations. Where the proposed project is located on an already developed site, the pre-project discharge rate and duration shall be that of the pre-developed, naturally occurring condition. The HMP shall be submitted to the Executive Officer within 2 years of permit adoption. The HMP will be made available for public review and comment and the Executive Officer will determine the need for a public hearing.

(1) The HMP must:

- (a) Identify a method for assessing susceptibility of channel segments which receive runoff discharges from Priority Development Projects. The geomorphic stability within the channel shall be assessed. A performance standard shall be created that ensures that the geomorphic stability within the channel not be compromised as a result of receiving runoff discharges from Priority Development Projects.
- (b) Utilize continuous simulation of the entire rainfall record (or other analytical method proposed by the Copermittees and deemed acceptable

¹⁷ Updated SSMP and hydromodification requirements shall apply to all priority projects or phases of priority projects which have not yet begun grading or construction activities at the time any updates SSMP or hydromodification requirement commences. If a Copermittee determines that lawful prior approval of a project exists, whereby application of an updated SSMP or hydromodification requirement to the project is legally infeasible, the updated SSMP or hydromodification requirement need not apply to the project. The Copermittees shall utilize the SSMP and hydromodification update periods to ensure that projects undergoing approval processes include application of the updated SSMP and hydromodification requirements in their plans.

by the Regional Board) to identify a range of runoff flows¹⁸ for which priority Development Project post-project runoff flow rates and durations shall not exceed pre-development (naturally occurring) runoff flow rates and durations by more than 10 percent, where the increased flow rates and durations will result in increased potential for erosion or other significant adverse impacts to beneficial uses. In addition, the identified range of runoff flow rates and durations must compensate for the loss of sediment supply due to the development. The lower boundary of the range of runoff flows identified shall correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or that erodes the toe of channel banks. The identified range of runoff flows may be different for specific watersheds, channels, or channel reaches. In the case of an artificially hardened (concrete lined, rip rap, etc.) channel, the lower boundary of the range of runoff flows identified shall correspond with the critical channel flow that produces the critical shear stress that initiates channel bed movement or that erodes the toe of channel banks of a comparable soft-bottomed channel.

- (c) Require Priority Development Projects to implement hydrologic control measures so that Priority Development Projects' post-project runoff flow rates and durations (1) do not exceed pre-project (naturally occurring) runoff flow rates and durations by more than 10 percent for the range of runoff flows identified under section F.1.h.(1)(b), where the increased flow rates and durations will result in increased potential for erosion or other significant adverse impacts to beneficial uses; (2) do not result in channel conditions which do not meet the channel standard developed under section F.1.h.(1)(a) for channel segments downstream of Priority Development Project discharge points; and (3) compensate for the loss of sediment supply due to development.
- (d) Include other performance criteria (numeric or otherwise) for Priority Development Projects as necessary to prevent runoff from the projects from increasing and/or continuing unnatural rates of erosion of channel beds and banks, silt pollutants generation, or other impacts to beneficial uses and stream habitat due to increased erosive force.
- (e) Include a review of pertinent literature.
- (f) Identify areas within the San Juan Hydrologic Unit where historic hydromodification has resulted in a negative impact to benthic macroinvertebrate and benthic periphyton by identifying areas with low or very low Index of Biotic Integrity (IBI) scores.

¹⁸ The identified range of runoff flows to be controlled should be expressed in terms of peak flow rates of rainfall events, such as "10% of the pre-development 2-year runoff event up to the pre-project 10-year runoff event."

- (g) Include a protocol to evaluate potential hydrograph change impacts to downstream watercourses from Priority Development Projects. This protocol must include the use of the IBI score as a metric for assessing impacts and improvements to downstream watercourses.
 - (h) Include a description of how the Copermittees will incorporate the HMP requirements into their local approval processes.
 - (i) Include criteria on selection and design of management practices and measures (such as detention, retention, and infiltration) to control flow rates and durations and address potential hydromodification impacts.
 - (j) Include technical information supporting any standards and criteria proposed.
 - (k) Include a description of inspections and maintenance to be conducted for management practices and measures to control flow rates and durations and address potential hydromodification impacts.
 - (l) Include a description of pre- and post-project monitoring and other program evaluation, including IBI score, to be conducted to assess the effectiveness of implementation of the HMP.
 - (m) Include mechanisms for assessing and addressing cumulative impacts within a watershed on channel morphology.
 - (n) Include information on evaluation of channel form and condition, including slope, discharge, vegetation, underlying geology, and other information, as appropriate.
- (2) In addition to the hydrologic control measures that must be implemented per section F.1.h.(1)(c), the HMP must include a suite of management measures to be used on Priority Development Projects to protect and restore downstream beneficial uses and prevent or further prevent adverse physical changes to downstream channels. The measures must be based on a prioritized consideration of the following elements in this order:
- (a) Hydrologic control measures;
 - (b) On-site management controls;
 - (c) Regional controls located upstream of receiving waters; and
 - (d) In-stream controls.

Where stream channels are adjacent to, or are to be modified as part of a Priority Development Project, management measures must include buffer zones and setbacks. Under no circumstances will in-stream controls include the use of non-naturally occurring hardscape materials such as concrete,

riprap, gabions, etc. The suite of management measures shall also include stream restoration as a viable option to achieve the channel standard in section F.1.h.(1)(a).

(3) Each individual Copermitee has the discretion to not require Section F.1.h. at Priority Development Projects where the project:

- (a) Discharges storm water runoff into underground storm drains discharging directly to bays or the ocean; or
- (b) Discharges storm water runoff into conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to ocean waters, enclosed bays, estuaries, or water storage reservoirs and lakes.

(4) HMP Reporting and Implementation

- (a) Within 2 years of adoption of the Order, the Copermitees shall submit to the Regional Board a draft HMP that has been reviewed by the public, including the analysis that identifies the appropriate limiting range of flow rates per section F.1.h.(1)(b).
- (b) Within 180 days of receiving Regional Board comments on the draft HMP, the Copermitees shall submit a final HMP that addressed the Regional Board's comments.
- (c) Within 90 days of receiving a finding of adequacy from the Executive Officer, each Copermitee shall incorporate and implement the HMP for all Priority Development Projects.
- (d) Prior to approval of the HMP by the Regional Board, the early implementation measures likely to be included in the HMP shall be encouraged by the Copermitees.

(5) Interim Hydromodification Criteria

Within one year of adoption of this Order, each Copermitee must ensure that all Priority Development Projects are implementing the following criteria by comparing the pre-development (naturally occurring) and post-project flow rates and durations using a continuous simulation hydrologic model such as US EPA's Hydrograph Simulation Program-Fortran (HSPF):

- (a) For flow rates from 10 percent of the 2-year storm event to the 5 year storm event, the post-project peak flows shall not exceed pre-development (naturally occurring) peak flows.
- (b) For flow rates from the 5 year storm event to the 10 year storm event the post-project peak flows may exceed pre-development (naturally

occurring) flows by up to 10 percent for a 1-year frequency interval.

The interim hydromodification criteria do not apply to Priority Development Projects where the project discharges (1) storm water runoff into underground storm drains discharging directly to bays or the ocean, or (2) storm water runoff into conveyance channels whose bed and bank are concrete lined all the way from the point of discharge to ocean waters, enclosed bays, estuaries, or water storage reservoirs and lakes.

Within one year of adoption of this Order, each Copermitttee must submit a signed, certification statement to the Regional Board verifying implementation of the interim hydromodification criteria.

- (6) No part of section F.1.h shall alleviate the Copermitttees responsibilities for implementing Low Impact Development BMPs as required under section F.1.d.(4).

i. TRAINING AND EDUCATION

(1) Municipal Departments and Personnel Education

Municipal Development Planning: Each Copermitttee must implement an education program so that its planning and development review staffs and contractors (and Planning Boards and Elected Officials, if applicable) have an understanding of:

- (a) Federal, State, and local water quality laws and regulations applicable to Development Projects;
- (b) The connection between land use decisions and short and long-term water quality impacts (i.e., impacts from land development and urbanization); and
- (c) Methods of minimizing impacts to receiving water quality resulting from development, including:
 - (i) Storm water management plan development and review;
 - (ii) Local sensitive water bodies, including 303(d)-impairments and ESAs;
 - (iii) Methods to control downstream erosion impacts;
 - (iv) Identification of pollutants of concern;
 - (v) Site design BMP techniques;
 - (vi) Source control BMPs;
 - (vii) Selection of the most effective treatment control BMPs for the pollutants of concern; and
 - (viii) Public health concerns related to storm water management infrastructure.

(2) Project Applicants, Developers, Contractors, Property Owners, and other Responsible Parties

- (a) Each Copermittee must implement a New Development / Redevelopment education program using all media as appropriate to:
- (i) Measurably increase the knowledge of the target communities regarding MS4s, impacts of runoff on receiving waters, and potential BMP solutions for the target audience; and
 - (ii) To measurably change the behavior of target communities and thereby reduce pollutant releases to MS4s and the environment.
- (b) Each Copermittee must educate each target community on the following topics where appropriate:
- (i) The importance of educating all construction workers in the field about storm water issues and BMPs through formal or informal training;
 - (ii) Federal, State, and local water quality laws and regulations applicable to new development and redevelopment activities;
 - (iii) Site design, source control, pollution prevention, and treatment BMPs;
 - (iv) General runoff concepts; and
 - (v) Other topics of local importance, including local water quality conditions, impaired waterbodies and environmentally sensitive areas.

2. CONSTRUCTION COMPONENT

Each Copermittee must implement a construction program which meets the requirements of this section, prevents illicit discharges into the MS4, implements and maintains structural and non-structural BMPs to reduce pollutants in storm water runoff from construction sites to the MS4, reduces construction site discharges of storm water pollutants from the MS4 to the MEP, and prevents construction site discharges from the MS4 from causing or contributing to a violation of water quality standards.

a. ORDINANCE UPDATE

Within 365 days of adoption of this Order, each Copermittee must review and update its grading ordinances and other ordinances as necessary to achieve full compliance with this Order, including requirements for the implementation of all designated BMPs and other measures.

b. SOURCE IDENTIFICATION

Each Copermittee must maintain an updated watershed based inventory of all construction sites within its jurisdiction. The use of an automated database system, such as Geographical Information Systems (GIS) is required.

c. SITE PLANNING AND PROJECT APPROVAL PROCESS

Each Copermittee must incorporate consideration of potential water quality impacts prior to approval and issuance of construction and grading permits.

- (1) Each construction and grading permit must require proposed construction sites to implement designated BMPs and other measures so that illicit discharges into the MS4 are prevented and storm water pollutants discharged from the site will be reduced to the maximum extent practicable and will not cause or contribute to a violation of water quality standards.
- (2) Prior to permit issuance, the project proponent's runoff management plan (or equivalent construction BMP plan) must be required to comply, and reviewed to verify compliance, with the local grading ordinance, other applicable local ordinances, and this Order.
- (3) Prior to permit issuance, each Copermittee must verify that project proponents subject to California's statewide General NPDES Permit for Storm Water Discharges Associated With Construction Activities, (hereinafter General Construction Permit), have existing coverage under the General Construction Permit.

d. BMP IMPLEMENTATION

- (1) Designate BMPs: Each Copermittee must designate a minimum set of BMPs and other measures to be implemented at all construction sites. The designated minimum set of BMPs must include:
 - (a) Management Measures:
 - (i) Pollution prevention, where appropriate;
 - (ii) Development and implementation of a site-specific runoff management plan;
 - (iii) Minimization of areas that are cleared and graded to only the portion of the site that is necessary for construction;
 - (iv) Minimization of exposure time of disturbed soil areas;
 - (v) Minimization of grading during the wet season and correlation of grading with seasonal dry weather periods to the extent feasible;
 - (vi) Limitation of grading to a maximum disturbed area as determined by each Copermittee before either temporary or permanent erosion controls are implemented to prevent storm water pollution. The Copermittee has the option of temporarily increasing the size of

disturbed soil areas by a set amount beyond the maximum, if the individual site is in compliance with applicable storm water regulations and the site has adequate control practices implemented to prevent storm water pollution;

- (vii) Temporary stabilization and reseeded of disturbed soil areas as rapidly as feasible;
- (viii) Wind erosion controls;
- (ix) Tracking controls;
- (x) Non-stormwater management measures to prevent illicit discharges and control storm water pollution sources;
- (xi) Waste management measures;
- (xii) Preservation of natural hydrologic features where feasible;
- (xiii) Preservation of riparian buffers and corridors where feasible;
- (xiv) Evaluation and maintenance of all BMPs, until removed; and
- (xv) Retention, reduction, and proper management of all storm water pollutant discharges on site to the MEP standard.

(b) Erosion and Sediment Controls:

- (i) Erosion prevention. Erosion prevention is to be used as the most important measure for keeping sediment on site during construction;
- (ii) Sediment controls. Sediment controls are to be used as a supplement to erosion prevention for keeping sediment on-site during construction;
- (iii) Slope stabilization must be used on all active slopes during rain events regardless of the season and on all inactive slopes during the rainy season and during rain events in the dry season; and
- (iv) Permanent revegetation or landscaping as early as feasible.

(c) Designate enhanced BMPs¹⁹ for 303(d) impairments and ESAs: Each Copermitttee must implement, or require implementation of, enhanced measures to address the exceptional threat to water quality posed by all construction sites tributary to CWA section 303(d) water body segments impaired for sediment or turbidity. Each Copermitttee must also implement, or require implementation of, enhanced, site-specific measures for construction sites within or adjacent to or discharging directly to coastal lagoons, the ocean, or other receiving waters within environmentally sensitive areas (as defined in Attachment C of this Order).

- (i) Active Sediment Treatment (AST): Each Copermitttee must require implementation of advanced treatment for sediment at construction

¹⁹ Enhanced BMPs are control actions specifically targeted to the pollutant or condition of concern and of higher quality and effectiveness than the minimum control measures otherwise required. Enhanced in this Order means better, not simply more, BMPs.

sites (or portions thereof) that are determined by the Copermittee to be an exceptional threat to water quality. In evaluating the threat to water quality, the following factors must be considered by the Copermittee:

- [a] Soil erosion potential or soil type;
- [b] The site's slopes;
- [c] Project size and type;
- [d] Sensitivity of receiving water bodies;
- [e] Proximity to receiving water bodies;
- [f] Non-storm water discharges;
- [g] Ineffectiveness of other BMPs;
- [h] Proximity and sensitivity of aquatic threatened and endangered species of concern;
- [i] Known effects of AST chemicals; and
- [j] Any other relevant factors.

- (d) Implement BMPs: Each Copermittee must implement, or require the implementation of, the designated minimum BMPs and any additional measures necessary to comply with this Order at each construction site within its jurisdiction year round. BMP implementation requirements, however, can vary based on wet and dry seasons. Dry season BMP implementation must plan for and address unseasonal rain events that may occur during the dry season (May 1 through September 30).

e. INSPECTION OF CONSTRUCTION SITES

Each Copermittee must conduct construction site inspections for compliance with its ordinances (grading, storm water, etc.), permits (construction, grading, etc.), and this Order. Priorities for inspecting sites must consider the nature and size of the construction activity, topography, and the characteristics of soils and receiving water quality.

- (1) During the wet season, each Copermittee must inspect at least biweekly (every two weeks), all construction sites within its jurisdiction meeting any of the following criteria:
- (a) All sites 30 acres or more in size with rough grading or active slopes occurring during the wet season;
 - (b) All sites one acre or more, and tributary to a CWA section 303(d) water body segment impaired for sediment or within or directly adjacent to, or discharging directly to, the ocean or a receiving water within an ESA; and
 - (c) Other sites determined by the Copermittees or the Regional Board as a significant threat to water quality. In evaluating threat to water quality, the following factors must be considered: (1) soil erosion potential; (2) site

slope; (3) project size and type; (4) sensitivity of receiving water bodies; (5) proximity to receiving water bodies; (6) non-storm water discharges; (7) past record of non-compliance by the operators of the construction site; and (8) any other relevant factors.

- (2) During the wet season, each Copermittee must inspect at least monthly, all construction sites with one acre or more of soil disturbance not meeting the criteria specified above in section F.2.e.(1).
- (3) During the wet season, each Copermittee must inspect construction sites less than one acre in size as needed to ensure compliance with its ordinances and this Order.
- (4) Each Copermittee must inspect all construction sites as needed during the dry season. Sites meeting the criteria in section F.2.e.(1) must be inspected at least once in August or September each year.
- (5) Re-inspections: Based upon site inspection findings, each Copermittee must implement all follow-up actions (i.e., re-inspection, enforcement) necessary to comply with this Order. Reinspection frequencies must be determined by each Copermittee based upon the severity of deficiencies, the nature of the construction activity, and the characteristics of soils and receiving water quality.
- (6) Inspections of construction sites must include, but not be limited to:
 - (a) Check for coverage under the General Construction Permit (Notice of Intent (NOI) and/or Waste Discharge Identification No.) during initial inspections;
 - (b) Assessment of compliance with Copermittee ordinances and permits related to runoff, including the implementation and maintenance of designated minimum BMPs;
 - (c) Assessment of BMP effectiveness;
 - (d) Visual observations for non-storm water discharges, potential illicit connections, and potential discharge of pollutants in storm water runoff;
 - (e) Education and outreach on storm water pollution prevention, as needed; and
 - (f) Creation of a written or electronic inspection report.
- (7) The Copermittees must track the number of inspections for each inventoried construction site throughout the reporting period to verify that each site is inspected at the minimum frequencies required.

f. ENFORCEMENT OF CONSTRUCTION SITES

- (1) Each Copermittee must develop and implement an escalating enforcement

process that achieves prompt corrective actions at construction sites for violations of the Copermittee's water quality protection permit requirements and ordinances. This enforcement process must include authorizing the Copermittee's construction site inspectors to take immediate enforcement actions when appropriate and necessary. The enforcement process must include appropriate sanctions such as stop work orders, non-monetary penalties, fines, bonding requirements, and/or permit denials for non-compliance.

- (2) Each Copermittee must be able to respond to complaints received from third-parties and to ensure the Regional Board that corrective actions have been implemented.

g. REPORTING OF NON-COMPLIANT SITES

- (1) In addition to the notification requirements in Attachment B, each Copermittee must notify the Regional Board when the Copermittee issues a stop work order or other high level enforcement to a construction site in its jurisdiction as a result of storm water violations.
- (2) Each Copermittee shall annually notify the Regional Board, prior to the commencement of the wet season, of all construction sites with alleged violations. Information may be provided as part of the JRMP annual report if submitted prior to the rainy season. Information provided shall include, but not be limited to, the following:
 - (a) WDID number if enrolled under the General Construction Permit
 - (b) Site Location, including address
 - (c) Current violations or suspected violations

h. TRAINING AND EDUCATION

- (1) Municipal Staff and Contractors: Requirements for municipal staff and contractors are described in the Municipal Component section of this Order.
- (2) Construction Site Owner / Operator Responsibilities:

As early in the planning and development process as possible and all through the permitting and construction process, each Copermittee must implement a program to educate project applicants, developers, contractors, property owners, and other responsible parties. The education program must provide an understanding of the topics listed below, as appropriate for the audience being educated.

- (a) The importance of educating all construction workers in the field about storm water issues and BMPs through formal or informal training;

- (b) Federal, State, and local water quality laws and regulations applicable to construction and grading activities;
- (c) Site design, source control, pollution prevention, and treatment BMPs;
- (d) General runoff concepts; and
- (e) Other topics of local importance, including local water quality conditions, impaired waterbodies and environmentally sensitive areas.

3. EXISTING DEVELOPMENT COMPONENT

a. MUNICIPAL

Each Copermittee must implement a municipal program which meets the requirements of this section, prevents illicit discharges into the MS4, reduces municipal discharges of storm water pollutants from the MS4 to the MEP, and prevents municipal discharges from the MS4 from causing or contributing to a violation of water quality standards.

(1) Source Identification / Inventory

Each Copermittee must maintain an updated watershed-based inventory of municipal areas and activities. The inventory must include the name, address (if applicable), and a description of the area/activity; which pollutants are potentially generated by the area/activity; whether the area/activity is adjacent to an ESA; and identification of whether the area/activity is tributary to a CWA section 303(d) water body segment and generates pollutants for which the water body segment is impaired. The use of an automated database system, such as Geographical Information Systems (GIS) is required when applicable.

(2) General BMP Implementation

- (a) Pollution Prevention: Each Copermittee must implement pollution prevention methods in its municipal program and must require their use by appropriate municipal departments, personnel, and contractors, where appropriate.
- (b) Designate Minimum BMPs: Each Copermittee must designate a minimum set of BMPs for all municipal areas and activities. The designated minimum BMPs for municipal areas and activities must be area or activity specific as appropriate. BMPs must be designated for special events that are expected to generate significant trash and litter.
- (c) Designate BMPs for ESAs and 303(d) Impairments: Each Copermittee must designate enhanced measures for municipal areas and activities tributary to CWA section 303(d) impaired water body segments when an area or activity generates pollutants for which the water body segment is

impaired. Each Copermittee must also designate additional controls for municipal areas and activities within or directly adjacent to or discharging directly to coastal lagoons, the ocean, or other receiving waters within environmentally sensitive areas (as defined in Attachment C of this Order).

- (d) Implement BMPs: Each Copermittee must implement, or require the implementation of, the designated minimum and enhanced BMPs and any additional measures necessary based on its inventory to comply with this Order for each municipal area or activity within its jurisdiction.

(3) BMP Implementation for Management of Pesticides, Herbicides, and Fertilizers

Each Copermittee must implement BMPs to reduce the contribution of storm water pollutants associated with the application, storage, and disposal of pesticides, herbicides and fertilizers from municipal areas and activities to MS4s and receiving waters. Such BMPs must include, at a minimum:

- (a) Educational activities, permits, certifications and other measures for municipal applicators and distributors;
- (b) Integrated Pest Management (IPM) measures that rely on non-chemical solutions;
- (c) The use of native vegetation;
- (d) Schedules for irrigation and chemical application; and
- (e) The collection and proper disposal of unused pesticides, herbicides, and fertilizers.

(4) BMP implementation for Flood Control Structures

- (a) Each Copermittee must implement procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies.
- (b) Each Copermittee must include water quality protection measures, where feasible, when retrofitting existing flood control structural devices.
- (c) Each Copermittee must evaluate its existing flood control devices, identify devices causing or contributing to a condition of pollution, identify measures to reduce or eliminate the structure's effect on pollution, and evaluate the feasibility of retrofitting the structural flood control device. The inventory and evaluation must be completed by and submitted to the Regional Board in the 2nd year JRMP Annual Report.

(5) BMP Implementation for Sweeping of Municipal Areas

Where municipal area sweeping is implemented as an MS4 BMP for municipal roads, streets, highways, and parking facilities, each Copermittee must design and implement the program based on the following criteria:

- (a) Optimize pickup of trash and debris based on land uses, trash collection schedules, seasonal factors (e.g., special events, tourism, etc.) and inspections of municipal areas/activities.

(6) Operation and Maintenance of Municipal Separate Storm Sewer System (MS4) and Structural Controls

- (a) Treatment Controls: Each Copermittee must implement a schedule of inspection and maintenance activities to verify proper operation of all municipal structural treatment controls designed to reduce storm water pollutant discharges to or from its MS4s and related drainage structures.
- (b) MS4 and Facilities: Each Copermittee must implement a schedule of maintenance activities for the MS4 and MS4 facilities (catch basins, storm drain inlets, open channels, etc). The maintenance activities must, at a minimum, include:
 - (i) Inspection and removal of accumulated waste at least once a year between May 1 and September 30 of each year for all MS4 facilities;
 - (ii) Additional cleaning as necessary between October 1 and April 30 of each year for facilities that receive or collect high volumes of trash and debris;
 - (iii) Following two years of inspections, any MS4 facility that requires inspection and cleaning less than annually may be inspected as needed, but not less than every other year;
 - (iv) Open channels must be cleaned of observed anthropogenic litter in a timely manner;
 - (v) Record keeping of the maintenance and cleaning activities including the overall quantity of waste removed;
 - (vi) Proper disposal of waste removed pursuant to applicable laws; and
 - (vii) Measures to eliminate waste discharges during MS4 maintenance and cleaning activities.

(7) Infiltration From Sanitary Sewer to MS4/Provide Preventive Maintenance of Both

- (a) Each Copermittee must implement controls and measures to prevent and eliminate infiltration of seepage from municipal sanitary sewers to MS4s through thorough, routine preventive maintenance of the MS4. Each Copermittee that operates both a municipal sanitary sewer system and a MS4 must implement controls and measures to prevent and eliminate infiltration of seepage from the municipal sanitary sewers to the MS4s that must include overall sanitary sewer and MS4 surveys and thorough, routine preventive maintenance of both.

(b) Each Copermittee must implement controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary. Such controls must include:

- (i) Adequate plan checking for construction and new development,
- (ii) Incident response training for municipal employees that identify sanitary sewer spills;
- (iii) Code enforcement inspections;
- (iv) MS4 maintenance and inspections;
- (v) Interagency coordination with sewer agencies; and
- (vi) Proper education of municipal staff and contractors conducting field operations on the MS4 or municipal sanitary sewer (if applicable).

(8) Inspection of Municipal Areas and Activities

(a) At a minimum, each Copermittee must inspect the following high priority municipal areas and activities annually:

- (i) Roads, Streets, Highways, and Parking Facilities;
- (ii) Flood Management Projects and Flood Control Devices;
- (iii) Areas and activities tributary to a CWA section 303(d) impaired water body segment, where an area or activity generates pollutants for which the water body segment is impaired.
- (iv) Areas and activities within or adjacent to or discharging directly to coastal lagoons, the ocean, or other receiving waters within environmentally sensitive areas (as defined in Attachment C of this Order);
- (v) Municipal Facilities:
 - [a] Active or closed municipal landfills;
 - [b] Publicly owned treatment works (including water and wastewater treatment plants) and sanitary sewage collection systems;
 - [c] Solid waste transfer facilities;
 - [d] Land application sites;
 - [e] Corporate yards including maintenance and storage yards for materials, waste, equipment and vehicles; and
 - [f] Household hazardous waste collection facilities.
- (vi) Municipal airfields;
- (vii) Parks and recreation facilities;
- (viii) Special event venues following special events (festivals, sporting events, etc.);
- (ix) Power washing; and
- (x) Other municipal areas and activities that the Copermittee determines may contribute a significant pollutant load to the MS4.

(b) Other municipal areas and activities must be inspected as needed and in response to water quality data, valid public complaints, and findings from

municipal or contract staff.

- (c) Based upon site inspection findings, each Copermittee must implement all follow-up actions necessary to comply with this Order.

(9) Enforcement of Municipal Areas and Activities

Each Copermittee must enforce its storm water ordinance for all municipal areas and activities as necessary to maintain compliance with this Order.

(10) Training and Education

Each Copermittee must ensure that all municipal personnel and contractors that have responsibilities for selecting, implementing, and evaluating BMPs for municipal areas and activities are adequately trained and educated to perform such tasks.

(a) Municipal Departments and Personnel Education

- (i) Municipal Construction Activities: Each Copermittee must implement an education program that includes annual training prior to the rainy season so that its construction, building, code enforcement, and grading review staffs, inspectors, and other responsible construction staff have, at a minimum, an understanding of the following topics, as appropriate for the target audience:
- [a] Federal, State, and local water quality laws and regulations applicable to construction and grading activities;
 - [b] The connection between construction activities and water quality impacts (i.e., impacts from land development and urbanization and impacts from construction material such as sediment);
 - [c] Proper implementation of erosion and sediment control and other BMPs to minimize the impacts to receiving water quality resulting from construction activities;
 - [d] The Copermittee's inspection, plan review, and enforcement policies and procedures to verify consistent application;
 - [e] Current advancements in BMP technologies;
 - [f] SSMP Requirements including treatment options, site design, source control, and applicable tracking mechanisms; and
 - [g] Other topics of local importance, including local water quality conditions, impaired water bodies, environmentally sensitive areas, and public health and disease vector issues associated with runoff.
- (ii) Municipal Industrial/Commercial Activities: Each Copermittee must train staff responsible for conducting storm water compliance inspections and enforcement of industrial and commercial facilities at

least once a year. Training must cover inspection and enforcement procedures, BMP implementation, and review of monitoring data

- (iii) Municipal Other Activities: Each Copermittee must implement an education program so that municipal personnel and contractors performing activities which generate pollutants have an understanding of the activity specific BMPs for each activity to be performed.

b. COMMERCIAL / INDUSTRIAL

Each Copermittee must implement a commercial / industrial program that meets the requirements of this section, prevents illicit discharges into the MS4, reduces commercial / industrial discharges of storm water pollutants from the MS4 to the MEP, and prevents commercial / industrial discharges from the MS4 from causing or contributing to a violation of water quality standards.

(1) Source Identification

- (a) Each Copermittee must maintain an updated watershed-based inventory of all industrial and commercial sites/sources within its jurisdiction (regardless of ownership) that could contribute a significant pollutant load to the MS4. The inventory must include the following minimum information for each industrial and commercial site/source: name; address; pollutants potentially generated by the site/source; and identification of whether the site/source is tributary to a Clean Water Act section 303(d) water body segment and generates pollutants for which the water body segment is impaired; and a narrative description including SIC codes which best reflects the principal products or services provided by each facility.

At a minimum, the following sites/sources must be included in the inventory:

- (i) Commercial Sites/Sources:
 - [a] Automobile repair, maintenance, fueling, or cleaning;
 - [b] Airplane repair, maintenance, fueling, or cleaning;
 - [c] Boat repair, maintenance, fueling, or cleaning;
 - [d] Equipment repair, maintenance, fueling, or cleaning;
 - [e] Automobile and other vehicle body repair or painting;
 - [f] Mobile automobile or other vehicle washing;
 - [g] Automobile (or other vehicle) parking lots and storage facilities;
 - [h] Retail or wholesale fueling;
 - [i] Pest control services;
 - [j] Eating or drinking establishments, including food markets;

- [k] Mobile carpet, drape or furniture cleaning;
- [l] Cement mixing or cutting;
- [m] Masonry;
- [n] Painting and coating;
- [o] Botanical or zoological gardens and exhibits;
- [p] Landscaping;
- [q] Nurseries and greenhouses;
- [r] Golf courses, parks and other recreational areas/facilities;
- [s] Cemeteries;
- [t] Pool and fountain cleaning;
- [u] Marinas;
- [v] Portable sanitary services;
- [w] Building material retailers and storage;
- [x] Animal facilities;
- [y] Mobile pet services;
- [z] Power washing services; and
- [aa] Other sites and sources with a history of un-authorized discharges to the MS4.

(ii) Industrial Sites/Sources:

- [a] Industrial Facilities, as defined at 40 CFR § 122.26(b)(14), including those subject to the General Industrial Permit or other individual NPDES permit;
- [b] Operating and closed landfills;
- [c] Facilities subject to SARA Title III; and
- [d] Hazardous waste treatment, disposal, storage and recovery facilities.

(iii) ESAs and 303(d) Listed Waterbodies: All other commercial or industrial sites/sources tributary to a CWA Section 303(d) impaired water body segment, where the site/source generates pollutants for which the water body segment is impaired. All other commercial or industrial sites/sources within or directly adjacent to or discharging directly to coastal lagoons, the ocean, or other receiving waters within environmentally sensitive areas (as defined in Attachment C of this Order).

(iv) All other commercial or industrial sites/sources that the Copermitttee determines may contribute a significant pollutant load to the MS4.

(2) General BMP Implementation

(a) Pollution Prevention: Each Copermitttee must require the use of pollution prevention methods by industrial and commercial sites/sources.

- (b) Designate / Update Minimum BMPs: Each Copermittee must designate a minimum set of BMPs for all industrial and commercial sites/sources. Where BMPs have already been designated, each Copermittee must review its existing BMPs for adequacy. The designated minimum BMPs must be specific to facility types and pollutant-generating activities, as appropriate.
- (c) Designate Enhanced BMPs for ESAs and 303(d) Impairments: Each Copermittee must designate enhanced measures for industrial and commercial sites/sources tributary to CWA section 303(d) impaired water body segments (where a site/source generates pollutants for which the water body segment is impaired). Each Copermittee must also designate additional controls for industrial and commercial sites/sources within or directly adjacent to or discharging directly to coastal lagoons, the ocean, or other receiving waters within environmentally sensitive areas (as defined in Attachment C of this Order).
- (d) Implement BMPs: Each Copermittee must implement, or require the implementation of, the designated minimum and enhanced BMPs and any additional measures necessary based on inspections, incident responses, and water quality data to comply with this Order at each industrial and commercial site/source within its jurisdiction.

(3) BMP Implementation for Mobile Businesses

- (a) Each Copermittee must develop and implement a program to reduce the discharge of storm water pollutants from mobile businesses to the MEP and to prohibit non-storm water discharges pursuant to Section B of this Order. Each Copermittee must keep as part of their commercial source inventory a listing of mobile businesses known to operate within its jurisdiction. The program must include:
 - (i) Development and implementation of minimum standards and BMPs to be required for each of the various types of mobile businesses;
 - (ii) Development and implementation of an enforcement strategy which specifically addresses the unique characteristics of mobile businesses;
 - (iii) Notification of those mobile businesses known to operate within the Copermittee's jurisdiction of the minimum standards and BMP requirements and local ordinances;
 - (iv) Development and implementation of an outreach and education strategy; and
 - (v) Inspection of mobile businesses as needed to implement the program.
- (b) If they choose to, the Copermittees may cooperate in developing and implementing their programs for mobile businesses, including sharing of mobile business inventories, BMP requirements, enforcement action

information, and education.

(4) Inspection of Industrial and Commercial Sites/Sources

Each Copermittee must conduct industrial and commercial site inspections for compliance with its ordinances, permits, and this Order.

(a) Inspection Procedures: Inspections must include but not be limited to:

- (i) Review of BMP implementation plans, if the site uses or is required to use such a plan;
- (ii) Review of facility monitoring data, if the site monitors its runoff;
- (iii) Check for coverage under the General Industrial Permit (Notice of Intent (NOI) and/or Waste Discharge Identification Number), if applicable;
- (iv) Assessment of compliance with Copermittee ordinances and permits related to runoff;
- (v) Assessment of BMP implementation, maintenance and effectiveness;
- (vi) Visual observations for non-storm water discharges, potential illicit connections, and potential discharge of pollutants in storm water runoff; and
- (vii) Education and training on storm water pollution prevention, as conditions warrant.

(b) Each Copermittee shall annually notify the Regional Board, prior to the commencement of the wet season, of all Industrial Sites and Industrial Facilities subject to the General Industrial Permit or other individual NPDES permit with alleged violations. Information may be provided as part of the JRMP annual report if submitted prior to the rainy season. Information provided shall include, but not be limited to, the following:

- (i) WDID number if enrolled under the General Industrial Permit;
- (ii) Site Location, including address;
- (iii) Current violations or suspected violations; and
- (iv) Past Violation history.

(c) Frequencies: At a minimum, 20 percent of the sites inventoried as required in section F.3.b.(1) above (excluding mobile sources and food facilities) must be inspected each year. Mobile businesses must be

inspected pursuant to the enforcement strategy developed pursuant to section F.3.b.(3). Other inspection frequencies must be based upon findings of the Copermittee's existing program and the following factors:

- (i) Type of activity (SIC code);
 - (ii) Materials used at the facility;
 - (iii) Wastes generated;
 - (iv) Pollutant discharge potential;
 - (v) Non-storm water discharges;
 - (vi) Size of facility;
 - (vii) Proximity to receiving water bodies;
 - (viii) Sensitivity of receiving water bodies;
 - (ix) Whether the facility is subject to the General Industrial Permit or an individual NPDES permit;
 - (x) Whether the facility has filed a No Exposure Certification/Notice of Non-Applicability;
 - (xi) Facility design;
 - (xii) Total area of the site, area of the site where industrial or commercial activities occur, and area of the site exposed to rainfall and runoff;
 - (xiii) The facility's compliance history; and
 - (xiv) Any other relevant factors.
- (d) Food Facilities: Each food facility must be inspected annually for compliance with the Copermittee's water quality ordinances and this Order. Each inspection of a food facility must, at a minimum, address the following concerns:
- (i) Trash storage and disposal;
 - (ii) Grease storage and disposal;
 - (iii) Washwater discharges to the MS4 (e.g., from floor mats, driveways, sidewalks, etc.);
 - (iv) Identification of outdoor sewer and MS4 connections; and
 - (v) Education of property managers when grease and/or trash facilities are shared by multiple facilities.
- (e) Third-Party Inspections: Each Copermittee may develop and implement a third party inspection program for verifying industrial and commercial site/source compliance with its ordinances, permits, and this Order. To the extent that third party inspections are conducted to fulfill the requirements of this Order, the Copermittee will be responsible for conducting and documenting quality assurance and quality control of the third-party inspections.
- (i) Each inspection conducted by a third-party must, at a minimum, result in the following:

- [a] Photo documentation of potential storm water violations identified during the third party inspection;
 - [b] Reporting to the Copermittee of identified significant potential violations, including imminent or observed illegal discharges, within 24 hours of the third party inspection;
 - [c] Reporting to the Copermittee of all inspection findings within one week of the inspection being conducted; and
 - [d] Copermittee follow-up and/or enforcement actions for identified potential storm water violations within two business days of the inspection or potential violation report receipt.
- (f) Based upon site inspection findings, each Copermittee must implement all follow-up actions and enforcement necessary to comply with this Order.
- (g) To the extent that the Regional Board has conducted an inspection of an industrial site during a particular year, the requirement for the responsible Copermittee to inspect this facility during the same year will be satisfied.
- (h) The Copermittees must track the number of inspections for the inventoried industrial and commercial sites/sources throughout the reporting period to verify that the sites/sources are inspected at the minimum frequencies listed in this Order.

(5) Enforcement of Industrial and Commercial Sites/Sources

Each Copermittee must enforce its storm water ordinance for all industrial and commercial sites/sources as necessary to maintain compliance with this Order. Copermittee ordinances or other regulatory mechanisms must include appropriate sanctions to achieve compliance. Sanctions must include the following or their equivalent: Non-monetary penalties, fines, bonding requirements, and/or permit denials for non-compliance.

(6) Training and Education for Owners and Operators of Commercial and Industrial Activities

- (a) Each Copermittee must implement an education program using all media as appropriate to (1) measurably increase the knowledge of owners and operators of commercial and industrial activities regarding MS4s, impacts of runoff on receiving waters, and potential BMP solutions for the target audience; and (2) to measurably change the behavior of target communities and thereby reduce storm water pollutant releases and eliminate prohibited non-storm water discharges to MS4s and the environment. At a minimum, the education program must meet the requirements of this section and address the following issues:
- (i) Laws, regulations, permits, & requirements;

- (ii) Best management practices;
- (iii) General runoff concepts; and
- (iv) Other topics, including public reporting mechanisms, water conservation, low-impact development techniques.

(b) BMP Notification: At least twice during the five-year period of this Order, each Copermittee must notify the owner/operator of each inventoried industrial and commercial site/source of the BMP requirements applicable to the site/source.

c. RESIDENTIAL

Each Copermittee must implement a residential program which meets the requirements of this section, prevents illicit discharges into the MS4, reduces residential discharges of storm water pollutants from the MS4 to the MEP, and prevents residential discharges from the MS4 from causing or contributing to a violation of water quality standards.

(1) Threat to Water Quality Prioritization

Each Copermittee must identify residential areas and activities that pose a high threat to water quality. At a minimum, these must include:

- (a) Automobile repair, maintenance, washing, and parking;
- (b) Home and garden care activities and product use (pesticides, herbicides, and fertilizers);
- (c) Disposal of trash, pet waste, green waste, and household hazardous waste (e.g., paints, cleaning products);
- (d) Any other residential source that the Copermittee determines may contribute a significant pollutant load to the MS4;
- (e) Any residential areas tributary to a CWA section 303(d) impaired water body, where the residence generates pollutants for which the water body is impaired; and
- (f) Any residential areas within or directly adjacent to or discharging directly to a coastal lagoon, the ocean, or other receiving waters within an environmentally sensitive area (as defined in Attachment C of this Order).

(2) BMP Implementation

- (a) Pollution Prevention: Each Copermittee must actively encourage the use of pollution prevention methods by residents.
- (b) Designate BMPs: Each Copermittee must designate minimum BMPs for high-threat-to-water quality residential areas and activities. The designated minimum BMPs for high-threat-to-water quality residential

areas and activities must be area or activity specific.

- (c) Hazardous Waste BMPs: Each Copermittee must facilitate the proper management and disposal of used oil, toxic materials, and other household hazardous wastes. Such facilitation must include educational activities, public information activities, and establishment of collection sites operated by the Copermittee or a private entity. Curbside collection of household hazardous wastes is encouraged.
- (d) Implement BMPs: Each Copermittee must implement, or require implementation of, the designated minimum BMPs and any additional measures necessary to comply with Sections A and B of this Order.
- (e) Each Copermittee must implement, or require implementation of, BMPs for residential areas and activities that have not been designated a high threat to water quality, as necessary.

(3) Enforcement of Residential Areas and Activities

Each Copermittee must enforce its storm water ordinance for all residential areas and activities as necessary to maintain compliance with this Order.

(4) Evaluation of Oversight of Residential Areas and Activities

Each Copermittee must annually review the effectiveness of efforts to reduce residential discharges of storm water pollutants from the MS4 and eliminate illicit residential discharges into the MS4. The evaluation must consider findings from monitoring data, municipal employee comments, inspections, complaints, and other appropriate sources.

(5) Common Interest Areas (CIA) / Home Owner Association (HOA) Areas

Each Copermittee must implement measures specifically to ensure that runoff within common interest developments, including areas managed by associations, meets the objectives of this section and Order.

- (a) BMP Implementation: Each Copermittee must implement management measures based on a review of pertinent factors, including:
 - (i) Current maintenance duties and procedures used by CIA/HOA maintenance associations within its jurisdiction;
 - (ii) Whether streets and storm drains are publicly or privately owned within the CIA/HOA;
 - (iii) Whether the CIA/HOA area has been identified as a high priority residential area;
 - (iv) Proximity to 303(d)-listed waterbodies, the ocean, environmentally

- sensitive areas;
- (v) Evaluation of water quality monitoring data;
- (vi) Evaluation of existing illegal discharge/illicit connection activities;
- (vii) Other activities conducted or authorized by the HOA that may pose a significant risk to inland or coastal receiving waters.

- (b) Legal Authority and Enforcement: Within one year of adoption of this Order, each Copermittee must review its Municipal Code to determine the most appropriate method to implement and enforce runoff management measures within CIA/HOA areas.

(6) Residential Education Program

- (a) Each Copermittee must implement a Residential Education Program using all media as appropriate to (1) measurably increase the knowledge regarding MS4s, impacts of runoff on receiving waters, and potential BMP solutions for the target audience; and (2) to measurably change the behavior of target communities and thereby reduce storm water and eliminate prohibited non-storm water pollutant releases to MS4s and the environment.
- (b) Copermittee educational programs must emphasize underserved target audiences, residents and managers of CIA/HOA areas, high-risk behaviors, and “allowable” behaviors and discharges. At a minimum, the education program must meet the requirements of this section and address the following issues:
 - (i) Laws, regulations, permits, and requirements;
 - (ii) Best management practices;
 - (iii) General runoff concepts;
 - (iv) Existing water quality, including local water quality conditions, impaired waterbodies and environmentally sensitive areas; and
 - (v) Other topics, including public reporting mechanisms, water conservation, low-impact development techniques, and public health and disease vector issues associated with runoff.

d. Retrofitting Existing Development

Each Copermittee must develop and implement a retrofitting program which meets the requirements of this section. The goals of the existing development retrofitting program are to reduce impacts from hydromodification, promote LID, support riparian and aquatic habitat restoration, reduce the discharges of storm water pollutants from the MS4 to the MEP, and prevent discharges from the MS4 from causing or contributing to a violation of water quality standards. Where feasible, at the discretion of the Copermittee, the existing development retrofitting program may be coordinated with flood control projects and infrastructure

improvement programs.

(1) Source Identification

The Copermittee must identify and inventory existing developments (i.e. municipal, industrial, commercial, residential) as candidates for retrofitting. Potential retrofitting candidates must include but are not limited to:

- (a) Development that contributes pollutants of concern to a TMDL or a ESA;
- (b) Receiving waters channelized or otherwise hardened;
- (c) Development tributary to receiving waters that are channelized or otherwise hardened;
- (d) Developments tributary to receiving waters that are significantly eroded;
- (e) Developments tributary to an ASBS or SWQPA; and
- (f) Development that causes hydraulic constriction.

(2) Each Copermittee shall evaluate and rank the inventoried existing developments to prioritize retrofitting. Criteria for evaluation must include but is not limited to:

- (a) Feasibility;
- (b) Cost effectiveness;
- (c) Pollutant removal effectiveness;
- (d) Impervious area potentially treated;
- (e) Maintenance requirements;
- (f) Landowner cooperation;
- (g) Neighborhood acceptance;
- (h) Aesthetic qualities; and
- (i) Efficacy at addressing concern.

(3) Each Copermittee must consider the results of the evaluation in prioritizing work plans for the following year. Highly feasible projects expected to benefit water quality should be given a high priority to implement source control and treatment control BMPs. Where feasible, the retrofit projects should be designed in accordance with the SSMP requirements within sections F.1.d.(3) through F.1.d.(8). In addition, the Copermittee shall encourage retrofit projects to implement where feasible the Hydromodification requirements in Section F.1.h.

(4) When requiring retrofitting on existing development, the Copermittees will cooperate with private landowners to encourage retrofitting projects. The Copermittee may consider the following practices in cooperating and encouraging private landowners to retrofit their existing development:

- (a) Demonstration retrofit projects;
- (b) Retrofits on public land and easements;

- (c) Education and outreach;
 - (d) Subsidies for retrofit projects;
 - (e) Requiring retrofit projects as mitigation or ordinance compliance;
 - (f) Public and private partnerships; and
 - (g) Fees for existing discharges to the MS4.
- (5) The completed retrofit BMPs shall be tracked and inspected in accordance with section F.1.f.
- (6) Where constraints on retrofitting preclude effective BMP deployment on existing developments at locations critical to protect receiving waters, a Copermittee may propose a regional mitigation project to improve water quality. Such regional projects may include but are not limited to:
- (a) Regional water quality treatment BMPs;
 - (b) Urban creek or wetlands restoration and preservation;
 - (c) Daylighting and restoring underground creeks;
 - (d) Localized rainfall storage and reuse to the extent such projects are fully protective of downstream water rights;
 - (e) Hydromodification project; and
 - (f) Removal of invasive plant species.
- (7) A retrofit project or regional mitigation project may qualify as a Watershed Water Quality Activity provided it meets the requirements in section G. Watershed Runoff Management Program.

4. ILLICIT DISCHARGE DETECTION AND ELIMINATION

Each Copermittee must implement a program which meets the requirements of this section to actively detect and eliminate illicit discharges and disposal into the MS4. The program must address all types of illicit discharges and connections excluding those non-storm water discharges not prohibited by the Copermittee in accordance with section B of this Order.

a. PREVENT AND DETECT ILLICIT DISCHARGES AND CONNECTIONS

Each Copermittee must implement measures to prevent and detect illicit discharges to the MS4.

- (1) Legal Authority: Each Copermittee must retain legal authority to prevent and eliminate illicit discharges and connections to the MS4.
- (2) Inspections: Each Copermittee must include use of appropriate municipal personnel and contractors to assist in identifying illicit discharges and connections during their daily activities.

- (a) Inspections for illegal discharges and connections must be conducted during routine maintenance of all MS4 facilities.
- (b) Municipal staff and contractors conducting non-MS4 field operations must be trained to report suspected illegal discharges and connections to proper municipal staff.

b. MAINTAIN MS4 MAP

Each Copermittee must maintain an updated map of its entire MS4 and the corresponding drainage areas within its jurisdiction. The use of GIS is required. The accuracy of the MS4 map must be confirmed during dry weather field screening and analytical monitoring and must be updated at least annually. The GIS layers of the MS4 map must be submitted with the updated Jurisdictional Runoff Management Plan within 365 days after adoption of this Order.

c. FACILITATE PUBLIC REPORTING OF ILLICIT DISCHARGES AND CONNECTIONS - PUBLIC HOTLINE

Each Copermittee must promote, publicize and facilitate public reporting of illicit discharges or water quality impacts associated with discharges into or from MS4s. Each Copermittee must facilitate public reporting through development and operation of a public hotline. Public hotlines can be Copermittee-specific or shared by Copermittees. All storm water hotlines must be capable of receiving reports in both English and Spanish 24 hours per day and seven days per week.

d. DRY WEATHER FIELD SCREENING AND ANALYTICAL MONITORING

Each Copermittee must conduct dry weather field screening and analytical monitoring of MS4 outfalls and other portions of its MS4 within its jurisdiction to detect illicit discharges and connections in accordance with Receiving Waters and MS4 Discharge Monitoring and Reporting Program No. R9-2009-0002 in Attachment E of this Order.

e. INVESTIGATION / INSPECTION AND FOLLOW-UP

Each Copermittee must implement procedures to investigate and inspect portions of the MS4 that, based on the results of field screening, analytical monitoring, or other appropriate information, indicate a reasonable potential of containing illicit discharges, illicit connections, or other sources of pollutants in non-storm water.

- (1) Develop response criteria for data: Each Copermittee must develop, update, and use numeric criteria action levels (or other actions level criteria where appropriate) to determine when follow-up investigations will be performed in response to water quality monitoring. The criteria must include required

non-storm water action levels (see Section C) and a consideration of 303(d)-listed waterbodies and environmentally sensitive areas (ESAs) as defined in Attachment C.

- (2) Respond to data: Each Copermittee must investigate portions of the MS4 for which water quality data or conditions indicates a potential illegal discharge or connection.
 - (a) Obvious illicit discharges (i.e. color, odor, or significant exceedances of action levels) must be investigated immediately.
 - (b) Field screen data: Within two business days of receiving dry weather field screening results that exceed action levels, the Copermittees must either initiate an investigation to identify the source of the discharge or document the rationale for why the discharge does not pose a threat to water quality and does not need further investigation. This documentation shall be included in the Annual Report.
 - (c) Analytical data: Within five business days of receiving analytical laboratory results that exceed action levels, the Copermittees must either initiate an investigation to identify the source of the discharge or document the rationale for why the discharge does not pose a threat to water quality and does not need further investigation. This documentation shall be included in the Annual Report.
- (3) Respond to notifications: Each Copermittee must respond to and resolve each reported incident (e.g., public hotline, staff notification, etc.) in a timely manner. Criteria may be developed to assess the validity of, and prioritize the response to, each report.

f. ELIMINATION OF ILLICIT DISCHARGES AND CONNECTIONS

Each Copermittee must take immediate action to initiate steps necessary to eliminate all detected illicit discharges, illicit discharge sources, and illicit connections after detection. Elimination measures may include an escalating series of enforcement actions for those illicit discharges that are not a serious threat to public health or the environment. Illicit discharges that pose a serious threat to the public's health or the environment must be eliminated immediately.

g. ENFORCE ORDINANCES

Each Copermittee must implement and enforce its ordinances, orders, or other legal authority to prevent illicit discharges and connections to its MS4 and to eliminate detected illicit discharges and connections to its MS4.

h. PREVENT AND RESPOND TO SEWAGE SPILLS (INCLUDING FROM PRIVATE LATERALS AND FAILING SEPTIC SYSTEMS) AND OTHER SPILLS

(1) Each Copermittee must implement management measures and procedures to prevent, respond to, contain and clean up all sewage (see below) and other spills that may discharge into its MS4 from any source (including private laterals and failing septic systems). Copermittees must coordinate with spill response teams to prevent entry of spills into the MS4 and contamination of surface water, ground water and soil. Each Copermittee must coordinate spill prevention, containment and response activities throughout all appropriate departments, programs and agencies so that maximum water quality protection is available at all times.

(2) Each Copermittee must develop and implement a mechanism whereby it is notified of all sewage spills from private laterals and failing septic systems into its MS4. Each Copermittee must implement management measures and procedures to prevent, respond to, and coordinate a response to contain and clean up sewage from any such notification.

i. EDUCATION AND TRAINING

Each Copermittee must implement educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials.

5. PUBLIC PARTICIPATION COMPONENT

Each Copermittee must incorporate a mechanism for public participation in the updating, development, and implementation of the Jurisdictional Runoff Management Program.

G. WATERSHED RUNOFF MANAGEMENT PROGRAM

1. Lead Watershed Copermittee Identification

Watershed Copermittees shall identify the Lead Watershed Copermittee for their Watershed Management Area (WMA). The Lead Watershed Copermittees shall serve as liaisons between the Permittees and Regional Board, where appropriate.

2. Watershed Water Quality Workplan (Watershed Workplan)

The Watershed Workplan shall describe the Permittees' development and implementation of a collective watershed strategy to assess and prioritize the water quality problems within the watershed's receiving waters, identify and model sources of the highest priority water quality problem(s), develop a watershed-wide BMP implementation strategy to abate highest priority water quality problems, and a monitoring strategy to evaluate BMP effectiveness and changing water quality prioritization in the WMA.

The work plan shall, at a minimum:

- a.** Characterize the receiving water quality in the WMA. Characterization shall include use of regularly collected water quality data, reports, monitoring and analysis generated in accordance with the requirements of the Receiving Waters Monitoring and Reporting Program, as well as applicable information available from other public and private organizations.
- b.** Identify the highest priority water quality problem(s), in terms of constituents by location, in the WMA's receiving waters. Identified water quality problem(s) shall, at a minimum, give consideration to; TMDLs, receiving waters listed on the CWA section 303(d) list, waters with persistent violations of water quality standards, toxicity, or impacts to beneficial uses, and other pertinent conditions.
- c.** Identify the sources of the highest water quality problem(s) within the WMA. Efforts to determine such sources shall include, but not be limited to: use of information from the construction, industrial/commercial, municipal, and residential source identification programs required within the Jurisdictional Runoff Program (JRMP) of this Order; specific actions to model pollutant transport to receiving waters for the sake of identifying the source(s) point(s) of origin; water quality monitoring data collected as part of the Receiving Water Monitoring and Reporting Program required by this Order, and additional focused water quality monitoring to identify specific sources within the watershed.
- d.** Develop a watershed BMP implementation strategy to attain receiving water quality objectives in the identified highest priority water quality problem(s). The BMP implementation strategy shall include a schedule for implementation of the BMP projects to abate specific receiving water quality problems. BMPs not

contributing to measured pollutant reductions or improvements to water quality must be removed and replaced with alternative BMPs. Identified watershed water quality problems may be the result of jurisdictional discharges that will need to be addressed with BMPs applied in a specific jurisdiction in order to generate a benefit to the watershed.

- e. Develop a strategy to model and monitor improvements in receiving water quality directly resulting from implementation of the BMPs described in the Watershed Workplan. The modeling and monitoring strategy shall generate the necessary data to report on the measured pollutant reduction that results from proper BMP implementation. Monitoring shall, at a minimum, be conducted in the receiving water to demonstrate reduction in pollutant concentrations and progression towards attainment of receiving water quality objectives.
 - f. Establish a schedule for development and implementation of the Watershed strategy outlined in the Workplan. The schedule shall, at a minimum, include forecasted dates of planned actions to address Provisions E.2(a) through E.2(e) and dates for watershed review meetings through the remaining portion of this Permit cycle. Annual watershed workplan review meetings must be open to the public and appropriately publically noticed such that interested parties may come and provide comments on the watershed program.
3. **Watershed Workplan Implementation** – Watershed Copermittee’s shall begin implementing the Watershed Workplan within 60-days of acceptance by the Regional Board Executive Officer. If within 30 days of submittal, the Regional Board has not taken an action, the Workplan shall be deemed acceptable.
 4. **Copermittee Collaboration** – Watershed Copermittees shall collaborate to develop and implement the Watershed Workplan. Watershed Copermittee collaboration shall include frequent regularly scheduled meetings.
 5. **Public Participation** – Watershed Copermittees shall implement a watershed-specific public participation mechanism within each watershed. A required component of the watershed-specific public participation shall be a minimum 30-day public review of the Watershed Workplan prior to submittal for acceptance by the Regional Board Executive Officer. Opportunity for the public to review and comment on the Watershed Workplan must occur before the workplan is implemented.
 6. **Watershed Workplan Review and Updates** – Watershed Copermittees shall review and update the Watershed Workplan annually to identify needed changes to the prioritized water quality problem(s) listed in the workplan. All updates to the Watershed Workplan shall be presented during an Annual Watershed Review Meeting. Annual Watershed Review Meetings shall occur once every calendar year and be conducted by the Watershed Copermittees. Annual Watershed Review Meetings shall be open to the public and adequately noticed. Individual Watershed Copermittees shall also review and modify their jurisdictional programs and JRMP

Annual Reports, as necessary, so that they are consistent with the updated Watershed Workplan.

7. Aliso Creek Watershed Runoff Management Plan (WRMP) Provisions

The following provisions apply to the Aliso Creek WRMP. Requirements in this subsection must supersede requirements prescribed by the Regional Board on October 18, 2005.²⁰

- a. Each Copermittee within the Aliso Creek Watershed must implement the monitoring and reporting program described in *Aliso Creek 13325 Directive, Revised Monitoring Program Design – Integration with NPDES Program*, December 2004 (Revised Aliso Creek Program).
- b. Each Copermittee must provide annual reports by March 1 of each year beginning in 2011 for the preceding annual period of January through December. The annual reports must contain the following information:
 - (1) Water quality data and assessment from the Revised Aliso Creek Program. Each municipality must implement the monitoring and reporting program described in the Revised Aliso Creek Program. All information submitted in the report must conform to a SWAMP-Compatible Quality Assurance Project Plan²¹. The report must contain an assessment of compliance with applicable water quality standards for each monitoring station. The report must include data in tabular and graphical form, and electronic data must be submitted to the Regional Board.
 - (2) Program Assessment. A description and assessment of each municipality's program implemented within the high-priority storm drain locations (as identified Revised Aliso Creek Program) to reduce discharges of indicator fecal bacteria/pathogens. Monitoring alone is not sufficient to assess progress of the municipal programs. Municipalities must demonstrate each year that their programs are effective and resulting in a reduction of bacteria sources.
 - (i) For structural and nonstructural management practices implemented, the assessment must contain a description of the

²⁰ On October 12, 2005, the Regional Board accepted proposed changes to the bacteria monitoring program that had been conducted since spring 2001 pursuant to an Investigative Order from the Regional Board's executive officer. The October 18, 2005, letter from the Regional Board's executive officer revised the Investigative Order and instituted the new monitoring and reporting requirements.

²¹ The State Water Resource Control Board (State Board) has prepared an electronic template for Quality Assurance Project Plans (QAPP) to assist in QAPP development, to provide a common format that will allow for review to be expedited, and to provide information on Surface Water Ambient Monitoring (SWAMP) consistency. Additional information and the template are available on-line at <http://www.waterboards.ca.gov/swamp/qapp.html>.

practice, capital and maintenance costs, expectations for effectiveness, date implemented, and any observed results.

- (ii) For structural and nonstructural management practices evaluated, the assessment must contain a description of the practice(s), conclusions from the evaluation, and whether and when the practice is planned for implementation by the municipality or group of municipalities.
- (3) Status Reports. Updates on high-priority storm drain areas. Status reports must be provided by each municipality that discuss the causes of impairment and subsequent management activities implemented within the reporting period in the high priority areas and the planned activities for the next reporting period.
- (4) Certification Statement. The technical reports submitted to the Regional Board must include the following certification statement signed by either the principal executive officer, ranking elected official, or duly authorized representative of that person:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person(s) directly responsible for gathering the information, the information is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

- c. The annual reports must be submitted until the Regional Board determines they are no longer warranted. If requested by a municipality, the monitoring program may be modified or reduced by the Regional Board. The monitoring program and annual reporting may be modified in response to adopted TMDLs and additional Clean Water Act 303(d) listings for impairment.
- d. Municipalities must continue meeting on a quarterly basis to discuss efforts to reduce bacteria in the Aliso Creek watershed.

H. FISCAL ANALYSIS

- 1. Secure Resources:** Each Copermittee must secure the resources necessary to meet all requirements of this Order.
- 2. Annual Analysis:** Each Copermittee must conduct an annual fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs required by this Order. The analysis must include estimated expenditures for the reporting period, the preceding period, and the next reporting period.
 - a.** Each analysis must include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.
 - b.** Each analysis must include a narrative description of circumstances resulting in a 25 percent or greater annual change for any budget line items.
- 3. Annual Reporting:** Each Copermittee must submit its annual fiscal analysis with the annual JRMP report.

I. TOTAL MAXIMUM DAILY LOADS

The waste load allocations (WLAs) of fully approved and adopted TMDLs are incorporated as Water Quality Based Effluent Limitations on a pollutant by pollutant, watershed by watershed basis. Early TMDL requirements, including monitoring, may be required and inserted into this Order pursuant to Finding E.10

1. Baby Beach Bacterial Indicator TMDL Water Quality Based Effluent Limitations

- a. The Copermitees in the Baby Beach watershed shall implement BMPs capable of achieving the interim and final Bacterial Indicator Waste Load Allocations (WLAs) in discharges to Baby Beach as described in Table 6.

Table 6: TMDL Waste Load Reduction Milestones

<u>Action</u>	<u>Date</u>
Meet 50% wasteload reductions	3 years after effective date for dry weather
	7 years after effective date for wet weather
Meet 100% wasteload reductions	5 years after effective date for dry weather
	10 years after effective date for wet weather

- b. The Copermitees shall conduct necessary monitoring, as described in Attachment A to Resolution No. R9-2008-0027, and submit annual progress reports as part of their yearly reports.
- c. The following WLAs (Table 7) are to be met in Baby Beach receiving water by the end of the year 2019 for wet weather and 2014 for dry weather:

Table 7: Final Bacterial Indicator Waste Load Allocations for Baby Beach

<u>Bacterial Indicator</u>	<u>Waste Load Allocation</u>	
	Dry Weather (Billion MPN / Day)	Wet Weather (Billion MPN / 30 Days)
Total Coliform	0.86	3,254
Fecal Coliform	0.17	112
<i>Enterococcus</i>	0.03	114

MPN: Most Probable Number

- d. The Copermitees must meet the following Numeric Targets (Table 8) in Baby Beach receiving waters in order to meet the underlying assumptions of the TMDL. The Numeric Targets are to be met once 100 percent of the WLA reductions have been achieved (see Table 7 above).

Table 8: Final Bacterial Indicator Numeric Targets for Baby Beach

<u>Bacterial Indicator</u>	30-day geo mean (MPN / 100mL)	Single Sample Max (MPN / 100mL)
	Dry Weather only	Dry and Wet Weather
Total Coliform	1,000	10,000
Fecal Coliform	200	400
<i>Enterococcus</i>	35	104

MPN: Most Probable Number

J. PROGRAM EFFECTIVENESS ASSESSMENT AND REPORTING

1. Jurisdictional Program Effectiveness Assessments

a. OBJECTIVES OF EFFECTIVENESS ASSESSMENTS

Beginning with the Annual Report due in 2011, each Copermittee must annually assess the effectiveness of its Jurisdictional Runoff Management Program (JRMP) implementation at meeting the following objectives:

- (1) Objective for 303(d) Waterbodies: Reduce storm water pollutant loadings.
 - (a) Each Copermittee must establish annual assessment measures or methods specifically for reducing discharges of storm water pollutants from its MS4 into each downstream 303(d)-listed water body for which that waterbody is impaired. Assessment measures must be developed for each of the six outcome levels described by CASQA.²²
 - (b) Each Copermittee must annually conduct each established assessment measure or method and evaluate the outcome. Each outcome must then be used to assess the effectiveness of implemented management measures toward reducing MS4 discharges of the specific pollutants causing or contributing to conditions of impairment.
 - (c) The assessment measures must target both water quality outcomes and the results of municipal enforcement activities.

- (2) Objective for Environmentally-Sensitive Areas: Prevent storm water MS4 discharges from causing or contributing to conditions of pollution, nuisance, or contamination.
 - (a) Each Copermittee must establish annual measures or methods specifically for assessing the effectiveness of its management measures for protecting downstream ESAs from adverse effects caused by discharges from its MS4. Assessment measures must be developed for each of the six outcome levels described by CASQA.
 - (b) Each Copermittee must annually implement each established assessment measure or method and evaluate the outcome. Each outcome must be used to assess the effectiveness of implemented management measures toward reducing MS4 discharges of the specific pollutants causing or contributing to conditions of impairment.
 - (c) The assessment measures must target both water quality outcomes and the results of municipal enforcement activities.

- (3) Objectives for major program component outcomes: Determined by Each

²² Effectiveness assessment outcome levels as defined by CASQA are defined in Attachment C of this Order. See "*Municipal Stormwater Program Effectiveness Assessment Guidance*" (CASQA, May 2007) for guidance for assessing program activities at the various outcome levels.

Copermittee.

- (a) Each Copermittee must annually develop objectives for each program component in Section F and the overall JRMP. The objectives must be established as appropriate in response to program implementation and evaluation of water quality and management practices.
 - (b) Assessment approaches for program implementation must include a mix of specific activities, general program components, and water quality data.
 - (c) The assessment measures must target both water quality outcomes and the results of municipal enforcement activities.
- (4) Objectives for actions taken to protect receiving water limitations in accordance with this Order.
- (a) Each Copermittee must develop and implement an effectiveness assessment strategy for each measure conducted in response to a determination to implement the “iterative” approach to prevent or reduce any storm water pollutants that are causing or contributing to the exceedance of water quality standards as outlined in this Order

b. ASSESSMENT REVIEW

- (1) Based on the results of the effectiveness assessments, each Copermittee must annually review its jurisdictional activities and BMPs to identify modifications and improvements needed to maximize JRMP effectiveness, as necessary to achieve compliance with this Order.
- (2) Each Copermittee must develop and annually conduct an Integrated Assessment²³ of each effectiveness assessment objective above (Section J.1.a) and the overall JRMP using a combination of outcomes as appropriate to the objectives.²⁴

2. Program Modifications

- a. Each Copermittee must develop and implement a plan and schedule to address program modifications and improvements identified during annual effectiveness assessments.
- b. Jurisdictional activities/BMPs that are ineffective or less effective than other comparable jurisdictional activities/BMPs must be replaced or improved upon by implementation of more effective jurisdictional activities/BMPs. Where monitoring data exhibits persistent water quality problems that are caused or

²³ Integrated assessment is defined in Attachment C. It is the process of evaluating whether program implementation is resulting in the protection or improvement of water quality. Integrated assessment combines assessments of program implementation and water quality.

²⁴ Not all program components need be addressed at each of the six outcome levels.

contributed to by MS4 discharges, jurisdictional activities or BMPs applicable to the water quality problems must be modified and improved to correct the water quality problems.

3. Effectiveness Assessment and Program Response Reporting

- a. Each Copermittee must include a description and summary of its annual and long-term effectiveness assessments within each Annual Report. Beginning with the Annual Report due in 2011, the Program Effectiveness reporting must include:
- (1) 303(d) waterbodies: A description and results of the annual assessment measures or methods specifically for reducing discharges of storm water pollutants from its MS4 into each 303(d)-listed waterbody;
 - (2) ESAs: A description and results of the annual assessment measures or methods specifically for managing discharges of pollutants from its MS4 into each downstream ESA;
 - (3) Other Program Components: A description of the objectives and corresponding assessment measures and results used to evaluate the effectiveness of each general program component. The results must include findings from both program implementation and water quality assessment where applicable;
 - (4) Receiving water protection: A description and results of the annual assessment measures or methods employed specifically for actions taken to protect receiving water limitations in accordance with Section A.3 of this Order;
 - (5) A description of the steps taken to use dry-weather and wet-weather monitoring data to assess the effectiveness of the programs for 303(d) impairments, ESAs, and general program components;
 - (6) A description of activities conducted in response to investigations of illicit discharge and illicit connection activities, including how each investigation was resolved and the pollutant(s) involved;
 - (7) Responses to effectiveness assessments: A description of each program modification, made in response to the results of effectiveness assessments conducted pursuant to Section J.1.a, and the basis for determining (pursuant to Section J.2.b.) that each modified activity and/or BMP represents an improvement with respect to reducing the discharge of storm water pollutants from the MS4.
 - (8) A description of the steps that will be taken to improve the Copermittee's ability to assess program effectiveness using measurable targeted outcomes, assessment measures, assessment methods, and outcome levels 1-6. Include a time schedule for when improvement will occur; and
 - (9) A description of the steps that will be taken to identify aspects of the Copermittee's Jurisdictional Runoff Management Program that will be changed based on the results of the effectiveness assessment.

4. Work Plan

Each Copermittee must develop a work plan to address their high priority water quality problems in an iterative manner over the life of the permit. The goal of the work plan is to demonstrate a responsive and adaptive approach for the judicious and effective use of available resources to attack the highest priority problems. The work plan shall include, at a minimum, the following:

- a.** The problems and priorities identified during the assessment;
- b.** A list of priority pollutants and known or suspected sources;
- c.** A brief description of the strategy employed to reduce, eliminate or mitigate the negative impacts;
- d.** A description and schedule for new and/or modified BMPs. The schedule is to include dates for significant milestones;
- e.** A description of how the selected activities will address an identified high priority problem. This will include a description of the expected effectiveness and benefits of the new and/or modified BMPs;
- f.** A description of implementation effectiveness metrics;
- g.** A description of how efficacy results will be used to modify priorities and implementation; and
- h.** A review of past activities implemented, progress in meeting water quality standards, and planned program adjustments.

The Copermittee shall submit the work plan to the Regional Board within 365 days of adoption of the Order. Annual updates are also required and shall be included with the annual JRMP report. The Regional Board will assess the work plan for compliance with the specific and overall requirements of the Order. To increase effectiveness and efficiencies, Copermittees may combine their implementation efforts and work plans within a hydrologic area or sub area. Each Copermittee, however, maintains individual responsibility for developing and implementing an acceptable work plan.

K. REPORTING

The Copermittees may propose alternate reporting criteria and schedules, as part of their updated JRMP, for the Executive Officer's acceptance. The Copermittees shall submit the updated JRMP within 365 days after adoption of this Order.

1. Runoff Management Plans**a. JURISDICTIONAL RUNOFF MANAGEMENT PLANS**

- (1) Copermittees: The written account of the overall program to be conducted by each Copermittee to meet the jurisdictional requirements of section F of this Order is referred to as the Jurisdictional Runoff Management Plan (JRMP). Each Copermittee must revise and update its existing JRMP so that it describes all activities the Copermittee will undertake to implement the requirements of this Order. Each Copermittee must submit its updated and revised JRMP to the Regional Board 365 days after adoption of this Order.
- (2) At a minimum, each Copermittee's JRMP must be updated and revised to demonstrate compliance with each applicable section of this Order.

b. WATERSHED WORKPLANS

- (1) Copermittees: The written account of the program conducted by each watershed group of Copermittees is referred to as the Watershed Workplan. Copermittees within each watershed shall be responsible for updating and revising each Watershed Workplan. Each Watershed Workplan shall be updated and revised to describe any changes in water quality problems or priorities in the WMAs, and any necessary change to actions Copermittees will take to implement jurisdictional or watershed BMPs to address those identified.
- (2) Lead Watershed Copermittee: Each Lead Watershed Permittee shall be responsible for coordinating the production of the Watershed Workplan, as well as coordinating Annual Watershed Review Meetings and public participation/public noticing in accordance with the requirements of this Order. The Lead Watershed Permittee shall submit the Watershed Workplan to the Principal.
- (3) Principal Copermittee: The Principal Permittee shall assemble and submit the Watershed Workplan to the Regional Board no later than 365 days after adoption of this Order, and shall be prepared to implement the workplan within 60 days of the Regional Board Executive Officer deeming the workplan acceptable.

- (4) Each Watershed Workplan shall, at a minimum, include:
- (a) Identification of the Lead Watershed Permittee for the watershed.
 - (b) An updated watershed map.
 - (c) Identification and description of all applicable water quality data, reports, analyses, and other information to be used to assess receiving water quality.
 - (d) Assessment and analysis of the watershed's water quality data, reports, analyses, and other information, used during identification and prioritization of the watershed's water quality problems.
 - (e) A prioritized list of water quality problems within the WMA including rationale explaining the method/logic used to determine prioritization.
 - (f) Identification of the likely sources, pollutant discharges, and/or other factors causing the high priority water quality problems within the WMA.
 - (g) A description of the strategy to be used to guide Copermittee implementation of BMPs either jurisdictionally or on a watershed-wide basis to abate the highest water quality problems
 - (h) A list of criteria used to evaluate BMP effectiveness and how it was applied.
 - (i) A GIS map of BMPs implemented and BMPs scheduled for implementation.
 - (j) A description of the public participation mechanisms to be used and the parties anticipated to be involved during the development and implementation of the Watershed Workplan.
 - (k) A description of Copermittee collaboration to accomplish development of the Watershed Workplan, including a schedule for Watershed meetings.
 - (l) A description of how TMDLs and 303(d)-listed water bodies were considered during prioritization of watershed water quality problems
 - (m) A description of the strategy to model and monitor improvement in receiving water quality directly resulting from implementation of the BMPs described in the Watershed Workplan.
 - (n) A scheduled annual Watershed Workplan Review Meeting once every calendar year. This meeting shall be open to the public.

2. Other Required Reports and Plans

a. SSMP UPDATES

- (1) Copermittees must submit their updated model SSMP in accordance with the applicable requirements of section F.1 with the JRMP two years after adoption of this Order.
- (2) Within 180 days of determination that the Model SSMP is in compliance with this Permit's provisions, each Copermittee must update their own local SSMP, and amended ordinances consistent with the model SSMP, and shall submit both (local SSMP and amended ordinances) to the Regional Board.
- (3) For SSMP-related requirements of Section F.1 with subsequent

implementation due dates, updated SSMPs must be submitted with the JRMP annual report covering the applicable reporting period.

b. REPORT OF WASTE DISCHARGE

The Principal Copermittee must submit to the Regional Board, no later than 210 days in advance of the expiration date of this Order, a Report of Waste Discharge (ROWD) as an application for issuance of new waste discharge requirements. The fourth annual report for this Order may serve as the ROWD, provided it contains the minimum information below.

At a minimum, the ROWD must include the following: (1) Proposed changes to the Copermittees' runoff management programs; (2) Proposed changes to monitoring programs; (3) Justification for proposed changes; (4) Name and mailing addresses of the Copermittees; (5) Names and titles of primary contacts of the Copermittees; and (6) Any other information necessary for the reissuance of this Order.

3. Annual Reports

a. JURISDICTIONAL RUNOFF MANAGEMENT PROGRAM (JRMP) ANNUAL REPORTS

- (1) Copermittees: Each Copermittee must generate individual JRMP Annual Reports which cover implementation of its jurisdictional activities during the past annual reporting period. Each Annual Report must verify and document compliance with this Order as directed in this section. Each Copermittee must retain records through 2015, available for review, that document compliance with each requirement of this Order. Each Copermittee must submit to the Principal Copermittee its individual JRMP Annual Report by the date specified by the Principal Copermittee. The reporting period for these annual reports must be the previous fiscal year. For example, the report submitted September 30, 2010 must cover the reporting period July 1, 2009 to June 30, 2010.
- (2) Principal Copermittee: The Principal Copermittee is responsible for collecting and assembling each Copermittee's individual JRMP Annual Report. The Principal Copermittee must submit Unified JRMP Annual Reports to the Regional Board by September 30 of each year, beginning on September 30, 2011. The Unified JRMP Annual Report must contain the 13 individual JRMP Annual Reports.
- (3) Each JRMP Annual Report must contain, at a minimum, the following information:
 - (a) Information required to be reported annually in Section H (Fiscal Analysis) of this Order;

- (b) Information required to be reported annually in Section J (Program Effectiveness) of this Order;
- (c) The completed Reporting Checklist found in Attachment D, and
- (d) Information for each program component by watershed as described in the following Table 9:

Table 9. Annual Reporting Requirements

Program Component	Reporting Requirement
New Development	1. Updated relevant sections of the General Plan and environmental review process and a description of planned updates within the next annual reporting period, if applicable
	2. Revisions to the local SSMP, including where applicable: <ul style="list-style-type: none"> (a) Identification and summary of where the SSMP fails to meet the requirements of this Order; (b) Updated procedures for identifying pollutants of concern for each Priority Development Project; (c) Updated treatment BMP ranking matrix; and (d) Updated site design and treatment control BMP design standards;
	3. Verification that site design, source control, and treatment BMPs were required on all applicable Priority Development Projects;
	4. Description of the application of LID and site design BMPs in the planning and approval process;
	5. Description of projects subject to the local waiver provision for numeric sizing of treatment control BMP requirements;
	6. Description and summary of the LID site design BMP substitution program, if applicable;
	7. Description and summary of the process to verify compliance with SSMP requirements;
	8. Updates to the BMPs that are listed in the local SSMP as options for treatment control;
	9. Description of the treatment control maintenance tracking process and verification that the requirements of this Order were met during the reporting period; <ul style="list-style-type: none"> (a) Updated watershed-based database of approved treatment control BMPs and treatment control BMP maintenance within its jurisdiction, including updates to the list of high-priority treatment BMPs;
	10. Description of the process for identifying and evaluating hydrologic conditions of concern and requiring a suite of management measures within all Priority Development Projects to protect downstream beneficial uses and prevent adverse physical changes to downstream stream channels;
	11. Description of enforcement activities applicable to the new development and redevelopment component and a summary of the effectiveness of those activities;

Program Component	Reporting Requirement
Construction	1. Updated relevant ordinances and description of planned ordinance updates within the next annual reporting period, if applicable;
	2. A description of procedures used for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality;
	3. Designated minimum and enhanced BMPs;
	4. Summary of the inspection program, including the following information: (a) Number and date of inspections conducted at each facility, including the facility address; (b) Number of facilities lacking adequate BMPs; (c) The BMP violations identified during the inspection by facility; (d) Number, date, and types of enforcement actions by facility; (e) Narrative description of inspection findings and follow-up activities for each facility;
Municipal	1. Updated source inventory;
	2. Changes to the designated municipal BMPs;
	3. Descriptions of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies;
	4. Summary and assessment of BMPs implemented at retrofitted flood control structures, including: (a) List of projects with BMP retrofits; and (b) List and description of structures retrofitted without BMPs;
	5. Description and assessment of the municipal structural treatment control operations and maintenance activities, including: (a) Number of inspections and types of facilities; and (b) Summary of findings;
	6. Description of the municipal areas/facilities operations and maintenance activities, including: (a) Number and types of facilities maintained; (b) Amount of material removed and how that material was disposed; and (c) List of facilities planned for bi-annual inspections and the justification;
	7. Description of the municipal areas/programs inspection activities, including: (a) Number and date of inspections conducted at each facility; (b) Number of facilities lacking adequate BMPs; (c) The BMP violations identified during the inspection by facility; (d) Number, date and types of enforcement actions by facility; (e) Narrative description of inspection findings and follow-up activities for each facility;

Program Component	Reporting Requirement
	8. Description of activities implemented to address sewage infiltration into the MS4;
Commercial / Industrial	1. Annual inventory of commercial / industrial sources; 2. Summary of the inspection program, including the following information: (a) Number and date of inspections conducted at each facility including the facility address; (b) Number of facilities lacking adequate BMPs; (c) The BMP violations identified during the inspection by facility; (d) Number, date, and types of enforcement actions by facility; (e) Narrative description of inspection findings and follow-up activities for each facility; 3. Changes to designated minimum and enhanced BMPs; 4. A list of industrial sites, including each name, address, and SIC code, that the Copermittee suspects may require coverage under the General Industrial Permit, but has not submitted an NOI;
Residential	1. Updated minimum BMPs required for residential areas and activities;
	2. Quantification and summary of applicable runoff and storm water enforcement actions within residential areas and activities;
	3. Description of efforts to manage runoff and storm water pollution in common interest areas;
Illicit Discharge Detection and Elimination	1. Changes to the legal authority to implement Illicit Discharge Detection and Elimination activities; 2. Changes to the established investigation procedures; 3. Public reporting mechanisms, including phone numbers and web pages; 4. All data and assessments from the Dry Weather Effluent Analytical Monitoring activities; 5. Response criteria developed for water quality data and notifications; 6. Summaries of illicit discharges (including spills and water quality data events) and how each significant case was resolved; 7. A description of instances when field screening and analytical data exceeded action levels, but for which no investigation was conducted; 8. A description of enforcement actions taken in response to investigations of illicit discharges and a description of the effectiveness of those enforcement measures; 9. A description of controls to prevent infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems;
Work Plan	Priorities, strategy, implementation schedule and effectiveness evaluation;

(4) Each JRMP Annual Report must also include the following information

regarding non-storm water discharges (see Section B.2. of this Order):

- (a) Identification of non-storm water discharge categories identified as a source of pollutants to waters of the U.S;
- (b) A description of ordinances, orders, or similar means to prohibit non-storm water discharge categories identified under section B.2 above ;
- (c) Identification of any control measures to be required and implemented for non-storm water discharge categories identified as needing said controls by the Regional Board; and
- (d) A description of a program to address pollutants from non-emergency fire fighting flows identified by the Copermittee to be significant sources of pollutants.

4. Interim Reporting Requirements

For the July 2009-June 2010 reporting period, the Jurisdictional RMP must be submitted on January 31, 2011. Each Jurisdictional RMP Annual Report submitted for this reporting period must, at a minimum, include comprehensive descriptions of all activities conducted to fully implement the Copermittees' Jurisdictional RMP documents, as those documents were developed to comply with the requirements of Order No. 2002-01. The Principal Copermittee must submit these documents in a unified manner, consistent with the unified reporting requirements of Order No. 2002-01.

5. Universal Reporting Requirements

All submittals must include an executive summary, introduction, conclusion, recommendations, and signed certified statement. Each Copermittee must submit a signed certified statement covering its responsibilities for each applicable submittal. The Principal Copermittee must submit a signed certified statement covering its responsibilities for each applicable submittal and the sections of the submittals for which it is responsible.

L. MODIFICATION OF PROGRAMS

Modifications of Jurisdictional Runoff Management Programs and/or Watershed Runoff Management Programs may be initiated by the Executive Officer of the Regional Board or by the Copermittees. Requests by Copermittees must be made to the Executive Officer, and must be submitted during the annual review process. Requests for modifications should be incorporated, as appropriate, into the Annual Reports or other deliverables required or allowed under this Order.

1. Minor Modifications: Minor modifications to Jurisdictional Runoff Management Programs, and/or Watershed Runoff Management Programs, may be accepted by the Executive Officer where the Executive Officer finds the proposed modification complies with all discharge prohibitions, receiving water limitations, and other requirements of this Order.
2. Modifications Requiring an Amendment to this Order: Proposed modifications that are not minor require amendment of this Order in accordance with this Order's rules, policies, and procedures.

M. PRINCIPAL COPERMITTEE RESPONSIBILITIES

Within 180 days of adoption of this Order, the Copermittees must designate the Principal Copermittee and notify the Regional Board of the name of the Principal Copermittee. The Principal Copermittee must, at a minimum:

1. Serve as liaison between the Copermittees and the Regional Board on general permit issues, and when necessary and appropriate, represent the Copermittees before the Regional Board.
2. Coordinate permit activities among the Copermittees and facilitate collaboration on the development and implementation of programs required under this Order.
3. Integrate individual Copermittee documents and reports into single unified documents and reports for submittal to the Regional Board as required under this Order.
4. Produce and submit documents and reports as required by section K of this Order and Receiving Waters and MS4 Discharge Monitoring and Reporting Program No. R9-2009-0002 in Attachment E of this Order.

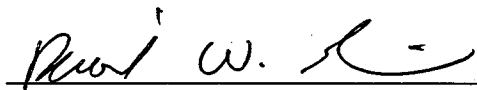

N. RECEIVING WATERS AND MS4 DISCHARGE MONITORING AND REPORTING PROGRAM

Pursuant to CWC section 13267, the Copermittees must comply with all the requirements contained in Receiving Waters and MS4 Discharge Monitoring and Reporting Program No. R9-2009-0002 in Attachment E of this Order.

O. STANDARD PROVISIONS, REPORTING REQUIREMENTS, AND NOTIFICATIONS

1. Each Copermittee must comply with Standard Provisions, Reporting Requirements, and Notifications contained in Attachment B of this Order. This includes 24 hour/5 day reporting requirements for any instance of non-compliance with this Order as described in section 5.e of Attachment B.
2. All plans, reports and subsequent amendments submitted in compliance with this Order must be implemented immediately (or as otherwise specified). All submittals by Copermittees must be adequate to implement the requirements of this Order.

I, David W. Gibson, Executive Officer, do hereby certify the foregoing is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region, on December 16, 2009.

David W. Gibson
Executive Officer

ATTACHMENT A**BASIN PLAN PROHIBITIONS**

California Water Code Section 13243 provides that a Regional Board, in a water quality control plan, may specify certain conditions or areas where the discharge of waste or certain types of waste is not permitted. The following discharge prohibitions are applicable to any person, as defined by Section 13050(c) of the California Water Code, who is a citizen, domiciliary, or political agency or entity of California whose activities in California could affect the quality of waters of the state within the boundaries of the San Diego Region.

1. The discharge of waste to waters of the state in a manner causing, or threatening to cause a condition of pollution, contamination or nuisance as defined in California Water Code Section 13050, is prohibited.
2. The discharge of waste to land, except as authorized by waste discharge requirements or the terms described in California Water Code Section 13264 is prohibited.
3. The discharge of pollutants or dredged or fill material to waters of the United States except as authorized by a NPDES permit or a dredged or fill material permit (subject to the exemption described in California Water Code Section 13376) is prohibited.
4. Discharges of recycled water to lakes or reservoirs used for municipal water supply or to inland surface water tributaries thereto are prohibited, unless this Regional Board issues a NPDES permit authorizing such a discharge; the proposed discharge has been approved by the State Department of Health Services and the operating agency of the impacted reservoir; and the discharger has an approved fail-safe long-term disposal alternative.
5. The discharge of waste to inland surface waters, except in cases where the quality of the discharge complies with applicable receiving water quality objectives, is prohibited. Allowances for dilution may be made at the discretion of the Regional Board. Consideration would include streamflow data, the degree of treatment provided and safety measures to ensure reliability of facility performance. As an example, discharge of secondary effluent would probably be permitted if streamflow provided 100:1 dilution capability.
6. The discharge of waste in a manner causing flow, ponding, or surfacing on lands not owned or under the control of the discharger is prohibited, unless the discharge is authorized by the Regional Board.
7. The dumping, deposition, or discharge of waste directly into waters of the state, or adjacent to such waters in any manner which may permit its being transported into the waters, is prohibited unless authorized by the Regional Board.
8. Any discharge to a storm water conveyance system that is not composed entirely of "storm water" is prohibited unless authorized by the Regional Board. [The federal regulations, 40 CFR 122.26(b)(13), define storm water as storm water

- runoff, snow melt runoff, and surface runoff and drainage. 40 CFR 122.26(b)(2) defines an illicit discharge as any discharge to a storm water conveyance system that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities. [§122.26 amended at 56 FR 56553, November 5, 1991; 57 FR 11412, April 2, 1992].
9. The unauthorized discharge of treated or untreated sewage to waters of the state or to a storm water conveyance system is prohibited.
 10. The discharge of industrial wastes to conventional septic tank/subsurface disposal systems, except as authorized by the terms described in California Water Code Section 13264, is prohibited.
 11. The discharge of radioactive wastes amenable to alternative methods of disposal into the waters of the state is prohibited.
 12. The discharge of any radiological, chemical, or biological warfare agent into waters of the state is prohibited.
 13. The discharge of waste into a natural or excavated site below historic water levels is prohibited unless the discharge is authorized by the Regional Board.
 14. The discharge of sand, silt, clay, or other earthen materials from any activity, including land grading and construction, in quantities which cause deleterious bottom deposits, turbidity or discoloration in waters of the state or which unreasonably affect, or threaten to affect, beneficial uses of such waters is prohibited.
 15. The discharge of treated or untreated sewage from vessels to Mission Bay, Oceanside Harbor, Dana Point Harbor, or other small boat harbors is prohibited.

ATTACHMENT B**STANDARD PROVISIONS, REPORTING REQUIREMENTS, AND NOTIFICATIONS****1. STANDARD PROVISIONS – PERMIT COMPLIANCE [40 CFR 122.41]****(a) *Duty to comply* [40 CFR 122.41(a)].**

- (1) The Copermitttee must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code (CWC) and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application.
- (2) The Copermitttee shall comply with effluent standards or prohibitions established under section 307(a) of the CWA toxic pollutants and with standards for sewage sludge use or disposal established under section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions or standards for sewage sludge use or disposal, even if the Order has not yet been modified to incorporate the requirement.

(b) *Need to halt or reduce activity not a defense* [40 CFR 122.41(c)]. It shall not be a defense for the Copermitttee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order.**(c) *Duty to mitigate* [40 CFR 122.41(d)].** The Copermitttee shall take all reasonable steps to minimize or prevent any discharge or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment.**(d) *Proper operation and maintenance* [40 CFR 122.41(e)].** The Copermitttee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Copermitttee to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems that are installed by the Copermitttee only when necessary to achieve compliance with the conditions of this Order.**(e) *Property rights* [40 CFR 122.41(g)].**

- (1) This Order does not convey any property rights of any sort or any exclusive privilege.
- (2) The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of State or local law or regulations.

(f) *Inspection and entry* [40 CFR 122.41(i)]. The Copermitttee shall allow the Regional Water Quality Control Board, San Diego Region (Regional Board), State Water

Resources Control Board (SWRCB), United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon presentation of credentials and other documents as may be required by law, to:

- (1) Enter upon the Copermittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this Order;
- (2) Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order;
- (3) Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and
- (4) Sample or monitor, at reasonable times, for the purpose of assuring Order compliance or as otherwise authorized by the CWA or the CWC, any substances or parameters at any location.

(g) *Bypass* [40 CFR 122.41(m)]

(1) Definitions:

- i) "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility.
 - ii) "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.
- (2) Bypass not exceeding limitations - The Copermittee may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it also is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance (g)(3), (g)(4) and (g)(5) below.
- (3) Prohibition of Bypass - Bypass is prohibited, and the Regional Board may take enforcement action against a Copermittee for bypass, unless:
- i) Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;
 - ii) There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass which occurred during normal periods of equipment downtime or preventive maintenance; and
 - iii) The Copermittee submitted notice as required under Standard Provisions – Permit Compliance (g)(3) above.

(4) Notice

- i) Anticipated bypass. If the Copermittee knows in advance of the need for a bypass, it shall submit a notice, if possible at least ten days before the date of the bypass.
 - ii) Unanticipated bypass. The Copermittee shall submit notice of an unanticipated bypass as required in Standard Provisions 5(e) below (24-hour notice).
- (h) *Upset* [40 CFR 122.41(n)] Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based effluent limitations because of factors beyond the reasonable control of the Copermittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.
- (1) Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance (h)(2) below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review.
- (2) Conditions necessary for a demonstration of upset. A Copermittee who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs, or other relevant evidence that:
- i) An upset occurred and that the Copermittee can identify the cause(s) of the upset;
 - ii) The permitted facility was at the time being properly operated;
 - iii) The Copermittee submitted notice of the upset as required in Standard Provisions – Permit Compliance (5)(e)(ii)(B) below (24-hour notice); and
 - iv) The Copermittee complied with any remedial measures required under Standard Provisions – Permit Compliance 1(c) above.
- (3) Burden of Proof. In any enforcement proceeding, the Copermittee seeking to establish the occurrence of an upset has the burden of proof.

2. STANDARD PROVISIONS – PERMIT ACTION

- (a) *General* [40 CFR 122.41(f)] This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Copermittee for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition.
- (b) *Duty to reapply* [40 CFR 122.41(b)]. If the Copermittee wishes to continue an activity regulated by this Order after the expiration date of this Order, the Copermittee must apply for and obtain new permit.

- (c) *Transfers*. This Order is not transferable to any person except after notice to the Regional Board. The Regional Board may require modification or revocation and reissuance of the Order to change the name of the Copermittee and incorporate such other requirements as may be necessary under the CWA and the CWC.

3. STANDARD PROVISIONS – MONITORING

- (a) Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. [40 CFR Section 122.41 (j) (1)]
- (b) Monitoring results must be conducted according to test procedures under 40 CFR Part 136, or in the case of sludge use or disposal, approved under 40 CFR Part 136 unless otherwise specified in 40 CFR Part 503 unless other test procedures have been specified in this Order [40 CFR Section 122.41(j)(4)][40 CFR Section 122.44(i)(1)(iv)].

4. STANDARD PROVISIONS – RECORDS

- (a) Except for records of monitoring information required by this Order related to the Copermittee's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 CFR Part 503), the Copermittee shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application, This period may be extended by request of the Regional Water Board Executive Officer at any time [40 CFR Section 122.41(j)(2)].
- (b) *Records of monitoring information* [40 CFR 122.41(j) (3)] shall include:
- (1) The date, exact place, and time of sampling or measurements;
 - (2) The individual(s) who performed the sampling or measurements;
 - (3) The date(s) analyses were performed;
 - (4) The individual(s) who performed the analyses;
 - (5) The analytical techniques or methods used; and
 - (6) The results of such analyses.
- (c) *Claims of confidentiality* [40 CFR Section 122.7(b)] of the following information will be denied:
- (1) The name and address of any permit applicant or Copermittee; and
 - (2) Permit applications and attachments, permits and effluent data.

5. STANDARD PROVISIONS – REPORTING

- (a) *Duty to provide information* [40 CFR 122.41(h)]. The Copermittee shall furnish to the Regional Board, SWRCB, or USEPA within a reasonable time, any information which

the Regional Board, SWRCB, or USPEA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Copermitttee shall also furnish to the Regional Board, SWRCB, or USEPA, copies of records required to be kept by this Order.

(b) *Signatory and Certification Requirements* [40 CFR 122.41(k)]

- (1) All applications, reports, or information submitted to the Regional Board, SWRCB, or USEPA shall be signed and certified in accordance with Standard Provisions – Reporting 5(b)ii), 5(b)iii), 5(b)iv), and 5(b) (see 40 CFR 122.22)
- (2) *Applications* [40 CFR 122.22(a)(3)] All permit applications shall be signed by either a principal executive officer or ranking elected official.
- (3) *Reports* [40 CFR 122.22(b)]. All reports required by this Order, and other information requested by the Regional Board, SWRCB, or USEPA shall be signed by a person described in Standard Provisions – Reporting 5(b)(2) above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
 - i) The authorization is made in writing by a person described in Standard Provisions-Reporting 5(b)(2) above;
 - ii) The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.); and,
 - iii) The written authorization is submitted to the Regional Water Board and State Water Board.
- (4) *Changes to authorization* [40 CFR Section 122.22(c)] If an authorization under Standard Provisions – Reporting 5(b)(3) of this reporting requirement is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting 5(b)(3) above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications to be signed by an authorized representative.
- (5) *Certification* [40 CFR Section 122.22(d)] Any person signing a document under Standard Provisions – Reporting 5(b)(2), or 5(b)(3) above shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who

manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.”

(c) *Monitoring reports.* [40 CFR 122.41(l)(4)]

- (1) Monitoring results shall be reported at the intervals specified in the Receiving Waters and Runoff Monitoring and Reporting Program No. R9-2009-0002.
- (2) Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Board or SWRCB for reporting results of monitoring of sludge use or disposal practices.
- (3) If the Copermittee monitors any pollutant more frequently than required by this Order using test procedures approved under 40 CFR Part 136 or, in the case of sludge use or disposal, approved under 40 CFR Part 136 unless otherwise specified in 40 CFR Part 503, or as specified in this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Board.
- (4) Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order.

(d) *Compliance schedules.* [40 CFR Section 122.41(l)(5)] Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order shall be submitted no later than 14 days following each schedule date.

(e) *Twenty-four hour reporting* [40 CFR Section 122.41(l)(6)]

- (1) The Copermittee shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Copermittee becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Copermittee becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.
- (2) The following shall be included as information, which must be reported within 24 hours under this paragraph:
 - i) Any unanticipated bypass that exceeds any effluent limitation in the Order (See 40 CFR 122.41(g)).
 - ii) Any upset which exceeds any effluent limitation in this Order.
- (3) The Regional Board may waive the above-required written report under this

provision on a case-by-case basis if the oral report has been received within 24 hours.

- (f) *Planned changes.* [40 CFR Section 122.41(l)(1)] The Copermittee shall give notice to the Regional Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when:
- (1) The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR 122.29(b); or
 - (2) The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants, which are not subject to effluent limitations in this Order.
 - (3) The alteration or addition results in a significant change in the Copermittee's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing Order, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan.
- (g) *Anticipated noncompliance.* [40 CFR Section 122.41(l)(7)] The Copermittee shall give advance notice to the Regional Board or SWRCB of any planned changes in the permitted facility or activity, which may result in noncompliance with Order requirements.
- (h) *Other noncompliance* [40 CFR Section 122.41(l) 7)] The Copermittee shall report all instances of noncompliance not reported under Standard Provisions 5(c), 5(d), and 5(e) above, at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting 5(e) above.
- (i) *Other information* [40 CFR Section 122.41(l)(8)] When the Copermittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Board, SWRCB, or USEPA, the Copermittee shall promptly submit such facts or information.

6. STANDARD PROVISIONS – ENFORCEMENT

- (a) The Regional Board is authorized to enforce the terms of this permit under several provisions of the CWC, including, but not limited to, Sections 13385, 13386, and 13387.

7. ADDITIONAL STANDARD PROVISIONS

- (a) *Municipal separate storm sewer systems* [40 CFR 122.42(c)]. The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer that has been designated by the Director under 40 CFR 122.26(a)(1)(v) must submit an annual report by the anniversary of the date of the issuance of the

permit for such system. The report shall include:

- (1) The status of implementing the components of the storm water management program that are established as permit conditions;
 - (2) Proposed changes to the storm water management programs that are established as permit conditions. Such proposed changes shall be consistent with 40 CFR 122.26(d)(2)(iii); and
 - (3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under 40 CFR 122.26(d)(2)(iv) and 40 CFR 122.26(d)(2)(v);
 - (4) A summary of data, including monitoring data, that is accumulated throughout the reporting year;
 - (5) Annual expenditures and budget for year following each annual report;
 - (6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; and
 - (7) Identification of water quality improvements or degradation.
- (b) *Storm water discharges* [40 CFR 122.42(d)]. The initial permits for discharges composed entirely of storm water issued pursuant to 40 CFR 122.26(e)(7) shall require compliance with the conditions of the permit as expeditiously as practicable, but in no event later than three years after the date of issuance of the permit.
- (c) *Other Effluent Limitations and Standards* [40 CFR 122.44(b)(1)]. If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant which is present in the discharge and that standard or prohibition is more stringent than any limitation on the pollutant in this Order, the Regional Board may institute proceedings under these regulations to modify or revoke and reissue the Order to conform to the toxic effluent standard or prohibition.
- (d) *Discharge is a privilege* [CWC section 13263(g)]. No discharge of waste into the waters of the State, whether or not such discharge is made pursuant to waste discharge requirements, shall create a vested right to continue such discharge. All discharges of waste into waters of the State are privileges, not rights.
- (e) *Review and revision of Order* [CWC section 13263(e)]. Upon application by any affected person, or on its own motion, the Regional Board may review and revise this permit.
- (f) *Termination or modification of Order* [CWC section 13381]. This permit may be terminated or modified for causes, including, but not limited to, all of the following:
- (1) Violation of any condition contained in this Order.
 - (2) Obtaining this Order by misrepresentation, or failure to disclose fully all relevant facts.
 - (3) A change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge.

- (g) *Transfers*. When this Order is transferred to a new owner or operator, such requirements as may be necessary under the CWC may be incorporated into this Order.
- (h) *Conditions not stayed*. The filing of a request by the Copermittee for modification, revocation and reissuance, or termination of this Order, or a notification of planned change in or anticipated noncompliance with this Order does not stay any condition of this Order.
- (i) *Availability*. A copy of this Order shall be kept at a readily accessible location and shall be available to on-site personnel at all times.
- (j) *Duty to minimize or correct adverse impacts*. The Copermittees shall take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this Order, including such accelerated or additional monitoring as may be necessary to determine the nature and impact of the noncompliance.
- (k) *Interim Effluent Limitations*. The Copermittee shall comply with any interim effluent limitations as established by addendum, enforcement action, or revised waste discharge requirements which have been, or may be, adopted by this Regional Board.
- (l) *Responsibilities, liabilities, legal action, penalties* [CWC sections 13385 and 13387]. The Porter-Cologne Water Quality Control Act provides for civil and criminal penalties comparable to, and in some cases greater than, those provided for under the CWA.

Nothing in this Order shall be construed to protect the Copermittee from its liabilities under federal, state, or local laws.

Except as provided for in 40CFR 122.41(m) and (n), nothing in this Order shall be construed to relieve the Copermittee from civil or criminal penalties for noncompliance.

Nothing in this Order shall be construed to preclude the institution of any legal action or relieve the Copermittee from any responsibilities, liabilities, or penalties to which the Copermittee is or may be subject to under Section 311 of the CWA.

Nothing in this Order shall be construed to preclude institution of any legal action or relieve the Copermittee from any responsibilities, liabilities, or penalties established pursuant to any applicable state law or regulation under authoring preserved by Section 510 of the CWA.

- (m) *Noncompliance*. Any noncompliance with this Order constitutes violation of the CWC and is grounds for denial of an application for modification of the Order (also see 40 CFR 122.41(a)).
- (n) *Director*. For purposes of this Order, the term "Director" used in parts of 40 CFR

incorporated into this Order by reference and/or applicable to this Order shall have the same meaning as the term "Regional Board" used elsewhere in this Order, except that in 40 CFR 122.41(h) and (l), "Director" shall mean "Regional Board, SWRCB, and USEPA."

- (o) The Regional Board has, in prior years, issued a limited number of individual NPDES permits for non-storm water discharges to MS4s. The Regional Board or SWRCB may in the future, upon prior notice to the Copermittee(s), issue an NPDES permit for any non-storm water discharge (or class of non-storm water discharges) to a MS4. Copermittees may prohibit any non-storm water discharge (or class of non-storm water discharges) to a MS4 that is authorized under such separate NPDES permits.
- (p) *Effective date.* This Order shall become effective on the date of its adoption provided the USEPA has no objection. If the USEPA objects to its issuance, this Order shall not become effective until such objection is withdrawn. This Order supersedes Order No. 2001-01 upon the effective date of this Order.
- (q) *Expiration.* This Order expires five years after adoption.
- (r) *Continuation of expired order* [23 CCR 2235.4]. After this Order expires, the terms and conditions of this Order are automatically continued pending issuance of a new permit if all requirements of the federal NPDES regulations on the continuation of expired permits (40 CFR 122.6) are complied with.
- (s) *Applications.* Any application submitted by a Copermittee for reissuance or modification of this Order shall satisfy all applicable requirements specified in federal regulations as well as any additional requirements for submittal of a Report of Waste Discharge specified in the CWC and the California Code of Regulations.
- (t) *Confidentiality.* Except as provided for in 40 CFR 122.7, no information or documents submitted in accordance with or in application for this Order will be considered confidential, and all such information and documents shall be available for review by the public at the Regional Board office.
- (u) *Severability.* The provisions of this Order are severable, and if any provision of this Order, or the application of any provisions of this Order to any circumstance, is held invalid, the application of such provision to other circumstances and the remainder of this Order shall not be affected thereby.
- (v) *Report submittal.* The Copermittee shall submit reports and provide notifications as required by this Order to the following:

NORTHERN WATERSHED UNIT
CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN DIEGO REGION
9174 SKY PARK COURT, SUITE 100
SAN DIEGO CA 92123-4340
Telephone: (858) 467-2952 Fax: (858) 571-6972

EUGENE BROMLEY
US ENVIRONMENTAL PROTECTION AGENCY
REGION IX
PERMITS ISSUANCE SECTION (W-5-1)
75 HAWTHORNE STREET
SAN FRANCISCO CA 94105

Unless otherwise directed, the Copermittee shall submit one hard copy for the official record and one electronic copy of each report required under this Order to the Regional Board and one electronic copy to the EPA.

USEPA	United States Environmental Protection Agency
WLA	Waste Load Allocation
WQMP	Water Quality Management Plan
WRMP	Watershed Runoff Management Plan

DEFINITIONS

Active Sediment Treatment - Using mechanical or chemical means to flocculate and remove suspended sediment from runoff from construction sites prior to discharge.

Anthropogenic Litter – Trash generated from human activities, not including sediment.

Average Monthly Action Level – the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Basin Plan – Water Quality Control Plan, San Diego Basin, Region 9, and amendments, developed by the Regional Board.

Beneficial Uses - The uses of water necessary for the survival or well being of man, plants, and wildlife. These uses of water serve to promote tangible and intangible economic, social, and environmental goals. “Beneficial Uses” of the waters of the State that may be protected include, but are not limited to, domestic, municipal, agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves. Existing beneficial uses are uses that were attained in the surface or ground water on or after November 28, 1975; and potential beneficial uses are uses that would probably develop in future years through the implementation of various control measures. “Beneficial Uses” are equivalent to “Designated Uses” under federal law. [California Water Code Section 13050(f)].

Best Management Practices (BMPs) - Defined in 40 CFR 122.2 as schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. In the case of municipal storm water permits, BMPs are typically used in place of numeric effluent limits.

Bioassessment - The use of biological community information to evaluate the biological integrity of a water body and its watershed. With respect to aquatic ecosystems, bioassessment is the collection and analysis of samples of the benthic macroinvertebrate community together with physical/habitat quality measurements associated with the sampling site and the watershed to evaluate the biological condition (i.e. biological integrity) of a water body.

Biocriteria - Under the CWA, numerical values or narrative expressions that define a desired biological condition for a water body that are legally enforceable. The USEPA defines biocriteria as: “numerical values or narrative expressions that describe the

reference biological integrity of aquatic communities inhabiting waters of a given designated aquatic life use... (that)...describe the characteristics of water body segments least impaired by human activities.”

Biofiltration - refers to practices that use vegetation and amended soils to detain and treat runoff from impervious areas. Treatment is through filtration, infiltration, adsorption, ion exchange, and biological uptake of pollutants.

Biological Integrity - Defined in Karr J.R. and D.R. Dudley. 1981. Ecological perspective on water quality goals. Environmental Management 5:55-68 as: “A balanced, integrated, adaptive community of organisms having a species composition, diversity, and functional organization comparable to that of natural habitat of the region.” Also referred to as ecosystem health.

Clean Water Act Section 402(p) [33 USC 1342(p)] - The federal statute requiring municipal and industrial dischargers to obtain NPDES permits for their discharges of storm water.

Clean Water Act Section 303(d) Water Body - An impaired water body in which water quality does not meet applicable water quality standards and/or is not expected to meet water quality standards, even after the application of technology based pollution controls required by the CWA. The discharge of runoff to these water bodies by the Copermitees is significant because these discharges can cause or contribute to violations of applicable water quality standards.

Construction Site – Any project, including projects requiring coverage under the General Construction Permit, that involves soil disturbing activities including, but not limited to, clearing, grading, disturbances to ground such as stockpiling, and excavation.

Contamination - As defined in the Porter-Cologne Water Quality Control Act, contamination is “an impairment of the quality of waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of disease. ‘Contamination’ includes any equivalent effect resulting from the disposal of waste whether or not waters of the State are affected.”

Critical Channel Flow (Qc) – The channel flow that produces the critical shear stress that initiates bed movement or that erodes the toe of channel banks. When measuring Qc, it should be based on the weakest boundary material – either bed or bank.

CWA – Federal Clean Water Act

CWC – California Water Code

Daily Discharge – Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day or any 24 hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g. concentration.)

The Daily Discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day, or other 24 hour period other than a day), or by the arithmetic mean of analytical results from one or more grab samples taken over the course of a day.

Detected, but not Quantified – those sample results less than the reporting level, but greater than or equal to the laboratory's Method of Detection Limit (MDL.)

Development Projects - New development or redevelopment with land disturbing activities; structural development, including construction or installation of a building or structure, the creation of impervious surfaces, public agency projects, and land subdivision.

Dilution Credit – the amount of dilution granted to a discharger in the calculation of a WQBEL, based on the allowance of a specific mixing zone. It is calculated from the dilution ratio, or determined through conducting of a mixing zone study, or modeling of the discharge and receiving water.

Dry Season – May 1 through September 30 of each year.

Dry Weather – weather is considered dry if the preceding 72 hours has been without precipitation.

Effectiveness Assessment Outcome Level 1 - Compliance with Activity-based Permit Requirements – Level 1 outcomes are those directly related to the implementation of specific activities prescribed by this Order or established pursuant to it.

Effectiveness Assessment Outcome Level 2 - Changes in Attitudes, Knowledge, and Awareness – Level 2 outcomes are measured as increases in knowledge and awareness among target audiences such as residents, businesses, and municipal employees.

Effectiveness Assessment Outcome Level 3 - Behavioral Change and BMP Implementation – Level 3 outcomes measure the effectiveness of activities in affecting behavioral change and BMP implementation.

Effectiveness Assessment Outcome Level 4 - Load Reductions – Level 4 outcomes measure load reductions which quantify changes in the amounts of pollutants associated with specific sources before and after a BMP or other control measure is employed.

Effectiveness Assessment Outcome Level 5 - Changes in Runoff and Discharge Quality – Level 5 outcomes are measured as changes in one or more specific constituents or stressors in discharges into or from MS4s.

Effectiveness Assessment Outcome Level 6 - Changes in Receiving Water Quality – Level 6 outcomes measure changes to receiving water quality resulting from discharges into and from MS4s, and may be expressed through a variety of means such as compliance with water quality objectives or other regulatory benchmarks, protection of biological integrity, or beneficial use attainment.

Enclosed Bays – Enclosed bays are indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost bay works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays do not include inland surface waters or ocean waters.

Erosion – When land is diminished or worn away due to wind, water, or glacial ice. Often the eroded debris (silt or sediment) becomes a pollutant via storm water runoff. Erosion occurs naturally but can be intensified by land clearing activities such as farming, development, road building, and timber harvesting.

Environmentally Sensitive Areas (ESAs) - Areas that include but are not limited to all Clean Water Act Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the State Water Resources Control Board (Water Quality Control Plan for the San Diego Basin (1994) and amendments); State Water Quality Protected Areas; water bodies designated with the RARE beneficial use by the State Water Resources Control Board (Water Quality Control Plan for the San Diego Basin (1994) and amendments); areas designated as preserves or their equivalent under the Natural Communities Conservation Program within the Cities and County of Orange; and any other equivalent environmentally sensitive areas which have been identified by the Copermittees.

Estuaries – waters, including coastal lagoons, located at the mouth of streams that serve as areas of mixing fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and ocean water. Estuaries do not include inland surface waters or ocean waters.

Feasibility Analysis – Detailed description of the selection process for the treatment control BMPs for a Priority Development Project, including justification of why one BMP is selected over another. For a Priority Development Project where a treatment control BMP with a low removal efficiency ranking (as identified by the Model SUSMP) is proposed, the analysis shall include a detailed and adequate justification exhibiting the reasons implementation of a treatment control BMP with a higher removal efficiency is infeasible for the Priority Development Project or portion of the Priority Development Project.

Flow Duration – The long-term period of time that flows occur above a threshold that causes significant sediment transport and may cause excessive erosion damage to creeks and streams (not a single storm event duration). The simplest way to visualize this is to consider a histogram of pre- and post-project flows using long-term records of hourly data. To maintain pre-project flow duration means that the total number of hours (counts) within each range of flows in a flow-duration histogram cannot increase between the pre- and post-project condition. Flow duration within the range of geomorphologically significant flows is important for managing erosion.

GIS – Geographic Information System

Grading - The cutting and/or filling of the land surface to a desired slope or elevation.

Hazardous Material – Any substance that poses a threat to human health or the environment due to its toxicity, corrosiveness, ignitability, explosive nature or chemical reactivity. These also include materials named by the USEPA in 40 CFR 116 to be reported if a designated quantity of the material is spilled into the waters of the U.S. or emitted into the environment.

Hazardous Waste - Hazardous waste is defined as “any waste which, under Section 600 of Title 22 of this code, is required to be managed according to Chapter 30 of Division 4.5 of Title 22 of this code” [CCR Title 22, Division 4.5, Chapter 11, Article 1].

Household Hazardous Waste – Paints, cleaning products, and other wastes generated during home improvement or maintenance activities.

Hydromodification – The change in the natural watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland flow, interflow and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport. In addition, alteration of stream and river channels, installation of dams and water impoundments, and excessive streambank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

Illicit Connection – Any connection to the MS4 that conveys an illicit discharge.

Illicit Discharge - Any discharge to the MS4 that is not composed entirely of storm water except discharges pursuant to a NPDES permit and discharges resulting from fire fighting activities [40 CFR 122.26(b)(2)].

Implementation Assessment – Assessment conducted to determine the effectiveness of Copermittee programs and activities in achieving measurable targeted outcomes, and in determining whether priority sources of water quality problems are being effectively addressed.

Inactive Slopes – Slopes on which no grading or other soil disturbing activities are conducted for 10 or more days.

Inland Surface Waters – all surface waters of the State that do not include the ocean, enclosed bays, or estuaries.

Integrated Assessment – Assessment to be conducted to evaluate whether program implementation is properly targeted to and resulting in the protection and improvement of water quality.

Jurisdictional Runoff Management Plan (JRMP) – A written description of the specific jurisdictional runoff management measures and programs that each Copermittee will implement to comply with this Order and ensure that storm water pollutant discharges in runoff are reduced to the MEP and do not cause or contribute to a violation of water quality standards.

Low Impact Development (LID) – A storm water management and land development strategy that emphasizes conservation and the use of on-site natural features integrated

with engineered, small-scale hydrologic controls to more closely reflect pre-development hydrologic functions.

Maximum Daily Action Level (MDAL) – is the highest allowable daily discharge of a pollutant, over a calendar day (or 24 hour period). For pollutants with action levels expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with action levels expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

Maximum Extent Practicable (MEP) – The technology-based standard established by Congress in CWA section 402(p)(3)(B)(iii) for storm water that operators of MS4s must meet. Technology-based standards establish the level of pollutant reductions that dischargers must achieve, typically by treatment or by a combination of source control and treatment control BMPs. MEP generally emphasizes pollution prevention and source control BMPs primarily (as the first line of defense) in combination with treatment methods serving as a backup (additional line of defense). MEP considers economics and is generally, but not necessarily, less stringent than BAT. A definition for MEP is not provided either in the statute or in the regulations. Instead the definition of MEP is dynamic and will be defined by the following process over time: municipalities propose their definition of MEP by way of their runoff management programs. Their total collective and individual activities conducted pursuant to the runoff management programs becomes their proposal for MEP as it applies both to their overall effort, as well as to specific activities (e.g., MEP for street sweeping, or MEP for MS4 maintenance). In the absence of a proposal acceptable to the Regional Board, the Regional Board defines MEP.

In a memo dated February 11, 1993, entitled "Definition of Maximum Extent Practicable," Elizabeth Jennings, Senior Staff Counsel, SWRCB addressed the achievement of the MEP standard as follows:

"To achieve the MEP standard, municipalities must employ whatever Best Management Practices (BMPs) are technically feasible (i.e., are likely to be effective) and are not cost prohibitive. The major emphasis is on technical feasibility. Reducing pollutants to the MEP means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, or the BMPs would not be technically feasible, or the cost would be prohibitive. In selecting BMPs to achieve the MEP standard, the following factors may be useful to consider:

- a. *Effectiveness: Will the BMPs address a pollutant (or pollutant source) of concern?*
- b. *Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?*
- c. *Public Acceptance: Does the BMP have public support?*
- d. *Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?*
- e. *Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc?*

The final determination regarding whether a municipality has reduced pollutants

to the maximum extent practicable can only be made by the Regional or State Water Boards, and not by the municipal discharger. If a municipality reviews a lengthy menu of BMPs and chooses to select only a few of the least expensive, it is likely that MEP has not been met. On the other hand, if a municipal discharger employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost would exceed any benefit derived, it would have met the standard. Where a choice may be made between two BMPs that should provide generally comparable effectiveness, the discharger may choose the least expensive alternative and exclude the more expensive BMP. However, it would not be acceptable either to reject all BMPs that would address a pollutant source, or to pick a BMP base solely on cost, which would be clearly less effective. In selecting BMPs the municipality must make a serious attempt to comply and practical solutions may not be lightly rejected. In any case, the burden would be on the municipal discharger to show compliance with its permit. After selecting a menu of BMPs, it is the responsibility of the discharger to ensure that all BMPs are implemented.”

Minimum Level – the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method sample weights, volumes and processing steps have been followed.

Municipal Separate Storm Sewer System (MS4) – A conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains): (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or designated and approved management agency under section 208 of the CWA that discharges to waters of the United States; (ii) Designated or used for collecting or conveying storm water; (iii) Which is not a combined sewer; (iv) Which is not part of the Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.26.

National Pollutant Discharge Elimination System (NPDES) - The national program for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits, and imposing and enforcing pretreatment requirements, under Sections 307, 318, 402, and 405 of the CWA.

NOI – Notice of Intent

Non-Storm Water - All discharges to and from a MS4 that do not originate from precipitation events (i.e., all discharges from a MS4 other than storm water). Non-storm water includes illicit discharges, non-prohibited discharges, and NPDES permitted discharges.

Nuisance - As defined in the Porter-Cologne Water Quality Control Act a nuisance is “anything which meets all of the following requirements: 1) Is injurious to health, or is indecent, or offensive to the senses, or an obstruction to the free use of property, so as

to interfere with the comfortable enjoyment of life or property. 2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal. 3) Occurs during, or as a result of, the treatment or disposal of wastes.”

Ocean Waters – the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Board’s California Ocean Plan.

Order – Order No. R9-2009-0002 (NPDES No. CAS0108740)

Person - A person is defined as an individual, association, partnership, corporation, municipality, State or Federal agency, or an agent or employee thereof [40 CFR 122.2].

Point Source - Any discernible, confined, and discrete conveyance, including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operations, landfill leachate collection systems, vessel, or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

Pollutant - Any agent that may cause or contribute to the degradation of water quality such that a condition of pollution or contamination is created or aggravated.

Pollution - As defined in the Porter-Cologne Water Quality Control Act: “the alteration of the quality of the waters of the State by waste, to a degree that unreasonably affects the either of the following: 1) The waters for beneficial uses; or 2) Facilities that serve these beneficial uses.” Pollution may include contamination.

Pollutants of Concern – Pollutants for which water bodies are listed as impaired under CWA section 303(d), pollutants associated with the land use type of a development, and/or pollutants commonly associated with runoff. Pollutants commonly associated with runoff include total suspended solids; sediment; pathogens (e.g., bacteria, viruses, protozoa); heavy metals (e.g., copper, lead, zinc, and cadmium); petroleum products and polynuclear aromatic hydrocarbons; synthetic organics (e.g., pesticides, herbicides, and PCBs); nutrients (e.g., nitrogen and phosphorus fertilizers); oxygen-demanding substances (decaying vegetation, animal waste, and anthropogenic litter).

Pollution Prevention - Pollution prevention is defined as practices and processes that reduce or eliminate the generation of pollutants, in contrast to source control BMPs, treatment control BMPs, or disposal.

Post-Construction BMPs - A subset of BMPs including structural and non-structural controls which detain, retain, filter, or educate to prevent the release of pollutants to surface waters during the final functional life of developments.

Pre-Project or Pre-Development Runoff Conditions (Discharge Rates, Durations, Etc.) – Runoff conditions that exist onsite immediately before the planned development activities occur. This definition is not intended to be interpreted as that period before any human-induced land activities occurred. This definition pertains to redevelopment as well as initial development.

Principal Copermittee – County of Orange

Priority Development Projects - New development and redevelopment project categories listed in Section F.1.d(2) of Order No. R9-2009-0002.

Receiving Waters – Waters of the United States.

Receiving Water Limitations (RWLs) - Waste discharge requirements issued by the Regional Board typically include both: (1) “Effluent Limitations” (or “Discharge Limitations”) that specify the technology-based or water-quality-based effluent limitations; and (2) “Receiving Water Limitations” that specify the water quality objectives in the Basin Plan as well as any other limitations necessary to attain those objectives. In summary, the “Receiving Water Limitations” provision is the provision used to implement the requirement of CWA section 301(b)(1)(C) that NPDES permits must include any more stringent limitations necessary to meet water quality standards.

Redevelopment - The creation, addition, and or replacement of impervious surface on an already developed site. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, and creation or addition of impervious surfaces. Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include trenching and resurfacing associated with utility work; resurfacing existing roadways; new sidewalk construction, pedestrian ramps, or bikelane on existing roads; and routine replacement of damaged pavement, such as pothole repair.

Retain – to keep or hold in a particular place, condition, or position without discharge to surface waters.

Runoff - All flows in a storm water conveyance system that consists of the following components: (1) storm water (wet weather flows) and (2) non-storm water including dry weather flows.

Sediment - Soil, sand, and minerals washed from land into water. Sediment resulting from anthropogenic sources (i.e. human induced land disturbance activities) is considered a pollutant. This Order regulates only the discharges of sediment from anthropogenic sources and does not regulate naturally occurring sources of sediment. Sediment can destroy fish-nesting areas, clog animal habitats, and cloud waters so that sunlight does not reach aquatic plants.

Shared Treatment Control BMP - BMPs used by multiple developments to infiltrate, filter, or treat the required volume or flow prior to discharge to a receiving water. This could include, for example, a treatment BMP at the end of an enclosed storm drain that collects runoff from several commercial developments.

Source Control BMP – Land use or site planning practices, or structural or nonstructural measures that aim to prevent runoff pollution by reducing the potential for contamination at the source of pollution. Source control BMPs minimize the contact between pollutants and runoff.

State Water Quality Protection Area – A nonterrestrial marine or estuarine area designated to protect marine species or biological communities from an undesirable alteration in natural water quality, including, but not limited to, areas of special biological significance that have been designated by the State Water Resources Control Board through its water quality control planning process. Areas of special biological significance are a subset of State Water Quality Protection Areas, and require special protection as determined by the State Water Resources Control Board pursuant to the California Ocean Plan adopted and reviewed pursuant to Article 4 (commencing with Section 13160) of Chapter 3 of Division 7 of the California Water Code and pursuant to the Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California (California Thermal Plan) adopted by the state board.

Storm Water – Per 40 CFR 122.26(b)(13), means storm water runoff, snowmelt runoff and surface runoff and drainage. Surface runoff and drainage pertains to runoff and drainage resulting from precipitation events.

Standard Storm Water Mitigation Plan (SSMP) – A plan developed to mitigate the impacts of runoff from Priority Development Projects.

Third Party Inspectors - Industrial and commercial facility inspectors who are not contracted or employed by a regulatory agency or group of regulatory agencies, such as the Regional Board or Copermittees. The third party inspector is not a regular facility employee self-inspecting their own facility. The third party inspector could be a contractor or consultant employed by a facility or group of businesses to conduct inspections.

Total Maximum Daily Load (TMDL) - The maximum amount of a pollutant that can be discharged into a water body from all sources (point and non-point) and still maintain water quality standards. Under CWA section 303(d), TMDLs must be developed for all water bodies that do not meet water quality standards after application of technology-based controls.

Toxicity - Adverse responses of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies). The water quality objectives for toxicity provided in the Water Quality Control Plan, San Diego Basin, Region 9, (Basin Plan), state in part...“All waters shall be free of toxic substances in concentrations that are toxic to, or that produce detrimental physiological responses in human, plant, animal, or aquatic life....The survival of aquatic life in surface waters subjected to a waste discharge or other controllable water quality factors, shall not be less than that for the same water body in areas unaffected by the waste discharge”.

Treatment Control BMP – Any engineered system designed to remove pollutants by simple gravity settling of particulate pollutants, filtration, biological uptake, media absorption or any other physical, biological, or chemical process.

Waste - As defined in CWC Section 13050(d), “waste includes sewage and any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation, including waste placed within containers of whatever nature prior to, and for purposes of, disposal.”

Article 2 of CCR Title 23, Chapter 15 (Chapter 15) contains a waste classification system that applies to solid and semi-solid waste, which cannot be discharged directly or indirectly to water of the state and which therefore must be discharged to land for treatment, storage, or disposal in accordance with Chapter 15. There are four classifications of waste (listed in order of highest to lowest threat to water quality): hazardous waste, designated waste, non-hazardous solid waste, and inert waste.

Water Quality Assessment – Assessment conducted to evaluate the condition of non-storm water and storm water discharges, and the water bodies which receive these discharges.

Water Quality Objective - Numerical or narrative limits on constituents or characteristics of water designated to protect designated beneficial uses of the water. [California Water Code Section 13050 (h)]. California’s water quality objectives are established by the State and Regional Water Boards in the Water Quality Control Plans. Numeric or narrative limits for pollutants or characteristics of water designed to protect the beneficial uses of the water. In other words, a water quality objective is the maximum concentration of a pollutant that can exist in a receiving water and still generally ensure that the beneficial uses of the receiving water remain protected (i.e., not impaired). Since water quality objectives are designed specifically to protect the beneficial uses, when the objectives are violated the beneficial uses are, by definition, no longer protected and become impaired. This is a fundamental concept under the Porter Cologne Act. Equally fundamental is Porter Cologne’s definition of pollution. A condition of pollution exists when the water quality needed to support designated beneficial uses has become unreasonably affected or impaired; in other words, when the water quality objectives have been violated. These underlying definitions (regarding beneficial use protection) are the reason why all waste discharge requirements implementing the federal NPDES regulations require compliance with water quality objectives. (Water quality objectives are also called water quality criteria in the CWA.)

Water Quality Standards - The beneficial uses (e.g., swimming, fishing, municipal drinking water supply, etc.) of water and the water quality objectives necessary to protect those uses.

Waters of the State - Any water, surface or underground, including saline waters within the boundaries of the State [CWC section 13050 (e)]. The definition of the Waters of the State is broader than that for the Waters of the United States in that all water in the State is considered to be a Waters of the State regardless of circumstances or condition. Under this definition, a MS4 is always considered to be a Waters of the State.

Waters of the United States - As defined in the 40 CFR 122.2, the Waters of the U.S. are defined as: “(a) All waters, which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; (b) All interstate waters, including interstate “wetlands;” (c) All other waters such as intrastate lakes, rivers, streams (including

intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation or destruction of which would affect or could affect interstate or foreign commerce including any such waters: (1) Which are or could be used by interstate or foreign travelers for recreational or other purposes; (2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) Which are used or could be used for industrial purposes by industries in interstate commerce; (d) All impoundments of waters otherwise defined as waters of the United States under this definition; (e) Tributaries of waters identified in paragraphs (a) through (d) of this definition; (f) The territorial seas; and (g) "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with the EPA."

Watershed - That geographical area which drains to a specified point on a water course, usually a confluence of streams or rivers (also known as drainage area, catchment, or river basin).

Watershed Runoff Management Plan (WRMP) – A written description of the specific watershed runoff management measures and programs that each watershed group of Copermittees will implement to comply with this Order and ensure that storm water pollutant discharges in runoff are reduced to the MEP and do not cause or contribute to a violation of water quality standards.

WDRs – Waste Discharge Requirements

Wet Season – October 1 through April 30 of each year.

ATTACHMENT D**SCHEDULED SUBMITTALS SUMMARY**

Submittal	Permit Section	Completion Date	Frequency
Prohibitions on dry-weather discharges listed in Section B.2	B.2	365 days after adoption and in annual reports	Annual
Submit Certified Statement of Adequate Legal Authority	E.2	365 days after adoption of the Order	One time
Flood Control Structure BMP Inventory and Evaluation	F.3.a.(4)	2 nd year JRMP Annual Report	One time
Fiscal Analysis	H.3	With annual JRMP report	Annual
Updated Jurisdictional Runoff Management Plans	K.1.a	365 days after adoption of the Order	One time
Updated Watershed Workplans	K.1.b	365 days after adoption of the Order	One time
Updated model SSMP	F.1.d, K.2.a	Two years after adoption of the Order	One time
Updated local SSMPs and amended ordinances and certified statement of adequate legal authority to implement LID and hydromodification requirements	E.2, F.1.d, K.2.a	180 days after RB determination that Model SSMP is in compliance	One time
Identify and remove barriers to LID implementation	F.1.d.(4)(a)(v)	2 nd year JRMP Annual Report	One time
Report of Waste Discharge	K.2.b	At least 210 days prior to expiration of this Order	One time
Submit to Principal Copermittee(s) individual JRMP Annual Reports	K.3.a.(1)	Prior to September 30, 2011 and annually thereafter (Principal Copermittee specifies date of submittal)	Annual
Principal Copermittee submits JRMP Annual Reports to Regional Board	K.3.a.(2)	September 30, 2011 and annually thereafter	Annual
Principal Copermittee submits Notification of Principal Copermittee	M	180 days after adoption of the Order	One Time
Principal Copermittee submits description of Receiving Waters Monitoring Program	Monitoring and Reporting Program (M&R Program), III.A.1	September 1, 2010 and annually thereafter	Annual
Receiving Waters and Runoff Monitoring Annual Reports	M&R Program, III.A.2	October 1, 2011 and annually thereafter	Annual
Principal Copermittee submits interim Receiving Waters Monitoring Program Annual Report	M&R Program, III.B	January 31, 2011	One Time
Hydromodification Management Plan	F.1.h.4	Draft within 2 years of adoption of the Order	One Time for Draft
Trash and Litter Impairment Special Study	M&R Program II.D.5	Draft Monitoring Protocol and Locations within 365 days of Order adoption	One Time

Jurisdictional Runoff Management Program Annual Report Checklist

In the JRMP Annual Report each Copermitttee shall provide an Annual Report Checklist. The Annual Report Checklist must be no longer than 2 pages, be current as of the 1st day of the rainy season of that year, and include a signed certification statement. The Annual Report Summary Checklist must provide the following information:

Order Requirements

Were All Requirements of this Order Met?

Construction

Number of Active Sites
Number of Inactive Sites
Number of Sites Inspected
Number of Inspections
Number of Violations
Number of Construction Enforcement Actions Taken

New Development

Number of Development Plan Reviews
Number of Grading Permits Issued
Number of Projects Exempted from Interim/Final Hydromodification Requirements

Post Construction Development

Number of Priority Development Projects
Number of SUSMP Required Post-Construction BMP Inspections
Number of SUSMP Required Post-Construction BMP Violations
Number of SUSMP Required Post-Construction BMP Enforcement Actions Taken

Illicit Discharges and Connections

Number of IC/ID Inspections
Number of IC/ID Detections by Staff
Number of IC/ID Detections from the Public
Number of IC/ID Eliminations
Number of IC/ID Violations
Number of IC/ID Enforcement Actions Taken

MS4 Maintenance

Number of Inspections Conducted
Amount of Waste Removed
Total Miles of MS4 Inspected

Municipal/Commercial/Industrial

Number of Facilities
Number of Inspections Conducted
Number of Facilities Inspected
Number of Violations
Number of Enforcement Actions Taken

**RECEIVING WATERS AND MS4 DISCHARGE MONITORING AND
REPORTING PROGRAM NO. R9-2009-0002**

I.	PURPOSE	2
II.	MONITORING PROGRAM	2
A.	Receiving Waters Monitoring Program.....	2
1.	Mass Loading Station (MLS) Monitoring.....	3
2.	Urban Stream Bioassessment (BA) Monitoring	6
3.	Follow-up Analysis and Actions	8
4.	Ambient Coastal Receiving Waters Monitoring (ACRW)	9
5.	Regional Monitoring Programs	10
B.	Wet Weather MS4 Discharge Monitoring	11
C.	Dry Weather Non-Storm Water Effluent Limitations	12
D.	Special Studies	15
E.	Monitoring Provisions	17
III.	REPORTING PROGRAM	19
A.	Monitoring Reporting	19
B.	Interim Reporting Requirements	23

I. PURPOSE

- A. This Receiving Waters and MS4 Discharge Monitoring and Reporting Program is intended to meet the following goals:
1. Assess compliance with Order No. R9-2009-002;
 2. Measure and improve the effectiveness of the Copermittees' runoff management programs;
 3. Assess the chemical, physical, and biological impacts to receiving waters resulting from MS4 discharges;
 4. Characterize storm water discharges;
 5. Identify sources of specific pollutants;
 6. Prioritize drainage and sub-drainage areas that need management actions;
 7. Detect and eliminate illicit discharges and illicit connections to the MS4; and
 8. Assess the overall health of receiving waters.
 9. Provide information to implement required BMP improvements
- B. In addition, this Receiving Waters and MS4 Discharges Monitoring and Reporting Program is designed to answer the following core management questions¹:
1. Are conditions in receiving waters protective, or likely to be protective, of beneficial uses?
 2. What is the extent and magnitude of the current or potential receiving water problems?
 3. What is the relative MS4 discharge contribution to the receiving water problem(s)?
 4. What are the sources of MS4 discharge that contribute to receiving water problem(s)?
 5. Are conditions in receiving waters getting better or worse?

II. MONITORING PROGRAM

A. Receiving Waters Monitoring Program

Each Copermittee must collaborate with the other Copermittees to develop, conduct, and report on a year-round watershed based Receiving Waters Monitoring Program. The monitoring program design, implementation, analysis, assessment, and reporting must be conducted

¹ Core management questions from "Model Monitoring Program for Municipal Separate Storm Sewer Systems in Southern California: A report from the Stormwater Monitoring Coalition's Model Monitoring Technical Committee." Technical Report No. 419. August 2004.

on a watershed basis for each of the watershed management areas. The monitoring program must be designed to meet the goals and answer the questions listed in section I above. The monitoring program must include the following components:

1. MASS LOADING STATION (MLS) MONITORING

- a. Locations: The following existing mass loading stations must continue to be monitored: Laguna Canyon, Aliso Creek, San Juan Creek, Trabuco Creek, Prima Deshecha Channel, and Segunda Deshecha Channel.
- b. Frequency: Each mass loading station to be monitored in a given year must be monitored twice during wet weather events and twice during dry weather flow conditions.
- c. Timing: Each mass loading station must be monitored for the first wet weather event of the season which meets the USEPA's criteria as described in 40 CFR 122.21(g)(7). Monitoring of the second wet weather event must be conducted after February 1. Dry weather mass loading monitoring events must be sampled at least three months apart between May and October. If flows are not evident in September or October for the second event, then sampling must be conducted during non-rain events in the wet weather season.
- d. Protocols: Protocols for mass loading sampling and analysis must be SWAMP comparable. At a minimum, analytical methods, target reporting limits, and data reporting formats should be SWAMP comparable. If the mass loading sampling and analysis are determined to be impracticable with the SWAMP standards, the Copermitees must provide explanation and discussion to this effect in the Receiving Waters and MS4 Discharge Monitoring Annual Report. Wet weather samples may be time-weighted composites, collected for the duration of the entire runoff event, where practical, consistent with methods used by the Copermitees during for the Receiving Waters Monitoring Program conducted for Regional Board Order No. R9-2002-01. Where such monitoring is not practical, such as for large watersheds with significant groundwater recharge flows, composites must be collected at a minimum during the first 3 hours of flow. Dry weather event sampling may be time-weighted composites composed of 24 discrete hourly samples, whereby the mass loads of pollutants are calculated as the product of the composite sample concentration and the total volume of water discharged past the monitoring point during the time of

sample collection.

- (1) Automatic samplers must be used to collect samples from mass loading stations.
 - (2) Grab samples must be analyzed for temperature, pH, specific conductance, biochemical oxygen demand, oil and grease, total coliform, fecal coliform, enterococcus and for total petroleum hydrocarbons whenever a sheen is observed.
- e. Copermittees must measure or estimate flow rates and volumes for each mass loading station sampling event in order to determine mass loadings of pollutants. Data from nearby USGS gauging stations may be utilized, or flow rates may be estimated in accordance with the USEPA Storm Water Sampling Guidance Document (EPA-833-B-92-001), Section 3.2.1.
- f. In the event that the required number of events is not sampled during one monitoring year at any given station, the Copermittees must submit, with the subsequent Receiving Waters Monitoring Annual Report, a written explanation for a lack of sampling data, including streamflow data from the nearest USGS gauging station.
- g. The following constituents must be analyzed for each monitoring event at each station:

Table 1. Analytical Testing for Mass Loading, Urban Stream Bioassessment (excluding bacteriological), and Ambient Coastal Receiving Waters Stations

Conventionals, Nutrients, Hydrocarbons	Pesticides	Metals (Total and Dissolved)	Bacteriological
<ul style="list-style-type: none"> • Total Dissolved Solids • Total Suspended Solids • Turbidity • Total Hardness • pH • Specific Conductance • Temperature • Dissolved Oxygen • Total Phosphorus • Dissolved Phosphorus • Nitrite ° • Nitrate ° • Total Kjeldahl Nitrogen • Ammonia 	<ul style="list-style-type: none"> Diazinon Chlorpyrifos <i>Malathion</i> <i>Carbamates*</i> <i>Pyrethroids*</i> 	<ul style="list-style-type: none"> Arsenic Cadmium Chromium Copper Lead Nickel Selenium Zinc 	<ul style="list-style-type: none"> Total Coliform Fecal Coliform Enterococcus

<ul style="list-style-type: none"> • Biological Oxygen Demand, 5-day • Chemical Oxygen Demand • Total Organic Carbon • Dissolved Organic Carbon • Methylene Blue Active Substances • Oil and Grease 			
<p>° Nitrate and nitrite may be combined and reported as nitrate + nitrite. * Carbamate and Pyrethroid pesticides must initially be monitored in Prima Deshecha and Segunda Deshecha watersheds. If carbamate and/or pyrethroid pesticides are found to correlate with observed acute or chronic toxicity, then that pesticide must be added to all stations displaying toxicity.</p>			

h. Toxicity testing must be conducted for each monitoring event at each station according to the following Table 2:

Table 2. Toxicity Testing for Mass Loading, Urban Stream Bioassessment, and Ambient Coastal Receiving Waters Stations

Program Component	Dry Weather Flows		Storm Water Flows	
	Freshwater Organisms	Estuarine & Marine Organisms	Freshwater Organisms	Estuarine & Marine Organisms
Mass Loading	2 chronic 2 acute	1 chronic**	2 acute	2 chronic 1 acute
Urban Stream Bioassessment	2 chronic* 2 acute*	n/a	n/a	n/a
Ambient Coastal Receiving Waters	n/a	2 chronic 1 acute	n/a	2 chronic 1 acute
Sediment Toxicity Special Study	1 chronic 1 acute 1	n/a	n/a	n/a
<p>Table Notes * Urban Stream Bioassessment on Aliso Creek must also include use of <i>Pimephales promelas</i> (fathead minnow) for chronic and acute toxicity testing. ** Dry weather toxicity monitoring at a mass loading station may be omitted if either (a) the channel flows are diverted year-round in dry weather conditions to the sanitary sewer for treatment; or (b) dry weather toxicity with marine species is occurring at an Ambient Coastal Waters Receiving station where that channel reaches the Pacific Ocean.</p> <p>Species Notes: 1. Freshwater acute toxicity testing must include <i>Hyalella azteca</i>.</p>				

2. Acute toxicity may be determined during the course of chronic toxicity monitoring per U.S. EPA protocols.
3. *Americamysis bahia* may be used as a marine test organism if *Holmesimysis costata* cannot reasonably be obtained. The use of, and justification for, of *A. bahia* must be clearly reported in each Monitoring Report.

- i. The presence of acute toxicity must be determined in accordance with USEPA protocol (EPA-821-R-02-012). The presence of chronic freshwater toxicity must be determined in accordance with USEPA protocol (EPA-821-R-02-013). The presence of chronic marine toxicity must be determined in accordance with USEPA guidance EPA 600/R95/136, except for chronic mysid tests that must be conducted in accordance with USEPA protocol EPA-821-R-02-014.

2. Urban Stream Bioassessment (BA) Monitoring

Copermittees must conduct Urban Stream Bioassessment Monitoring using a triad of indicators to assess the condition of biological communities in freshwater, urban receiving waters.

- a. Locations: At a minimum, the program shall consist of station identification, sampling, monitoring, and analysis of data for six bioassessment stations in order to determine the biological and physical integrity of urban streams within the County of Orange. At least one urban bioassessment station shall be located within each watershed management area. In addition to the urban stream bioassessment stations, three reference bioassessment stations shall be identified, sampled, monitored, and analyzed. Locations of reference stations must be identified according to protocols outlined in "A Quantitative Tool for Assessing the Integrity of Southern Coastal California Streams," by Ode, et al. 2005.²
- b. Frequency: Bioassessment stations which have year round flow conditions must be monitored in May or June (to represent the influence of wet weather on the communities) or September or October (to represent the influence of dry weather flows on the communities). Copermittees shall determine when the annual sampling for stations with year round flow will occur in accordance with the purposes of sampling, as outlined in Section I of

² Ode, et al. 2005. "A Quantitative Tool for Assessing the Integrity of Southern Coastal California Streams." Environmental Management. Vol. 35, No. 1, pp. 1-13.

Attachment E. Those stations that do not have year round flow shall continue to be monitored twice per year. The timing of monitoring of bioassessment stations must coincide with dry weather monitoring of mass loading stations and Inland Aquatic Habitat stations.

- c. Parameters / Methods: The triad of indicators for urban stream bioassessment monitoring must include bioassessment, aquatic chemistry, and aqueous toxicity.
- (1) Aquatic chemistry and aqueous toxicity must be conducted using the same parameters and methods as the mass loading station monitoring, with the addition of pyrethroid pesticides.
 - (2) Bioassessment analysis procedures must include calculation of the Index of Biotic Integrity (IBI) for benthic macroinvertebrates for all bioassessment stations, as outlined in "A Quantitative Tool for Assessing the Integrity of Southern Coastal California Streams," by Ode, et al. 2005.
 - (3) Monitoring of bioassessment stations must be conducted according to bioassessment procedures developed by the Surface Water Ambient Monitoring Program (SWAMP), as amended.³
 - (4) Monitoring of bioassessment stations must incorporate assessment of algae in addition to macroinvertebrates, using the USEPA's 1999 Rapid Bioassessment Protocols for Use in Wadeable Streams and Rivers⁴ and SWAMP's Incorporating bioassessment using freshwater algae into California's Surface Water Ambient Monitoring Program (SWAMP)⁵. Assessment of freshwater algae must include algal taxonomic composition (diatoms and soft algae) and algal biomass. Future bioassessment shall incorporate algal IBI scores, when developed.

³ Ode, P.R.. 2007. Standard operating procedures for collecting macroinvertebrate samples and associated physical and chemical data for ambient bioassessments in California. California State Water Resources Control Board Surface Water Ambient Monitoring Program (SWAMP) Bioassessment SOP 001.

⁴ USEPA, 1999. *Rapid Bioassessment Protocols for Use in Wadeable Streams and Rivers*. EPA-841-B-99-002.

⁵ Fetscher, E. A., and K. McLaughlin. 2008. Incorporating bioassessment using freshwater algae into California's Surface Water Ambient Monitoring Program (SWAMP). Southern California Coastal Water Research Project. Costa Mesa, CA

- d. A qualified professional environmental laboratory must perform all sampling, laboratory, quality assurance, and analytical procedures.

3. FOLLOW-UP ANALYSIS AND ACTIONS

When results from the required monitoring indicate MS4 discharge induced degradation at a mass loading station, bioassessment, or dry weather discharge station, Copermittees within the watershed must evaluate the extent and causes of MS4 discharge pollution in receiving waters and prioritize and implement management actions to eliminate or reduce sources. Toxicity Identification Evaluations (TIEs) must be conducted to determine the cause of toxicity as outlined in Table 3 below. Other follow-up activities, which must be conducted by the Copermittees, are also identified in Table 3. Once the cause of toxicity has been identified by a TIE, the Copermittees must perform source identification projects as needed and implement the measures necessary to reduce or eliminate the pollutant discharges and abate the sources causing the toxicity.

Table 3. Triad Approach to Determining Follow-Up Actions⁶

Chemistry	Toxicity	Benthic Alteration	Example Conclusions	Possible Actions or Decisions
1. Exceedance of water quality objectives	Evidence of toxicity	Indications of alteration	Strong evidence of pollution-induced degradation	Use TIE to identify contaminants of concern, based on TIE metric Initiate upstream source identification as a high priority
2. No persistent exceedances of water quality objectives	No evidence of toxicity	No indications of alteration	No evidence of current pollution-induced degradation Potentially harmful pollutants not yet concentrated enough to cause visible impact	No immediate action necessary Conduct periodic broad scans for new and/or potentially harmful pollutants
3. Exceedance of water quality objectives	No evidence of toxicity	No indications of alteration	Contaminants are not bioavailable Test organisms not sensitive to problem pollutants	TIE would not provide useful information with no evidence of toxicity Continue monitoring for toxic and benthic impacts Initiate upstream source identification as a low priority Consider whether different or additional test organisms should be evaluated
4. No persistent exceedances of water quality objectives	Evidence of toxicity	No indications of alteration	Unmeasured contaminant(s) or conditions have the potential to cause degradation Pollutant causing toxicity at very low levels	Recheck chemical analyses; verify toxicity test results Consider additional advanced chemical analyses Use TIE to identify contaminants of concern, based on TIE metric Initiate upstream source identification as a medium priority
5. No persistent exceedances of water quality objectives	No evidence of toxicity	Indications of alteration	Alteration may not be due to toxic contamination Test organisms not sensitive to problem pollutants	No action necessary due to toxic chemicals Initiate upstream source identification (for physical sources) as a high priority Consider whether different or additional test organisms should be evaluated
6. Exceedance of water quality objectives	Evidence of toxicity	No indications of alteration	Toxic contaminants are bioavailable, but in situ effects are not demonstrable Benthic analysis not sensitive enough to detect impact Potentially harmful pollutants not yet concentrated enough to change community	Determine if chemical and toxicity tests indicate persistent degradation Recheck benthic analyses; consider additional data analyses If recheck indicates benthic alteration, perform TIE to identify contaminants of concern, based on TIE metric Initiate upstream source identification as a high priority If recheck shows no effect, use TIE to identify contaminants of concern, based on TIE metric Initiate upstream source identification as a medium priority
7. No persistent exceedances of water quality objectives	Evidence of toxicity	Indications of alteration	Unmeasured toxic contaminants are causing degradation Pollutant causing toxicity at very low levels Benthic impact due to habitat disturbance, not toxicity	Recheck chemical analyses and consider additional advanced analyses Use TIE to identify contaminants of concern, based on TIE metric Initiate upstream source identification as a high priority Consider potential role of physical habitat disturbance
8. Exceedance of water quality objectives	No evidence of toxicity	Indications of alteration	Test organisms not sensitive to problem pollutants Benthic impact due to habitat disturbance, not toxicity	TIE would not provide useful information with no evidence of toxicity Initiate upstream source identification as a high priority Consider whether different or additional test organisms should be evaluated Consider potential role of physical habitat disturbance

4. AMBIENT COASTAL RECEIVING WATERS MONITORING (ACRW)

Copermittees must continue to conduct the Ambient Coastal Receiving Waters Monitoring (ACRW) program to assess the impact of MS4 discharge to ecologically-sensitive coastal areas by analyzing water chemistry and aqueous toxicity in both dry and wet weather and the magnitude of storm water discharge plumes to these areas. Copermittees must prioritize locations for further study and conduct special investigations.

⁶ Orange County Storm Water Program, 2006. Report of Waste Discharge (San Diego Region), Section 11.

- a. Locations: Copermittees must assess the existing Ambient Coastal Receiving Waters Monitoring (ACRW) stations to determine whether all ecologically-sensitive areas are represented. Stations must be established within all Areas of Special Biological Significance (ASBS) and Marine Life Refuges that receive significant MS4 discharges.
 - (1) Dana Point Harbor must continue to be monitored. ACRW monitoring in Dana Point Harbor may be suspended as long as the Harbor is being monitored pursuant to the Regional Harbor Monitoring Program⁷ and follow-up investigations are conducted when appropriate based on guidance from the Storm Water Monitoring Coalition.
- b. Parameters: Aquatic chemistry and aqueous toxicity must be conducted using the same parameters and methods as the mass loading station monitoring.
- c. ACRW monitoring must be concurrent with the mass loading station monitoring whenever feasible.
- d. Special investigations Ambient Coastal Receiving Waters: Special investigations must be designed and conducted to most effectively answer each of questions 1-5 of section I.B above, with an emphasis on answering question 4.

5. REGIONAL MONITORING PROGRAMS

a. Regional Bacteria Monitoring

The Copermittees shall participate in the development and implementation of monitoring for the collaborative regional bacteria monitoring program. It is expected that the regional monitoring will allow for a more effective and efficient bacteria monitoring program. The regional monitoring plan must be submitted to the Executive Officer for review and approval. Documentation of participation and monitoring shall be included in the annual report.

⁷ On July 24, 2003, the Regional Board required the County of Orange to participate in an Investigative Order to comprehensively assess the receiving water conditions of Dana Point Harbor. The Regional Harbor Monitoring Program is described in the *Regional Technical Report: Harbor Monitoring Program for San Diego Region San Diego Bay, Mission Bay, Oceanside Harbor, and Dana Point Harbor*, MEC Analytical Systems and Brock Bernstein, February 2004.

b. Regional Monitoring Programs

The Regional Board recognizes the importance and advantages of participation by Copermittees in Regional Monitoring Programs. As such, the Copermittees may propose participation in additional regional monitoring programs to supplement and/or replace existing monitoring requirements. The regional monitoring plan must be submitted to the Executive Officer for review and approval. Documentation of participation and monitoring shall be included in the annual report.

B. Wet Weather MS4 Discharge Monitoring

Each Copermittee must collaborate with the other Copermittees to develop, conduct, and report on a year-round watershed based Wet Weather MS4 Discharge Monitoring Program. The monitoring program design, implementation, analysis, assessment, and reporting must be conducted on a watershed basis for each of the hydrologic units. The monitoring program must be designed to meet the goals and answer the questions listed in section I above. The monitoring program must include the following components;

1. MS4 OUTFALL MONITORING

The Copermittees must collaborate to develop and implement a monitoring program to characterize pollutant discharges from MS4 outfalls in each watershed during wet weather. The program must include rationale and criteria for selection of outfalls to be monitored. The program must, at a minimum, include collection of samples for those pollutants causing or contributing to violations of water quality standards within the watershed. This monitoring program must be implemented within each watershed and must begin no later than the 2010-2011 monitoring year.

a. The program must comply with Section D of the Order for Storm Water Action Levels (SALs). Samples must be collected during the first 24 hours of the storm water discharge or for the entire storm water discharge if it is less than 24 hours.

1. Grab samples may be utilized only for pH, indicator bacteria, DO, temperature and hardness.

2. All other constituents must be sampled using 24 hour composite samples or for the entire storm water discharge if the storm event is less than 24 hours.
- b. Sampling to compare MS4 outfall discharges with total metal SALs must include a measurement of receiving water hardness at each outfall. If a total metal concentration exceeds a SAL, that concentration must be compared to the California Toxic Rule criteria and the USEPA 1 hour maximum concentration for the detected level of receiving water hardness associated with that sample. If it is determined that the sample's total metal concentration for that specific pollutant exceeds the SAL but does not exceed the applicable 1 hour criteria for the measured level of hardness, then the SAL shall be considered not exceeded for that measurement.

2. SOURCE IDENTIFICATION MONITORING

The Copermittees must collaborate to develop and implement a monitoring program to identify sources of pollutants causing the priority water quality problems within each watershed. The monitoring program must include focused monitoring which moves upstream into each watershed as necessary to identify sources. This monitoring program must be implemented within each watershed and must begin no later than the 2010-2011 monitoring year.

C. Non-Storm Water Dry Weather Action Levels

Each Copermittee must collaborate with the other Copermittees to conduct, and report on a year-round watershed based Dry Weather Non-storm Water MS4 Discharge Monitoring Program. The monitoring program implementation, analysis, assessment, and reporting must be conducted on a watershed basis for each of the hydrologic units. The monitoring program must be designed to assess compliance with non-storm water dry weather action levels in section C of this Order, adopted dry weather Total Maximum Daily Loads Waste Load Allocations and assessment of the contribution of dry weather flows to 303(d) listed impairments. The monitoring program must include the following components;

Each Copermittee's program must be designed to determine levels of pollutants in effluent discharges from the MS4 into receiving waters. Each Copermittee must conduct the following dry weather field screening and analytical monitoring tasks:

a. Dry Weather Non-storm Water Effluent Analytical Monitoring Stations

- (1) Stations must be major outfalls. Major outfalls chosen must include outfalls discharging to inland surface waters; to bays, harbors and lagoons/estuaries; and to the surf zone. Other outfall points (or any other point of access such as manholes) identified by the Copermittees as potential high risk sources of polluted effluent or as identified under Section C.3.e shall be sampled.
- (2) Each Copermittee must clearly identify each dry weather effluent analytical monitoring station on its MS4 Map as either a separate GIS layer or a map overlay hereafter referred to as a Dry Weather Non-storm Water Effluent Analytical Stations Map.

b. Develop Dry Weather Non-storm Water Effluent Analytical Monitoring Procedures

Each Copermittee must develop and/or update written procedures for effluent analytical monitoring (these procedures must be consistent with 40 CFR part 136), including field observations, monitoring, and analyses to be conducted. At a minimum, the procedures must meet the following guidelines and criteria:

- (1) Determining Sampling Frequency: Effluent analytical monitoring must be conducted at major outfalls and identified stations. The Copermittees must sample a representative number of major outfalls and identified stations. The sampling must be done to assess compliance with dry weather non-storm water action levels pursuant to section C of this Order. All monitoring conducted must be preceded by a minimum of 72 hours of dry weather.
- (2) If ponded MS4 discharge is observed at a monitoring station, make observations and collect at least one (1) grab sample. If flow is evident a 1 hour composite sample may be taken. Record flow estimation (i.e., width of water surface, approximate depth of water, approximate flow velocity, flow rate).

- (3) Effluent samples shall undergo analytical laboratory analysis for constituents in: *Table 1. Analytical Testing for Mass Loading, Urban Stream Bioassessment, and Ambient Coastal Receiving Waters Stations* and for those constituents with action levels under Section C of this Order. Effluent samples must also undergo analysis for Chloride, Sulfate and Total Dissolved Solids.
 - (4) If the station is dry (no flowing or ponded MS4 discharge), make and record all applicable observations.
 - (5) Develop and/or update criteria for dry weather non-storm water effluent analytical monitoring results:
 - (a) Criteria must include action levels in Section C of this Order.
 - (b) Criteria must include evaluation of LC₅₀ levels for toxicity to appropriate test organisms
 - (6) Develop and/or update procedures for source identification follow up investigations in the event of exceedance of dry weather non-storm water effluent analytical monitoring result criteria. These procedures must be consistent with procedures required in section F.4.d and F.4.e. of this Order.
 - (7) Develop and/or update procedures to eliminate detected illicit discharges and connections. These procedures must be consistent with the non-storm water dry weather action levels in Section C and with each Copermittees' Illicit Discharge and Elimination component of its Jurisdictional Runoff Management Plan as discussed in section F.4 and F.4.e. of this Order.
- c. Conduct Dry Weather Non-storm Water Effluent Analytical Monitoring

The Copermittees must commence implementation of dry weather effluent analytical monitoring under the requirements of this Order no later than May 1, 2011. If monitoring indicates an illicit connection or illegal discharge, conduct the follow-up investigation and elimination activities as described in submitted dry weather field screening and analytical monitoring procedures and found in sections C, F.4.d and F.4.e of Order No. R9-2009-0002.

- (a) Until the dry weather non-storm water effluent analytical monitoring program is implemented under the requirements of this Order, each Copermittee must continue to implement dry weather field screening and analytical monitoring as it was most recently implemented pursuant to Order No. 2002-01.

D. Special Studies

1. Aliso Creek bacteria investigation: Each Copermittee within the Aliso Creek watershed must implement the Aliso Creek 13225 Directive Revised Monitoring Program Design – Integration with NPDES Program⁸ (December 2004). The Copermittees must include that monitoring program into the overall monitoring and reporting program.
2. The Copermittees must conduct special studies, including any monitoring required for TMDL development and implementation, as directed by the Executive Officer. A TMDL Monitoring Plan must be developed to comply with TMDL Resolution No. R9-2008-0027. The monitoring plan must be submitted within 365 days of Order adoption.
3. Stormwater Monitoring Coalition Regional Monitoring of Southern California's Coastal Watersheds:

The Copermittees must implement the monitoring program developed by the Stormwater Monitoring Coalition for Regional Monitoring of the Southern California's Coastal Watersheds within the San Juan Hydrologic Unit. Each Copermittee must evaluate the results of the monitoring program within and downstream of its jurisdiction and integrate the results into program assessments and modifications.

4. Sediment Toxicity Study

Copermittees must develop, submit to the Regional Board for review, and implement an approved special study which will investigate the toxicity of sediment in urban streams. The Study must be submitted within 24 months of adoption of Order R9-2009-0002. After Regional

⁸ On October 12, 2005, the Regional Board accepted the revised Aliso Creek watershed bacteria monitoring plan proposal from the MS4 Copermittees. The Regional Board concluded that the scope of the current bacteria monitoring in the watershed was no longer warranted and that the proposed changes would constitute an effective interim program until adoption in the future of a Total Maximum Daily Load, requiring a bacteria reduction and assessment program for the watershed. In addition, the Regional Board recognized that as a result of reduced monitoring costs, the municipalities expect to direct additional resources toward implementation of management practices to reduce indicator bacteria and pathogens.

Board review, the Sediment Toxicity Study must be implemented in conjunction with the Urban Stream Bioassessment Monitoring and, at a minimum, contain the following:

- a. Locations: At a minimum, 4 bioassessment locations must be sampled, including 1 reference site.
- b. Frequency: At a minimum, sampling must occur once per year at each site for at least 2 years. Sampling must be done in conjunction with the bioassessment sampling required under Section II.A.2 of the Monitoring and Reporting Program of this Order.
- c. Parameters/Methods: At a minimum, sediment toxicity analysis shall include the measurement of metals, pyrethroids and organochlorine pesticides. Analysis must include estimates of bioavailability based upon sediment grain size, organic carbon and receiving water temperature. Acute and chronic toxicity testing must be done using *Hyalella azteca* in accordance with Table 2.
- d. Results: Results and a Discussion shall be included in the Monitoring Annual Report. The Discussion must include an assessment of the relationship between observed IBI scores under Section II.A.2 and all variables measured.

5. Trash and Litter Impairment Investigation

Copermittees must develop and implement a special investigation beginning no later than 2 years following the adoption of this Order to assess trash (including litter) as a pollutant within receiving waters on a watershed based scale. Litter is defined in California Government Code 68055.1g as "litter means all improperly discarded waste material, including, but not limited to, convenience food, beverage, and other product packages or container constructed of steel, aluminum, glass, paper, plastic and other natural and synthetic materials, thrown or deposited on lands and waters of the state, but not including the properly discarded waste of the primary processing of agriculture, mining, logging, sawmilling, or manufacturing." A lead Copermittee may be selected for each watershed, and will be responsible for the following:

- a. Locations: The lead Copermittee will identify suitable sampling locations within each watershed.

- b. Frequency: Trash at each location shall be monitored a minimum of twice during the wet season following a qualified monitoring storm event (minimum of 0.1 inches preceded by 72 hours of dry weather) and twice during the dry season.
- c. Protocol: The lead Copermittee for each watershed shall use the Final Monitoring Workplan for the Assessment of Trash in San Diego County Watersheds and A Rapid Trash Assessment Method Applied to Waters of the San Francisco Bay Region to develop a monitoring protocol for each Watershed. The draft monitoring protocol, including sampling locations and frequency, shall be submitted to the Regional Board for review no later than 365 days following the adoption of this Order. Although sampling must occur on a watershed basis, a County-wide protocol may be developed that incorporates each individual watershed.
- d. Results and Discussion from the Trash and Litter Impairment Study shall be included in the Monitoring Annual Report.

E. Monitoring Provisions

All monitoring activities must meet the following requirements:

1. Where procedures are not otherwise specified in this Receiving Waters Monitoring and Reporting Program, sampling, analysis and quality assurance/quality control must be conducted in accordance with the Quality Assurance Management Plan (QAMP) for the State of California's Surface Water Ambient Monitoring Program (SWAMP), adopted by the State Water Resources Control Board (SWRCB).
2. Samples and measurements taken for the purpose of monitoring must be representative of the monitored activity [40 CFR 122.41(j)(1)].
3. The Copermittees must retain records of all monitoring information, including all calibration and maintenance of monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the Report of Waste Discharge and application for this Order, for a period of at least five (5) years from the date of the sample, measurement, report, or application. This period may be extended by request of the Regional Board or USEPA at any time and must be extended during the course of any unresolved litigation regarding this discharge. [40 CFR 122.41(j)(2), CWC section 13383(a)]

4. Records of monitoring information must include [40 CFR 122.41(j)(3)]:
 - a. The date, exact place, and time of sampling or measurements;
 - b. The individual(s) who performed the sampling or measurements;
 - c. The date(s) analyses were performed;
 - d. The individual(s) who performed the analyses;
 - e. The analytical techniques or methods used; and
 - f. The results of such analyses.
5. All sampling, sample preservation, and analyses must be conducted according to test procedures approved under 40 CFR part 136, unless other test procedures have been specified in this Receiving Waters Monitoring and Reporting Program or approved by the Executive Officer [40 CFR 122.41(j)(4)].
6. The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this Order must, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than four years, or both. [40 CFR 122.41(j)(5)]
7. Calculations for all limitations which require averaging of measurements must utilize an arithmetic mean unless otherwise specified in this Receiving Waters Monitoring and Reporting Program. [40 CFR 122.41(l)(4)(iii)]
8. All chemical, bacteriological, and toxicity analyses must be conducted at a laboratory certified for such analyses by the California Department of Health Services or a laboratory approved by the Executive Officer.
9. For priority toxic pollutants that are identified in the California Toxics Rule (CTR) (65 Fed. Reg. 31682), the Copermittees must instruct its laboratories to establish calibration standards that are equivalent to or lower than the Minimum Levels (MLs) published in Appendix 4 of the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). If a Copermittee can demonstrate that a particular ML is not attainable, in accordance with procedures set forth in 40 CFR 136, the lowest quantifiable concentration of the lowest calibration standard analyzed by a specific analytical procedure (assuming that all the method

specified sample weights, volumes, and processing steps have been followed) may be used instead of the ML listed in Appendix 4 of the SIP. The Copermittee must submit documentation from the laboratory to the Regional Board for approval prior to raising the ML for any priority toxic pollutant.

10. The Regional Board Executive Officer or the Regional Board may make revisions to this Receiving Waters and MS4 Discharge Monitoring and Reporting Program at any time during the term of Order No. R9-2009-002 and may include a reduction or increase in the number of parameters to be monitored, locations monitored, the frequency of monitoring, or the number and size of samples collected.
11. The Clean Water Act provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including monitoring reports or reports of compliance or non-compliance must, upon conviction, be punished by a fine of not more than \$10,000 per violation, or by imprisonment for not more than six months per violation, or by both. [40 CFR 122.41(k)(2)]
12. Monitoring must be conducted according the USEPA test procedures approved under 40 CFR 136, "Guidelines Establishing Test Procedures for Analysis of Pollutants under the Clean Water Act" as amended, unless other test procedures have been specified in this Receiving Waters and MS4 Discharge Monitoring and Reporting Program, in Order No. R9-2009-002, or by the Executive Officer.
13. If the discharger monitors any pollutant more frequently than required by the permit using test procedures approved under 40 CFR part 136, unless otherwise specified in the Order, the results of this monitoring must be included in the calculation and reporting of the data submitted in the reports requested by the Regional Board. [40 CFR 122.41(l)(4)(ii)]

III. REPORTING PROGRAM

A. Monitoring Reporting

1. Planned Monitoring Program: The Principal Copermittee must submit a description of the Receiving Waters and MS4 Discharge Monitoring Program to be implemented for every monitoring year. The submittals must begin on September 1, 2010, and continue every year thereafter.

The submittals must describe all monitoring to be conducted during the upcoming monitoring year. For example, the September 1, 2010. submittal must describe the monitoring to be conducted from October 1, 2010 through September 30, 2011.

2. Monitoring Annual Report: The Principal Copermittee must submit the Receiving Waters and MS4 Discharge Monitoring Annual Report to the Regional Board on October 1 of each year, beginning on October 1, 2011. Receiving Waters and MS4 Discharge Monitoring Annual Reports must meet the following requirements:
 - a. Annual monitoring reports must include the data/results, methods of evaluating the data, graphical summaries of the data, and an explanation/discussion of the data for each monitoring program component.
 - b. Annual monitoring reports must include a watershed-based analysis of the findings of each monitoring program component. Each watershed-based analysis must include:
 - (1) Identification and prioritization of water quality problems within each watershed.
 - (2) Identification and description of the nature and magnitude of potential sources of the water quality problems within each watershed.
 - (3) Exhibition of pollutant load and concentration increases or decreases at each mass loading and temporary watershed assessment station.
 - (4) Evaluation of pollutant loads and concentrations at mass loading and temporary watershed assessment stations with respect to land use, population, sources, and other characteristics of watersheds using tools such as multiple linear regression, factor analysis, and cluster analysis.
 - (5) Identification of links between source activities/conditions and observed receiving water impacts.
 - (6) Identification of recommended future monitoring to identify and address sources of water quality problems.
 - (7) Results and discussion of any TIE conducted, together with actions that will be implemented to reduce the discharge of pollutants and abate the sources causing the toxicity.
 - c. Aliso Creek Bacteria Investigation: Annual monitoring reports for the Aliso Creek Bacteria Investigation must contain the following information:

- (1) Water quality data and assessment. The report must contain all data collected and an assessment of compliance with applicable water quality standards for each monitoring station;
- (2) Program Assessment. A description and assessment of each municipality's program implemented within the high-priority storm drain locations to reduce storm water discharges of indicator fecal bacteria/pathogens. Water quality monitoring alone is not sufficient to assess progress of the municipal programs. Municipalities must demonstrate each year that their programs are effective and resulting in a reduction of bacteria sources.
 - (a) For structural and nonstructural management practices implemented, the assessment must contain a description of the practice, capital and maintenance costs, expectations for effectiveness, date implemented, and any observed results.
 - (b) For structural and nonstructural management practices implemented, the assessment must contain a description of the practice, capital and maintenance costs, expectations for effectiveness, date implemented, and any observed results
- d. Annual monitoring reports must include discussions for each watershed which answer each of the management questions listed in section I.B of this Receiving Waters Monitoring and Reporting Program.
- e. Annual monitoring reports must identify how each of the goals listed in section I.A of this Receiving Waters Monitoring and Reporting Program has been addressed by the Copermittees' monitoring.
- f. Annual monitoring reports must include identification and analysis of any long-term trends in storm water or receiving water quality. Trend analysis must use nonparametric approaches, such as the Mann-Kendall test, including exogenous variables in a multiple regression model, and/or using a seasonal nonparametric trend model, where applicable.
- g. Annual monitoring reports must provide an estimation of total pollutant loads (wet weather loads plus dry weather loads) due to MS4 Discharge for each of the watersheds specified in Table 3 of Order No. R9-2009-0002.

- h. Annual monitoring reports must, for each monitoring program component listed above, include an assessment of compliance with applicable water quality standards.
 - i. Annual monitoring reports must describe monitoring station locations by latitude and longitude coordinates, frequency of sampling, quality assurance/quality control procedures, and sampling and analysis protocols.
 - j. Annual monitoring reports must use a standard report format and must include the following:
 - (1) A stand alone comprehensive executive summary addressing all sections of the monitoring report;
 - (2) Comprehensive interpretations and conclusions; and
 - (3) Recommendations for future actions.
 - k. All monitoring reports submitted to the Principal Copermittee or the Regional Board must contain the certified perjury statement described in Attachment B of this Order No. R9-2009-0002.
 - l. Annual monitoring reports must be reviewed prior to submittal to the Regional Board by a committee of the Copermittees (consisting of no less than three members).
 - m. Annual monitoring reports must be submitted in both electronic and paper formats. Electronic formats must be CEDEN or SWAMP-uploadable.⁹
3. The Principal Copermittee must submit by July 1, 2010, a detailed description of the monitoring programs to be implemented under requirement II.B.1 of Receiving Waters and MS4 Discharge Monitoring and Reporting Program No. R9-2009-002. The description must identify and provide the rationale for the constituents monitored, locations of monitoring, frequency of monitoring, and analyses to be conducted with the data generated.
4. Monitoring programs and reports must comply with section II.D of Receiving Waters and MS4 Discharge Monitoring and Reporting Program No. R9-2009-002 and Attachment B of Order No. R9-2009-002.

⁹ For updates to the SWAMP templates and formats, see <http://www.waterboards.ca.gov/swamp>.

5. Following completion of an annual cycle of monitoring in October, the Copermittees must make the monitoring data and results available to the Regional Board at the Regional Board's request.

B. Interim Reporting Requirements

For the October 2009 to October 2010 monitoring period, the Principal Copermittee must submit the Receiving Waters Monitoring Annual Report by January 31, 2011. The Receiving Waters Monitoring Annual Report must address the monitoring conducted to comply with the requirements of Order No. 2002-001.

I. FACT SHEET FORMAT

This Fact Sheet briefly sets forth the principle facts and the significant factual, legal, methodological, and policy questions that the California Regional Water Quality Control Board, San Diego Region (Regional Board) considered in preparing Order No. R9-2009-0002. In accordance with the Code of Federal Regulations (CFR) title 40 parts 124.8 and 124.56, this Fact Sheet includes, but is not limited to, the following information:

- A. Contact information
- B. Public process and notification procedures
- C. Background information
- D. Permitting approach
- E. Economic issues
- F. Legal authority
- G. Findings
- H. Directives

Tentative Order No. R9-2008-0001 was distributed for review on February 9, 2007. A public hearing was subsequently held on April 11, 2007 in the City of Mission Viejo to receive oral comments from interested persons, and the Regional Board accepted written comments on the Tentative Order until April 25, 2007. Following review of the comments, a Revised Tentative Order was distributed on July 6, 2007 with a Response to Comments document (RTC 1). A second set of written comments were received on the revisions until August 23, 2007. Following review of the second round of written comments, the Regional Board further revised specific sections of the Order and distributed a second Response to Comments document (RTC 2). Tentative Order No. R9-2008-0001 was submitted to the Board for adoption on February 13, 2008. Upon review and comment, the Board chose not to adopt Tentative Order No. R9-2008-0001 and sent the Order back to staff with comments for changes. Tentative Order No. R9-2009-0002 was distributed for review on March 13, 2009. Written comments received on the tentative Order prior to June 19, 2009 were provided to Regional Board members for a public hearing regarding the Tentative Order held on July 1, 2009. On August 12, 2009, the sixth version of the Tentative Order was distributed for review. On November 18, 2009 an adoption hearing was held on the Tentative Order. The Regional Board directed staff to make specific changes and bring the Tentative Order back for consideration.

The Regional Board's files applicable to the issuance of Order No. R9-2009-0002 are incorporated into the administrative record in support of the findings and requirements of Order No. R9-2009-0002.

III. PUBLIC PROCESS AND NOTIFICATION PROCEDURES

The Regional Board followed the schedule listed below for the preparation of Order No. R9-2009-0002:

- A. In April 2006 and July 2006, the Northern Watershed Unit of the Regional Board met with the Copermitees to discuss the Report of Waste Discharge (ROWD) and potential changes to the permit based on the annual reports and the tentative permit for San Diego County.
- B. On August 18, 2006, the Regional Board received the ROWD for the permit renewal.
- C. On October 20, 2006 the Regional Board provided written comments on the ROWD to the Copermitees.
- D. On November 15, 2006, the Regional Board received the 2005-06 annual reports from the Copermitees for the existing permit.
- E. On January 11, 2007, the Regional Board notified all known interested parties that an electronic email listserv had been established to provide information and notices on the reissuance of the municipal storm water NPDES permit for southern Orange County.
- F. On February 9, 2007, the Regional Board released the tentative Order and notified interested parties of a planned workshop. Written comments were accepted until April 25, 2007.
- G. A public workshop was held on March 12, 2007.
- H. A public hearing of the tentative Order was conducted on April 11, 2007.
- I. A revised tentative Order was released on July 6, 2007. Written comments were accepted until August 23, 2007.
- J. A second revised tentative Order was released on December 12, 2007.
- K. A public hearing was conducted on February 13, 2008. The Regional Board chose not to adopt the tentative Order, and sent it back to staff for revision.
- L. On March 13, 2009 the Regional Board released a fourth version of the revised tentative Order and notified interested parties of a planned workshop.
- M. On April 03, 2009 and May 06, 2009 the Regional Board held public workshops.
- N. A public hearing of the tentative Order was held on July 01, 2009.
- O. On August 12, 2009 the Regional Board released an additional version of the revised tentative Order for public review. Written comments were accepted until September 28, 2009.
- P. An adoption hearing of the tentative Order was conducted on November 18, 2009. The Regional Board chose not to adopt the tentative Order and directed staff to make specific changes.

IV. BACKGROUND

Tentative Order No. R9-2009-0002 is the fourth iteration of the storm water permit for the municipal separate storm sewer systems (MS4s) in the Orange County portion of the San Diego region. The first permit was adopted in 1990, and the permit was reissued in 1996 and 2002.

Municipal Storm Water Permits are required by the Federal Clean Water Act 1987 Amendments. The federal Clean Water Act (CWA) was amended in 1987 to address storm water runoff from municipal and industrial dischargers. One requirement of the amendment was that many municipalities throughout the United States were obligated for the first time to obtain National Pollutant Discharge Elimination System (NPDES) permits for discharges of storm water runoff from their MS4s. In response to the CWA amendment (and the pending federal NPDES regulations which would implement the amendment), the Regional Board issued a municipal storm water permit, Order No. 90-38, in July 1990 to the Copermittees for their MS4 discharges.¹

The First and Second Term Permits, Order Nos. 90-38 and 96-03, provided maximum flexibility. Order No. 90-38 contained the “essentials” of the 1990 regulations, but the requirements were written in very broad, generic terms. This was done in order to provide the maximum amount of flexibility to the Copermittees in implementing the new requirements (flexibility was, in fact, the stated reason for issuing the permit in advance of the final regulations). This lack of specificity was reflected in the Drainage Area Management Plan (DAMP) implemented under this First Term Permit in 1993 and renewed under the Second Term Permit in 1996. From staff’s perspective however, this same lack of specificity, combined with the lack of funding and political will, also provided the Copermittees with ample reasons to take few substantive steps towards permit compliance. The situation was exacerbated by the Regional Board’s own lack of storm water resources.

By 2000 the Regional Board and Copermittees recognized the importance of an improved storm water program. Although renewed in 1996 as Order No. 96-03, the 1993 DAMP implemented by the Copermittees was not significantly updated until 2000. The 2000 DAMP submitted to the Regional Board for the Third-Term Permit renewal was improved over the earlier DAMP. Regional Board staff concluded, however, that it reflected only the basic requirements of the 1990 Federal Regulations and in most cases did not represent significant improvement over the 1993 DAMP. Continued implementation of the DAMP without amendment would not have adequately addressed the impacts to receiving waters resulting from the discharge of storm water runoff and would not have achieved the maximum extent practicable standard (MEP) as defined in the Order.

¹ The 1990 permit was issued to the County of Orange, the Orange County Flood Control District, and six incorporated cities. Additional municipalities have been added to the MS4 NPDES permit as they have incorporated.

In order to provide the Copermittees with the minimum requirements to meet the MEP standard for storm water of the Regional Board, a more detailed Order was adopted (Order No. R9-2002-01) that emphasized the strong jurisdictional level programs developed by the Copermittees during the First and Second Term Permits as well as the watershed-level approach embodied in the proposed DAMP.

The Third-Term Permit introduced specific requirements. The regulatory approach incorporated into Order No. R9-2002-01 was a significant departure from the regulatory approach of the First and Second-Term Permits. Where Order Nos. 90-38 and 96-03 included broad, nonspecific requirements in order to provide the Copermittees with the maximum amount of flexibility in developing their programs, Order No. R9-2002-01 used detailed, specific requirements which outlined the minimum level of implementation required for the Copermittees' programs. The shift in permitting approaches resulted from the Regional Board's conclusion that the lack of specificity in earlier Orders resulted in frequently unenforceable permit requirements, which in turn allowed some Copermittees to only make limited progress in implementing their programs.

The Third-Term Permit followed the San Diego County permit template. The shift in regulatory approaches for MS4 permits was first manifested in the 2001 MS4 permit to the owners and operators of San Diego County MS4s (Order No. R9-2001-01). The Third-Term Orange County Permit included similar requirements as the 2001 San Diego County Permit. Both the San Diego and Orange County Permits were appealed to the State Water Resources Control Board (State Board).² Minor modifications of each were made by the State Board, but the vast majority of the requirements were upheld. The San Diego County permit was also challenged in the Superior Court of the State of California and the Court of Appeal, Fourth Appellate District. Further litigation on the Orange County permit was held pending the precedential decisions on the San Diego Permit. The San Diego Permit was largely upheld in the Superior and Appellate Courts. The State of California Supreme Court declined to hear a final appeal from the Building Industry Association in March 2005. Thus, the Third-Term Orange County permit requirements remained as slightly modified by the State Board.

² Seven petitions were filed with the State Board over the Third-Term Orange County Permit. Six were placed in abeyance. Three of the petitioners sought stays. One stay request was dismissed and one was withdrawn. The active petition and stays were addressed by the State Board in Order No. WQO 2002-0014. That Order stayed provision F.5.f regarding sewage spills and modified Finding No. 26 regarding chronic toxicity.

The Third-Term Permit was adopted following substantial public participation.

Public participation was extensive during the adoption process of the Third-Term Permit. The draft permit was released for public review and comment on July 2, 2001, and revised in response to comments and State Board Order WQ 2001-15 on the petition to review the San Diego Municipal Storm Water Permit. Because the proposed requirements for Orange County were similar to those that had recently been adopted and contested in San Diego County, much of the public participation dialogue echoed the discussions held during the San Diego renewal. Approximately 684 comments were received and responded to during two public workshops and a written comment period on the Tentative Order for the Third-Term Orange County permit. Following the extensive public participation process, the Regional Board adopted Order No. R9-2002-01 on February 13, 2002.

Storm water programs have improved under the Third-Term Permit. Since adoption of Order No. R9-2002-01, the Copermittees' storm water programs have expanded dramatically. Audits of the Copermittees' programs and reviews of annual reports exhibit that the Copermittees' jurisdictional programs are largely in compliance with the Order. Some of the efforts currently being conducted on a regular basis by the Copermittees that were not conducted on a widespread basis prior to adoption of Order No. R9-2002-01, include: construction site storm water inspections, industrial and commercial facility storm water inspections, municipal facility storm water inspections, management of storm water quality from new development, development of BMP requirements for existing development, interdepartmental coordination, comprehensive water quality monitoring, and assessment of storm water program effectiveness.

Significant challenges remain. When viewed relative to the magnitude of the storm water runoff problem, enormous challenges remain, particularly regarding the management of storm water runoff on a watershed scale. Today, storm and non-storm water discharges from the MS4 continue to be the leading cause of water quality impairment in the San Diego Region.³ The Copermittees' monitoring data exhibits persistent exceedances of water quality objectives in most watersheds.⁴ Many watersheds also have conditions that are frequently toxic to aquatic life. Bioassessment data from the watersheds further reflects these conditions, finding that macroinvertebrate communities in creeks have widespread Poor to Very Poor Index of Biotic Integrity ratings. Finally, the now too familiar "health advisory" or "beach closure" signs, which often result from high levels of bacteria in storm and non-storm water, exhibit the continued threat to public health by such discharges.

³ The potential sources of impairments are identified on the CWA section 303(d) list of impaired water bodies for the San Diego Region.

⁴ Data is provided in annual reports to the Regional Board. A summary of data collected during the third-term permit is provided in the Copermittees' application for permit reissuance. That summary is available on-line at: http://www.ocwatersheds.com/StormWater/documents_ROWd.asp

V. PERMITTING APPROACH (PROGRAM INTEGRATION, FLEXIBILITY, AND DETAIL)

The Order contains an increased emphasis on storm water discharge management on a watershed basis. This shift towards increased watershed management is consistent with planning efforts conducted by the Regional Board regarding reissuance of the San Diego Permit (Order No. R9-2007-0001), and it is also consistent with the Copermittees' most recent Report of Waste Discharge (ROWD).⁵ This shift reflects recognition of the maturity of the storm water programs since they began implementing the Third-Term Permit. Addressing storm water discharge management on a watershed basis is only possible if effective jurisdictional programs have been established, and maintaining effective jurisdictional programs is crucial to the success of watershed-focused management.

There are several reasons for this shift in emphasis. First, the Copermittees are generally doing an effective job at implementing their jurisdictional programs; while on the other hand, an emphasis on watersheds is necessary to shift the focus of the Copermittees from program development and implementation to water quality results. After over 15 years of Copermittee program implementation, it is critical that the Copermittees link their efforts with positive impacts on water quality. Addressing storm water on a watershed scale focuses on water quality results by emphasizing the receiving waters within the watershed. The conditions of the receiving waters drive management actions, which in turn focus on the water quality problems in each watershed.

Focusing on watershed implementation does not mean that the Copermittees must expend funds outside of their jurisdictions. Rather, the Copermittees within each watershed are expected to collaborate to develop a watershed strategy to address the high priority water quality problems within each watershed. They have the option of implementing the strategy in the manner they find to be most effective. Each Copermittee can implement the strategy individually within its jurisdiction, or the Copermittees can group together to implement the strategy throughout the watershed.

While the Order includes a new emphasis on addressing storm water discharges on a watershed basis, the Order includes recognition of the importance of continued program implementation on jurisdictional and countywide levels. The Order also acknowledges that jurisdictional, watershed, and countywide efforts are not always mutually exclusive. For this reason, an attempt has been made to allow for the Copermittees' jurisdictional, watershed, and countywide programs to integrate.

⁵ The Report of Waste Discharge (ROWD) was submitted to the Regional Board on August 18, 2006 by the Principal Permittee (County of Orange) on behalf of all Copermittees.

In the Order, the watershed requirements serve as the mechanism for this program integration. Since jurisdictional and countywide activities can also serve watershed purposes, such activities can be integrated into the Copermitees' watershed programs, provided the activities meet certain criteria. In this manner, the Copermitees' activities do not always need to distinguish between jurisdictional, watershed, and countywide levels of implementation. Instead, they can be integrated on multiple levels.

Such opportunities for program integration inherently provide flexibility to the Copermitees in implementing their programs. Program integration can be expanded or minimized as the Copermitees see fit. For example, there is flexibility provided in determining the activities to be integrated and implemented in the watershed programs – watershed-based efforts, countywide efforts, enhanced jurisdictional efforts, or a mixture of the three. Significant flexibility is also provided throughout other portions of the Order.

Copermitees can choose the best management practices (BMPs) to be implemented, or required to be implemented, for development, construction, and existing development areas. Flexibility to determine which industrial or commercial sites are to be inspected is also provided to the Copermitees. Educational approaches are also to be determined by the Copermitees under the Order. Implementation of certain efforts on a countywide basis is largely optional for the Copermitees as well. Significant leeway is also provided to the Copermitees in using methods to assess the effectiveness of their various runoff management programs. This flexibility is further extended to the monitoring program requirements, which allow the Copermitees to develop monitoring approaches to several aspects of the monitoring program.

The challenge in drafting the Order is to provide the flexibility described above while ensuring that the Order is still enforceable. To achieve this, the Order frequently prescribes minimum measurable outcomes, while providing the Copermitees with flexibility in the approaches they use to meet those outcomes. Enforceability has been found to be a critical aspect of the Order. For example, the watershed requirements of Order No. R9-2002-01 were some of the Order's most flexible requirements. This lack of specificity in the watershed requirements resulted in inefficient watershed compliance efforts. This situation reflects a common outcome of flexible permit language. Such language can be unclear and unenforceable, and it can lead to implementation of inadequate programs.

To avoid these types of situations, a balance between flexibility and enforceability has been crafted into the Order. Minimum measurable outcomes are utilized to ensure the Order is enforceable, while the Copermitees are provided flexibility in deciding how they will implement their programs to meet the minimum measurable outcomes.

GENERAL CRITERIA

Non-storm water discharges may contain pollutants which result from various activities that occur within areas draining into the MS4. This includes, but is not limited to, illicit discharges and connections, exempted categories of discharge not a source of pollutants (40 CFR 122.26(d)), and discharges into the MS4 covered under a separate NPDES permit. As such, existing and proposed discharges of non-storm water from MS4s:

- a) Result from similar activities through the MS4 system;
- b) Are the same type of water;
- c) Require similar effluent limitations for the protection of the Beneficial Uses of the receiving waters;
- d) Require similar monitoring;
- e) Are under the control of the owner and operator of the MS4 system;
and
- f) Are more appropriately regulated under a general permit than individual permits.

VI. ECONOMIC ISSUES

Economic discussions of storm and non-storm water management programs tend to focus on the significant costs incurred by municipalities in developing and implementing the programs. However, when considering the cost of implementing the programs, it is also important to consider the alternative costs incurred by not fully implementing the programs, as well as the benefits which result from program implementation. For instance, unhealthful coastal water quality conditions negatively affect residents, tourists, and related portions of the Orange County economy.⁶

⁶ Orange County 2006 Community Indicators Project. 2006. Sponsored by the County of Orange, the Orange County Business Council, and the Children and Families Commission of Orange County. Available on-line at www.oc.ca.gov/ceocommunity.asp

It is very difficult to ascertain the true cost of implementation of the Copermittees' management programs because of inconsistencies in reporting by the Copermittees. Reported costs of compliance for the same program element can vary widely from city to city, often by a very wide margin that is not easily explained.⁷ Despite these problems, efforts have been made to identify management program costs, which can be helpful in understanding the costs of program implementation. The Orange County Municipalities plan to prepare a common fiscal reporting strategy to better define the expenditure and budget line items included in annual reports.⁸

Estimates of Phase I Storm Water Program Costs.

The United States Environmental Protection Agency (USEPA), the California Regional Water Quality Control Boards, and the State Board have attempted to evaluate the costs of implementing municipal storm water programs. The assessments demonstrate that true costs are difficult to ascertain and reported costs vary widely. Nonetheless, they provide a useful context for considering the costs of requirements within Tentative Order No. R9-2008-0001. In addition, reported fiscal analyses tend to neglect the costs incurred to municipalities when storm water runoff is not effectively managed. Such costs result from pollution, contamination, nuisance, and damage to ecosystems, property, and human health.

In 1999 USEPA reported on multiple studies it conducted to determine the cost of management programs. A study of Phase II municipalities determined that the annual cost of the Phase II program was expected to be \$9.16 per household. USEPA also studied 35 Phase I municipalities, finding costs to be \$9.08 per household annually, similar to those anticipated for Phase II municipalities.⁹ The USEPA cost estimate for Phase I municipalities is valuable because it considers municipalities in Orange County.

A study on program cost was also conducted by the California Regional Water Quality Control Board, Los Angeles Region (LARWQCB), where program costs reported in the municipalities' annual reports were assessed. The LARWQCB estimated that average per household cost to implement the MS4 program in Los Angeles County was \$12.50.¹⁰ Since the Los Angeles County permit is very similar to Order No. R9-2002-01, this estimate is also useful in assessing general program costs in Orange County.

⁷ LARWQCB, 2003. Review and Analysis of Budget Data Submitted by the Permittees for Fiscal Years 2000-2003. P. 2.

⁸ Orange County Storm Water Copermittees. 2006. Report of Waste Discharge (San Diego Region)

⁹ Federal Register / Vol. 64, No. 235 / Wednesday, December 8, 1999 / Rules and Regulations. P. 68791-68792.

¹⁰ LARWQCB, 2003. Review and Analysis of Budget Data Submitted by the Permittees for Fiscal Years 2000-2003. P. 2.

The State Board also recently commissioned a study by the California State University, Sacramento to assess costs of the Phase I MS4 program. This study includes an assessment of costs incurred by Phase I MS4s throughout the State to implement their programs. Annual cost per household in the study ranged from \$18-46, with the City of Encinitas in San Diego County representing the upper end of the range.¹¹ Although no Orange County municipalities were assessed, the cost of the City of Encinitas' program may be somewhat representative of the upper range of Orange County MS4 programs. Encinitas shares similarities with southern Orange County, including the similarity of the San Diego MS4 permit to the Orange County MS4 permit, the city's coastal location, and its reliance on tourism. However, the City's program cost can be considered as the high end of the spectrum for management program costs because the City has a consent decree with environmental groups regarding its program, and City of Encinitas has received recognition for implementing a superior program.

It is important to note that reported program costs are not all attributable to compliance with MS4 permits. Many program components, and their associated costs, existed before any MS4 permits were ever issued. For example, street sweeping and trash collection costs cannot be solely or even principally attributable to MS4 permit compliance, since these practices have long been implemented by municipalities. Therefore, true program cost resulting from MS4 permit requirements is some fraction of reported costs. The California State University, Sacramento study found that only 38 percent of program costs are new costs fully attributable to MS4 permits. The remainder of the program costs were either pre-existing or resulted from enhancement of pre-existing programs.¹² In 2000, the County of Orange found that even lesser amounts of program costs are solely attributable to MS4 permit compliance, reporting that the amount attributable to implement the Drainage Area Management Plan (DAMP), was less than 20 percent of the total budget. The remaining 80 percent was attributable to pre-existing programs.¹³

Estimating Costs of Reissued Storm Water Permits

The vast majority of costs that will be incurred as a result of implementing Order No. R9-2009-0002 are not new. Storm water management programs have been in place in Orange County for over 15 years. Any increase in cost to the Copermitttees will be incremental in nature. Moreover, since Order No. R9-2009-0002 "fine tunes" the requirements of Order No. R9-2002-01, these cost increases are expected to be modest.

¹¹ State Water Board, 2005. NPDES Stormwater Cost Survey. P. ii.

¹² Ibid. P. 58.

¹³ County of Orange, 2000. A NPDES Annual Progress Report. P. 60. More current data from the County of Orange is not used in this discussion because the County of Orange no longer reports such information.

The anticipated costs of program changes are difficult to estimate because of the flexibility inherent within the Permit and the recognition that program modifications will vary among the municipalities in response to the specific needs of the local and watershed programs. In other words, the Permit is intended to allow each Permittee to de-emphasize some program components and strengthen others based on the experience of the jurisdictional programs.

The changes in Order No. R9-2009-0002 reflect the iterative process of BMP implementation and the necessarily adaptive nature of storm water management that is expected by the USEPA. In 1996, USEPA recognized that changes to MS4 programs would occur during the reapplication period based on new information on the relative magnitude of a problem, new data on water quality impacts of the storm water discharges, and experience gained under the prior permit.¹⁴ Some program changes have been proposed by the Copermittees in the permit reapplication package, and others have been included because the Regional Board considers those measures necessary and feasible to protect water quality from the effects of MS4 discharges.

Other Economic Considerations.

Economic considerations of management programs cannot be limited only to program costs. Evaluation of programs requires information on the implementation costs and information on the benefits derived from environmental protection and improvement.¹⁵ Attention is often focused on program costs, but the programs must also be viewed in terms of their value to the public.

For example, household willingness to pay for improvements in fresh water quality for fishing and boating has been estimated by USEPA to be \$158-210.¹⁶ This estimate can be considered conservative, since it does not include important considerations such as marine waters benefits, wildlife benefits, or flood control benefits. The California State University, Sacramento study corroborates USEPA's estimates, reporting annual household willingness to pay for statewide clean water to be \$180.¹⁷ When viewed in comparison to household costs of existing management programs, household willingness to pay estimates exhibit that per household costs incurred by Copermittees to implement their management programs remain reasonable.

The effect of storm and non-storm water discharges on receiving waters can also influence the value of real estate in southern Orange County. For instance, recent marketing of new developments in the region prominently features access or proximity to the ocean.¹⁸ This demonstrates the added value of healthy aquatic environments to property values. The real estate industry recognizes that home buyers are willing to pay for access to clean water environments. The ability to market water-based recreational activities is dependent on healthy water quality conditions.

Municipalities and business groups in Orange County recognize the value of programs to prevent and treat storm water pollution in Orange County. For instance, both coastal and inland Orange County cities positively promote their access to the Pacific Ocean as a valuable quality of life feature.¹⁹ In addition, the South Orange County Regional Chamber of Commerce's legislative policy for infrastructure includes the support of programs and solutions for non-point source storm water runoff. This demonstrates that the business community realizes the negative economic effects that result from polluted storm water.

Another important way to consider management program costs is to consider implementation in terms of costs incurred by not improving the programs. Storm and non-storm water discharges from MS4s in southern California has been found to cause illness in people bathing near storm drains.²⁰ A study of south Huntington Beach and north Newport Beach (both located in northern Orange County) found that an illness rate of about 0.8 percent among bathers at those beaches resulted in about \$3 million annually in health-related expenses.²¹ Extrapolation of such numbers to the wide range of beaches of Orange County could result in huge public expenses.

Storm and non-storm water MS4 discharges, and their impact on receiving waters also affect tourism. In past years, Orange County was featured in the national press for its water quality problems. Such news is likely to have a negative impact on tourism, since polluted beaches are generally not attractive to tourists. According to the Orange County Community Indicators Project, the County's visitors spent an average of \$107.70 per day in 2004.²² The experience of Huntington Beach provides an example of the potential economic impact of poor water quality. Approximately eight miles of Huntington Beach were closed for two months in the middle of summer of 1999, severely impacting beach visitation. When considered with the number of visitors and their average expenditure, the negative effects to the local economy are obvious.

Coastal tourism is an important industry in Orange County and is dependent upon effective management of storm water pollution and the prevention of non-storm water pollution. The following examples reflect that relationship.

DANA POINT: In response to a Grand Jury finding (1999-2000 Rainy Season's First Flush Hits the Harbors of Orange County), the city of Dana Point notes the interrelationship between the clean coastal water and the economic health of the city. Dana Point reports receiving \$5.2 million in transit occupancy tax funds in FY 1999-2000 "due in large part because of proximity to the beach. Without clean beaches, Dana Point risks losing its major revenue source."²³ More recently, the City budget report estimates that transit occupancy taxes comprise 35 percent of general fund revenues for the 2006 fiscal year.

LAGUNA BEACH: Tourism is one of the primary components of the Laguna Beach economy, and the beach is one of the main tourist attractions in the city. In 1999, hotel/motel bed tax revenue was approximately \$3 million, representing 13 percent of the City's general fund revenue.²⁴ In 2006, the City expects transit occupancy taxes to represent about 11 percent of general fund revenue.²⁵ The proportional decrease is due to an increase in property taxes, which is also affected in part by the quality of coastal waters. The City Council recognizes the value of the beaches to tourists, and the local population and has funded several low-flow non-storm water diversion systems in an attempt to prevent beach pollution and beach closures.

²⁵ City of Laguna Beach, adopted budget 2006-2007. Available on-line at: <http://www.lagunabeachcity.net/government/reference/budget07>

DOHENY STATE BEACH: In 1997, the U.S. Army Corps of Engineers (USACE) prepared an economic analysis as part of the San Juan Creek and Aliso Creek Watershed Study. Recreational value for Doheny State Beach, based on annual visitation of 670,545 people in 1995, was calculated at \$2,850,000. Furthermore, the USACE notes that lifeguards reported that beach attendance falls dramatically when there are unhealthy conditions in the ocean. In 1999, the USACE prepared an updated economic study as part of the Feasibility Phase of the San Juan Creek Watershed Management Study. The 1999 study reports that average beach attendance from 1996 to 1998 increased to 918,735. The USACE places a recreation value per visitor at \$5.76, which implies the annual recreational value of Doheny State Beach for 1996 to 1998 was \$5,291,914.

ALISO BEACH: In 1997, the USACE prepared an economic analysis as part of the San Juan Creek and Aliso Creek Watershed Study. Recreational value for Aliso Beach, based on annual visitation of 3,477,369 people in 1995, was calculated at \$14,779,000. In the 1999 Draft Feasibility Report for the Aliso Creek Watershed Management Study, the USACE noted that the average beach attendance from 1996 to 1998 decreased to 1,148,374. The recreation value per visitor was calculated at \$4.50 and the average annual impact from water quality-related beach closures at Aliso Beach Park was estimated to be \$468,392. This number is comparable to an economic analysis conducted as part of the Aliso Creek Watershed 205(j) study that estimated the annual average recreational value impact of beach closures at Aliso Beach Park to be \$468,400.

Finally, it is important to consider the benefits of management programs in conjunction with their costs. A recent study conducted by the University of Southern California and University of California, Los Angeles assessed the costs and benefits of implementing various approaches for achieving compliance with the MS4 permits in the Los Angeles Region. The study found that non-structural systems would cost \$2.8 billion but provide \$5.6 billion in benefit. If structural systems were determined to be needed, the study found that total costs would be \$5.7 to \$7.4 billion, while benefits could reach \$18 billion.²⁶ Costs are anticipated to be borne over many years – probably ten years at least. As can be seen, the benefits of the programs are expected to considerably exceed their costs. Such findings are corroborated by USEPA, which found that the benefits of implementation of its Phase II storm water rule would also outweigh the costs.²⁷

Additional discussion of economic issues can be found at section 3 of the Fact Sheet/Technical Report for Regional Board Order No. R9-2002-01, available at:

http://www.waterboards.ca.gov/sandiego/programs/oc_stormwater.html.

VII. LEGAL AUTHORITY

The following statutes, regulations, and Water Quality Control Plans provide the basis for the requirements of Order No. R9-2009-0002: Clean Water Act (CWA), California Water Code (CWC), 40 CFR Parts 122, 123, 124 (National Pollutant Discharge Elimination System Permit Application Regulations for Storm Water Discharges, Final Rule), Part II of 40 CFR Parts 9, 122, 123, and 124 (National Pollutant Discharge Elimination System – Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges; Final Rule), Water Quality Control Plan – Ocean Waters of California (California Ocean Plan), Water Quality Control Plan for the San Diego Basin (Basin Plan), 40 CFR 131 Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California; Rule (California Toxics Rule), and the California Toxics Rule Implementation Plan.

The legal authority citations below generally apply to directives in Order No. R9-2009-0002, and provide the Regional Board with ample underlying authority to require each of the directives of Order No. R9-2009-0002. Legal authority citations are also provided with each permit section discussion in section IX of this Fact Sheet/Technical Report.

CWA 402(p)(3)(B)(ii) – The CWA requires in section 402(p)(3)(B)(ii) that permits for discharges from municipal storm sewers “shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers.”

CWA 402(p)(3)(B)(iii) – The CWA requires in section 402(p)(3)(B)(iii) that permits for discharges from municipal storm sewers “shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.”

40 CFR 122.26(d)(2)(i)(B,C,E, and F) – Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B,C,E, and F) provide that each Copermitttee’s permit application “shall consist of: (i) Adequate legal authority. A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to: [...] (B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer; (C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water; [...] (E) Require compliance with condition in ordinances, permits, contracts or orders; and (F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.”

40 CFR 122.26(d)(2)(iv) – Federal NPDES regulation 40 CFR 122.26(d)(2)(iv) provides that the Copermitttee shall develop and implement a proposed management program which “shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. [...] Proposed programs may impose controls on a system wide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. [...] Proposed management programs shall describe priorities for implementing controls.”

40 CFR 122.26(d)(2)(iv)(A - D) – Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A - D) require municipalities to implement controls to reduce pollutants in storm water runoff from new development and significant redevelopment, construction, and commercial, residential, industrial, and municipal land uses or activities. Prevention of illicit discharges is also required.

CWC 13377 – CWC section 13377 provides that “Notwithstanding any other provision of this division, the State Board or the regional boards shall, as required or authorized by the CWA, as amended, issue waste discharge requirements and dredged or fill material permits which apply and ensure compliance with all applicable provisions of the act and acts amendatory thereof or supplementary, thereto, together with anymore stringent effluent standards or limitation necessary to implement water quality control plans, or for the protection of beneficial uses, or to prevent nuisance.”

Order No. R9-2009-0002 is an essential mechanism for achieving the water quality objectives that have been established for protecting the beneficial uses of the water resources in the San Diego Regional Board’s portion of Orange County. Federal NPDES regulation 40 CFR 122.44(d)(1) requires MS4 permits to include any requirements necessary to “achieve water quality standards established under CWA section 303, including State narrative criteria for water quality.” The term “water quality standards” in this context refers to a water body’s beneficial uses and the water quality objectives necessary to protect those beneficial uses as established in the Basin Plan and antidegradation policies.

VIII. FINDINGS

The findings of the Order have been modified to reduce repetition in their discussions and address new requirements. Each finding of the Order is provided and discussed below. Additional discussion relative to the findings can be found in section IX of the Fact Sheet, which provides discussions of the Order's directives.

A. Basis For the Order

Finding A.1. This Order is based on the federal Clean Water Act (CWA), the Porter-Cologne Water Quality Control Act (Division 7 of the Water Code, commencing with Section 13000), applicable state and federal regulations, all applicable provisions of statewide Water Quality Control Plans and Policies adopted by the State Water Resources Control Board (State Board), the Water Quality Control Plan for the San Diego Basin adopted by the Regional Board, the California Toxics Rule, and the California Toxics Rule Implementation Plan.

Discussion of Finding A.1. In 1987, Congress established CWA Amendments to create requirements for storm water discharges under the NPDES program, which provides for permit systems to regulate the discharge of pollutants. Under the Porter-Cologne Water Quality Control Act, the State Board and the nine Regional Water Quality Control Boards have primary responsibility for the coordination and control of water quality, including the authority to implement the CWA. Porter-Cologne (section 13240) directs the Regional Water Quality Control Boards to set water quality objectives via adoption of Basin Plans that conform to all State policies for water quality control.

As a means for achieving those water quality objectives, Porter-Cologne (section 13243) further authorizes the Regional Water Quality Control Boards to establish waste discharge requirements (WDRs) to prohibit waste discharges in certain conditions or areas. Since 1990, the San Diego Regional Board has issued area-wide MS4 NPDES permits. The Order will renew Order No. R9-2002-01 to comply with the CWA and attain water quality objectives in the Basin Plan by limiting the contributions of pollutants conveyed by storm water and by including numeric action levels for dry weather non-storm water discharges designed to ensure that the Copermittees comply with the requirement to effectively prohibit all types of unauthorized non-storm water discharges into their MS4. Further discussions of the legal authority associated with the prohibitions and directives of the Order are provided in section VII this document.

Finding A.2. This Order renews National Pollutant Discharge Elimination System (NPDES) Permit No. CAS0108740, which was first issued on July 16, 1990 (Order No. 90-38), and then renewed on August 8, 1996 (Order No. 96-03) and February 13, 2002 (Order No. R9-2002-01). On August 21, 2006, in accordance with Order No. R9-2002-01, the County of Orange, as the Principal Permittee, submitted a Report of Waste Discharge (ROWD) for renewal of the MS4 Permit.

Discussion of Finding A.2. This Order renews National Pollutant Discharge Elimination System (NPDES) Permit No. CAS0108740, which was first issued on July 16, 1990 (Order No. 90-38), and then renewed on August 8, 1996 (Order No. 96-03) and February 13, 2002 (Order No. R9-2002-01). On August 21, 2006, in accordance with Order No. R9-2002-01, the County of Orange, as the Principal Permittee, submitted a Report of Waste Discharge (ROWD) for renewal of the MS4 Permit. Supporting information discussing the topic of this finding can be found in section V of this document.

Finding A.3. This Order is consistent with the following precedential Orders adopted by the State Water Resources Control Board (State Board) addressing municipal storm water NPDES Permits: Order 99-05, Order WQ-2000-11, Order WQ 2001-15, Order WQO 2002-0014, and Order WQ-2009-0008 (*SWRCB/OCC FILE A-1780*).

Discussion of Finding A.3. In recent years the State Board has considered several appeals of MS4 permits issued by the Regional Boards. In Order 99-05, the State Board established language for Receiving Water Limitation Language for MS4 permits. In Order No. WQ-2000-11, the State Board addressed design standards for Standard Urban Storm Water Mitigation Plan (SUSMP) requirements. Order WQ 2001-15 addressed Petitions of the San Diego County MS4 Permit issued by the Regional Board in 2001 (Order No. R9-2001-01). Order WQO 2002-0014 addresses Petitions of the Orange County MS4 Permit issued by the Regional Board in 2002 (Order No. R9-2002-01).

B. Regulated Parties

Finding B.1. Each of the persons in Table 1 of the Order, hereinafter called Copermittees or dischargers, owns or operates a municipal separate storm sewer system (MS4), through which it discharges storm water and non-storm water into waters of the United States within the San Diego Region. These MS4s fall into one or more of the following categories: (1) a medium or large MS4 that services a population of greater than 100,000 or 250,000 respectively; or (2) a small MS4 that is “interrelated” to a medium or large MS4; or (3) an MS4 which contributes to a violation of a water quality standard; or (4) an MS4 which is a significant contributor of pollutants to waters of the United States.

Discussion of Finding B.1. Section 402 of the CWA prohibits the discharge of any pollutant to waters of the United States from a point source, unless that discharge is authorized by a NPDES permit. Though storm water and non-storm water may come from a diffuse source, it is discharged through MS4s, which are point sources under the CWA. Federal NPDES regulation 40 CFR 122.26(a) (iii) and (iv) provide that discharges from MS4s, which service medium or large populations greater than 100,000 or 250,000 respectively, shall be required to obtain a NPDES permit. Federal NPDES regulation 40 CFR 122.26(a)(v) also provides that a NPDES permit is required for “A [storm water] discharge which the Director, or in states with approved NPDES programs, either the Director or the USEPA Regional Administrator, determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.” Such sources are then designated into the program.

Other small MS4s, such as those serving universities and military installations, also exist within the watersheds of Orange County in the San Diego Region. While these MS4s are not subject to this Order, they are subject to the Phase II NPDES storm water regulations. Over time, these MS4s will be designated for coverage under the State Board’s statewide general storm water permit for small MS4s.

C. Discharge Characteristics

Finding C.1. Runoff discharged from an MS4 contains waste, as defined in the California Water Code (CWC), and pollutants that adversely affect the quality of the waters of the State. The discharge of runoff from an MS4 is a “discharge of pollutants from a point source” into waters of the U.S. as defined in the CWA.

Discussion of Finding C.1. Section 13050(d) of the CWC defines “waste” as “sewage and any and all other waste substances, liquid, solid, gaseous, or radioactive, associated with human habitation, or of human or animal origin, or from any producing, manufacturing, or processing operation, including waste placed within containers of whatever nature prior to, and for purposes of, disposal.” 40 CFR 122.2 defines “point source” as “any discernable, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.” 40 CFR 122.2 defines “discharge of a pollutant” as “Any addition of any pollutant or combination of pollutants to waters of the U.S. from any point source.” Also, the justification for control of pollution into waters of the state can be found at CWC section 13260(a)(1). State Board Order WQ 2001-15 verifies that discharges from the MS4 contain waste.²⁸

The term urban runoff has been removed throughout Tentative Order R9-2009-0002 and replaced with storm water (wet weather) or non-storm water (dry weather) runoff. This clarification is necessary to prevent the misunderstanding that regulation under this permit is subject only to urbanized areas. The term “urban runoff” is not defined in the Code of Federal Regulations or Federal Register in the regulation of phase 1 MS4 discharges.

The discharge of runoff from an MS4 is a “discharge of pollutants from a point source” into waters of the U.S. as defined in the Clean Water Act (CWA). The Permit defines runoff as all flows in a storm water conveyance system (MS4 defined below) and consists of the following components:

- (1) storm water (wet weather flows) and
- (2) non-storm water discharges (dry weather flows).

The Permit defines an MS4 as a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains):

²⁸ State Board, 2001. Order WQ 2001-15. In the Matter of Petitions of Building Industry Association of San Diego County and Western States Petroleum Association: For Review of Waster Discharge Requirements Order No. 2001-01 for Urban Runoff from San Diego County [NPDES No. CAS0108758] Issued by the Regional Board.

- (i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;
- (ii) Designated or used for collecting or conveying storm water;
- (iii) Which is not a combined sewer;
- (iv) Which is not part of the Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.26.

Permit finding D.3.c. includes natural streams that convey runoff as part of the MS4. The presence of an MS4 system is not limited to areas considered to be “urban” in nature. Though the term urban is often referred to specifically as pertaining to cities, runoff means all flows in a storm water conveyance system, regardless of the location of the conveyance system. A conveyance system owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law), may be located in a setting (e.g. unincorporated area, low density residential) that is not considered by the public to be “urban” in nature. These areas are contributing pollutants to the MS4 system that must be addressed. The term runoff applies to all flows in an MS4 system, no matter where the MS4 may be located in regards to incorporated or unincorporated property.

The Code of Federal Regulations (CFR) at 40 CFR 122.26 requires that large and medium MS4s obtain a permit for all discharges from their systems. Appendix I to 40 CFR 122 designates Orange County as having a large and medium MS4 requiring a permit. The regulations do not differentiate discharges from urban or rural MS4 systems. Rather, the regulations require the permit for all discharges from their systems. In the Final Rule establishing the Phase 1 storm water regulations, the USEPA clarified that all discharges are subject to a permit. On page 48041 of the Final Rule, the USEPA states:

“EPA recognizes that some of the counties addressed by today’s rule have, in addition to areas with high unincorporated urbanized populations, areas that are essentially rural or uninhabited and may not be the subject of planned development. While permits issued for these municipal systems ***will cover*** (*emphasis added*) *municipal systems discharges in unincorporated portions of the county* (*emphasis added*), it is the intent of EPA that management plans

and other components of the programs focus on the urbanized and developing areas of the county.”

So, while the Permit covers all MS4 discharges regardless if that discharge is in an urban or unincorporated area; the Copermittees management program should focus on urbanized areas. Due to the Permit’s requirements, the Copermittees management programs will naturally focus on urbanized areas. Urbanized areas have more industry, construction, pollution and MS4s that require more inspection, maintenance, monitoring, enforcement and complaint follow-up.

USEPA further clarified on page 48041 that all MS4 discharges require permit coverage when addressing highway MS4 systems:

“[The regulations] will result in discharges from separate storm sewer systems serving State highways and other highways through storm sewers ... in unincorporated portions of specified unincorporated portions of specified counties being included as part of the large or medium municipal separate storm sewer systems, since all municipal separate storm sewers within the boundaries of these political entities are included.”

In their summary on page 48043, the USEPA states:

“The definition [of MS4] provides that all systems within a geographical area including highways and flood controls will be covered, thereby avoiding fragmented and ill-coordinated programs;”

Neither the State Board’s storm water permit for Caltrans (Order No. 99-06-DWQ) nor the Los Angeles Regional Board’s draft MS4 permit for Ventura County include the term “urban runoff” in a significant regulatory capacity. The Caltrans permit has one reference to “urban runoff” where the term is used interchangeably with “storm water.” The draft Ventura permit uses the term “urban runoff” when referring to titles of reference documents, previously adopted management plans and municipal ordinances that may contain the phrase.

Understandably, the Copermittees have expressed concern regarding the regulation of pollutants from natural, undeveloped areas that enter the MS4 in an unincorporated area. The MS4 collection could change a natural sheet flow discharge to a concentrated point discharge. The MS4 does not provide natural infiltration or other pollutant remediation that these flows would receive in an otherwise natural drainage system. The MS4 may concentrate these natural pollutants and flows. In some cases, the MS4 may ultimately discharge the elevated concentrations of natural pollutants and flow rates to waters of the US far from the natural pollutant and flow source, causing a condition of pollution or a violation of water quality standards.

Finding C.2. MS4 storm water and non-storm water discharges are likely to contain pollutants that cause or threaten to cause a violation of surface water quality standards, as outlined in the Regional Board's Water Quality Control Plan for the San Diego Basin (Basin Plan). Storm water and non-storm water discharges from the MS4 are subject to the conditions and requirements established in the San Diego Basin Plan for point source discharges. These water quality standards must be complied with at all times, irrespective of the source and manner of discharge.

Discussion of Finding C.2. This finding is a clarification regarding the potential for discharges of storm water and non-storm water to impact the Beneficial Uses as described in the Basin Plan. As such these point source discharges require Waste Discharge Requirements (WDRs) to ensure that water quality standards are met. Furthermore, since point source discharges require WDRs, the discharges are subject to the prohibitions, conditions and requirements of the Basin Plan.

In addition, municipal discharges have been split into storm water and non-storm water discharges to represent the differing regulations applicable to storm water and non-storm water, though both types of discharges are likely to contain pollutants.

Finding C.3. The most common categories of pollutants in runoff include total suspended solids, sediment (due to anthropogenic activities); pathogens (e.g., bacteria, viruses, protozoa); heavy metals (e.g., copper, lead, zinc and cadmium); petroleum products and polynuclear aromatic hydrocarbons; synthetic organics (e.g., pesticides, herbicides, and PCBs); nutrients (e.g., nitrogen and phosphorus fertilizers); oxygen-demanding substances (decaying vegetation, animal waste); detergents; and trash.

Discussion of Finding C.3. The National Urban Runoff Program (NURP) study showed that heavy metals, organics, coliform bacteria, nutrients, oxygen demanding substances (e.g., decaying vegetation), and total suspended solids are found at relatively high levels in storm water and non-storm water discharges.²⁹ It also found that MS4 discharges draining residential, commercial, and light industrial areas contain significant loadings of total suspended solids and other pollutants. The Basin Plan goes on to identify runoff pollutants to include lawn and garden chemicals, household and automotive care products dumped or drained on streets, and sediment that erodes from construction sites.³⁰ In addition, the State Board Urban Runoff Technical Advisory Committee (TAC) finds that urban runoff pollutants include sediments, nutrients, oxygen-demanding substances, heavy metals, petroleum hydrocarbons, pathogenic bacteria, viruses, and pesticides.³¹ Runoff that flows over streets, parking lots, construction sites, and industrial, commercial, residential, and municipal areas carries these untreated pollutants through storm drain networks directly to the receiving waters of the San Diego Region.

Finding C.4. The discharge of pollutants and/or increased flows from MS4s may cause or threaten to cause the concentration of pollutants to exceed applicable receiving water quality objectives and impair or threaten to impair designated beneficial uses resulting in a condition of pollution (i.e., unreasonable impairment of water quality for designated beneficial uses), contamination, or nuisance.

Discussion of Finding C.4. The 1992, 1994, and 1996 National Water Quality Inventory Reports to Congress prepared by USEPA showed a trend of impairment in the nation's waters from contaminated storm and non-storm water runoff.³² The 1998 National Water Quality Inventory Report showed that runoff discharges affect 11 percent of rivers, 12 percent of lakes, and 28 percent of estuaries. The report states that ocean shoreline impairment due to runoff increased from 55 percent in 1996 to 63 percent in 1998. The report notes that runoff discharges are the leading source of pollution and the main factor in the degradation of surface water quality in California's coastal waters, rivers, and streams. Furthermore, the NURP study found that pollutant levels from illicit non-storm water discharges were high enough to significantly degrade receiving water quality, and threaten aquatic life, wildlife, and human health.³³

³³ USEPA, 1993. Results of the Nationwide Urban Runoff Program, Volume 1 – Final Report.

In addition, the Region's CWA section 303(d) list, which identifies water bodies with impaired beneficial uses within the region, also indicates that the impacts of storm water and non-storm water runoff on receiving waters are significant. Many of the impaired water bodies on the 303(d) list are impaired by constituents that have been found at high levels within storm water and non-storm water runoff by the County of Orange storm water monitoring program.³⁴ Examples of constituents frequently responsible for beneficial use impairment include indicator fecal bacteria, heavy metals, and sediment; these constituents have been found at high levels in runoff both regionally and nationwide.^{35,36} In addition, impairments may be caused by synergistic effects of multiple contaminants or by pollutants not currently monitored by storm water programs³⁷.

Finding C.5. Pollutants in runoff can threaten and adversely affect human health. Human illnesses have been clearly linked to recreating near storm drains flowing to coastal waters. Also, runoff pollutants in receiving waters can bioaccumulate in the tissues of invertebrates and fish, which may be eventually consumed by humans.

³⁷ County of Orange, 2006. Orange County Municipal Copermittees 2005-2006 Annual Storm Water Program Report, Section 11.

Discussion of Finding C.5. A landmark study, conducted by the Santa Monica Bay Restoration Project, found that there was an increased occurrence of illness in people that swam in proximity to a flowing storm drain.³⁸ A study of south Huntington Beach and north Newport Beach (both located in northern Orange County) found that an illness rate of about 0.8 percent among bathers at those beaches resulted in about \$3 million annually in health-related expenses.³⁹ Furthermore, runoff pollutants in receiving waters can bioaccumulate in the tissues of invertebrates and fish, which may eventually be consumed by humans. Pollutants such as heavy metals and pesticides, which are commonly found in MS4 runoff, have been found to bioaccumulate and biomagnify in long-lived organisms at the higher trophic levels.⁴⁰ Since many aquatic species are utilized for human consumption, toxic substances accumulated in species' tissues can pose a significant threat to public health. USEPA supports this finding when it states, "As runoff flows over areas altered by development, it picks up harmful sediment and chemicals such as oil and grease, pesticides, heavy metals, and nutrients (e.g., nitrogen and phosphorus). These pollutants often become suspended in runoff and are carried to receiving waters, such as lakes, ponds, and streams. Once deposited, these pollutants can enter the food chain through small aquatic life, eventually entering the tissues of fish and humans."⁴¹

Finding C.6. Runoff discharges from MS4s often contain pollutants that cause toxicity to aquatic organisms (i.e., adverse responses of organisms to chemicals or physical agents ranging from mortality to physiological responses such as impaired reproduction or growth anomalies). Toxic pollutants impact the overall quality of aquatic systems and beneficial uses of receiving waters.

⁴⁰ Abel, P.D., 1996. *Water Pollution Biology*.

⁴¹ USEPA, 2000. Storm Water Phase II Compliance Assistance Guide. Washington D.C. EPA 833-R-00-002.

Discussion of Finding C.6. The Copermittees' monitoring data exhibits frequent toxic conditions in runoff during storm events and dry weather. Toxicity is observed in both fresh and marine receiving waters, but varies significantly within and among sites and over time. However, according to the County of Orange, toxicity in both dry and wet weather appears concentrated along the coast. This supports the conclusion that toxicity is associated with anthropogenic activities and is caused by pollutants that flow downstream and become concentrated near the bottom of developed watersheds. Physical channel modification and hydromodification are also greatest near the coast and likely contribute to findings of toxicity. The cause of toxicity may vary between locations, dates, and indicator organisms. The actual cause may be influenced by various factors such as development, runoff management, habitat modification, hydromodification, and native aquatic environment. Toxicity identification evaluations (TIEs) have failed to confirm initial findings of toxicity. Follow-up studies by the County of Orange implicate both pollutants and physical stream habitat degradation (e.g. channel modification and hydromodification) as factors related to toxicity findings.⁴²

Finding C.7. The Copermittees discharge runoff into lakes, drinking water reservoirs, rivers, streams, creeks, bays, estuaries, coastal lagoons, the Pacific Ocean, and tributaries thereto within one of the eleven hydrologic units (San Juan Hydrologic Unit) comprising the San Diego Region as shown in Tables 2a and 2b. Some of the receiving water bodies have been designated as impaired by the Regional Board and the United States Environmental Protection Agency (USEPA) in 2006 pursuant to CWA section 303(d). Also shown in the Tables are the watershed management areas (WMAs) as defined in the Regional Board report, Watershed Management Approach, January 2002.

Discussion of Finding C.7. This finding identifies the Copermittees responsible for MS4 discharges in each watershed management area. The list is identical to Order No. R9-2002-0001. The CWA Section 303(d) List of Impaired Waters, 2006 Update has been approved by the Regional Board, State Board, and USEPA.⁴³ This 303(d) list identifies waters that do not meet water quality standards after applying certain required technology-based effluent limits ("impaired" water bodies). As part of this listing process, states are required to prioritize waters/watersheds for future development of Total Maximum Daily Loads (TMDLs). The listed 303(d) pollutant(s) of concern do not necessarily reflect impairment of the entire corresponding WMA or all corresponding major surface water bodies. The specific impaired portions of each WMA are listed in the State Board's 2006 Section 303(d) List of Water Quality Limited Segments.

⁴² County of Orange, 2006. Orange County Municipal Copermittees 2005-2006 Annual Storm Water Program Report, Section 11.

⁴³ The approved 2006 Clean Water Act Section 303(d) List of Water Quality Limited Segments is on-line at: http://www.waterboards.ca.gov/tmdl/303d_lists2006.html

Finding C.8. Trash is a persistent pollutant which can enter receiving waters from the MS4 resulting in accumulation and transport in receiving waters over time. Trash poses a serious threat to the Beneficial Uses of the receiving waters, including, but not limited to, human health, rare and endangered species, navigation and human recreation.

Discussion of Finding C.8. The Copermittees to date have documented high volumes of trash coming from the MS4 system and in receiving waters.⁴⁴

The Basin Plan specifies the following narrative Water Quality Objective (WQO) for Floating Material:

“Waters shall not contain floating material, including solids, liquids, foams, and scum in concentrations which cause nuisance or adversely affect beneficial uses.”

The Basin Plan specifies the following narrative WQO for Suspended and Settleable Solids: Material:

“Waters shall not contain suspended and settleable solids in concentrations of solids that cause nuisance or adversely affect beneficial uses.”

Additionally, high density urban areas in Southern California have been shown to be responsible for up to 60 percent of the trash that enters receiving waters from the MS4.⁴⁵ The retrofitting of existing MS4 systems, such as catch basins, in targeted high trash areas can result in significant reductions in the amount of trash entering receiving waters from the MS4.

Trash, as litter in both solid and liquid form, is consistently found on and adjacent to roadways. A California Department of Transportation Litter Management Pilot Study found that of roadway trash, plastics and Styrofoam accounted for 33 percent of trash by weight, and 43 percent by volume. Further, the study found that approximately 80 percent of the litter associated with roadways was floatable, indicating that, without capture, this litter would enter Waters of the State after a storm event, resulting in the impairment of Beneficial Uses.⁴⁶ The study, however, relied upon a mesh capture size of 0.25 inches (6.35 millimeters). This size is too large to effectively capture plastic pre-production pellets (aka “nurdles”), which are roughly 3 mm in size, and likely underestimated the total contribution of plastics. Plastics, including pre-production pellets, have been found to be the dominant pollutant on beaches in the County of Orange.⁴⁷ Furthermore, pre-production plastic pellets, which are small enough to be easily digested, have been found to carry persistent organic pollutants, including PCBs

and DDT.⁴⁸

Finding C.9. The Copermittees' water quality monitoring data submitted to date documents persistent violations of Basin Plan water quality objectives for various runoff-related pollutants (fecal coliform bacteria, total suspended solids, turbidity, metals, etc.) at various watershed monitoring stations. Persistent toxicity has also been observed at some watershed monitoring stations. In addition, bioassessment data indicates that the majority of urbanized receiving waters have Poor to Very Poor Index of Biotic Integrity ratings. In sum, the above findings indicate that runoff discharges are causing or contributing to water quality impairments, and are a leading cause of such impairments in Orange County.

Discussion of Finding C.9. The Copermittees have produced data that demonstrates water quality objectives are frequently not met during dry and wet weather. The 2006 Report of Waste Discharge and the 2005-06 Annual Reports document that receiving water monitoring stations often fail to meet water quality objectives established in the Basin Plan. Similar conclusions are found in monitoring reported to the Regional Board pursuant to Investigative Orders issued between 2001 and 2006 for Aliso Creek, Salt Creek⁴⁹, Prima Deshecha⁵⁰, and North Creek at Doheny Beach⁵¹. Monitoring reported to the State Board pursuant to funding grant agreements also demonstrates that discharges from MS4s routinely exceed water quality objectives.^{52,53, 54, 55, 56}

Water quality in receiving waters downstream of MS4 discharges fail to meet Ocean Plan standards⁵⁷, California Toxics Rule standards⁵⁸, and Basin Plan objectives. Data submitted in the MS4 Annual Reports indicate that at various times chemical, bacteria, pesticide, and metal concentrations may exceed water quality objectives in marine and fresh water receiving waters in both wet and dry weather conditions. Although wet weather MS4 effluent data is not generally reported, dry-weather non-storm water MS4 effluent data demonstrates that the effluent contains concentrations of pollutants that would exceed receiving water quality objectives.

In most of these watersheds, there are no other significant NPDES permits discharging to the creeks. For instance, there are no live-stream discharges of treated waste water in south Orange County. The few NPDES permits in the watersheds are mainly for recycled water which only discharges occasionally during the rainy season. Because the water quality monitoring indicates exceedances of water quality standards and MS4 discharges are the main source of pollutants in the watersheds, it can be inferred that the MS4 discharges are causing or contributing to water quality impairments, and are a leading cause of such impairments in Orange County.

Finding C.10. When natural vegetated pervious ground cover is converted to impervious surfaces such as paved highways, streets, rooftops, and parking lots, the natural absorption and infiltration abilities of the land are lost. Therefore, runoff leaving a developed area is significantly greater in runoff volume, velocity, and peak flow rate than pre-development runoff from the same area. Runoff durations can also increase as a result of flood control and other efforts to control peak flow rates. Increased volume, velocity, rate, and duration of runoff greatly accelerate the erosion of downstream natural channels. Significant declines in the biological integrity and physical habitat of streams and other receiving waters have been found to occur with as little as a 3-5 percent conversion from natural to impervious surfaces. The increased runoff characteristics from new development must be controlled to protect against increased erosion of channel beds and banks, sediment pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force.

Finding C.11. Development creates new pollution sources as human population density increases and brings with it proportionately higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, trash, etc. which can either be washed or directly dumped into the MS4. As a result, the runoff leaving the developed area is significantly greater in pollutant load than the pre-development runoff from the same area. These increased pollutant loads must be controlled to protect downstream receiving water quality.

⁵⁷ The Basin Plan incorporates terms and conditions of the State Board's *Water Quality Control Plan for Ocean Waters of California* (Ocean Plan) as a water quality objective for Ocean Waters in the San Diego Region.

⁵⁸ The California Toxics Rule criteria promulgated by the USEPA are directly applicable water quality standards for certain priority toxic pollutants in inland surface waters and enclosed bays and estuaries in California.

Discussion of Findings C.10 and C.11.

The Natural Resources Defense Council (NRDC) 1999 Report, "*Stormwater Strategies, Community Responses to Runoff Pollution*" identifies two main causes of the storm water pollution problem in developed areas. Both causes are directly related to development:

1. Increased volume and velocity of surface runoff. There are three types of human-made impervious covers that increase the volume and velocity of runoff: (i) rooftop, (ii) transportation imperviousness, and (iii) non-porous (impervious) surfaces. As these impervious surfaces increase, infiltration will decrease, forcing more water to run off the surface, picking up speed and pollutants.
2. The concentration of pollutants in the runoff. Certain industrial, commercial, residential and construction activities are large contributors of pollutant concentrations in storm water runoff. As human population density increases, it brings with it proportionately higher levels of car emissions, car maintenance wastes, municipal sewage, pesticides, household hazardous wastes, pet wastes, trash, etc.

As a result of these two causes, runoff leaving developed areas is significantly greater in volume, velocity, and pollutant load than pre-development runoff from the same area.

By accommodating the traditional approach to storm water management, development has also altered the flow regime (rate, magnitude, frequency, timing, and flashiness of runoff) that supports aquatic and riparian habitats. These hydrologic changes are driven by the loss of water storage capacity in the watersheds,⁵⁹ and exacerbated by physical alterations of the stream channel network.⁶⁰ This relationship between development and stream channel integrity has been documented nationally and in southern California.

⁵⁹ Konrad, Christopher P. and Derek K. Booth, 2005. *Hydrologic Changes in Urban Streams and Their Ecological Significance*. American Fisheries Society Symposium Vol.47 pp.157-177.

⁶⁰ Poff, N.L. et al. 1997. The Natural Flow Regime: A paradigm for river conservation and restoration. *Bioscience* Vol. 47, No. 11, pp.769-784.

Hydrologic changes from development also directly and indirectly adversely affect wetlands. Natural wetlands support many beneficial uses and provide important water-quality related ecological services, including pollutant removal, flood attenuation, and groundwater recharge.⁶¹ The Center for Watershed Protection recently provided USEPA with a synthesis of more than 100 scientific studies on the direct and indirect impacts of development, particularly urbanization, on wetlands and the role wetlands play in watershed quality. The report found that the three changes from land development with the most potential to impact wetlands include: Increased storm water runoff; decreased groundwater recharge; and flow constriction.⁶² Each of these changes can often be avoided or minimized by implementing LID and hydromodification BMPs.

When Order No. R9-2002-01 was adopted, studies had shown that the level of imperviousness in an area strongly correlates with the quality of nearby receiving waters.⁶³ One comprehensive study, which looked at numerous areas, variables, and methods, revealed that stream degradation occurs at levels of imperviousness as low as 10 – 20 percent.⁶⁴ Stream degradation is a decline in the biological integrity and physical habitat conditions that are necessary to support natural biological diversity. For instance, few urban streams can support diverse benthic communities with imperviousness greater than or equal to 25 percent.⁶⁵ To provide some perspective, a medium density, single-family home area can be from 25 percent to 60 percent impervious (variation due to street and parking design).⁶⁶

More recently, a report on the effects of impervious in southern California streams found that local ephemeral and intermittent streams are more sensitive to such effects than streams in other parts of the country. This study, by the Southern California Coastal Water Research Program, estimated a threshold of response at a two to three percent change in percent of impervious cover in a watershed.⁶⁷ This threshold is lower than the previously reported estimates by the USEPA that were cited in the Fact Sheet for Order No. R9-2002-01.

⁶⁷ Coleman, Derrick, et al. 2005. *Effect of Increases in Peak Flows and Imperviousness on the Morphology of Southern California Streams*. Technical Report No. 450 of the Southern California Coastal Water Research Project.

To demonstrate the principle of increased volume and velocity of runoff from urbanization, Figure 1 shows the flow rate of an urban vs. a natural stream. What the figure demonstrates is that urban stream flows have greater peaks and volumes, as well as shorter retention times than natural stream flows. The greater peak flows and volumes result in stream degradation through increased erosion of stream banks and damage to aquatic habitat. The shorter retention times result in less time for sediments and other pollutants to settle before being carried out to the ocean. This sediment, and the associated pollutants it carries, can be a significant cause of water quality degradation.

Figure 1. Flow Rate of Urban and Natural Streams⁶⁸

Increased volume and velocity of runoff adversely impacts receiving waters and their beneficial uses in many ways. According to the Urban Runoff TAC report,⁶⁹ increases in population density and imperviousness result in changes to stream hydrology including:

1. Increased peak discharges compared to pre-development levels;
2. Increased volume of storm water runoff with each storm compared to pre-development levels;
3. Decreased travel time to reach receiving water; increased frequency and severity of floods;
4. Reduced stream flow during prolonged periods of dry weather due to reduced levels of infiltration;
5. Increased runoff velocity during storms due to a combination of effects of higher discharge peaks, rapid time of concentration, and smoother hydraulic surfaces from channelization; and

⁶⁸ Adapted from Schueler, T.R., 1987. Controlling Urban Runoff: A Practical Manual for Planning and Designing Urban BMPs. Metropolitan Washington Council of Governments.

⁶⁹ State Board, 1994. Urban Runoff Technical Advisory Committee Report and Recommendations. Nonpoint Source Management Program.

6. Decreased infiltration and diminished ground water recharge.

Even though the rainfall depths in arid watersheds are lower, watershed development can greatly increase peak discharge rates during rare flood events.⁷⁰ A study conducted in arid watersheds around Riverside, CA showed that, over two decades, impervious cover increased from 9 percent to 22 percent, which resulted in an increase of more than 100 percent in the peak flow rate for the two-year storm event. The study also showed that the average annual storm water runoff volume had increased by 115 percent to 130 percent over the same time span.⁷¹

Prior hydromodification studies in California have shown that the increase in impervious cover, and thus change in runoff volume, velocity, rate, and duration, results in a shift in the range of storms that produce geomorphically significant flows within receiving waters (see above discussion). Additionally, studies in California have determined that ninety percent of the geomorphic “work” done within channels receiving flows from developed areas now occurs from flows below the 10 year peak flow event.⁷²

This increased volume, velocity, rate, and duration of runoff greatly accelerates the erosion of the beds and banks within downstream receiving waters. Additionally, storm water flows which runoff directly from impervious surfaces into the MS4 and thus receiving waters prevent the associated runoff of natural sediments which would occur in pre-project conditions. This combined alteration of the physical condition of storm water runoff results in accelerated downstream erosion of receiving water bed and banks. The excessive erosion of stream beds and banks releases pollutants found in soils into receiving waters, degrades macroinvertebrate habitat (see D.2.c), eliminates spawning habitat, reduces associated wetland and riparian habitat, and threatens existing infrastructure adjacent to receiving waters. Bank sloughing within creeks and streams increases the pollutant loading to those receiving waters, particularly for turbidity and phosphorous.⁷³ In arid environments, accelerated channel erosion has been shown to have synergistic impacts within watersheds. Increased channel erosion within Las Vegas wash has resulted in the loss of over 1,000 acres of wetland and riparian habitat, released additional pollutants into downstream receiving waters, and eliminated in-stream habitat and water quality conditions required for existing threatened and endangered species.⁷⁴

Regarding the impact of development on storm water runoff pollutant loads, the Regional Board's Basin Plan states:

Nonpoint source pollution is primarily the result of man's uses of land such as urbanization, roads and highways, vehicles, agriculture, construction, industry, mineral extraction, physical habitat alteration (dredging/filling), hydromodification (diversion, impoundment, channelization), silviculture (logging), and other activities which disturb land.⁷⁵ As a result, when rain falls on and drains through urban freeways, industries, construction sites, and neighborhoods it picks up a multitude of pollutants. The pollutants can be dissolved in the runoff and quickly transported by gravity flow through a vast network of concrete channels and underground pipes referred to as storm water conveyance systems. Such systems ultimately discharge the polluted runoff, without treatment, into the nation's creeks, rivers, estuaries, bays, and oceans.⁷⁶

According to the Center for Watershed Protection, urbanization strongly shapes the quality of both surface and ground water in arid and semi-arid regions of the southwest. Since rain events are so rare, pollutants have more time to build up on impervious surfaces compared to humid regions. Therefore, the pollutant concentrations of storm water runoff from arid watersheds tends to be higher than that of humid watersheds.⁷⁷ The effect of antecedent rainfall events is demonstrated in a recent report from the California Department of Transportation (Caltrans) that found the concept of a seasonal first flush is applicable to the southern California climate.⁷⁸

Finding C.12. Development and urbanization especially threaten environmentally sensitive areas (ESAs), such as water bodies designated as supporting a RARE beneficial use (supporting rare, threatened or endangered species) and CWA 303(d)-impaired water bodies. Such areas have a much lower capacity to withstand pollutant shocks than might be acceptable in other areas. In essence, development that is ordinarily insignificant in its impact on the environment may become significant in a particularly sensitive environment. Therefore, additional control to reduce storm water pollutants from new and existing development may be necessary for areas adjacent to or discharging directly to an ESA.

⁷⁸ Stenstrom, Michael and Masoud Kayhanian, 2005. *First Flush Phenomenon Characterization*. Prepared for Caltrans. Report No. CTSW-RT-05-73-02.6 Study jointly performed by UCLA and UCD. Most of the data presented was collected from three highly urbanized highway sites in west Los Angeles. Much effort went into developing a quantitative way of defining the mass first flush. Other aspects include: variability of water quality during storm events, litter characteristics, correlation among constituents, first flush of organics and particle size distribution, new methods for measuring oil and grease, and grab and composite sampling strategies. The report is available on-line at: <http://www.dot.ca.gov/hq/env/stormwater/special/newsetup/>

Discussion of Finding C.12. ESAs are defined in the Order as “Areas that include but are not limited to all CWA Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the Basin Plan ; water bodies designated with the RARE beneficial use by the Basin Plan; areas designated as preserves or their equivalent under the Natural Communities Conservation Program within the Cities and County of Orange; and any other equivalent environmentally sensitive areas which have been identified by the Copermitees.”

Areas that meet this definition are inherently sensitive habitats containing unique, rare, threatened, or endangered species, or are not achieving their designated beneficial uses. As discussed above, runoff is known to contain a wide range of pollutants and has demonstrated toxicity to plants and animals. Therefore, it is necessary to apply additional storm water controls for developments within, adjacent to, or directly discharging to ESAs. This need for additional storm water controls is addressed within each component of the Order. USEPA supports the requirement for additional storm water controls, stating “For construction sites that discharge to receiving waters that do not support their designated use or other waters of special concern, additional construction site controls are probably warranted and should be strongly considered.”⁷⁹ Further support for requiring additional controls to reduce pollutants in storm water discharges to ESAs can be found in *Mitigation of Storm Water Impacts From New Developments in Environmentally Sensitive Areas*, a technical report written by the LARWQCB.⁸⁰

ESAs within the area subject to this Order are expected to be substantially similar to the previous Order. Additions may be necessary once the South County Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) is formally adopted. Other modifications may reflect updated descriptions or findings of threatened or endangered aquatic species.

Finding C.13. Although dependent on several factors, the risks typically associated with properly managed infiltration of runoff (especially from residential land use areas) are not significant. The risks associated with infiltration can be managed by many techniques, including (1) designing landscape drainage features that promote infiltration of runoff, but do not “inject” runoff (injection bypasses the natural processes of filtering and transformation that occur in the soil); (2) taking reasonable steps to prevent the illegal disposal of wastes; (3) protecting footings and foundations; (4) ensuring that each drainage feature is adequately maintained in perpetuity; and (5) pretreatment.

⁸⁰ LARWQCB, 2001. *Mitigation of Storm Water Impacts From New Developments In Environmentally Sensitive Areas*.

Discussion of Finding C.13. Infiltration is an effective means for managing runoff. However, measures must be taken to protect groundwater quality when infiltration of runoff is implemented. USEPA supports runoff infiltration and provides guidance for protection of groundwater: “With a reasonable degree of site-specific design considerations to compensate for soil characteristics, infiltration may be very effective in controlling both urban runoff quality and quantity problems. This strategy encourages infiltration of urban runoff to replace the natural infiltration capacity lost through urbanization and to use the natural filtering and sorption capacity of soils to remove pollutants; however, the potential for some types of urban runoff to contaminate groundwater through infiltration requires some restrictions.”⁸¹ The restrictions placed on runoff infiltration in this Order are based on recommendations provided by the USEPA Risk Reduction Engineering Laboratory. The State Board found in Order WQ 2000-11 on the appeal of the LARWQCB’s Standard Urban Storm Water Mitigation Plan (SUSMP) requirements that the guidance provided in the above referenced document by the USEPA Risk Reduction Engineering Laboratory is sufficient for the protection of groundwater quality from runoff infiltration. To further protect groundwater quality, the Order also includes guidance from the LARWQCB,⁸² the State of Washington,⁸³ and the State of Maryland.⁸⁴ Subsequently, the California Storm Water Quality Association (CASQA) has produced technical guidance for post-construction treatment BMPs to protect ground water quality⁸⁵.

Finding C.14. Non-storm water (dry weather) discharge from the MS4 is not considered a storm water (wet weather) discharge and therefore is not subject to regulation under the Maximum Extent Practicable (MEP) standard from CWA 402(p)(3)(B)(iii), which is explicitly for “Municipal ... *Stormwater Discharges* (emphasis added)” from the MS4. Non-storm water discharges, per CWA 402(p)(3)(B)(ii), are to be effectively prohibited. Such dry weather non-storm water discharges have been shown to contribute significant levels of pollutants and flow in arid, developed Southern California watersheds and are not to be effectively prohibited under the Clean Water Act.

Discussion of Finding C.14.

Permitting Framework

The Clean Water Act (CWA) employs the strategy of prohibiting the discharge of any pollutant from a point source into waters of the United States unless the discharger of the pollutant(s) obtains a NPDES permit pursuant to Section 402 of the Clean Water

Act. The discharge of storm water and/or non-storm water from an MS4 system is considered a discharge from a point source. As discussed below, however, the Clean Water Act regulates storm water and non-storm water discharges under different standards.

In 1987 the CWA was amended to include provisions that specifically concerned NPDES permitting requirements for storm water discharges from MS4 systems. Section 402(p) of the CWA regulates the discharge of storm water from a point source, the municipal separate storm sewers. Such discharges of storm water are subject to the maximum extent practicable (MEP) storm water standard and the related iterative process. The MEP standard for storm water discharges reflects Congress' recognition that the variability of flow and intensity of storm events render difficult strict compliance with water quality standards by MS4s. However, this standard was not considered applicable to non-storm water discharges, which under 402(p) are required to be effectively prohibited from entering the MS4. Clearly, if non-storm water discharges must be effectively prohibited from entering the MS4, the very next requirement (402(p)(3)(B)(iii)) requiring discharges from the MS4 be reduced to the MEP intends that the discharge of pollutants be limited to storm water. Unless exempt or authorized under a separate NPDES permit, non-storm water discharges are not authorized to enter the MS4 in the first instance and are considered to be illicit discharges.

The Federal Register further clarifies that such discharges through an MS4 are not authorized under the CWA (55 Fed. Reg. 47995):

“Today’s rule defines the term “illicit discharge” to describe any discharge through a municipal separate storm sewer system that is not composed entirely of storm water and that is not covered by an NPDES permit. Such illicit discharges are not authorized under the Clean Water Act. Section 402(p)(3)(B) requires that permits for discharges from municipal separate storm sewers require the municipality to “effectively prohibit” non-storm water discharges from the municipal separate storm sewer...Ultimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit.”

The federal regulations (40 Code of Federal Regulations (CFR) 122.26(d)(vi)(2)(B)) require that the municipal separate storm sewer discharger prohibit “through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer.” As owners and operators of the MS4, Copermittees cannot passively receive discharges from third parties (Federal Register 68766) and thus are responsible for the discharge of any non-storm water from their MS4.

The State Water Board’s recent precedential order (Order WQ-2009-0008) affirming a Los Angeles County MS4 permit modification, consistent with USEPA’s prior interpretations, recognizes that “[n]either the Clean Water Act nor the federal storm water regulations define ‘non-storm water.’ ‘Illicit discharge’ is defined as any discharge to an MS4 ‘not composed entirely of storm water.’[fn]. Thus, ‘illicit

discharge' is the most nearly applicable definition of 'non-storm water' found in federal law and is often used interchangeably with that term."⁸⁶

Storm Water and Non-storm Water Definitions

By definition non-storm water is not precipitation related. 40 CFR 122.26(b)(13) states that: "Storm water means storm water runoff, snowmelt runoff, and surface runoff and drainage." While "surface runoff and drainage" is not defined in federal law, it is related to precipitation events such as rain and/or snowmelt (see 55 Fed Reg 47995-96). The Federal Register (55, page 47995) includes an entire section on the definition of storm water and non-storm water. The term "surface runoff and drainage" does not include all incidental flows in the MS4 system, but consists of flows relating to precipitation events as clarified by the Federal Register, USEPA's documents and permitting, and other Regional Board Orders.

The Federal Register (55 Fed Reg 47995-47996) provides clarification on the distinction between storm water and non-storm water discharges, including their regulation:

"In response to the comments which requested EPA to define the term storm water broadly to include a number of classes of discharges **which are not in any way related to precipitation events, EPA believes that this rulemaking is not an appropriate forum for addressing the appropriate regulation of such non-storm water discharges**, even though some classes of non-storm water discharges may typically contain only minimal amounts of pollutants. Congress did not intend that the term storm water be used to describe any discharge that has a de minimis amount of pollutants, not did it intend for section 402(p) to be used to provide a moratorium from permitting other non-storm water discharges."

As recently recognized by the State Water Board in a precedential decision upholding an MS4 permit modification adopted by the Los Angeles Regional Water Board, "U.S. EPA has previously rejected the notion that 'storm water,' as defined at 40 Code of Federal Regulations section 122.26(b)(13), includes dry weather flows. In U.S. EPA's preamble to the storm water regulations, U.S. EPA rejected an attempt to define storm water to include categories of discharges 'not in any way related to precipitation events.'^[fn]."⁸⁷ Thus, USEPA has made it clear that it deems discharges unrelated to precipitation events to be non-storm water discharges. 40 CFR 122.26(d)(iv)(B) itself provides specific examples of non-storm water discharges:

"...the following category of non-storm water discharges or flows shall only be addressed where such discharges are identified by the municipality as sources of pollutants to the United States: water line flushing, landscape irrigation,

⁸⁶ State Water Board Order WQ-2009-0008 (*In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District*, adopted August 4, 2009), p. 4.

⁸⁷ State Water Board Order WQ-2009-0008 (*In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District*, adopted August 4, 2009), p. 7.

diverted stream flows, rising ground waters, uncontaminated groundwater infiltration (as defined at 40 CFR 35.2005(20) to separate storm sewers, uncontaminated pumped groundwater,..."

USEPA also removed street wash waters from the definition of storm water, as USEPA specifically identified this discharge as being non-storm water (55 Fed. Reg. page 47996). Additionally, section 1.2.2.2. of USEPA's Multi-Sector General Permit for Industrial Activities (MSGP-2000) considers fire hydrant flushings, irrigation drainage, landscape watering, and foundation or footing drains to be non-storm water discharges. USEPA's September 1999 Storm Water Management Fact Sheet for Non-Storm Water Discharges to Storm Sewers states that non-storm water discharges can include discharges of process water, air conditioning condensate, non-contact cooling water, vehicle wash water, or sanitary wastes.

While these types of non-storm water discharges (or illicit discharges) may be regulated under storm water permits because as a practical matter they can enter and be discharged from the MS4 systems, they are not regulated as storm water discharges under the Clean Water Act because they are unrelated to precipitation events. As indicated above, the State Water Resources Control Board recent discussion of this issue supports the conclusion that non-storm water discharges are unrelated to precipitation events. In its Order affirming amendments to the Los Angeles County MS4 permit to implement a TMDL to control bacteria in dry weather flows, the State Water Board rejected petitioners County of Los Angeles and the Los Angeles County Flood Control District implied assertion that the definition of "storm water" contained in the federal regulations (defined as "surface run-off and drainage") includes the run-off and drainage from non-storm events. The State Water Board notes that the challenged permit provisions do not apply to storm water flows in that they apply only during dry weather conditions as defined in the permit. In upholding the challenged order, the State Water Board notes that the Los Angeles Water Board's permit language followed USEPA's approach, referring to USEPA's rejection of attempts to define storm water to include categories of discharges "not in any way related to precipitation events."⁸⁸

Lastly, the Regional Board and State Board have issued multiple permits for non-storm water discharges, including, but not limited to, R9-2008-0002 (extracted groundwater), R9-2002-0020 (hydrostatic discharge) and 2006-008 DWQ (utility vaults), pursuant to section 402 of the CWA.

Permitting Non-storm Water Discharges

The U.S. EPA's approach (and the Regional Board's under its approved program) for non-storm water discharges from MS4s is to regulate these discharges under the existing 402 NPDES framework (Fed Reg 47995 and 48037 see below) for discharges

⁸⁸ State Water Board Order WQ-2009-0008 (*In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District*, adopted August 4, 2009), p. 7 (quoting 55 Fed. Reg. 47990. 47995).

to surface waters. The NPDES program (40 CFR 122.44(d)) utilizes discharge prohibitions and effluent limitations as regulatory mechanisms to regulate non-storm water discharges, including the use of technology and water quality-based effluent limitations. Non-numerical effluent limitations, such as BMPs for non-storm water discharges may only be authorized where numerical effluent limits are infeasible or where the practices are reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of the CWA (40 CFR 122.44(k) see below).

The Federal Register (55, page 48037) provides clarification that non-storm water discharges from the MS4 are to be regulated under section 402, not 402(p):

“Conveyances which continue to accept other “non-storm water” discharges (e.g. discharges without an NPDES permit) with the exceptions noted above (*exempted discharges that are not a source of pollutants*) do not meet the definition of municipal separate storm sewer and are not subject to 402(p)(3)(B) of the CWA unless such discharges are issued separate NPDES permits. Instead, conveyances which continue to accept non-storm water discharges which have not been issued separate NPDES permits are subject to sections 301 and 402 of the CWA.”

This regulatory approach is consistent with the approach recently upheld by the State Water Board in a precedential order adopted on August 4, 2009. In this Order, the State Water Board rejected a challenge to amendments to the Los Angeles County MS4 permit that require compliance with receiving water limitations and discharge prohibitions for dry weather, non-storm water discharges. Petitioners there argued that the receiving water limits and discharge prohibitions for dry weather dischargers were inappropriate and that the Los Angeles Water Board should instead have regulated the discharges with the maximum extent practicable standard, through an iterative process. The State Water Board concludes that dry weather discharges, as defined in the permit and in the underlying TMDL, “are more appropriately regarded as non-storm water discharges, which the Clean Water Act requires to be effectively prohibited.”⁸⁹

As stated above, for NPDES permits under 402 of the CWA, the Code of Federal Regulations (122.44(k)) clarify that a discharger may utilize BMPs to control or abate the discharge of pollutants when:

- “(1) Authorized under section 304(e) of the CWA for the control of toxic pollutants and hazardous substances from ancillary industrial activities;
- (2) Authorized under section 402(p) of the CWA for the control of storm water discharges;
- (3) Numeric limits are infeasible; or
- (4) The practices are reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of the CWA.”

⁸⁹ State Water Board Order WQ-2009-0008 (*In the Matter of the Petition of County of Los Angeles and Los Angeles County Flood Control District*, adopted August 4, 2009), p. 8

For the last 19 years, Southern Orange County NPDES permits for discharges of storm water have regulated non-storm water discharges from the MS4. These permits required Copermittees (dischargers) to prohibit non-storm water discharges into (thus through and from) their MS4 systems, implement a program to prevent illicit discharges, and monitor to identify illicit discharges and exempted discharges that are a source of pollution. These measures are considered Best Management Practices (BMPs), are required to be included in NPDES permits issued under Section 402(p) of the CWA, and are considered by USEPA to be an interim approach to permitting non-storm water discharges from the MS4 in accordance with section 402 of the CWA and CFR 122.44(k).

As explained in the discussion of Finding C.15., below, the Copermittees' reliance on BMPs for the past 19 years has not resulted in compliance with applicable water quality standards. The Regional Board has evaluated (in accordance with 40 CFR 122.44(d)(1)) past and existing controls (BMPs), non-storm water effluent monitoring results, the sensitivity of the species in receiving waters (e.g. endangered species), and the potential for effluent dilution, and has determined that existing BMPs to control pollutants in storm water discharges are not sufficient to protect water quality standards in receiving waters and the existing requirement that Copermittees effectively prohibit all types of unauthorized non-storm water discharges into the MS4 historically results in the discharge of pollutants to the receiving waters. Thus, numeric action levels for non-storm water, dry weather, discharges from the MS4 and required actions following observed exceedances of numeric action levels have been established. For further discussion regarding the development of action levels please see Finding E.12 and discussion.

Dry weather action levels are applicable to non-storm water discharges of effluent from the MS4 system. Non-storm water effluent discharges from the MS4 are those which occur during dry weather conditions. These action levels are not applied to storm water discharges, as defined within the Order. Storm water discharges regulated by the Order are required to meet the MEP standard and related iterative process and have separate action levels.

Dry weather action levels are applicable to non-storm water discharges from the MS4 system into receiving waters. Non-storm water discharges are already required to be prohibited unless specifically exempted or covered under a separate NPDES permit. Dry weather action levels apply to non-storm water discharges of effluent from a point source into receiving waters. The MS4 is not a receiving water. Should a discharger wish to discharge a non-exempt category to the MS4 system, such discharges require a separate NPDES permit pursuant to sections 402 and 301 of the CWA. It is also infeasible to monitor and sample every discharge into the MS4, as such discharges are diffuse by nature and may vary spatially and temporally.

Finding C.15. Non-storm water discharges to the MS4 granted an influent exception (i.e., which are exempt from the effective prohibition requirement set forth in CWA section 402(p)(3)(B)(ii)) under 40 CFR 122.26 are included within this Order. Any exempted discharges identified by Copermittees as a source of pollutants are subsequently required to be *addressed* (emphasis added) as illicit discharges through prohibition and incorporation into existing IC/ID programs. The Copermittees have identified landscape irrigation, irrigation water and lawn water, previously exempted discharges, as a source of pollutants and conveyance of pollutants to waters of the United States.

Discussion of Finding C.15. The Federal Register (55, page 48037) and 40 CFR 122.26(d)(iv)(B) clarify that certain components and categories of non-storm water discharges into the MS4 are not required to be prohibited. The Code of Federal Regulations requires the discharger have:

“...a program, including inspections, to implement through ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program shall address all types of illicit discharges, however, the following category of non-storm water discharges or flows shall only be addressed where such discharges are identified by the municipality as sources of pollutants to the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated groundwater infiltration (as defined at 40 CFR 35.2005(20) to separate storm sewers, uncontaminated pumped groundwater...”

As such, the identification of any of these categories as a source of pollutants requires them to be addressed as illicit discharges, which are not authorized under the CWA, and are required to be “effectively prohibited” as illicit discharges via ordinance, order or similar means. The prohibition of previously exempted discharges of non-storm water to waters of the United States from entering, and necessarily being discharged from an MS4, conforms with CWA requirements for standards and enforcement for effluent limitations to necessary to meet water quality standards (33 U.S.C. 1311(b)(1)(C)).

To date the Copermittees have identified overspray and drainage from potable and reclaimed water landscape irrigation as a substantial source and conveyance mechanism for pollutants into waters of the United States. Irrigation runoff into the MS4, as identified by the Copermittees, is a source of pollutants to waters of the United States, and is required to be *addressed* (emphasis added) as an illicit discharge per 40 CFR 122.26(d)(2)(iv)(B)(1) by prohibition through implementing and enforcing an ordinance, order or similar means. The Copermittees have identified irrigation water as a source of pollutants and conveyance of pollutants to waters of the United States, when applied improperly in excess and thereafter entering the MS4, in the following documents:

- Per requirements of 401 Water Quality Certification 02C-055, the County of Orange conducted a **Drainage Area Reconnaissance and Urban Runoff**

Characterization study. From the reconnaissance and characterization, the County of Orange determined that:

“...water quality results provided two important findings.” First, *“analytical data strongly indicates that irrigation overspray and drainage constitutes a very substantial source and conveyance mechanism for fecal indicator bacteria into Aliso Creek, and suggests that reduction measures for this source of urban runoff could provide meaningful reduction in bacteria loading to the stream.”*

- Aliso Creek, currently 303(d) listed as impaired for Indicator Bacteria, is included in the Bacteria Project I TMDL adopted by the Regional Board on December 12, 2007. Secondly, reclaimed water high in electrical conductivity and Nitrate was indicated as:
“...the source water at three of the excessive runoff locations (P1,P2,J01). These dissolved nitrogen concentration and flow rates create relatively high nitrogen loadings, which have the potential to contribute to undesirable levels of periphytic algal growth in Aliso Creek.”
- On November 15, 2007 the **Unified Annual Progress Report Program Effectiveness Assessment** for the 2006-2007 reporting period was submitted by the Copermittees. Within the report, the Copermittees demonstrate that a *“wide range of constituents exceeded the tolerance interval bounds”*, including orthophosphate. Tolerance interval bounds are pollutant levels set by the Copermittees that represent when a problem may be occurring. These tolerance levels sometimes equate with Basin Plan Objectives (BPOs) and California Toxic Rules (CTR) and USEPA Criteria. The report states that *“high levels of orthophosphate concentration are most likely the result of fertilizer runoff or reclaimed water runoff”*. Aliso Creek is currently 303(d) listed as impaired for phosphorous.
- On November 15, 2007 the **Watershed Action Plan Annual Report(s)** for the 2006-2007 reporting period was submitted by the County of Orange, Orange County Flood Control District and Copermittees within the San Juan Creek, Laguna Coastal Streams, Aliso Creek, and Dana Point Coastal Streams Watersheds. San Juan Creek, Laguna Coastal Streams, Aliso Creek and Dana Point Coastal Streams are all currently 303(d) listed as impaired for Indicator Bacteria within their watersheds and/or in the Pacific Ocean at the discharge points of their watersheds. These locations are included in the Bacteria Project I TMDL adopted by the Regional Board on December 12, 2007. The Copermittees, within their Watershed Action Strategy Table for Fecal Indicator Bacteria
“Support programs to reduce or eliminate the discharge of anthropogenic dry weather nuisance flow throughout the [...] watershed. Dry weather flow is the transport medium for bacteria and other 303(d) constituents of

concern". Additionally, they state that "conditions in the MS4 contribute to high seasonal bacteria propagation in-pipe during warm weather. Landscape irrigation is a major contributor to dry weather flow, both as surface runoff due to over-irrigation and overspray onto pavements; and as subsurface seepage that finds its way into the MS4."

- In 2006, the State Water Quality Control Board (State Board) allocated Grant funding to the **SmartTimer/Edgescape Evaluation Program (SEEP)**. Project partners include the following Copermittees: the Cities of Aliso Viejo, Dana Point, Laguna Beach, Laguna Hills, Laguna Nigel, Laguna Woods, Lake Forest, Mission Viejo, Rancho Santa Margarita and San Juan Capistrano. Also included in the study were the Metropolitan Water District of Southern California, the Department of Agriculture and ten south Orange County water districts. The project targets irrigation runoff by retrofitting existing development and documenting the conservation and runoff improvements. The Grant Application states that:

"Irrigation runoff contributes flow & pollutant loads to creeks and beaches that are 303(d) listed for bacteria indicators."

Furthermore, the grant application states:

"Regional program managers agree that the reduction and/or elimination of irrigation-related urban flows and associated pollutant loads may be key to successful attainment of water quality and beneficial use goals as outlined in the San Diego Basin Plan and Bacteria TMDL over the long term."

This is reinforced in the project descriptions and objectives:

"Elevated dry-weather storm drain flows, composed primarily in the South Orange County Region of landscape irrigation water wasted as runoff, carry pollutants that impair recreational use and aquatic habitats all along Southern California's urbanized coastline. Storm drain systems carry the wasted water, along with landscape derived pollutants such as bacteria, nutrients and pesticides, to local creeks and the ocean. Given the local Mediterranean climate, excessive perennial dry season stream flows are an unnatural hydrologic pattern, causing species shifts in local riparian communities and warm, unseasonal contaminated freshwater plumes in the near-shore marine environment".

The basis of this grant project, conducted by the Copermittees and additional water use partners, is that over-irrigation (landscape irrigation, irrigation water and lawn watering) into the MS4 is a source and conveyance of pollutants. In addition, they indicate that this alteration of natural flows is impacting the Beneficial Uses of Waters of the State and U.S.

D. Runoff Management Programs

Finding D.1.a. This Order specifies requirements necessary for the Copermittees to reduce the discharge of pollutants in storm water runoff to the maximum extent practicable (MEP). However, since MEP is a dynamic performance standard, which evolves over time as runoff management knowledge increases, the Copermittees' runoff management programs must continually be assessed and modified to incorporate improved programs, control measures, best management practices (BMPs), etc. in order to achieve the evolving MEP standard. Absent evidence to the contrary, this continual assessment, revision, and improvement of runoff management program implementation is expected to ultimately achieve compliance with water quality standards in the Region.

Discussion of Finding D.1.a. Under CWA section 402(p), municipalities are required to reduce the discharge of storm water pollutants from their MS4s to the maximum extent practicable (MEP). MEP is the critical technology-based performance standard that municipalities must attain. The MEP standard is an ever-evolving, flexible, and advancing concept, which considers technical and economic feasibility. As knowledge about controlling storm water runoff continues to evolve, so does that which constitutes MEP. Reducing the discharge of storm water pollutants to the MEP requires Copermittees to assess each program component and revise activities, control measures, best management practices (BMPs), and measurable goals, as necessary to meet MEP.

To achieve the MEP standard, municipalities must employ whatever BMPs are technically feasible (i.e., are likely to be effective) and are not cost prohibitive. The major emphasis is on technical feasibility. Reducing storm water pollutants to the MEP means choosing effective BMPs, and rejecting applicable BMPs only where other effective BMPs will serve the same purpose, or the BMPs would not be technically feasible, or the cost would be prohibitive. In selecting BMPs to achieve the MEP standard, the following factors may be useful to consider:

1. Effectiveness: Will the BMPs address a pollutant (or pollutant source) of concern?
2. Regulatory Compliance: Is the BMP in compliance with storm water regulations as well as other environmental regulations?
3. Public Acceptance: Does the BMP have public support?
4. Cost: Will the cost of implementing the BMP have a reasonable relationship to the pollution control benefits to be achieved?
5. Technical Feasibility: Is the BMP technically feasible considering soils, geography, water resources, etc?

If a municipality reviews a lengthy menu of BMPs and chooses to select only a few of the least expensive BMPs, it is likely that MEP has not been met. On the other hand, if a municipal discharger employs all applicable BMPs except those where it can show that they are not technically feasible in the locality, or whose cost is prohibitive, it would have met the standard. Where a choice may be made between two BMPs that should provide generally comparable effectiveness, the discharger may choose the least expensive alternative and exclude the more expensive BMP. However, it would not be acceptable either to reject all BMPs that would address a pollutant source, or to pick a BMP based solely on cost, which would be clearly less effective. In selecting BMPs the municipality must make a serious attempt to comply and practical solutions may not be easily dismissed. In any case, the burden is on the municipal discharger to show compliance with its permit. After selecting BMPs, it is the responsibility of the discharger to ensure that all BMPs are implemented.⁹⁰

A definition of MEP is not provided in either the federal statute or in the federal regulations. The final determination regarding whether a municipality has reduced storm water pollutants to the MEP can only be made by the Regional Board or the State Board, and not by the municipal discharger. While the Regional Board or the State Board ultimately define MEP, it is the responsibility of the Copermittees to initially propose actions that implement BMPs to reduce storm water pollution to the MEP. In other words, the Copermittees' runoff management programs to be developed under the Order are the Copermittees' proposals of MEP. Their total collective and individual activities conducted pursuant to their runoff management programs become their proposal for MEP as it applies both to their overall effort, as well as to specific activities. The Order provides a minimum framework to guide the Copermittees in meeting the MEP standard for storm water.

It is the Regional Board's responsibility to evaluate the proposed programs and specific BMPs to determine what constitutes MEP, using the above guidance and the court's 1994 decision in NRDC v. California Department of Transportation, Federal District Court, Central District of California. The federal court stated that a Copermittee must evaluate and implement BMPs except where (1) other effective BMPs will achieve greater or substantially similar pollution control benefits; (2) the BMP is not technically feasible; or (3) the cost of BMP implementation greatly outweighs the pollution control benefits. In the absence of a proposal acceptable to the Regional Board, the Regional Board will define MEP by requiring implementation of additional measures by the Copermittees.

⁹⁰ State Water Resources Control Board, 1993. Memo Entitled Definition of Maximum Extent Practicable.

The Copermittees' continual evolution in meeting the MEP standard is expected to achieve compliance with water quality standards. USEPA has consistently supported this expectation. In its Interim Permitting Approach for Water Quality-Based Effluent Limitations (WQBELs) in Storm Water Permits, USEPA states "the interim permitting approach uses best management practices (BMPs) in first-round storm water permits, and expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for attainment of water quality standards."⁹¹ USEPA reiterated its position in 1999, when it stated regarding the Phase II municipal storm water regulations that "successive iterations of the mix of BMPs and measurable goals will be driven by the objective of assuring maintenance of water quality standards" and "EPA anticipates that a permit for a regulated small MS4 operator implementing BMPs to satisfy the six minimum control measures will be sufficiently stringent to protect water quality, including water quality standards [...]."⁹²

The requirements of the Order are expected to achieve compliance with receiving water quality standards. The approach to be used is the continual assessment, revision, and improvement of Copermittee best management practice implementation. This approach is consistent with the Clean Water Act and State Board guidance. In *Defenders of Wildlife v. Browner* (1999, 197 F. 3d 1035), the United States Court of Appeals for the Ninth Circuit states: "Under 33 U.S.C. section 1342 (p)(3)(B)(iii), the EPA's choice to include either management practices or numeric limitations in the permits was within its discretion." In addition, the approach is consistent with State Board Order WQ 99-05, which outlines an iterative approach for achieving compliance with water quality standards.

Finding D.1.b. The Copermittees have generally been implementing the jurisdictional runoff management programs required pursuant to Order No. R9-2002-01 since February 13, 2003. Prior to that, the Copermittees were regulated by Order No. 96-03 since August 8, 1996. Runoff discharges, however, continue to cause or contribute to violations of water quality standards as evidenced by the Copermittees monitoring results.⁹³

⁹¹ Federal Register / Vol. 61, No. 166 / August 26, 1996 / P. 43761.

⁹² Federal Register / Vol. 64, No. 235 / Wednesday, December 8, 1999 / Rules and Regulations. P. 68753-68754.

⁹³ Orange County Storm Water Program, 2006. Unified Annual Progress Report, Program Effectiveness Assessment (San Diego Region).

Discussion of Finding D.1.b. In response to Order No. R9-2002-01, the Copermittees have improved their runoff management programs. For instance, comprehensive runoff management plans have been developed. In order to implement the plans, the Copermittees have, among other things, developed BMP requirements, improved inter- and intra-governmental coordination, improved training programs, improved illicit discharge detection procedures, and improved their monitoring efforts. Although the programmatic improvements have led to better implementation of BMPs, the Copermittees' monitoring data demonstrate that additional or revised BMPs are necessary to prevent discharges from MS4s from causing and contributing to violations of water quality standards. A discussion of data collected by the Copermittees is included in the discussion for Finding C.9.

Finding D.1.c. This Order contains new or modified requirements that are necessary to improve Copermittees' efforts to reduce the discharge of storm water pollutants in runoff to the MEP and achieve water quality standards. Some of the new or modified requirements, such as the revised Watershed Runoff Management Program section, are designed to specifically address these high priority water quality problems. Other new or modified requirements address program deficiencies that have been noted during audits, report reviews, and other Regional Board compliance assessment activities.

Discussion of Finding D.1.c. The Copermittees are required to update and expand their runoff management programs on jurisdictional and watershed levels in order to improve their efforts to reduce the contribution of storm water pollutants in runoff to the MEP and meet water quality standards. Changes to Order No. R9-2002-01's requirements have been made to help ensure these two standards are achieved by the Copermittees.

The Orders' jurisdictional requirements have changed based on findings by the Regional Board during typical compliance assurance activities or receipt of complaints.⁹⁴ The Regional Board performed full jurisdictional program audits of 8 of the 13 Copermittees during the Order No. R9-2002-01 permit term. Where the audits found common implementation problems, requirements have been altered to better ensure compliance. In addition, the Regional Board conducted detailed reviews of every jurisdictional annual report submitted by the Copermittees. Updates to the Copermittees' programs are also based on recommendations found in the Copermittees' ROWD.⁹⁵ In many instances, the Copermittees and the Regional Board have identified similar issues that merit program modifications.

⁹⁴ Audit reports, report reviews, and inspection reports are available for review at the Regional Board office.

⁹⁵ All significant changes made to the Order's requirements are described and explained in detail in Fact Sheet section X.

To better focus on attainment of water quality standards, the Order's watershed requirements have been improved. The conditions of the receiving waters now drive management actions, which in turn focus diminishing resources on the highest priority water quality problems within the receiving waters in each watershed. Improvements to watershed requirements were also made to facilitate a mutually clear understanding of the requirements between the Regional Board and Copermittees.

Finding D.1.d. Updated Jurisdictional Runoff Management Plans (JRMPs) and Watershed Runoff Management Plans (WRMPs), which describe the Copermittees' runoff management programs in their entirety, are needed to guide the Copermittees' runoff management efforts and aid the Copermittees in tracking runoff management program implementation. It is practicable for the Copermittees to update the JRMPs and WRMPs within one year, since significant efforts to develop these programs have already occurred.

Discussion of Finding D.1.d. Development of runoff management plans is a crucial runoff management measure and should be considered a BMP. The plans help organize and focus the Copermittees' programs and guide their implementation. In its statewide assessment report to USEPA Region IX and the State Board, Tetra Tech, Inc. concluded that the lack of a master storm water planning document must be considered a serious program deficiency⁹⁶. When submitted to the Regional Board, the plans provide useful correspondence between the Copermittees and the Regional Board. The Plans also become available for review by the public, and thus facilitate public participation in runoff management decisions. Finally, while development and submittal of runoff management plans are not necessary to ensure compliance of the Copermittees' runoff management programs with the Order, the Regional Board is provided with a means to track Copermittee implementation.

The focus of the Order is on development and implementation of storm water programs which meet MEP, rather than creation of Copermittee plans which exhibit MEP. While the Order does not rely upon the plans to ensure MEP and other standards are achieved, the plans still serve a useful purpose. As stated above, the plans serve to organize the Copermittees' efforts to address runoff. As a practical matter, any program of the size required by the Order should be documented in writing. This serves to guide implementation of the program by the numerous individuals responsible for program implementation.

⁹⁶ Tetra Tech, Inc. 2006. *Assessment Report on Tetra Tech's Support of California's MS4 Stormwater Program*. Produced for USEPA Region IX and the California State and Regional Water Quality Control Boards.

Runoff management plans are not necessary for ensuring compliance with the Order because the Order itself contains sufficient detailed requirements to ensure that compliance with discharge prohibitions, receiving water limitations, and the narrative standard of MEP for storm water are achieved. Implementation by the Copermittees of programs in compliance with the Order's requirements, prohibitions, and receiving water limitations is the pertinent compliance standard to be used under the Order, as opposed to assessing compliance by reviewing the Copermittees' implementation of their plans alone. The Regional Board ensures compliance with the Order by reviewing annual reports, conducting inspections, performing audits, and through other general program oversight.

Runoff management plans are particularly important and useful for municipalities when program implementation is spread across several departments and/or when municipalities experience staff turnover.⁹⁷ Each Copermittee relies on multiple employees or contractors for program implementation, but the spread of responsibility varies among Copermittees.⁹⁸ Written jurisdictional plans ensure appropriate coordination within each municipality.

Copermittees' runoff management plans are simply descriptions of their runoff management programs required under the Order. These plans serve as procedural correspondence which guides program implementation and aids the Copermittees and Regional Board in tracking implementation of the programs. In this manner, the plans are not functional equivalents of the Order. For these reasons, the Copermittees' runoff management plans need not be an enforceable part of the Order.

The Copermittees' plans and programs can be updated within one year because much of their plans and programs are already in existence. In fact, many parts of their plans and programs have been in place for 15 years. Moreover, the adoption of Order No. R9-2002-01 required a larger scale reorganization of the Copermittees' programs than Tentative Order No. R9-2009-0002, but also allowed one year for program updates. The Copermittees were generally able to meet the time schedule required under Order No. R9-2002-01.

Finding D.1.e. Pollutants can be effectively reduced in storm water runoff by the application of a combination of pollution prevention, source control, and treatment control BMPs. Pollution prevention is the reduction or elimination of pollutant generation at its source and is the best "first line of defense". Source control BMPs (both structural and non-structural) minimize the contact between pollutants and flows (e.g., rerouting run-on around pollutant sources or keeping pollutants on-site and out of receiving waters). Treatment control BMPs remove pollutants that have been mobilized by wet-weather or dry-weather flows.

⁹⁷ Tetra Tech, Inc. 2005. Program Evaluation Report. Orange County Storm Water Program: Cities of Laguna Beach, Laguna Hills, Lake Forest, and Rancho Santa Margarita.

⁹⁸ Responsible departments and employees are described in the 2005-06 Annual Reports for the MS4 programs.

Discussion of Finding D.1.e. The State Board finds in its Order No. WQ 98-01 that BMPs are effective in reducing pollutants in storm water runoff, stating that “implementation of BMPs [is] generally the most appropriate form of effluent limitations when designed to satisfy technology requirements, including reduction of pollutants to the maximum extent practicable.” A State Board TAC further supports this finding by recommending “that nonpoint source pollution control can be accomplished most effectively by giving priority to [BMPs] in the following order:

1. Pollution Prevention – implementation of practices that use or promote pollution free alternatives;
2. Source Control – implementation of control measures that focus on preventing or minimizing urban runoff from contacting pollution sources;
3. Treatment Control – implementation of practices that require treatment of polluted runoff either onsite or offsite.”⁹⁹

Pollution prevention, the reduction or elimination of pollutant generation at its source, is an essential aspect of BMP implementation. Fewer pollutants are available to be washed from developed areas when the generation of pollutants by activities is limited. Thus, pollutant loads in storm water discharges are reduced from these areas. In addition, there is no need to control or treat pollutants that are never generated.¹⁰⁰ Furthermore, pollution prevention BMPs are generally more cost effective than removal of pollutants by treatment facilities or cleanup of contaminated media.^{101,102}

In the Pollution Prevention Act of 1990, Congress established a national policy that emphasizes pollution prevention over control and treatment. CWC section 13263.3(a) also supports pollution prevention, stating “The Legislature finds and declares that pollution prevention should be the first step in a hierarchy for reducing pollution and managing wastes, and to achieve environmental stewardship for society. The Legislature also finds and declares that pollution prevention is necessary to support the federal goal of zero discharge of pollutants into navigable waters.” Finally, the Basin Plan also supports this finding by stating “To eliminate pollutants in storm water, one can either clean it up by removing pollutants or prevent it from becoming polluted in the first place. Because of the overwhelming volume of storm water and the enormous costs associated with pollutant removal, pollution prevention is the only approach that makes sense.”¹⁰³

¹⁰³ Regional Board, 1994. Water Quality Control Plan, San Diego Basin, Region 9.

USEPA also supports the utilization of a combination of BMPs to address pollutants in runoff. For example, USEPA has found there has been success in addressing illicit discharge related problems through BMP initiatives like storm drain stenciling and recycling programs, including household hazardous waste special collection days.¹⁰⁴ Structural BMP performance data has also been compiled and summarized by USEPA.¹⁰⁵

The summary provides the performance ranges of various types of structural BMPs for removing suspended solids, nutrients, pathogens, and metals from storm water flows. These pollutants are generally a concern in storm water in the San Diego Region and Orange County.¹⁰⁶ For suspended solids, the least effective structural BMP type was found to remove 30-65 percent of the pollutant load, while the most effective was found to remove 65-100 percent of the pollutant load. For nutrients, the least effective structural BMP type was found to remove 15-45 percent of the pollutant load, while the most effective was found to remove 65-100 percent of the pollutant load. For pathogens, the least effective structural BMP type was found to remove <30 percent of the pollutant load, while the most effective was found to remove 65-100 percent of the pollutant load. For metals, the least effective structural BMP type was found to remove 15-45 percent of the pollutant load, while the most effective was found to remove 65-100 percent of the pollutant load.

Several studies conducted in the last few years have measured the effectiveness of treatment BMPs in southern Orange County. Studies have been conducted on both dry weather and wet weather flows. Each demonstrates that treatment control BMPs can, to varying degrees, remove pollutants from runoff, but that pollution prevention and source control BMPs are necessary to reduce storm water pollutant discharges to the point of supporting water quality objectives in the receiving waters. A partial list of such studies includes:

1. "Assessment of Best Management Practice (BMP) Effectiveness" by the Southern California Coastal Water Research Project (SCCWRP).¹⁰⁷ This project assesses the effectiveness of BMPs in southern California for improving water quality related to toxicity.
2. "Final Report for the Del Obispo Storm Drain Project" by the City of Dana Point.¹⁰⁸ This report assesses the implementation of a solids removal unit and low-flow diversion project.

3. "Final Report for the Alipaz Storm Drain Treatment and Low Flow Diversion Project" by the City of Dana Point.¹⁰⁹ This report assesses the implementation of a solids removal unit and low-flow diversion project.
4. "Final Report for Poche Beach Urban Runoff Ultraviolet Light Bacteria Disinfection Project" by the County of Orange.¹¹⁰ This report assesses the implementation of an ultraviolet system within a box culvert.
5. Final Report for J01P28 Interim Water Quality Improvement Package Plant Best Management Practices.¹¹¹ This report assesses the implementation of an ultraviolet treatment system at an inland waters storm drain outfall.
6. "Final Report for Wetland Capture and Treatment (WetCAT) Network" by the City of Laguna Niguel.¹¹² This report assesses the implementation of constructed wetlands.

Results of these recent studies demonstrate that treatment at the MS4 outfalls for pollutants that have already been discharged *into* the MS4 is generally unlikely to reduce pollutant concentrations to levels that would support water quality objectives. It also demonstrates that non-storm water discharges are occurring into the MS4 that are illicit discharges, exempted discharges that are a source of pollutants and/or discharges under a separate NPDES permit that are in violation of that permit.

It is important to note that the Clean Water Act and NPDES federal regulations clearly require control of discharges into the MS4. Section 402(p)(3)(B)(ii) of the Clean Water Act states that MS4 permits must "prohibit non-storm water discharges into the storm sewers." 40 CFR 122.26(d)(2)(iv)(B) requires Copermittees to "detect and remove [...] illicit discharges and improper disposal into the storm sewer." See Finding C.14 and Discussion.

The Order's approach to regulating discharges into and from the MS4 is in accordance with State Board Order WQ 2001-15. In that order, the State Board reviewed the San Diego County permit (Order No. 2001-01) requirements and made one change to one prohibition.¹¹³ The Order upheld all other requirements of the current permit. Order No. R9-2009-0002 incorporates the one change made by the State Board, and continues the approach of Order No. 2001-01 (the basis for the current permit), as it was upheld by the State Board in Order WQ 2001-15. State Board Order WQ 2001-15 supports such requirements, stating: "It is important to emphasize that dischargers into MS4s continue to be required to implement a full range of BMPs, including source control."

The Court of Appeals, Fourth Appellate District, found that the current permit's approach to regulation of discharges into the MS4 was appropriate. Since the Tentative Order utilizes the same approach, the court decision supports the Tentative Order's requirements.

Finding D.1.f. Runoff needs to be addressed during the three major phases of urban development (planning, construction, and use) in order to reduce the discharge of storm water pollutants to the MEP, effectively prohibit non-storm water discharges and protect receiving waters. Development which is not guided by water quality planning policies and principles can unnecessarily result in increased pollutant load discharges, flow rates, and flow durations which can impact receiving water beneficial uses. Construction sites without adequate BMP implementation result in sediment runoff rates which greatly exceed natural erosion rates of undisturbed lands, causing siltation and impairment of receiving waters. Existing development generates substantial pollutant loads which are discharged in runoff to receiving waters.

Discussion of Finding D.1.f. MS4 permits are issued to municipalities because of their land use authority. The ultimate responsibility for the pollutant discharges, increased runoff, and inevitable long-term water quality degradation that results from development lies with local governments. This responsibility is based on the fact that it is the local governments that have authorized the development (i.e., conversion of natural pervious ground cover to impervious surfaces) and the land uses that generate the pollutants and runoff. Furthermore, the MS4 through which the pollutants and increased flows are conveyed, and ultimately discharged into natural receiving waters, are owned and operated by the same local governments. In summary, the Copermitees under the Order are responsible for discharges into and out of their MS4s because (1) they own and operate the MS4; and (2) they have the legal authority that authorizes the very development and land uses with generate the pollutants and increased flows in the first place.

¹¹³ The State Board removed the prohibition of discharges *into* the MS4 that cause or contribute to exceedances of water quality objectives. The revision allows for treatment of storm water flows once the pollutants have entered the MS4. It does not affect the effective prohibition on certain dry-weather flows into the MS4 that is required by the Clean Water Act.

For example, since grading cannot commence prior to the issuance of a local grading permit, the Copermittees have a built-in mechanism to ensure that all grading activities are protective of receiving water quality. The Copermittee has the authority to withhold issuance of the grading permit until the project proponent has demonstrated to the satisfaction of the Copermittee that the project will not violate their ordinances or cause the Copermittee to be in violation of its MS4 permit. Since the Copermittee will ultimately be held responsible for any discharges from the grading project by the Regional Board, the Copermittee will want to use its own permitting authority to ensure that whatever measures the Copermittee deems necessary to protect discharges into its MS4 are in fact taken by the project proponent.

The Order holds the local government accountable for this direct link between its land use decisions and water quality degradation. The Order recognizes that each of the three major stages in the development process (development planning, construction, and the use or operational stage) are controlled by and must be authorized by the local government. Accordingly, this permit requires the local government to implement, or require others to implement, appropriate best management practices to reduce storm water pollutant discharges and increased flow during each of the three stages of development.

Including plans for BMP implementation during the design phase of new development and redevelopment offers the most cost effective strategy to reduce storm water runoff pollutant loads to surface waters.¹¹⁴ The Phase II regulations for small municipalities reflect the necessity of addressing runoff during the early planning phase. Due to the greater water quality concerns generally experienced by larger municipalities, Phase II requirements for small municipalities are also applicable to larger municipalities such as the Copermittees. The Phase II regulations direct municipalities to develop, implement, and enforce a program to address storm water runoff from new development and redevelopment projects that disturb greater than or equal to one acre, including projects less than one acre that are part of a larger common plan of development or sale. The program must ensure that controls are in place that would prevent or minimize water quality impacts. This includes developing and implementing strategies which include a combination of structural and/or non-structural BMPs appropriate to the locality. The program must also ensure the adequate long-term operation and maintenance of BMPs.¹¹⁵ USEPA expands on the Phase II regulations for urban development when it recommends that Copermittees:

¹¹⁴ USEPA, 2000. Storm Water Phase II Compliance Assistance Guide. EPA 833-R-00-002.

¹¹⁵ USEPA, 1999. 40 CFR Parts 9, 122, 123, and 124 National Pollutant Discharge Elimination System-Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges; Final Rule. 64 FR 68845.

“Adopt a planning process that identifies the municipality’s program goals (e.g., minimize water quality impacts resulting from post-construction runoff from new development and redevelopment), implementation strategies (e.g., adopt a combination of structural and/or non-structural BMPs), operation and maintenance policies and procedures, and enforcement procedures. In developing your program, you should consider assessing existing ordinances, policies, programs and studies that address storm water runoff quality.”

Management of storm water runoff during the construction phase is also essential. USEPA explains in the preamble to the Phase II regulations that storm water discharges generated during construction activities can cause an array of physical, chemical, and biological water quality impacts. Specifically, the biological, chemical and physical integrity of the waters may become severely compromised due to runoff from construction sites. Fine sediment from construction sites can adversely affect aquatic ecosystems by reducing light penetration, impeding sight-feeding, smothering benthic organisms, abrading gills and other sensitive structures, reducing habitat by clogging interstitial spaces within the streambed, and reducing intergravel dissolved oxygen by reducing the permeability of the bed material. Water quality impairment also results, in part, because a number of pollutants are preferentially absorbed onto mineral or organic particles found in fine sediment. The interconnected process of erosion (detachment of the soil particles), sediment transport, and delivery is the primary pathway for introducing key pollutants, such as nutrients, metals, and organic compounds into aquatic systems.¹¹⁶

Finally, storm water and non-storm water runoff from existing development must be addressed. The Copermittees’ monitoring data exhibits that significant water quality problems exist in receiving waters which receive runoff from areas with extensive existing development, such as Aliso Creek. Source identification, BMP requirements, inspections, and enforcement are all important measures which can be implemented to address runoff from existing development. USEPA supports inspections and enforcement by municipalities when it states “Effective inspection and enforcement requires [...] penalties to deter infractions and intervention by the municipal authority to correct violations. Enforcement mechanisms [...] also must be described.”¹¹⁷

Finding D.1.g. Annual reporting requirements included in this Order are necessary to meet federal requirements and to evaluate the effectiveness and compliance of the Copermittees’ programs.

Discussion of Finding D.1.g. The annual reporting requirements are consistent with federal NPDES regulation 40 CFR 122.41, which states:

¹¹⁶ Ibid., 64 FR 68728.

¹¹⁷ USEPA, 1992. Guidance Manual for the Preparation of Part II of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems. EPA 833-B-92-002.

“The operator of a large or medium municipal separate storm sewer system of a municipal separate storm sewer system that has been designated by the Director under section 122.26(a)(1)(v) of this part must submit an annual report by the anniversary of the date of the issuance of the permit for such a system. The report shall include: (1) The status of implementing the components of the storm water management program that are established as permit conditions; (2) Proposed changes to the storm water management program that are established as permit condition, Such proposed changes shall be consistent with § 122.26(d)(2)iii) of this part; (3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under § 122.26(d)(2)iv) and (d)(2)v) of this part; (4) A summary of data, including monitoring data, that is accumulated throughout the reporting year; (5) Annual expenditures and budget for year following each annual report; (6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; and (7) Identification of water quality improvements or degradation.”

CWC section 13267 provides that “the regional board may require that any person who has discharged [...] shall furnish, under penalty of perjury, technical or monitoring reports which the regional board requires.”

The Regional Board must assess the reports to ensure that the Copermittees’ programs are adequate to assess and address water quality. The reporting requirements can also be useful tools for the Copermittees to review, update, or revise their programs. Areas or issues which have received insufficient efforts can also be identified and improved.

Finding D.1.h. This Order establishes Storm Water Action Levels (SALs) for selected pollutants based on USEPA Rain Zone 6 (arid southwest) Phase I MS4 monitoring data for pollutants in storm water. The SALs were computed as the 90th percentile of the data set, utilizing the statistical based population approach, one of three approaches recommended by the California Water Board’s Storm Water Panel in its report, ‘The Feasibility of Numerical Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities (June 2006). SALs are identified in Section D of this Order. Copermittees shall implement a timely, comprehensive, cost-effective storm water pollution control program to reduce the discharge of pollutants in storm water from the permitted areas so as not to exceed the SALs. SALs express an integration of the adequacy/inadequacy of programmatic measures and BMPs required in this Order.

Discussion of Finding D.1.h. Section 402(p) of the CWA states MS4 permits for storm water shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the

Administrator or the State determines appropriate for the control of such pollutants. This includes requiring numeric effluent limitations for storm water.

SALs are not numeric effluent limitations, which is reflected in language which clarifies an excursion above a SAL does not create a presumption that MEP is not being met. Instead, a SAL exceedance is to be used by the Copermittee as an indication that the MS4 storm water discharge point is a definitive "bad actor," and the result from the monitoring needs to be considered as part of the iterative process for reducing pollutants in storm water to the MEP.

The CWA defines effluent limitations as:

"Any restriction imposed by the Director on quantities, discharge rates, and concentrations of pollutants which are "discharged" from "point sources" into "waters of the United States"..." A SAL is not a restriction on a quantity, rate or concentration, but is a level at which actions that further reduce pollutants from that discharge point need to be evaluated in order to reduce storm water pollutants to the MEP. Thus, SALs are not effluent limitations as defined by the CWC or CWA.

The approach of using "action levels" is consistent with recommendations made by USEPA in their Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits, dated August 26, 1996:

"Under the Clean Water Act(CWA) and NPDES regulations, permitting authorities may employ a variety of conditions and limitations in storm water permits, including best management practices, performance objectives, narrative conditions, monitoring triggers, action levels (e.g., monitoring benchmarks, toxicity reduction evaluation action levels), etc., as the necessary water-quality based limitations, where numeric water quality based effluent limitations are determined to be unnecessary or infeasible". As such, these action levels are not considered numeric water quality-based effluent limitations.

It should be noted that a purpose of monitoring, required under this and previous Orders, is to aid in the evaluation of implemented programs and BMPs in reducing pollutants in storm water discharges to the MEP. The tentative Monitoring and Reporting Program states:

This Receiving Waters and Runoff Monitoring and Reporting Program is intended to meet the following goals:

2. Measure and improve the effectiveness of the Permittees' runoff management programs;
 3. Assess the chemical, physical, and biological impacts to receiving waters resulting from runoff discharges;
 4. Characterize runoff discharges;
 5. Identify sources of specific pollutants;
 6. Prioritize drainage and sub-drainage areas that need management actions;
- and

9. Provide information to implement required BMP improvements.

For the past 4 permit cycles (19 years), Copermittees have utilized non-numerical limitations (BMPs) to control and abate the discharge of any pollutants in storm water discharges to the MEP. Copermittees have been accorded 19 years to research, develop, and deploy BMPs that are capable of reducing storm water discharges from the MS4 to levels represented in SALs. Storm Water Action Levels are set at such a level that any exceedance of a SAL will clearly indicate BMPs being implemented are insufficient to protect the Beneficial Uses of waters of the State. Copermittee shall utilize the exceedance information as a high priority consideration when adjusting and executing annual work plans, as required by this Permit. Failure to appropriately consider and react to SAL exceedances in an iterative manner creates a presumption that the Copermittee(s) have not complied to the MEP.

SALs have been developed utilizing Phase I storm water effluent data (updated February 2008, <http://rpitt.eng.ua.edu/Research/ms4/mainms4.shtml>) from the arid west region (USEPA Rain Zone 6). USEPA Rainfall Zone 6, which includes MS4 effluent data from Orange, San Diego, Los Angeles and Ventura County. While the County of Orange has a large monitoring data set, Regional Board staff have concluded that there is a lack of effluent monitoring from major outfalls that are representative of conditions throughout the Region. The approach taken to derive SALs is a straightforward percentile approach, with the SAL being set as the 90th percentile of the dataset for each constituent. This approach is consistent with the 2006 State Board Panel Report:

"The statistically based population approach would once again rely on the average distribution of measured water quality values developed from many water quality samples taken for many events at many locations. In this case, however, the Action Level would be defined by the central tendency and variance estimates from the population data. For example, the Action Level could be set as two standard deviations above the mean, i.e. if measured concentrations are consistently higher than two standard deviations above the mean, an Action Level would be triggered. Other population based measures of central tendency could be used (i.e. geomean, median, etc.) or estimates of variance (i.e. prediction intervals, etc.). Regardless of which population based estimators are used (or percentile from above), the idea would be to identify the [statistically derived] point at which managers feel concentrations are significantly beyond the norm."

SALs are a measurable criteria which quantifies the performance of BMPs for a particular watershed or subwatershed that discharges storm water MS4 effluent from that particular discharge point. Thus, Copermittees can utilize SAL results to determine the effectiveness BMPs on the effluent from a particular area of the MS4.

SALs represent the lowest 10 percent of pollutant reduction for USEPA Rain Zone 6 MS4 Phase I programs discharging to waters of the United States. For the past 4

permit cycles (19 years), Copermitees have utilized non-numerical limitations (BMPs) to control and abate the discharge of any pollutants in storm water discharges to the MEP. Copermitees have been accorded 19 years to research, develop, and deploy BMPs that are capable of reducing storm water discharges from the MS4 to levels represented in SALs. Storm Water Action Levels are set at such a level that any exceedance of a SAL will indicate to the Copermitee(s) that the discharge is within the lowest 10% of monitored outfalls. Therefore, an exceedance of a SAL warrants priority consideration within the Copermitee iterative process.

Finding D.2.a. The Standard Storm Water Mitigation Plan (SSMP) requirements contained in this Order are consistent with Order WQ-2000-11 adopted by the State Water Resources Control Board (State Board) on October 5, 2000. In the precedential order, the State Board found that the design standards, which essentially require that runoff generated by 85 percent of storm events from specific development categories be infiltrated or treated, reflect the MEP standard. The order also found that the SSMP requirements are appropriately applied to the majority of the Priority Development Project categories contained in Section D.1 of this Order. The State Board also gave Regional Water Quality Control Boards the needed discretion to include additional categories and locations, such as retail gasoline outlets (RGOs), in SSMPs.

Discussion of Finding D.2.a. The post-construction requirements and design standards contained in the SSMP section of Order No. R9-2009-0002 constitute MEP consistent with State Board guidance, court decisions, and Regional Board requirements. The State Board and Regional Boards have made several recent decisions in regards to inclusion of SSMP requirements in MS4 permits. In a precedential decision, State Board WQ Order No. 2000-11, the State Board found that the SSMP provisions constitute MEP for addressing storm water pollutant discharges resulting from Priority Development Projects. The provisions of the SSMP section of the Order are also consistent with those previously issued by the Regional Board for Orange County (Order No. R9-2002-0001) and San Diego County (Order Nos. R9-2001-01 and R9-2007-0001), as well as requirements in the Los Angeles County MS4 permit (Order No. R4-2001-182). In State Board Order WQ 2001-15, the State Board reaffirmed that SSMP requirements constitute MEP. Moreover, the SSMP requirements of the San Diego County MS4 permit (Order No. R9-2001-01) were upheld when the California State Supreme Court declined to hear the matter on appeal.

Finding D.2.b. Controlling runoff pollution by using a combination of onsite source control and site design BMPs augmented with treatment control BMPs before the runoff enters the MS4 is important for the following reasons: (1) Many end-of-pipe BMPs (such as diversion to the sanitary sewer) are typically ineffective during significant storm events. Whereas, onsite source control BMPs can be applied during all runoff conditions; (2) End-of-pipe BMPs are often incapable of capturing and treating the wide range of pollutants which can be generated on a sub-watershed scale; (3) End-of-pipe BMPs are more effective when used as polishing BMPs, rather than the sole BMP to be implemented; (4) End-of-pipe BMPs do not protect the quality or beneficial uses of receiving waters between the pollutant source and the BMP; and (5) Offsite end-of-pipe BMPs do not aid in the effort to educate the public regarding sources of pollution and their prevention.

Discussion of Finding D.2.b. Many end-of-pipe BMPs are designed for low flow conditions because their end-of-pipe location prevents them from being designed for large storm events. This results in the end-of-pipe BMPs being overwhelmed, bypassed, or ineffective during larger storm events more frequently than onsite BMPs designed for larger storms. BMPs are also frequently most effective for a particular type of pollutant (such as sediment). Such BMPs may be appropriate for small sites with a limited suite of pollutants generated; however, end-of-pipe BMPs must typically be able to address a wide range of pollutants generated by a sub-watershed, limiting their effectiveness and/or increasing costs. Moreover, the location of some end-of-pipe BMPs allow for untreated pollutants to be discharged to and degrade receiving waters prior to their reaching the BMPs. This fails to protect receiving waters, which is the purpose of BMP implementation. In addition, opportunities to educate the public regarding runoff pollution can be lost when end-of-pipe BMPs are located away from pollutant sources and out of sight. Onsite BMPs can lead to a better public understanding of runoff issues since their presence can provide a visible and/or tangible lesson in pollution prevention.

Finding D.2.c. Use of Low-Impact Development (LID) site design BMPs at new development, redevelopment and retrofit projects can be an effective means for minimizing the impact of storm water runoff discharges from the development projects on receiving waters. LID is a site design strategy with a goal of maintaining or replicating the pre-development hydrologic regime through the use of design techniques. LID site design BMPs help preserve and restore the natural hydrologic cycle of the site, allowing for filtration and infiltration which can greatly reduce the volume, peak flow rate, velocity, and pollutant loads of storm water runoff. Current runoff management, knowledge, practices and technology have resulted in the use of LID BMPs as an acceptable means of meeting the storm water MEP standard.

Discussion of Finding D.2.c. The Clean Water Act (CWA) is the cornerstone of surface water quality protection in the United States. (The Act does not deal directly with ground water nor with water quantity issues.) The statute employs a variety of regulatory and nonregulatory tools to sharply reduce direct pollutant discharges into

waterways, and manage polluted runoff. These tools are employed to achieve the broader goal of restoring and maintaining the chemical, physical, and biological integrity of the nation's waters so that they can support the protection and propagation of fish, shellfish, wildlife and recreation in and on the water.

Increasing the volume, velocity, frequency and discharge duration of storm water runoff from developed areas will eventually greatly accelerate downstream erosion, impair stream habitat in natural drainages, and negatively impact beneficial uses. Development and urbanization increase pollutant loads and volume while simultaneously increasing impervious area. Impervious surfaces can neither absorb water nor remove pollutants and thus lose the purification and infiltration provided by naturally vegetated soil. Furthermore, impervious surfaces tend to concentrate pollutants on the top of the surface that are then washed off into the MS4 and waters of the State in a concentrated manner. The use of Low-Impact Development (LID) site design BMPs can be an effective means of minimizing the impact of runoff discharges on receiving waters. By reducing water pollution, reducing runoff and increasing groundwater recharge, LID helps to improve the quality of receiving surface waters, stabilize the flow rates of receiving waters (preventing downstream hydromodification), reduce downstream flooding and protect and enhance water supply sources. Current runoff management, knowledge, practice and technology has resulted in the use of LID BMPs as an acceptable means of meeting the MEP standard for storm water treatment.

Current municipal codes may oppose or hinder the design, use and implementation of specific elements of LID. These codes include, but are not limited to, emergency services access requirements, building landscape ordinances, building height limits and parking space requirements. It is essential for Copermittees to work with other responsible agencies and/or update codes that have the potential to impact the use of LID.

The Local Government Commission, a non-profit organization working to build livable communities, developed a set of principles known as the *Ahwahnee Water Principles for Resource-Efficient Land Use*¹¹⁸ that provide the opportunity to reduce costs and improve the reliability and quality of our water resources. Implementation of LID incorporates several of the Ahwahnee principles such as:

1. "Community Design should be compact, mixed use, walkable and transit-oriented so that urban runoff pollutants are minimized and the open lands that absorb water are preserved to the maximum extent possible."
3. "Water holding areas such as creek beds, recessed athletic fields, ponds, cisterns, and other features that serve to recharge groundwater, reduce runoff, improve water quality and decrease flooding should be incorporated into the urban landscape."

¹¹⁸ Local Government Commission, "The Ahwahnee Water Principles – A Blueprint for Regional Sustainability", http://water.lgc.org/Members/tony/docs/lgc_water_guide.pdf

4. "All aspects of landscaping from the selection of plants to soil preparation and the installation of irrigation systems should be designed to reduce water demand, retain runoff, decrease flooding, and recharge groundwater."
5. "Permeable surfaces should be used for hardscape. Impervious surfaces such as driveways, streets, and parking lots should be minimized so that land is available to absorb storm water, reduce polluted urban runoff, recharge groundwater and reduce flooding."

The use of LID site design BMPs helps reduce the amount of impervious area associated with development and allows storm water to infiltrate into the soil. Natural vegetation and soil filters storm water runoff and reduces the volume and pollutant loads of storm water. Studies have revealed that the level of imperviousness resulting from development and urbanization is strongly correlated with the water quality impairment of nearby receiving waters.¹¹⁹ In many cases, the impacts on receiving waters due to changes in hydrology can be more significant than those attributable to the contaminants found in storm water discharges.¹²⁰ These impacts include stream bank erosion (increased sediment load and subsequent deposition), benthic habitat degradation, and decreased diversity of macroinvertebrates. Although conventional BMPs do reduce storm water pollutant loads, they may not effectively control adverse effects from changes in the discharge hydrologic conditions.¹²¹

The Order includes requirements for developments to include site design BMPs that mimic or replicate the natural hydrologic cycle. Open space designs which maximize pervious surfaces and retention of "natural" drainages have been found to reduce both the costs of development and pollutant export.¹²² Moreover, USEPA finds including plans for a "natural" site design and BMP implementation during the design phase of new development and redevelopment offers the most cost effective strategy to reduce storm water pollutant loads to surface waters.¹²³ In addition, a recent U.S. Department of Housing and Urban Development guidance document on low-impact development notes that the use of LID-based storm water management design allows land to be developed, but in a cost-effective manner that helps mitigate potential environmental impacts.¹²⁴

Finding D.2.d. Retail Gasoline Outlets (RGOs) are significant sources of pollutants in storm water runoff. RGOs are points of convergence for motor vehicles for automotive related services such as repair, refueling, tire inflation, and radiator fill-up and consequently produce significantly higher loadings of hydrocarbons and trace metals (including copper and zinc) than other developed areas.

Discussion of Finding D.2.d. RGOs are included in the Order as a Priority Development Project category because RGOs produce significantly greater loadings of hydrocarbons and trace metals (including copper and zinc) than other developed areas. To meet the storm water MEP standard, source control and structural treatment BMPs are needed at RGOs that meet the following criteria: (a) 5,000 square feet or more or (b) an ADT of 100 or more vehicles per day. These are appropriate thresholds since vehicular development size and volume of traffic are good indicators of potential impacts of storm water runoff from RGOs on receiving waters.

This finding has been added to satisfy State Board WQ Order No. 2000-11's requirements for including RGOs as a Priority Development Category. Order No. 2000-11 acknowledged that a threshold (size, average daily traffic, etc.) appropriate to trigger SSMP requirements should be developed for RGOs and that specific findings regarding RGOs should be included in MS4 permits to justify the requirement.¹²⁵ Additional detail to support the inclusion of RGOs can be found in the Fact Sheet discussion of Section D.1.d.2.j.

Finding D.2.e. Industrial sites are significant sources of pollutants in runoff. Pollutant concentrations and loads in runoff from industrial sites are similar or exceed pollutant concentrations and loads in runoff from other land uses, such as commercial or residential land uses. As with other land uses, LID site design, source control, and treatment control BMPs are needed at industrial sites in order to meet the MEP standard. These BMPs are necessary where the industrial site is larger than 10,000 square feet. The 10,000 square feet threshold is appropriate, since it is consistent with requirements in other Phase I NPDES storm water regulations throughout California.

¹²⁵ State Board, 2000. Order WQ 2000-11. In the Matter of the Petitions of The Cities Of Bellflower, Et Al., The City Of Arcadia, And Western States Petroleum Association Review of January 26, 2000 Action of the Regional Board And Actions and Failures to Act by both the California Regional Water Quality Control Board, Los Angeles Region and Its Executive Officer Pursuant to Order No. 96-054, Permit for Municipal Storm Water and Urban Run-Off Discharges Within Los Angeles County [NPDES NO. CAS614001] SWRCB/OCC FILES A-1280, A-1280(a) and A-1280(b)

Discussion of Finding D.2.e. Industrial sites can be a significant source of pollutants in storm water runoff. In an extensive review of storm water literature, the LARWQCB found widespread support for the finding that "industrial and commercial activities can also be considered hot spots as sources of pollutants." It also found that "industrial and commercial areas were likely to be the most significant pollutant source areas" of heavy metals.¹²⁶ Likewise, storm water runoff from heavy industry in the Santa Clara Valley has been found to be extremely toxic.¹²⁷ These findings are corroborated by USEPA, which states in the preamble to the 1990 Phase I NPDES storm water regulations that "Because storm water from industrial facilities may be a major contributor of pollutants to municipal separate storm sewer systems, municipalities are obligated to develop controls for storm water discharges associated with industrial activity through their system in their storm water management program." Since heavy industrial sites can be a significant source of pollutants in runoff in a manner similar to other SSMP project categories such as commercial development or automotive repair shops, it is appropriate to include heavy industrial sites as a SSMP category in the Order.

The Phase I NPDES storm water regulations require the Copermittees to "control through ordinance, permit, contract, order, or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity" (40 CFR 122.26(d)(2)(i)). In addition, it has been established that the MEP standard for the control of storm water runoff from new development projects includes incorporation of the SSMP requirements. Since the Copermittees must both control storm water pollutants from industrial sites and meet the storm water MEP standard for new development, it is appropriate to apply the SSMP requirements to heavy industrial sites.

The State Board's Order WQ 2000-11 indicates that it is appropriate to apply SSMP requirements to categories of development where evidence shows the category of development can be a significant source of pollutants. As evidenced above, heavy industrial sites can be a significant source of pollutants. Therefore, the Order includes heavy industrial sites as a SSMP Priority Development Project category.

¹²⁷ Schueler and Holland, 2000. Storm Water Strategies for Arid and Semi-Arid Watersheds (Article 66). The Practice of Watershed Protection.

Finding D.2.f. If not properly designed or maintained, certain BMPs implemented or required by municipalities for runoff management may create a habitat for vectors (e.g. mosquitoes and rodents). However, proper BMP design and maintenance to avoid standing water can prevent the creation of vector habitat. Nuisances and public health impacts resulting from vector breeding can be prevented with close collaboration and cooperative effort between municipalities, the Orange County Vector Control District, and the California Department of Public Health during the development and implementation of runoff management programs.

Discussion of Finding D.2.f. The implementation of certain structural BMPs or other runoff treatment systems can result in significant vector problems in the form of increased breeding or harborage habitat for mosquitoes, rodents or other potentially disease transmitting organisms. The implementation of BMPs that retain water may provide breeding habitat for a variety of mosquito species, some of which have the potential to transmit diseases such as Western Equine Encephalitis, St. Louis Encephalomyelitis, and malaria. Recent BMP implementation studies by Caltrans¹²⁸ in District 7 and District 11 have demonstrated mosquito breeding associated with some types of BMPs. The Caltrans BMP Retrofit Pilot study cited lack of maintenance and improper design as factors contributing to mosquito production. However, a Watershed Protection Techniques article describes management techniques for selecting, designing, and maintaining structural treatment BMPs to minimize mosquito production.¹²⁹ State and local runoff management programs that include structural BMPs with the potential to retain water have been implemented in Florida and the Chesapeake Bay region without resulting in significant public health threats from mosquitoes or other vectors.¹³⁰

Finding D.2.g. The increased volume, velocity, frequency and discharge duration of storm water runoff from developed areas has the potential to greatly accelerate downstream erosion, impair stream habitat in natural drainages, and negatively impact beneficial uses. Development and urbanization increase pollutant loads in storm water runoff and the volume of storm water runoff. Impervious surfaces can neither absorb water nor remove pollutants and thus lose the purification and infiltration provided by natural vegetated soil. Hydromodification measures for discharges to hardened channels allow for the future restoration of the hardened channels to their natural state, thereby restoring the chemical, physical, and biological integrity and Beneficial Uses of local receiving waters.

¹³⁰ Shaver, E. and R. Baldwin, 1995. Sand Filter Design for Water Quality Treatment in Herricks, E., Ed. Stormwater Runoff and Receiving Systems: Impact, Monitoring, and Assessment, CRC Lewis Publishers, New York, NY.

Discussion of Finding D.2.g. Increasing the volume, velocity, frequency and discharge duration of storm water runoff from developed areas will eventually greatly accelerate downstream erosion, impair stream habitat in natural drainages, and negatively impact beneficial uses. Development and urbanization increase pollutant loads and volume while simultaneously increasing impervious area. Impervious surfaces can neither absorb water nor remove pollutants and thus lose the purification and infiltration provided by naturally vegetated soil.

Historic hydromodification impacts, such as concrete lining and channelization, have impacted the natural physical habitat of urban streams resulting in low Index of Biotic Integrity (IBI) scores. The Copermittee's 2006-2007 monitoring indicated decreased IBI scores in the developed watersheds. In the absence of water chemistry and toxicity impacts, these low scores were attributed to be a result of poor physical habitat conditions.¹³¹

Hydromodification impacts result in poor physical habitat conditions through streambed scour, erosion, vegetation displacement, sediment deposition, channelization and channel modifications. Increased sediment loads from hydromodification causes other impacts to physical habitats including increased turbidity which then may cause increased temperatures. In addition, an increased sediment load may have an increased biological content thereby increasing the sediment oxygen demand and lowering the dissolved oxygen available for aquatic life.¹³²

The objective of the CWA is "to restore and maintain the chemical, *physical*, and biological integrity of the Nation's waters (emphasis added)." Stream restoration by removing concrete and other unnatural materials is a major step toward achieving that objective. The success of future stream restoration and stabilization is, however, dependent on preventing and reducing physical impacts from activities upstream. Therefore, hydromodification management measures are necessary upstream of modified (e.g. concrete, rip rap, etc.) channels in addition to non-modified channels.

Please see discussion of Findings C.10 and C.11.

Finding D.3.a. In accordance with federal NPDES regulations and to ensure the most effective oversight of industrial and construction site discharges, discharges of runoff from industrial and construction sites are subject to dual (state and local) storm water regulation. Under this dual system, each Copermitttee is responsible for enforcing its local permits, plans, and ordinances, and the Regional Board is responsible for enforcing the General Construction Activities Storm Water Permit, State Board Order 99-08 DWQ, NPDES No. CAS000002 (General Construction Permit) and the General Industrial Activities Storm Water Permit, State Board Order 97-03 DWQ, NPDES No. CAS000001 (General Industrial Permit). NPDES municipal regulations require that municipalities develop and implement measures to address runoff from industrial and construction activities. Those measures may require the implementation of additional BMPs than are required under the statewide general permits for activities subject to both state and local regulation.

Discussion of Finding D.3.a. USEPA finds the control of pollutant discharges from industry and construction so important to receiving water quality that it has established a double system of regulation over industrial and construction sites. This double system of regulation consists of two parallel regulatory systems with the same common objective: to keep pollutants from industrial and construction sites out of the MS4. In this double system of regulation for runoff from industrial and construction sites, local governments must enforce their legal authorities (i.e., local ordinances and permits) while the Regional Board must enforce its legal authority (i.e., statewide general industrial and construction storm water permits). These two regulatory systems are designed to complement and support each other. Municipalities are not required to enforce Regional Board and State Board permits; however, they are required to enforce their ordinances and permits. The Federal regulations are clear that municipalities have responsibility to prevent non-storm water and address storm water runoff from industrial and construction sites which enters their MS4s.

Municipalities have this responsibility because they have the authority to issue land use and development permits. Since municipalities are the lead permitting authority for industrial land use and construction activities, they are also the lead for enforcement regarding runoff discharges from these sites. For sites where the municipality is the lead permitting authority, the Regional Board will work with the municipality and provide support where needed. The Regional Board will assist municipalities in enforcement against non-compliant sites after the municipality has exhibited a good faith effort to bring the site into compliance.

According to USEPA, the storm water regulations envision that NPDES permitting authorities and municipal operators will cooperate to develop programs to monitor and control pollutants in storm water discharges from industrial facilities.¹³³ USEPA discusses the “dual regulation” of construction sites in its Storm Water Phase II Compliance Assistance Guide, which states “Even though all construction sites that disturb more than one acre are covered nationally by an NPDES storm water permit, the construction site runoff control minimum measure [...] is needed to induce more localized site regulation and enforcement efforts, and to enable operators [...] to more effectively control construction site discharges into their MS4s.”¹³⁴ While the Storm Water Phase II Compliance Assistance Guide applies to small municipalities, it is applicable to the Copermittees, because they are similar in size and have the potential to discharge similar pollutant types as Phase II municipalities.

Finding D.3.b. Identification of sources of pollutants in runoff (such as municipal areas and activities, industrial and commercial sites/sources, construction sites, and residential areas), development and implementation of BMPs to address those sources, and updating ordinances and approval processes are necessary for the Copermittees to ensure that discharges of pollutants from its MS4 in storm water are reduced to the MEP and that non-storm water discharges are not occurring. Inspections and other compliance verification methods are needed to ensure minimum BMPs are implemented. Inspections are especially important at high risk areas for pollutant discharges.

Discussion of Finding D.3.b. Source identification is necessary to characterize the nature and extent of pollutants in discharges and to develop appropriate BMPs. It is the first step in a targeted approach to runoff management. Source identification helps identify the location of potential sources of pollutants in runoff. Pollutants found to be present in receiving waters can then be traced to the sites which frequently generate such pollutants. In this manner source inventories can help to target inspections, monitoring, and potential enforcement. This allows for limited inspection, monitoring, and enforcement time to be most effective. USEPA supports source identification as a concept when it recommends construction, municipal, and industrial source identification in guidance and the federal regulations.^{135,136}

¹³³ USEPA, 1992. Guidance Manual for the Preparation of Part II of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems. EPA 833-B-92-002.

¹³⁴ USEPA, 2000. Storm Water Phase II Compliance Assistance Guide. EPA 833-R-00-002.

¹³⁵ USEPA, 1992. Guidance Manual for the Preparation of Part II of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems. EPA 833-B-92-002.

¹³⁶ 40 CFR 122.26(d)(2)(ii)

The development of BMPs for identified sources will help ensure that appropriate, consistent controls are implemented at all types of development and areas. Copermittees must reduce the discharge of pollutants in storm water runoff to the maximum extent practicable. To achieve this level of pollutant reduction, BMPs must be implemented. Designation of minimum BMPs helps ensure that appropriate BMPs are implemented for various sources. These minimum BMPs also serve as guidance as to the level of water quality protection required. USEPA requires development and implementation of BMPs for construction, municipal, commercial, industrial, and residential sources at 40 CFR 122.26(d)(2)(iv)(A-D).

Updating ordinances and approval processes is necessary in order for the Copermittees to control discharges to their MS4s. USEPA supports updating ordinances and approval processes when it states “A crucial requirement of the NPDES storm water regulation is that a municipality must demonstrate that it has adequate legal authority to control the contribution of pollutants in storm water discharged to its MS4. [...] In order to have an effective municipal storm water management program, a municipality must have adequate legal authority to control the contribution of pollutants to the MS4. [...] ‘Control,’ in this context, means not only to require disclosure of information, but also to limit, discourage, or terminate a storm water discharge to the MS4.”¹³⁷

Inspections provide a necessary means for the Copermittees to evaluate compliance of pollutant sources with their municipal ordinances and minimum BMP requirements. USEPA supports inspections when it recommends inspections of construction, municipal, and industrial sources.¹³⁸ Inspection of high risk sources are especially important because of the ability of frequent inspections to help ensure compliance, thereby reducing the risk associated with such sources. USEPA suggests that inspections can improve compliance when it states “Effective inspection and enforcement requires [...] penalties to deter infractions and intervention by the municipal authority to correct violations.”¹³⁹

Finding D.3.c. Historic and current development makes use of natural drainage patterns and features as conveyances for runoff. Urban streams used in this manner are part of the municipalities MS4 regardless of whether they are natural, anthropogenic, or partially modified features. In these cases, the urban stream is both an MS4 and receiving water.

¹³⁷ USEPA, 1992. Guidance Manual for the Preparation of Part II of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems. EPA 833-B-92-002.

¹³⁸ Ibid.

¹³⁹ USEPA, 1992. Guidance Manual for the Preparation of Part II of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems. EPA 833-B-92-002.

Discussion of Finding D.3.c. An MS4 is defined in the federal regulations as a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains), owned or operated by a Copermittee, and designed or used for collecting or conveying runoff.¹⁴⁰ Natural drainage patterns and urban streams are frequently used by municipalities to collect and convey runoff away from development within their jurisdiction. Therefore, the Regional Board considers natural drainages that are used for conveyances of runoff, regardless of whether or not they've been altered by the municipality, as both part of the MS4s and as receiving waters. To clarify, an unaltered natural drainage, which receives runoff from a point source (channeled by a Copermittee to drain an area within their jurisdiction), which then conveys the runoff to an altered natural drainage or a man-made MS4, is both an MS4 and a receiving water.¹⁴¹

Finding D.3.d. As operators of the MS4s, the Copermittees cannot passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or control. These discharges may cause or contribute to a condition of contamination or a violation of water quality standards.

¹⁴⁰ USEPA, 2000. EPA Administered Permit Programs: The National Pollutant Discharge Elimination System. Code of Federal Regulations, Vol. 40, Part 122.

¹⁴¹ Regional Board, 2001. Response in Opposition to Petitions for Review of California Regional Water Quality Control Board San Diego Region Order No. 2001-01 – NPDES Permit No. CAS0108758 (San Diego Municipal Storm Water Permit).

Discussion of Finding D.3.d. CWA section 402(p) requires operators of MS4s to prohibit non-storm water discharges into their MS4s. This is necessary because pollutants which enter the MS4 generally are conveyed through the MS4 to be eventually discharged into receiving waters. If a municipality does not prohibit non-storm water discharges, it is providing the pathway (its MS4) which enables pollutants to reach receiving waters. Since the municipality's storm water management service can result in pollutant discharges to receiving waters, the municipality must accept responsibility for the water quality consequences resulting from this service. Furthermore, third party discharges can cause a municipality to be out of compliance with its permit. Since pollutants from third parties which enter the MS4 will eventually be discharged from the MS4 to receiving waters, the third party discharges can result in a situation of municipality non-compliance if the discharges lead to an exceedance of water quality standards. For these reasons, each Copermittee must prohibit and/or control discharges from third parties to its MS4. USEPA supports this concept when it states "the operators of regulated small MS4s cannot passively receive and discharge pollutants from third parties" and "the operator of a small MS4 that does not prohibit and/or control discharges into its system essentially accepts 'title' for those discharges. At a minimum, by providing free and open access to the MS4s that convey discharges to the waters of the United States, the municipal storm sewer system enables water quality impairment by third parties."¹⁴²

Finding D.3.e. Waste and pollutants which are deposited and accumulate in MS4 drainage structures will be discharged from these structures to waters of the U.S. unless they are removed. These discharges may cause or contribute to, or threaten to cause or contribute to, a condition of pollution in receiving waters. For this reason, pollutant discharges from storm water into MS4s must be reduced using a combination of management measures, including source control, and an effective MS4 maintenance program must be implemented by each Copermittee.

Discussion of Finding D.3.e. When rain falls and drains freeways, industries, construction sites, and neighborhoods, it picks up a multitude of pollutants. Gravity flow transports the pollutants to the MS4. Illicit discharges and connections also can contribute a significant amount of pollutants to MS4s. MS4s are commonly designed to convey their contents as quickly as possible. Due to the resulting typically high flow rates within the concrete conveyance systems of MS4s, pollutants which enter or are deposited in the MS4 and not removed are generally flushed unimpeded through the MS4 to waters of the United States. Since treatment generally does not occur within the MS4, in such cases reduction of storm water pollutants to the MEP must occur prior to discharges entering the MS4.

¹⁴² Federal Register / Vol. 64, No. 235 / Wednesday, December 8, 1999 / Rules and Regulations. P. 68765-68766.

The importance of this concept is supported by the tons of wastes/pollutants that have been removed from the Copermittees' MS4s as reported in their ROWD.¹⁴³ Moreover, these pollutants will be discharged into receiving waters unless an effective MS4 and structural treatment BMP maintenance program is implemented by the Copermittees. The requirement for Copermittees to conduct a MS4 maintenance program is specifically directed in both the Phase I and Phase II storm water regulations. Regarding MS4 cleaning, USEPA states "The removal of sediment, decaying debris, and highly polluted water from catch basins has aesthetic and water quality benefits, including reducing foul odors, reducing suspended solids, and reducing the load of oxygen-demanding substances that reach receiving waters."¹⁴⁴ It goes on to say, "Catch basin cleaning is an efficient and cost-effective method for preventing the transport of sediment and pollutants to receiving water bodies." USEPA also finds that "Lack of maintenance often limits the effectiveness of storm water structural controls such as detention/retention basins and infiltration devices. [...] The proposed program should provide for maintenance logs and identify specific maintenance activities for each class of control, such as removing sediment from retention ponds every five years, cleaning catch basins annually, and removing litter from channels twice a year."¹⁴⁵

Finding D.3.f. Enforcement of local runoff related ordinances, permits, and plans is an essential component of every runoff management program and is specifically required in the federal storm water regulations and this Order. Each Copermittee is individually responsible for adoption and enforcement of ordinances and/or policies, implementation of identified control measures/BMPs needed to prevent or reduce pollutants in storm water runoff, and for the allocation of funds for the capital, operation and maintenance, administrative, and enforcement expenditures necessary to implement and enforce such control measures/BMPs under its jurisdiction. Education is an important aspect of every effective runoff management program and the basis for changes in behavior at a societal level. Education of municipal planning, inspection, and maintenance department staffs is especially critical to ensure that in-house staffs understand how their activities impact water quality, how to accomplish their jobs while protecting water quality, and their specific roles and responsibilities for compliance with this Order. Public education, designed to target various urban land users and other audiences, is also essential to inform the public of how individual actions affect receiving water quality and how adverse effects can be minimized.

¹⁴³ Orange County Storm Water Copermittees. 2006. Report of Waste Discharge (San Diego Region).

¹⁴⁴ USEPA, 1999. Storm Water O&M Fact Sheet, Catch Basin Cleaning. EPA 832-F-99-011.

¹⁴⁵ USEPA, 1992. Guidance Manual for the Preparation of Part II of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems. EPA 833-B-92-002.

Discussion of Finding D.3.f. The Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A – D) are clear in placing responsibility on municipalities for control of runoff from third party activities and land uses to their MS4.¹⁴⁶ In order for municipalities to assume this responsibility, they must implement ordinances, permits, and plans addressing runoff from third parties. Assessments for compliance with their ordinances, permits, and plans are essential for a municipality to ensure that third parties are not causing the municipality to be in violation of its municipal storm water permit. When conditions of non-compliance are determined, enforcement is necessary to ensure that violations of municipality ordinances and permits are corrected. When the Copermittees determine a violation of its storm water ordinance, it must pursue correction of the violation. Without enforcement, third parties do not have incentive to correct violations. USEPA supports enforcement by municipalities when it states “Effective inspection and enforcement requires [...] penalties to deter infractions and intervention by the municipal authority to correct violations. Enforcement mechanisms [...] also must be described.”¹⁴⁷

Education is a critical BMP and an important aspect of runoff management programs. USEPA finds that “An informed and knowledgeable community is critical to the success of a storm water management program since it helps ensure the following: Greater support for the program as the public gains a greater understanding of the reasons why it is necessary and important, [and] greater compliance with the program as the public becomes aware of the personal responsibilities expected of them and others in the community, including the individual actions they can take to protect or improve the quality of area waters.”¹⁴⁸

Regarding target audiences, USEPA also states “The public education program should use a mix of appropriate local strategies to address the viewpoints and concerns of a variety of audiences and communities, including minority and disadvantaged communities, as well as children.”

Finding D.3.g. Public participation during the development of runoff management programs is necessary to ensure that all stakeholder interests and a variety of creative solutions are considered.

Discussion of Finding D.3.g.

This finding is supported by the Phase II Storm Water Regulations, which state “early and frequent public involvement can shorten implementation schedules and broaden public support for a program.” USEPA goes on to explain, “Public participation is likely to ensure a more successful storm water program by providing valuable expertise and a conduit to other programs and governments.”¹⁴⁹

Finding D.3.h. Retrofitting existing development with storm water treatment controls including LID, is necessary to address storm water discharges from existing development that may cause or contribute to a condition of pollution or a violation of water quality standards. Although SSMP BMPs are required for redevelopment, the current rate of redevelopment will not address water quality problems in a timely manner. Cooperation with private landowners is necessary to effectively identify, implement and maintain retrofit projects for the preservation, restoration, and enhancement of water quality.

Discussion of Finding D.3.h. Existing BMPs are not sufficient to protect the Beneficial Uses of receiving waters from storm water MS4 discharges, as evidenced by 303(d) listings and exceedances of Water Quality Objectives from the Copermittees monitoring reports. Implementing more advanced BMPs, including the retrofitting of existing development with LID, is part of the iterative process. Based on the current rate of redevelopment compared to existing BMPs, the use of LID only on new and redevelopment will not adequately address current water quality problems, including downstream hydromodification. Retrofitting existing development is practicable for a municipality through a systematic evaluation, prioritization and implementation plan focused on impaired water bodies, pollutants of concern, areas of downstream hydromodification, feasibility and effective communication and cooperation with private property owners.

Finding D.4.a. Since runoff within a watershed can flow from and through multiple land uses and political jurisdictions, watershed-based runoff management can greatly enhance the protection of receiving waters. Such management provides a means to focus on the most important water quality problems in each watershed. By focusing on the most important water quality problems, watershed efforts can maximize protection of beneficial use in an efficient manner. Effective watershed-based runoff management actively reduces pollutant discharges and abates pollutant sources causing or contributing to watershed water quality problems. Watershed-based runoff management that does not actively reduce pollutant discharges and abate pollutant sources causing or contributing to watershed water quality problems can necessitate implementation of the iterative process outlined in section A.3 of the Tentative Order. Watershed management of runoff does not require Copermittees to expend resources outside of their jurisdictions. Watershed management requires the Copermittees within a watershed to develop a watershed-based management strategy, which can then be implemented on a jurisdictional basis.

Discussion of Finding D.4.a. In recent years, addressing water quality issues from a watershed perspective has increasingly gained attention. Regarding watershed-based permitting, the USEPA *Watershed-Based NPDES Permitting Policy Statement* issued on Jan. 7, 2004 states the following:

USEPA continues to support a holistic watershed approach to water quality management. The process for developing and issuing NPDES permits on a watershed basis is an important tool in water quality management. USEPA believes that developing and issuing NPDES permits on a watershed basis can benefit all watershed stakeholders, from the NPDES permitting authority to local community members. A watershed-based approach to point source permitting under the NPDES program may serve as one innovative tool for achieving new efficiencies and environmental results. USEPA believes that watershed-based permitting can:

- Lead to more environmentally effective results;
- Emphasize measuring the effectiveness of targeted actions on improvements in water quality;
- Provide greater opportunities for trading and other market based approaches;
- Reduce the cost of improving the quality of the nation's waters;
- Foster more effective implementation of watershed plans, including total maximum daily loads (TMDLs); and
- Realize other ancillary benefits beyond those that have been achieved under the CWA (e.g., facilitate program integration including integration of clean water act and safe drinking water act programs).

Watershed-based permitting is a process that ultimately produces NPDES permits that are issued to point sources on a geographic or watershed basis. In establishing point source controls in a watershed-based permit, the permitting authority may focus on watershed goals, and consider multiple pollutant sources and stressors, including the level of nonpoint source control that is practicable. In general, there are numerous permitting mechanisms that may be used to develop and issue permits within a watershed approach.

This USEPA guidance is in line with State Board and Regional Board watershed management goals. For example, the State Board's TAC recommends watershed-based water quality protection, stating "Municipal permits should have watershed specific components." The TAC further recommends that "All NPDES permits and Waste Discharge Requirements should be considered for reissuance on a watershed basis."

In addition, the Basin Plan states that "public agencies and private organizations concerned with water resources have come to recognize that a comprehensive evaluation of pollutant contributions on a watershed scale is the only way to realistically assess cumulative impacts and formulate workable strategies to truly protect our water resources. Both water pollution and habitat degradation problems can best be solved by following a basin-wide approach."

In light of USEPA's policy statement and the State Board's and Regional Board's watershed management goals, the Regional Board seeks to expand watershed management in the regulation of runoff from the MS4. Watershed-based MS4 permits can provide for more effective receiving water quality protection by focusing on specific water quality problems. The entire watershed for the receiving water can be assessed, allowing for critical areas and practices to be targeted for corrective actions. Known sources of pollutants of concern can be investigated for potential water quality impacts. Problem areas can then be addressed, leading to eventual improvements in receiving water quality. Management of runoff on a watershed basis allows for specific water quality problems to be targeted so that efforts result in maximized water quality improvements.¹⁵⁰

Finding D.4.b. Some runoff issues, such as general education and training, can be effectively addressed on a regional basis. Regional approaches to runoff management can improve program consistency and promote sharing of resources, which can result in implementation of more efficient programs.

Discussion of Finding D.4.b. Copermittees in Orange County participate in several runoff-related activities whose scope extends beyond the area subject to this Order. These include countywide activities (e.g., portions of Orange County fall under the jurisdiction of the Santa Ana Regional Board), southern California, and statewide activities. Copermittees' participation in these regional activities is generally directed at improving management capability, preventing redundancy and taking advantage of economies of scale. For instance, Copermittees seek to develop consistency between watershed and/or jurisdictional programs (e.g., through standards development), and to collaborate on certain program activities such as education, training, and monitoring. The Copermittees report agreeing that jurisdictional, watershed, and regional programs cannot be effectively developed and implemented in isolation. In addition, the Copermittees, through WRMP implementation efforts, have learned that many watershed activities can be more effectively implemented (e.g., achieve more water quality benefits) at the regional level due to economies of scale and agree watershed protection should be increasingly emphasized as a focal point of Copermittee efforts under the re-issued Permit.¹⁵¹

Finding D.4.c. It is important for the Copermittees to coordinate their water quality protection and land use planning activities to achieve the greatest protection of receiving water bodies. Copermittee coordination with other watershed stakeholders, especially Caltrans, the Department of Defense, and water and sewer districts, is also important.

¹⁵⁰ Regional Board, 2004. San Diego County Municipal Storm Water Permit Reissuance Analysis Summary. P. 1.

¹⁵¹ Orange County Storm Water Copermittees. 2006. Report of Waste Discharge (San Diego Region).

Discussion of Finding D.4.c. Conventional planning and zoning can be limited in their ability to protect the environmental quality of creeks, rivers, and other waterbodies. Watershed-based planning is often ignored, despite the fact that receiving waters unite land by collecting runoff from throughout the watershed. Since watersheds unite land, they can be used as an effective basis for planning. Watershed-based planning enables local and regional areas to realize economic, social, and other benefits associated with growth, while conserving the resources needed to sustain such growth, including water quality.

This type of planning can involve four steps: (1) Identify the watersheds shared by the participating jurisdictions; (2) Identify, assess, and prioritize the natural, social, and other resources in the watersheds; (3) Prioritize areas for growth, protection, and conservation, based on prioritized resources; and (4) Develop plans and regulations to guide growth and protect resources. Local governments have started with simple, yet effective, steps toward watershed planning, such as adopting a watershed-based planning approach, articulating the basic strategy in their General Plans, and beginning to pursue the basic strategy in collaboration with neighboring local governments who share the watersheds. Examples of new mechanisms created to facilitate watershed-based planning and zoning include the San Francisquito Creek Watershed Coordinated Resource Management Process and the Santa Clara Basin Watershed Management Initiative.¹⁵²

E. Statute and Regulatory Considerations

Finding E.1. The Receiving Water Limitations (RWL) language specified in this Order is consistent with language recommended by the USEPA and established in State Board Water Quality Order 99-05, *Own Motion Review of the Petition of Environmental Health Coalition to Review Waste Discharge Requirements Order No. 96-03, NPDES Permit No. CAS0108740*, adopted by the State Board on June 17, 1999. The RWL in this Order require compliance with water quality standards, which for storm water discharges is to be achieved through an iterative approach requiring the implementation of improved and better-tailored BMPs over time. Compliance with receiving water limitations based on applicable water quality standards is necessary to ensure that MS4 discharges will not cause or contribute to violations of water quality standards and the creation of conditions of pollution.

Discussion of Finding E.1. The RWLs in the Order require storm water compliance with water quality standards through an iterative approach for implementing improved and better-tailored BMPs over time. The iterative BMP process requires the implementation of increasingly stringent BMPs until receiving water standards are achieved. This is necessary because implementation of BMPs alone cannot ensure attainment of receiving water quality standards. For example, a BMP that is effective in one situation may not be applicable in another. An iterative process of BMP development, implementation, and assessment is needed to promote consistent compliance with receiving water quality objectives. If assessment of a given BMP confirms that the BMP is ineffective, the iterative process should be restarted, with redevelopment of a new BMP that is anticipated to result in compliance with receiving water quality objectives.

The issue of whether storm water discharges from MS4s must meet water quality standards has been intensely debated in past years. The argument arises because CWA section 402(p) fails to clearly state that municipal dischargers of storm water must meet water quality standards. On the issue of industrial discharges of storm water, the statute clearly indicates that industrial dischargers must meet both (1) the technology-based standard of “best available technology economically achievable (BAT)” and (2) applicable water quality standards. On the issue of municipal discharges however, the statute states that municipal dischargers must meet (1) the technology-based standard of “MEP” and (2) “such other provisions that the Administrator or the State determines appropriate for the control of such pollutants.” The statute fails, however, to specifically state that municipal dischargers must meet water quality standards.

As a result, the municipal storm water dischargers have argued that they do not have to meet water quality standards; and that they only are required to meet MEP for storm water. Environmental interest groups maintain that not only do MS4 discharges have to meet water quality standards, but that MS4 permits must also comply with numeric effluent limitations for the purpose of meeting water quality standards. On the issue of water quality standards, USEPA, the State Board, and the Regional Board have consistently maintained that MS4s must indeed comply with water quality standards. On the issue of whether water quality standards must be met by numeric effluent limitations, USEPA, the State Board (in Orders WQ 91-03 and WQ 91-04), and the Regional Board have maintained that MS4 permits can contain narrative requirements for the implementation of BMPs in place of numeric effluent limitations for storm water discharges.¹⁵³

In addition to relying on USEPA's legal opinion concluding that MS4s must meet MEP for storm water and water quality standards, the State Board also relied on the CWA's explicit authority for States to require "such other provisions that the Administrator or the State determines appropriate for the control of such pollutants" in addition to the technology-based standard of MEP for storm water discharges. To further support its conclusions that MS4 permit dischargers must meet water quality standards, the State Board relied on provisions of the CWC that specify that all waste discharge requirements must implement applicable Basin Plans and take into consideration the appropriate water quality objectives for the protection of beneficial uses.

The State Board first formally concluded that permits for MS4s must contain effluent limitations based on water quality standards in its Order WQ 91-03. In that Order, the State Board also concluded that it was appropriate for Regional Boards to achieve this result by requiring best management practices, rather than by inserting numeric effluent limitations into MS4 permits. Later, in Order WQ 98-01, the State Board prescribed specific precedent setting Receiving Water Limitations language to be included in all future MS4 permits. This language specifically requires that MS4 dischargers meet water quality standards and allows for the use of narrative BMPs (increasing in stringency and implemented in an iterative process) as the mechanism by which water quality standards can be met for storm water discharges.

In Order WQ 99-05, the State Board modified its receiving water limitations language in Order WQ 98-01 to meet specific objections by USEPA (the modifications resulted in stricter compliance with water quality standards). State Board Order WQ 99-05 states:

¹⁵³ For the most recent assessment, see Storm Water Panel Recommendations to the California State Water Resources Control Board, 2006. *The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial, and Construction Activities.*

“In Order WQ 98-01, the State Board ordered that certain receiving water limitation language be included in future municipal storm water permits. Following inclusion of that language in permits issued by the San Francisco Bay and San Diego Regional Boards for Vallejo and Riverside respectively, the USEPA objected to the permits. The USEPA objection was based on the receiving water limitation language. The USEPA has now issued those permits itself and has included receiving water limitation language it deems appropriate.

In light of USEPA’s objection to the receiving water limitation language in Order WQ 98-01 and its adoption of alternative language, the State Board is revising its instructions regarding receiving water limitation language for municipal storm water permits. It is hereby ordered that Order WQ 98-01 will be amended to remove the receiving water limitation language contained therein and to substitute the USEPA language. Based on the reasons stated here, and as a precedent decision, the following receiving water limitation language shall be included in future municipal storm water permits.”

In the 1999 case involving MS4 permits issued by USEPA to several Arizona cities (*Defenders of Wildlife v. Browner*, 1999, 197 F. 3d 1035), the United States Court of Appeals for the Ninth Circuit upheld USEPA’s requirement for MS4 dischargers to meet water quality standards, but it did so on the basis of USEPA’s discretion rather than on the basis of strict compliance with the Clean Water Act. In other words, while holding that the Clean Water Act does not require all MS4 discharges to comply strictly with state water quality standards, the Court also held that USEPA has the authority to determine that ensuring strict compliance with state water quality standards is necessary to control pollutants. On the question of whether MS4 permits must contain numeric effluent limitations, the court upheld USEPA’s use of iterative BMPs in place of numeric effluent limitations for storm water discharges.

On October 14, 1999, the State Board issued a legal opinion on the federal appellate decision and provided advice to the Regional Boards on how to proceed in the future. In the memorandum, the State Board concludes that the recent Ninth Circuit opinion upholds the discretion of USEPA and the State to (continue to) issue storm water permits to MS4s that require compliance with water quality standards through iterative BMPs. Moreover, the memorandum states that “[...] because most MS4 discharges enter impaired water bodies, there is a real need for permits to include stringent requirements to protect those water bodies. As TMDLs are developed, it is likely that MS4s will have to participate in pollutant load reductions, and the MS4 permits are the most effective vehicles for those reductions.” In summary, the State Board found that the Regional Boards should continue to include the RWL established in State Board Order WQ 99-05 in all future permits.

The issue of the RWLs language was also central to BIA's (and others') appeal of Order No. 2001-01 (San Diego MS4 permit), which was used as a template for Order No. R9-2002-01. BIA contended that the storm water MEP standard was a ceiling on what could be required of the Copermitees in implementing their runoff management programs, and that Order No. 2001-01's receiving water limitations requirements exceeded that ceiling. In other words, BIA argued that the Copermitees could not be required to comply with receiving water limitations if they necessitated efforts which went beyond the MEP standard. Again, the courts upheld the Regional Board's discretion to require compliance with water quality standards in municipal storm water permits, without limitation. The Court of Appeal, Fourth Appellate District found that the Regional Board has "the authority to include a permit provision requiring compliance with water quality standards."¹⁵⁴ On further appeal by BIA, the California State Supreme Court declined to hear the matter.

While implementation of the iterative BMP process is a means to achieve compliance with water quality objectives for storm water MS4 discharges, it does not shield the discharger from enforcement actions for continued non-compliance with water quality standards. Consistent with USEPA guidance,¹⁵⁵ regardless of whether or not an iterative process is being implemented, discharges that cause or contribute to a violation of water quality standards are in violation of Order No. R9-2008-0001.

Finding E.2. The Water Quality Control Plan for the San Diego Basin (Basin Plan), identifies the following beneficial uses for surface waters in Orange County: Municipal and Domestic Supply (MUN)¹⁵⁶, Agricultural Supply (AGR), Industrial Process Supply (PROC), Industrial Service Supply (IND), Ground Water Recharge (GWR), Contact Water Recreation (REC1) Non-contact Water Recreation (REC2), Warm Freshwater Habitat (WARM), Cold Freshwater Habitat (COLD), Wildlife Habitat (WILD), Rare, Threatened, or Endangered Species (RARE), Freshwater Replenishment (FRSH), Hydropower Generation (POW), and Preservation of Biological Habitats of Special Significance (BIOL). The following additional beneficial uses are identified for coastal waters of Orange County: Navigation (NAV), Commercial and Sport Fishing (COMM), Estuarine Habitat (EST), Marine Habitat (MAR), Aquaculture (AQUA), Migration of Aquatic Organisms (MIGR), Spawning, Reproduction, and/or Early Development (SPWN), and Shellfish Harvesting (SHELL).

¹⁵⁴ Building Industry Association et al., v. State Water Resources Control Board, et al. 2004.

¹⁵⁵ USEPA, 1998. Jan. 21, 1998 correspondence, "State Board/OCC File A-1041 for Orange County," from Alexis Strauss to Walt Petit, and March 17, 1998 correspondence from Alexis Strauss to Walt Petit.

¹⁵⁶ Subject to exceptions under the "Sources of Drinking Waters" Policy (Resolution No. 89-33)

Discussion of Finding E.2. The southern portion of Orange County is within the San Diego Region. The Orange County portion of the San Diego Region falls within and comprises the majority of the San Juan Hydrologic Unit. Major streams within the Orange County watersheds include San Juan Creek, Trabuco Creek, and San Mateo Creek. Other surface water bodies include Aliso Creek, Prima Deshecha Canada, Segunda Deshecha Canada, Oso Creek, Salt Creek, Laguna Canyon Channel, Canada Gobernadora, and Bell Canyon. Several small canyon streams drain directly to the Ocean. Major inland waterbodies include Oso Reservoir, El Toro Reservoir, and Sulphur Creek Reservoir.

The Orange County watersheds include unincorporated portions of Orange County, the Cities of Aliso Viejo, Dana Point, Laguna Beach, Laguna Hills, Laguna Niguel, Laguna Woods, Lake Forest, Mission Viejo, Rancho Santa Margarita, San Clemente, and San Juan Capistrano. The uppermost portions of the San Mateo, San Juan, Trabuco, and Aliso Creek watersheds are within the Cleveland National Forests.

Approximately 500,000 people reside within the permitted area. This estimate is based on the 2000 census, which does not represent exact numbers because three municipalities (County of Orange and the Cities of Laguna Hills and Lake Forest) lie within both the San Diego Region and the Santa Ana Region. In addition, new developments have increased the housing stock of the area since the 2000 census. This includes the master planned developments of Ladera Ranch in the San Juan Creek watershed and Talega in the San Clemente Coastal and San Mateo Creek watersheds.

Finding E.3. This Order is in conformance with State Board Resolution No. 68-16, *Statement of Policy with Respect to Maintaining High Quality Waters in California*, and the federal Antidegradation Policy described in 40 CFR 131.12.

Discussion of Finding E.3. Runoff management programs are required to be designed to reduce pollutants in storm water MS4 discharges to the maximum extent practicable and achieve compliance with water quality standards. Therefore, implementation of runoff management programs, which satisfy the requirements of Order No. R9-2009-0002, will prevent violations of receiving water quality standards. The Basin Plan states that "Water quality objectives must [...] conform to US EPA regulations covering antidegradation (40 CFR 131.12) and State Board Resolution 68-16, *Statement of Policy with Respect to Maintaining High Quality of Waters in California*." As a result, when water quality standards are met, USEPA and State Board antidegradation policy requirements are also met.

Finding E.4. Section 6217(g) of the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) requires coastal states with approved coastal zone management programs to address non-point pollution impacting or threatening coastal water quality. CZARA addresses five sources of non-point pollution: agriculture, silviculture, urban, marinas, and hydromodification. This NPDES permit addresses the management measures required for the urban category, with the exception of septic systems. The adoption and implementation of this NPDES permit relieves the Permittee from developing a non-point source plan, for the urban category, under CZARA. The Regional Board addresses septic systems through the administration of other programs.

Discussion of Finding E.4. Coastal states are required to develop programs to protect coastal waters from nonpoint source pollution, as mandated by the federal CZARA. CZARA Section 6217 identifies polluted runoff as a significant factor in coastal water degradation, and requires implementation of management measures and enforceable policies to restore and protect coastal waters. In lieu of developing a separate NPS program for the coastal zone, California's NPS Pollution Control Program was updated in 2000 to address the requirements of both the CWA section 319 and the CZARA section 6217 on a statewide basis. The California Coastal Commission (CCC), the State Board, and the nine Regional Water Quality Control Boards are the lead State agencies for upgrading the program, although 20 other State agencies also participate. Pursuant to the CZARA (6217(g) Guidance Document the development of runoff management programs pursuant to this NPDES permit fulfills the need for coastal cities to develop an runoff non-point source plan identified in the State's Non-point Source Program Strategy and Implementation Plan.¹⁵⁷

Finding E.5. Section 303(d)(1)(A) of the CWA requires that "Each state shall identify those waters within its boundaries for which the effluent limitations...are not stringent enough to implement any water quality standard (WQS) applicable to such waters." The CWA also requires states to establish a priority ranking of impaired waterbodies known as Water Quality Limited Segments and to establish Total Maximum Daily Loads (TMDLs) for such waters. This priority list of impaired waterbodies is called the Section 303(d) List. The current Section 303(d) List was approved by the State Board on February 4, 2003 and on July 25, 2003 by USEPA. The List was recently updated by the State Board on October 25, 2006. On June 28, 2007 the 2006 303(d) list for California was given final approval by the United States Environmental Protection Agency (USEPA).

¹⁵⁷ State Board/CCC, 2000. Nonpoint Source Program Strategy and Implementation Plan, 1998-2013 (PROSIP).

Discussion of Finding E.5. Section 303(d) of the federal CWA (CWA, 33 USC 1250, et seq., at 1313(d)), requires States to identify waters that do not meet water quality standards after applying certain required technology-based effluent limits (“impaired” water bodies). States are required to compile this information in a list and submit the list to USEPA for review and approval. This list is known as the Section 303(d) list of impaired waters. As part of this listing process, States are required to prioritize waters/watersheds for future development of TMDLs. The State Board and Regional Boards have ongoing efforts to monitor and assess water quality, to prepare the Section 303(d) list, to prioritize waters/watersheds for TMDL development and to subsequently develop TMDLs. TMDLs developed and adopted by the Regional Board are incorporated into the Basin Plan via a Basin Plan Amendment as authorized under section 13240 of the California Water Code. The 2006 California 303(d) List identifies impaired receiving water bodies and their watersheds within the State of California. Storm water and non-storm water runoff that is discharged from the Copermittees’ MS4s is a leading cause of receiving water quality impairment in the San Diego Region.¹⁵⁸ TMDLs Project I and II for bacteria are considered priority development TMDLs due to impacts to REC 1 benefits due to impairment of waters for human contact recreation.

Finding E.6. This Order does not constitute an unfunded local government mandate subject to subvention under Article XIII B, Section (6) of the California Constitution for several reasons, including, but not limited to, the following. First, this Order implements federally mandated requirements under federal Clean Water Act section 402. (33 U.S.C. § 1342(p)(3)(B).) Second, the local agency Copermittees’ obligations under this Order are similar to, and in many respects less stringent than, the obligations of non-governmental and new dischargers who are issued NPDES permits for storm water and non-storm water discharges. Third, the local agency Copermittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Order. Fourth, the Copermittees have requested permit coverage in lieu of compliance with the complete prohibition against the discharge of pollutants contained in federal Clean Water Act section 301, subdivision (a) (33 U.S.C. § 1311(a)) and in lieu of numeric restrictions on their storm water discharges. Fifth, the local agencies’ responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under State law predates the enactment of Article XIII B, Section (6) of the California Constitution. Likewise, the provisions of this Order to implement total maximum daily loads (TMDLs) are federal mandates. The federal Clean Water Act requires TMDLs to be developed for water bodies that do not meet federal water quality standards. (33 U.S.C. sec. 1313(d).) Once the U.S. Environmental Protection Agency or a state develops a TMDL, federal law requires that permits must contain effluent limitations consistent with the assumptions of any applicable wasteload allocation. (40 C.F.R. sec. 122.44(d)(1)(vii)(B).)

¹⁵⁸ The approved 2006 Clean Water Act Section 303(d) List of Water Quality Limited Segments is on-line at: http://www.waterboards.ca.gov/tmdl/303d_lists2006.html.

Discussion of Finding E.6. This Order does not constitute an unfunded local government mandate subject to subvention under Article XIII B, Section (6) of the California Constitution for several reasons, including, but not limited to, the following. First, this Order implements federally mandated requirements under federal Clean Water Act section 402, subdivision (p)(3)(B). (33 U.S.C. § 1342(p)(3)(B).) This includes federal requirements to effectively prohibit non-storm water discharges, to reduce the discharge of pollutants in storm water to the maximum extent practicable, and to include such other provisions as the Administrator or the State determines appropriate for the control of such pollutants. Federal cases have held these provisions require the development of permits and permit provisions on a case-by-case basis to satisfy federal requirements. (Natural Resources Defense Council, Inc. v. U.S. E.P.A. (9th Cir. 1992) 966 F.2d 1292, 1308, fn. 17.)

The authority exercised under this Order is not reserved state authority under the Clean Water Act's savings clause (cf. Burbank v. State Water Resources Control Bd. (2005) 35 Cal.4th 613, 627-628 [relying on 33 U.S.C. § 1370, which allows a state to develop requirements which are not "less stringent" than federal requirements]), but instead, is part of a federal mandate to develop pollutant reduction requirements for municipal separate storm sewer systems. To this extent, it is entirely federal authority that forms the legal basis to establish the permit provisions. (See, City of Rancho Cucamonga v. Regional Water Quality Control Bd.-Santa Ana Region (2006) 135 Cal.App.4th 1377, 1389; Building Industry Ass'n of San Diego County v. State Water Resources Control Bd. (2004) 124 Cal.App.4th 866, 882-883.)

Second, the local agency Copermittees' obligations under this Order are similar to, and in many respects less stringent than, the obligations of non-governmental dischargers who are issued NPDES permits for storm water discharges. With a few inapplicable exceptions, the Clean Water Act regulates the discharge of pollutants from point sources (33 U.S.C. § 1342) and the Porter-Cologne regulates the discharge of waste (Wat. Code, § 13263), both without regard to the source of the pollutant or waste. As a result, the "costs incurred by local agencies" to protect water quality reflect an overarching regulatory scheme that places similar requirements on governmental and nongovernmental dischargers. (See County of Los Angeles v. State of California (1987) 43 Cal.3d 46, 57-58 [finding comprehensive workers compensation scheme did not create a cost for local agencies that was subject to state subvention].)

The Clean Water Act and the Porter-Cologne Water Quality Control Act largely regulate storm water with an even hand, but to the extent there is any relaxation of this even-handed regulation, it is in favor of the local agencies. Except for municipal separate storm sewer systems, the Clean Water Act requires point source dischargers, including discharges of storm water associated with industrial or construction activity, to comply strictly with water quality standards. (33 U.S.C. § 1311(b)(1)(C), *Defenders of Wildlife v. Browner* (1999) 191 F.3d 1159, 1164-1165 [noting that industrial storm water discharges must strictly comply with water quality standards].) As discussed in prior State Water Resources Control Board decisions, this Order does not require strict compliance with water quality standards. (SWRCB Order No. WQ 2001-15, p. 7.) The Order, therefore, regulates the discharge of waste in municipal storm water more leniently than the discharge of waste from non-governmental sources.

Third, the local agency Copermittees have the authority to levy service charges, fees, or assessments sufficient to pay for compliance with this Order. The fact sheet demonstrates that numerous activities contribute to the pollutant loading in the municipal separate storm sewer system. Local agencies can levy service charges, fees, or assessments on these activities, independent of real property ownership. (See, e.g., *Apartment Ass'n of Los Angeles County, Inc. v. City of Los Angeles* (2001) 24 Cal.4th 830, 842 [upholding inspection fees associated with renting property].) The ability of a local agency to defray the cost of a program without raising taxes indicates that a program does not entail a cost subject to subvention. (*County of Fresno v. State of California* (1991) 53 Cal.3d 482, 487-488.)

Fourth, the Copermittees have requested permit coverage in lieu of compliance with the complete prohibition against the discharge of pollutants contained in federal Clean Water Act section 301, subdivision (a) (33 U.S.C. § 1311(a)) and in lieu of numeric restrictions on their storm water discharges. To the extent, the local agencies have voluntarily availed themselves of the permit, the program is not a state mandate. (*Accord County of San Diego v. State of California* (1997) 15 Cal.4th 68, 107-108.) Likewise, the Copermittees have voluntarily sought a program-based municipal storm water permit in lieu of a numeric limitations approach on their storm water discharge. (See *City of Abilene v. U.S. E.P.A.* (5th Cir. 2003) 325 F.3d 657, 662-663 [noting that municipalities can choose between a management permit or a permit with numeric limitations].) The local agencies' voluntary decision to file a report of waste discharge proposing a program-based permit is a voluntary decision not subject to subvention. (See *Environmental Defense Center v. USEPA* (9th Cir. 2003) 344 F.3d 832, 845-848.)

Fifth, the local agencies' responsibility for preventing discharges of waste that can create conditions of pollution or nuisance from conveyances that are within their ownership or control under state law predates the enactment of Article XIII B, Section (6) of the California Constitution.

Finding E. 7. Runoff treatment and/or mitigation must occur prior to the discharge of runoff into receiving waters. Treatment BMPs must not be constructed in waters of the U.S. or State unless the runoff flows are sufficiently pretreated to protect the values and functions of the water body. Federal regulations at 40 CFR 131.10(a) state that in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S. Authorizing the construction of an runoff treatment facility within a water of the U.S., or using the water body itself as a treatment system or for conveyance to a treatment system, would be tantamount to accepting waste assimilation as an appropriate use for that water body. Furthermore, the construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body. Without federal authorization (e.g., pursuant to Clean Water Act Section 404), waters of the U.S. may not be converted into, or used as, waste treatment or conveyance facilities. Similarly, waste discharge requirements pursuant to California Water Code Section 13260 are required for the conversion or use of waters of the State as waste treatment or conveyance facilities. Diversion from waters of the U.S./State to treatment facilities and subsequent return to waters of the U.S. is allowable, provided that the effluent complies with applicable NPDES requirements.

Discussion of Finding E.7. Runoff treatment and/or mitigation in accordance with any of the requirements in the Order must occur prior to the discharge of storm water into receiving waters. Allowing storm water polluted runoff to enter receiving waters prior to treatment to the MEP will result in degradation of the water body and potential exceedances of water quality standards, from the discharge point to the point of dissipation, infiltration, or treatment. Furthermore, the construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body. This requirement is supported by federal regulation 40 CFR 131.10(a) and USEPA guidance. According to USEPA,¹⁵⁹ "To the extent possible, municipalities should avoid locating structural controls in natural wetlands. Before considering siting of controls in a natural wetland, the municipality should demonstrate that it is not possible or practicable to construct them in sites that do not contain natural wetlands... Practices should be used that settle solids, regulate flow, and remove contaminants prior to discharging storm water into a wetland."

Additional Federal guidance discusses the implementation of wetlands to treat municipal storm water discharges (USEPA, 2000. *Guiding Principles for Constructed Treatment Wetlands: Providing for Water Quality and Wildlife Habitat*). It states:

¹⁵⁹ USEPA, 1992. Guidance Manual for the Preparation of Part II of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems. EPA 833-B-92-002.

“..treatment wetlands should not be constructed in a waters of the U.S. unless you can sufficiently pretreat the stormwater flows to protect the values and functions of the waters of the U.S. Because storm water is an unpredictable effluent source and can contain high levels of toxic substances, nutrients, and pathogens, we strongly encourage that you construct the treatment wetland in uplands and use best management practices in these projects.”¹⁶⁰

Consistent with USEPA guidance, the conversion or use of waters of the U.S./State into runoff treatment facilities or conveyance facilities for untreated storm water discharges must be appropriately reviewed by both Federal and State resource agencies. Such projects may be subject to federal permitting pursuant to Clean Water Act Section 404 if discharges of dredged or fill material is involved.

The placement of hydromodification controls within waters of the U.S./State may also be subject to federal and/or state permitting, but would not necessarily be considered a pollutant treatment BMP. Provided the grade control structures are designed to re-establish a natural channel gradient and correct excessive changes to the sediment transport regime caused by urbanization, rather than to create a series of artificial hydrological impoundments for the purpose of treating pollution, this type of project is not considered an in-stream treatment BMP.

Finding E. 8. The issuance of waste discharge requirements and an NPDES permit for the discharge of runoff from MS4s to waters of the U.S. is exempt from the requirement for preparation of environmental documents under the California Environmental Quality Act (CEQA) (Public Resources Code, Division 13, Chapter 3, section 21000 et seq.) in accordance with the CWC section 13389.

Discussion of Finding E. 8. CWC Section 13389 exempts the adoption of waste discharge requirements (such as NPDES permits) from CEQA requirements: “Neither the State Board nor the regional boards shall be required to comply with the provisions of Chapter 3 (commencing with section 21100) of Division 13 of the Public Resources Code prior to the adoption of any waste discharge requirement, except requirements for new sources as defined in the Federal Water Pollution Control Act or acts amendatory thereof or supplementary thereto.”

¹⁶⁰ USEPA, 2000. Guiding Principles for Constructed Treatment Wetlands: Providing for Water Quality and Wildlife Habitat, (EPA 843-B-00-003).

This CEQA exemption was challenged during BIA's (and others') appeal of Order No. 2001-01. BIA contended that the CEQA exemption did not apply to permit requirements where the Regional Board utilized its discretion to craft permit requirements which were more prescriptive than required by federal law. The Court of Appeal, Fourth Appellate District disagreed with this argument, stating "we also reject Building Industry's argument to the extent it contends the statutory CEQA exemption in Water Code section 13389 is inapplicable to a particular NPDES permit provision that is discretionary, rather than mandatory, under the CWA."¹⁶¹ On further appeal by BIA, the California State Supreme Court declined to hear the matter.

In a recent decision, the Court of Appeal of the State of California, Second Appellate District, upheld the CEQA exemption for municipal storm water NPDES permits (County of Los Angeles, et al. v. California State Water Resources Control Board, et al.).¹⁶²

Finding E.9. Multiple water bodies in Orange County have been identified as impaired and placed on the 303(d) list. In 2004, Bacteria Impaired Waters TMDL Project II included six bacteria impaired shorelines in Dana Point Harbor and San Diego Bay: Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park, B Street, G Street Pier, Tidelands Park, and Chula Vista Marina in San Diego Bay. Since then, only Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay can be confirmed as still impaired by indicator bacteria. On June 11, 2008 the Regional Board adopted a Basin Plan amendment to incorporate *Bacteria Impaired Waters TMDL Project II for San Diego Bay and Dana Point Harbor Shorelines*. On June 16, 2009, the State Board approved the Basin Plan amendment. This action meets requirements of section 303(d) of the Clean Water Act (CWA). The Basin Plan amendment process is authorized under section 13240 of the Water Code. The State's Office of Administrative Law (OAL) approved the TMDLs on September 15, 2009. The effective date of the TMDLs is the date of OAL approval. USEPA approved the TMDLs on October 26, 2009.

Finding E.10. Storm water discharges from developed and developing areas in Orange County are significant sources of certain pollutants that cause, may be causing, threatening to cause or contributing to water quality impairment in the waters of Orange County. Furthermore, as delineated in the CWA section 303(d) list in Table 3, the Regional Board has found that there is a reasonable potential that municipal storm water and non-storm water discharges from MS4s cause or may cause or contribute to an excursion above water quality standards for the following pollutants: Indicator Bacteria, Phosphorous, Toxicity and Turbidity. In accordance with CWA section 303(d), the Regional Board is required to establish Total Maximum Daily Loads (TMDLs) for these pollutants to these waters to eliminate impairment and attain water quality standards. Therefore, certain early pollutant control actions and further pollutant impact assessments by the Copermitttees are warranted and required

¹⁶¹ Building Industry Association et al., v. State Water Resources Control Board, et al. 2004.

¹⁶² Los Angeles County Super. Ct. No. BS080792. Partial publication dated November 6, 2006.

pursuant to this Order.

Finding E.11. This Order incorporates only those MS4 Waste Load Allocations (WLAs) developed in TMDLs that have been adopted by the Regional Water Board and have been approved by the State Board, Office of Administrative Law and U.S. EPA. Approved TMDL WLAs are to be addressed using water quality-based effluent limitations (WQBELs) calculated as numeric limitations (either in the receiving waters and/or at the point of MS4 discharge) and/or as BMPs. In most cases, the numeric limitation must be achieved to ensure the adequacy of the BMP program. Waste load allocations for storm water and non-storm water discharges have been included within this Order only if the TMDL has received all necessary approvals. This Order establishes WQBELs and conditions consistent with the requirements and assumptions of the WLAs in the TMDLs as required by 40 CFR 122.44(d)(1)(vii)(B).

A TMDL is the total amount of a particular pollutant that a water body can receive and still meet Water Quality Standards (WQSs), which are comprised of Water Quality Objectives (WQOs), Beneficial Uses and the States Policy on Maintaining High Quality Waters¹⁶³. The WQOs serve as the primary basis for protecting the associated Beneficial Use. The Numeric Target of a TMDL interprets and applies the numeric and/or narrative WQOs of the WQSs as the basis for the WLAs. This Order addresses TMDLs through Water Quality Based Effluent Limitations (WQBELs) that must be consistent with the assumptions and requirements of the WLA¹⁶⁴. Federal guidance¹⁶⁵ states that when adequate information exists, storm water permits are to incorporate numeric water quality based effluent limitations. In most cases, the numeric target(s) of a TMDL are a component of the WQBELs. When the numeric target is based on one or more numeric WQOs, the numeric WQOs and underlying assumptions and requirements will be used in the WQBELs as numeric effluent limitations by the end of the TMDL compliance schedule, unless additional information is required. When the numeric target interprets one or more narrative WQOs, the numeric target may assess the efficacy and progress of the BMPs in meeting the WLAs and restoring the Beneficial Uses by the end of the TMDL compliance schedule.

This Order fulfills a component of the TMDL Implementation Plan adopted by this Regional Board on June 11, 2008 for indicator bacteria in Baby Beach by establishing WQBELs expressed as both BMPs to achieve the WLAs and as numeric limitations¹⁶⁶ for the City of Dana Point and the County of Orange. The establishment of WQBELs expressed as BMPs should be sufficient to achieve the WLA specified in the TMDL. The Waste Load Allocations (WLAs) and Numeric Targets are the necessary metrics to ensure that the BMPs achieve appropriate concentrations of bacterial indicators in

¹⁶³ State Water Resources Control Board, Resolution No. 68-16

¹⁶⁴ 40 CFR 122.44(d)(1)(vii)(B)

¹⁶⁵ USEPA, *Interim Permitting Approach for Water Quality-Based Effluent Limitations in Storm Water Permits*, 61 FR 43761, August 26, 1996

¹⁶⁶ The Waste Load Allocations are defined in Resolution No. R9-2008-0027, A Resolution to Adopt an Amendment to the *Water Quality Control Plan for the San Diego Basin (9)* to Incorporate Total Maximum Daily Loads for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay.

the receiving waters.

Discussion of Finding E.9, E.10, E.11. Section 303(d)(1)(A) of the Clean Water Act (CWA) requires that:

“Each state must identify those waters within its boundaries for which the effluent limitations...are not stringent enough to implement any water quality standard (WQS) applicable to such waters.”

The CWA also requires states to establish a priority ranking of impaired waterbodies known as Water Quality Limited Segments and to establish Total Maximum Daily Loads (TMDLs) for such waters. This priority list of impaired waterbodies is called the Section 303(d) List. The current Section 303(d) List was approved by the State Water Resources Control Board (State Board) on October 25, 2006. On June 28, 2007 the 2006 303(d) list for California was given final approval by the United States Environmental Protection Agency (USEPA). Every two years the State of California is required by CWA section 303(d) and 40 CFR(130.7) to develop and submit to the USEPA for approval an updated 303(d) list of impaired waterbodies. The Regional Board is currently undergoing the required 2 year (2008) update for submittal to the State Board.

Multiple water bodies in Orange County have been identified as impaired and placed on the Section 303(d) list. The Regional Board has 78 current 303(d) listings for which TMDLs must be prioritized and subsequently developed. The 303(d) listing of a waterbody and subsequent TMDL development is required when regulations under current permits, such as Technology Based Effluent Limitations (TBELS), are not stringent enough to meet Water Quality Standards and protect the Beneficial Uses of Waters of the State. In 2004, the *Bacteria Impaired Waters TMDL Project II* addressed six bacteria impaired shorelines including Baby Beach in Dana Point Harbor. On June 11, 2008 the Regional Board adopted a Basin Plan amendment to incorporate *TMDLs for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay*. On June 16, 2009, the State Board approved the Basin Plan amendment. The *TMDLs for Indicator Bacteria, Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in San Diego Bay* are pending approval by the State Office of Administrative Law (OAL) and USEPA.

Storm water discharges from developed and developing areas in Orange County are a significant source of certain pollutants that cause, may be causing, threatening to cause or contributing to water quality impairment in the waters of Orange County. Furthermore, the CWA section 303(d) list indicates that there is a reasonable potential that municipal storm water and dry weather discharges from MS4s cause or may cause or contribute to an excursion above water quality standards for the following pollutants: Indicator Bacteria, Phosphorous, Toxicity and Turbidity. In accordance with CWA section 303(d), the Regional Board is required to establish TMDLs for these pollutants in these waters to eliminate impairment and attain water quality standards. Per 40 CFR(130.7), WLAs are required for all point sources, including storm water and

non-storm water discharges from MS4s. Therefore, focused pollutant control actions and further pollutant impact assessments by the Copermittees are warranted and required pursuant to this Order.

MS4 Permits address only those TMDL WLAs that have been adopted by the Regional Board and have been approved by the State Board, OAL and USEPA. WLAs are portions of a receiving water's loading capacity that is allocated to one of its existing or future point sources of pollution. The TMDL WLAs in MS4 Permits can be addressed using water quality-based numeric effluent limitations (WQBELs) calculated at end-of-pipe. WQBELs must be consistent with the assumptions and requirements of the WLAs.¹⁶⁷

Assessment of compliance with WLAs is to be assessed at the point of discharge to the receiving water and within the receiving water. TMDL WLAs evaluated end-of-pipe will be assessed using WQBELs. Determination of compliance may also be assessed within the receiving waters to evaluate WLA reductions, program effectiveness and to assess overall water quality. As Numeric Targets serve to establish WLAs, they are part of the underlying assumptions of the WLA and can serve as points of compliance.

Finding E.12. This Order requires each Copermittee to effectively prohibit all types of unauthorized discharges of non-storm water into its MS4. However, historically pollutants have been identified as present in dry weather non-storm water discharges from the MS4s through 303(d) listings, monitoring conducted by the Copermittees under Order No. R9-2002-0001, and there are others expected to be present in dry weather non-storm water discharges because of the nature of these discharges. This Order includes action levels for pollutants in non-storm water, dry weather, discharges from the MS4 designed to ensure that the requirement to effectively prohibit all types of unauthorized discharges of non-storm water in the MS4 is being complied with. Action levels in the Order are based upon numeric or narrative water quality objectives and criteria as outlined in the Basin Plan, Water Quality Control Plan for Ocean Waters of California (Ocean Plan), and State Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP). An exceedance of an action level requires specified responsive action by the Copermittees. This Order describes what actions the Copermittees must take when an exceedance of an action level is observed. Exceedances of non-storm water action levels do not alone constitute a violation of this Order but could indicate non-compliance with the requirement to effectively prohibit all types of unauthorized non-storm water discharges into the MS4 or other prohibitions established in this Order. Failure to undertake required source investigation and elimination action following an exceedance of a non-storm water action level (NAL or action level) is a violation of this Order. The Regional Board recognizes that use of action levels will not necessarily result in detection of all unauthorized sources of non-storm water discharges because there may be some

¹⁶⁷ Per 40 CFR 122.44(d)(1)(vii)(B)

discharges in which pollutants do not exceed established action levels. However, establishing NALs at levels appropriate to protect water quality standards is expected to lead to the identification of significant sources of pollutants in dry weather non-storm water discharges.

Discussion of Finding E.12. This Order includes the existing requirement that Copermitees effectively prohibit all types of unauthorized non-storm water discharges in the MS4s. It also includes the following prohibition set forth in the Basin Plan: “The discharge of waste to waters of the state in a manner causing, or threatening to cause a condition of pollution, contamination or nuisance as defined in California Water Code section 13050 is prohibited.” (Prohibition A.1.) As discussed in the Order’s Findings on discharge characteristics, e.g., C.2., C.4., C.6., C.7., C.9., C.14., and C.15., the Copermitees’ reliance on BMPs for the past 19 years has not resulted in compliance with applicable water quality standards or compliance with the requirement to effectively prohibit all types of unauthorized discharges of non-storm water in the MS4. The Regional Board has evaluated (in accordance with 40 CFR 122.44(d)(1)) past and existing control (BMPs), non-storm water effluent monitoring results, the sensitivity of the species in receiving waters (e.g. endangered species), and the potential for effluent dilution and has determined that existing BMPs to control pollutants in storm water discharges are not sufficient to protect water quality standards in receiving waters and the existing requirement that Copermitees effectively prohibit all types of unauthorized non-storm water discharges into the MS4 historically results in the discharge of pollutants to the receiving waters.

Therefore it is appropriate to establish dry weather non-storm water action levels based upon established water quality standards to measure pollutants levels in the discharge of dry weather non-storm water that could indicate non-compliance with the requirement to effectively prohibit all types of unauthorized non-storm water discharges into the MS4 and/or that these discharges are causing, or threatening to cause, a condition of pollution, contamination or nuisance in the receiving waters. NALs are not numeric effluent limitations. While not alone a violation of this Order, an exceedance of an NAL requires the Copermitees to initiate a series of source investigation and elimination actions to address the exceedance. Results from the NAL monitoring are to be used in developing the Copermitees annual work plans. Failure to undertake required source investigation and elimination action following an exceedance of an NAL is a violation of this Order. Please see further discussion in the directives section C of the fact sheet.

A purpose of monitoring, required under this and previous Orders, as stated in the Monitoring and Reporting Program is to “detect and eliminate illicit discharges and illicit connections to the MS4” and to answer the following core management questions:

1. Are conditions in receiving waters protective, or likely to be protective, of beneficial uses?

2. What is the extent and magnitude of the current or potential receiving water problems?
3. What is the relative MS4 discharge contribution to the receiving water problem(s)?
4. What are the sources of MS4 discharge that contribute to receiving water problem(s)?
5. Are conditions in receiving waters getting better or worse?

For the past 4 permit cycles (19 years), Copermittees have utilized their IC/ID program to identify and eliminate non-storm water discharges that are sources of pollutants to the MS4. The Copermittees are also subject to the requirement to effectively prohibit all types of unauthorized discharges of non-storm water into the MS4s. Historically, discharges of unauthorized non-storm water do occur, resulting in the discharge of pollutants to the receiving water. NALs have been included in this Order to ensure that the Copermittees comply with the requirement to effectively prohibit all types of unauthorized non-storm water discharges that are a source of pollutants in the receiving waters.

F. Public Process

Finding F.1. The Regional Board has notified the Copermitttees, all known interested parties, and the public of its intent to consider adoption of an Order prescribing waste discharge requirements that would serve to renew an NPDES permit for the existing discharge of runoff.

Discussion of Finding F.1. Public notification of development of a draft permit is required under Federal regulation 40 CFR 124.10(a)(1)(ii). This regulation states “(a) Scope. (1) The Director shall give public notice that the following actions have occurred: (ii) A draft permit has been prepared under Sec. 124.6(d).” Public notifications “shall allow at least 30 days for public comment,” as required under Federal regulation 40 CFR 124.10(b)(1).

Finding F.2. The Regional Board has held public hearings on April 11, 2007, February 13, 2008, July 1, 2009, and November 18, 2009 and heard and considered all comments pertaining to the terms and conditions of this Order.

Discussion of Finding F.2. Public hearings are required under CWC Section 13378, which states “Waste discharge requirements and dredged or fill material permits shall be adopted only after notice and any necessary hearing.” Federal regulation 40 CFR 124.12(a)(1) also requires public hearings for draft permits, stating “The Director shall hold a public hearing whenever he or she finds, on the basis or requests, a significant degree of public interest in a draft permit(s).” Regarding public notice of a public hearing, Federal regulation 40 CFR 124.10(b)(2) states that “Public notice of a public hearing shall be given at least 30 days before the hearing.”

IX. DIRECTIVES

This section discusses significant changes which have been made to the requirements of the Order from the requirements which were previously included in Order No. R9-2002-0001. For each section of the Order that has been changed there is a discussion which describes the change that was made and provides the rationale for the change. In addition, comments on the Copermittees' ROWD recommendations, as they pertain to each changed requirement of the Order, are provided.

Requirements of the Order that are not discussed in this section have not been significantly changed from those requirements previously included in Order No. 2002-0001. For such requirements, discussions and rationale for the requirements can be found in section VII of the Fact Sheet/Technical Report for Regional Board Order No. R9-2002-0001, dated February 13, 2002. Section VII also provides additional background information for those requirements that have undergone significant change which are described in detail in this report. The Fact Sheet/Technical Report is available for download at:

http://www.waterboards.ca.gov/sandiego/programs/oc_stormwater.html

Legal authority citations are provided for each major section of the Tentative Order. These citations apply to all applicable requirements within the section for which they are provided.

A. Prohibitions and Receiving Water Limitations

The following legal authority applies to section A:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: The Regional Board Water Quality Control Plan for the San Diego Basin (Basin Plan) contains the following waste discharge prohibition: "The discharge of waste to waters of the state in a manner causing, or threatening to cause a condition of pollution, contamination, or nuisance as defined in California Water Code Section 13050, is prohibited."

California Water Code section 13050(l) states "(1) 'Pollution' means an alteration of the quality of waters of the state by waste to a degree which unreasonably affects either of the following: (A) The water for beneficial uses. (B) Facilities which serve beneficial uses. (2) 'Pollution' may include "contamination."

California Water Code section 13050(k) states “‘Contamination’ means an impairment of the quality of waters of the state by waste to a degree which creates a hazard to public health through poisoning or through the spread of disease. ‘Contamination’ includes any equivalent effect resulting from the disposal of waste, whether or not waters of the state are affected.”

California Water Code section 13050(m) states “‘Nuisance’ means anything which meets all of the following requirements: (1) Is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property. (2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal. (3) Occurs during, or as a result of, the treatment or disposal of wastes.”

California Water Code section 13241 requires each regional board to “establish such water quality objectives in water quality control plans as in its judgment will ensure the reasonable protection of beneficial uses and the prevention of nuisance [...]”

California Water Code Section 13243 provides that “A regional board, in a water quality control plan or in waste discharge requirements, may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted.”

California Water Code Section 13263(a) provides that waste discharge requirements prescribed by the Regional Board implement the Basin Plan.

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A - D) require municipalities to implement controls to reduce pollutants in storm water runoff from commercial, residential, industrial, and construction land uses or activities.

Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(A - D) require municipalities to have legal authority to control various discharges to their MS4.

Federal NPDES regulation 40 CFR 122.44(d)(1) requires municipal storm water permits to include any requirements necessary to “[a]chieve water quality standards established under section 303 of the CWA, including State narrative criteria for water quality.”

Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to “control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality.”

Section A of the Order combines two previously distinct requirement sections – Prohibitions and RWLs. These sections have been combined into one section for organization purposes and to reduce redundancy, since both sections address the same issue. These changes have no net effect on the implementation and enforcement of the Order.

Section A.3 describes the “iterative process.” The Copermitees must reduce the discharge of storm water pollutants to the MEP and ensure that their MS4 discharges do not cause or contribute to violations of water quality standards. If the Copermitees have reduced storm water pollutant discharges to the MEP, but their discharges are still causing or contributing to violations of water quality standards, the Order provides a clear and detailed process for the Copermitees to follow. This process is often referred to as the "iterative process" and can be found at section A.3. The language of section A.3 is prescribed by the State Board and is included in MS4 permits statewide. Section A.3 essentially requires additional BMPs to be implemented until MS4 storm water discharges no longer cause or contribute to a violation of water quality standards.

The State Policy with respect to maintaining high quality waters has been added to clarify that discharges from the MS4 that cause or contribute to a violation of the Policy for high quality waters is prohibited.

B. Non-Storm Water Discharges

The following legal authority applies to section B:

Broad Legal Authority: CWA sections 402, 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F), 40 CFR 122.26(d)(2)(iv) and 40 CFR 122.44.

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B) requires MS4 operators “to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(1) provides that the Copermitees shall prevent all types of illicit discharges into the MS4 except for certain non-storm water discharges.

Section B of the Order has been reworded to simplify and clarify the requirements for addressing non-storm water discharges that are not prohibited. This rewording has no net effect on the implementation and enforcement of the Order.

Section B.2 has been modified by the removal of landscape irrigation, irrigation water and lawn watering from the list of non-storm water discharges that are not prohibited, i.e. landscape irrigation, irrigation water and lawn watering discharges into and from the MS4 are now prohibited. Saline swimming pool discharges have been added as a footnote to the list provided the discharge is directly to a saline water body (see Finding C.14 and Discussion). Language has been added to the section to clarify differences in the federal regulations under 40 CFR 122.26(d)(iv)(B) and for the authority of the Director (Regional Board) in regards to exempted discharges.

The following exemptions have been removed from Section B, per identification as a source and conveyance of pollutants to waters of the United States when discharged from the MS4: landscape irrigation, irrigation water and lawn watering. Therefore, these illicit discharges must be addressed per 40 CFR 122.26(B). These previously exempted discharges have been identified by Permittees as a source of pollutants and conveyance of pollutants to waters of the United States in the following:

The County of Orange conducted, per requirements of 401 Water Quality Certification 02C-055, a Drainage Area Reconnaissance and Urban Runoff Characterization study. From the reconnaissance and characterization, the County of Orange determined that “water quality results provided two important findings”. First, “analytical data strongly indicates that irrigation overspray and drainage constitutes a very substantial source and conveyance mechanism for fecal indicator bacteria into Aliso Creek, and suggests that reduction measures for this source of urban runoff could provide meaningful reduction in bacteria loading to the stream”. Aliso Creek, currently 303(d) listed as impaired for Indicator Bacteria, is included in the Bacteria Project I TMDL adopted by the San Diego Regional Board on December 12, 2007. Secondly, reclaimed water high in electrical conductivity and Nitrate was indicated as “the source water at three of the excessive runoff locations (P1,P2,J01P02). These dissolved nitrogen concentration and flow rates create relatively high nitrogen loadings, which have the potential to contribute to undesirable levels of periphytic algal growth in Aliso Creek”.

The County of Orange, Cities of Orange County and Orange County Flood Control District on November 15, 2007 submitted their Unified Annual Progress Report for the 2006-2007 reporting period. Within the report, the Copermitees demonstrate that a “wide range of constituents exceeded the tolerance interval bounds”, including orthophosphate. “These high levels of orthophosphate concentration are most likely the result of fertilizer runoff or reclaimed water runoff”. Aliso Creek is currently 303(d) listed as impaired for phosphorous.

The County of Orange, Orange County Flood Control District and Permittees within the San Juan Creek, Laguna Coastal Streams, Aliso Creek, and Dana Point Coastal Streams Watersheds on November 15, 2007 submitted their Watershed Action Plan Annual Reports for the 2006-2007 reporting period. San Juan Creek, Laguna Coastal Streams, Aliso Creek and Dana Point Coastal Streams are all currently 303(d) listed as impaired for Indicator Bacteria within the watershed and/or Pacific Ocean at the discharge point of the watershed. These locations are included in the Bacteria Project I TMDL adopted by the San Diego Regional Board on December 12, 2007. The Copermitees, within their Watershed Action Strategy Table for Fecal Indicator Bacteria “Support programs to reduce or eliminate the discharge of anthropogenic dry weather nuisance flow throughout the [...] watershed. Dry weather flow is the transport medium for bacteria and other 303(d) constituents of concern”. Additionally, they state that “conditions in the MS4 contribute to high seasonal bacteria propagation in-pipe during warm weather. Landscape irrigation is a major contributor to dry weather flow, both as surface runoff due to over-irrigation and overspray onto pavements; and as subsurface seepage that finds its way into the MS4”.

In 2006, the State Water Quality Control Board allocated Grant funding to the Smarttimer/Edgescape Evaluation Program (SEEP). Project partners include the cities of Aliso Viejo, Dana Point, Laguna Beach, Laguna Hills, Laguna Nigel, Laguna Woods, Lake Forest, Mission Viejo, Rancho Santa Margarita and San Juan Capistrano as well as the Metropolitan Water District of Southern California, the Department of Agriculture and ten south Orange County water districts. The project targets irrigation runoff by retrofitting existing development and documenting the conservation and runoff improvements. The Grant Application states that "Irrigation runoff contributes flow & pollutant loads to creeks and beaches that are 303(d) listed for bacteria indicators". Furthermore, the grant application states that "Regional program managers agree that the reduction and/or elimination of irrigation-related urban flows and associated pollutant loads may be key to successful attainment of water quality and beneficial use goals as outlined in the San Diego Basin Plan and Bacteria TMDL over the long term". This is reinforced in the project descriptions and objectives: "Elevated dry-weather storm drain flows, composed primarily in the South Orange County Region of landscape irrigation water wasted as runoff, carry pollutants that impair recreational use and aquatic habitats all along Southern California's urbanized coastline. Storm drain systems carry the wasted water, along with landscape derived pollutants such as bacteria, nutrients and pesticides, to local creeks and the ocean. Given the local Mediterranean climate, excessive perennial dry season stream flows are an unnatural hydrologic pattern, causing species shifts in local riparian communities and warm, unseasonal contaminated freshwater plumes in the near-shore marine environment". The basis of this grant project, conducted by the Permittees and additional water use partners, is that over-irrigation (landscape irrigation, irrigation water and lawn watering) into the MS4 is a source and conveyance of pollutants. In addition, they indicate that the alteration of natural flows is impacting the Beneficial Uses of waters of the State.

Section B.3 has been clarified by the recognition of building fire suppression system maintenance (e.g. fire sprinklers) as an illicit discharge. The Regional Board has found that such discharges contain waste, and as such the Regional Board is requiring these discharges be addressed as illicit discharges by the Copermittees. This is consistent with the Federal Regulations (55 Fed Reg 48037). Thus, the discharges are to be prohibited via ordinance, order or similar means and incorporated as part of the Copermittees IC/ID program.

C. Non Storm Water Dry Weather Action Levels

The following legal authority applies to Section C:

Broad Legal Authority: CWA section 402, 402(p)(3)(B)(ii), CWC §13377. 40 CFR 122.26(d)(2)(i)(B, C, E, and F), and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority:

The Clean Water Act section 402(p)(3)(B)(ii) provides that MS4 permits “shall include a requirement to effectively prohibit non-storm water discharges into the storm sewers.”

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B) provides that the proposed management program “shall be based on a description of a program including a schedule, to detect and remove (or require the discharger to the municipal storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(1) provides that the Copermittee include in its proposed management program “a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal storm sewer system; this program description shall address all types of illicit discharges, however the [listed exempt] category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(2) provides that the Copermittee include in its proposed management program “a description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(3) provides that the Copermittee include in its proposed management program “procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field scree, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water.”

Section C establishes non-storm water dry weather action levels (see also Finding C.14, Finding E.12, and the Discussion for those sections).

Non-exempted, non-storm water discharges are to be effectively prohibited from entering the MS4 or become subject to another NPDES permit (see Federal Register, Vol. 55, No. 222, pg. 47995). Conveyances which continue to accept non-exempt, non-storm water discharges do not meet the definition of MS4 and are not subject to

section 402(p)(3)(B) of the CWA unless the discharges are issued separate NPDES permits. Instead, conveyances that continue to accept non-exempt, non-storm water discharges that do not have a separate NPDES permit are subject to sections 301 and 402 of the CWA (see Federal Register, Vol. 55, No. 222, pg. 48037).

The Order requires the sampling of a representative percentage of major outfalls and other identified stations within each hydrologic subarea. While it is important to assess all major outfall discharges from the MS4 into receiving waters, to date the Copermittees have implemented a dry-weather monitoring program that has identified major outfalls that are representative of each hydrologic subarea and have randomly sampled other major outfalls. Thus, it is expected that the Copermittees will utilize past dry weather monitoring in the selection and annual sampling of a representative percentage of major outfalls in accordance with the requirements under Section C.4.

Background and Rationale for Requirements

The Regional Board developed the requirements for dry weather, non-storm water action levels based upon an evaluation of existing controls, monitoring and reporting programs (effluent and receiving water), special studies, and based upon Findings C.1 C.3, C.4, C.6, C.7 and C.14.

Water Quality Control Plan

Section 303(C) of the Clean Water Act requires the state to establish Water Quality Standards (WQS). WQS define the water quality goals of a waterbody, or part thereof, by designating their use or uses to be made of the water and by setting criteria necessary to protect those uses.

The Regional Board's Water Quality Control Plan for the San Diego Basin (Basin Plan) designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan. The Basin Plan was adopted by the Regional Board on September 8, 1994, and was subsequently approved by the State Board on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the Regional Board and State Board.

State Board Resolution No. 88-63 establishes state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal and domestic supplies. Requirements of this Order do not include effluent limitations reflecting municipal and domestic supply use as all waters within the County of Orange under this Order are specifically exempted from municipal and domestic supply as a Beneficial Use.

The State Board adopted the Water Quality Control Plan for Ocean Waters of California (Ocean Plan) in 2005, it was approved by USEPA, and became effective on February 14, 2006. The Ocean Plan establishes Water Quality Objectives, general requirements for management of waste discharged to the ocean, effluent quality

requirements, discharge provisions, and general provisions. Limitations derived from the Ocean Plan have been included in this Order as action levels to protect the Beneficial Uses of enclosed bays and estuaries because their Beneficial Uses are similar

National Toxics Rule (NTR) and California Toxics Rule (CTR)

The USEPA adopted the NTR on December 22, 1992, which was amended on May 4, 1995, and November 9, 1999. The CTR was adopted by USEPA on May 18, 2000, and amended on February 13, 2001. These rules include water quality criteria for priority pollutants and are applicable to non-storm water discharges from the MS4. Criteria for 126 priority pollutants are established by the CTR. USEPA promulgated this rule to fill a gap in California water quality standards that was created in 1994 when a California court overturned the State's water quality control plans containing criteria for priority toxic pollutants. The federal criteria are legally applicable in the State of California for inland surface waters, enclosed bays and estuaries for all purposes and programs under the CWA.

Antidegradation Policy

Section 131.12 of 40 CFR requires that the State water quality standards include an antidegradation policy consistent with the federal policy. The State Board established California's antidegradation policy in State Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Regional Boards' Basin Plans implement, and incorporate by reference, both the State and federal antidegradation policies. Permitted non-storm water discharges from the MS4 are consistent with the antidegradation provision of 40 CFR section 131.12 and State Board Resolution No. 68-16.

Monitoring and Reporting

40 CFR Section 122.48 requires that all NPDES permits specify requirements for recording and reporting monitoring results. Sections 13267 and 13383 of CWC authorize the Regional Boards to require technical and monitoring reports. The Monitoring and Reporting Program establishes monitoring and reporting requirements to implement state and federal regulations. The Monitoring and Reporting Program can be found as Attachment E of the Order.

Dilution or Mixing Zones

In order to protect the Beneficial Uses of receiving waters from pollutants as a result of non-storm water MS4 discharges, this Order does not provide for a mixing zone or a zone of initial dilution except when the discharge is to the surf zone.

The San Diego Region has predominately intermittent and ephemeral rivers and streams (Inland Surface Waters) which vary in flow volume and duration at spatial and temporal scales. Therefore, it is assumed that any non-storm water discharge from

the MS4 into the receiving water is likely to be of a quantity and duration that does not allow for dilution or mixing. For ephemeral systems, non-storm water discharges from the MS4 are likely to be the only surface flows present within the receiving water during the dry season.

MS4 discharge points to bays, estuaries and lagoons are not designed to achieve maximum initial dilution and dispersion of non-storm water discharges. Thus, initial dilution factors for non-storm water discharges from the MS4 into bays, estuaries, and lagoons are conservatively assumed to equal zero.

It is appropriate to base numeric action levels for dry weather non-storm water discharges on these considerations.

California Ocean Plan

A discharge to a surf zone occurs when the non-storm water discharge point from the MS4 discharges:

- a) Directly into the ocean in a wave induced area subject to long-shore conditions;
or
- b) Across a primarily sandy substrate beach and subsequently directly into a wave induced area subject to long-shore conditions;

Establishment of Action Levels

Action levels in the Order are based upon numeric or narrative water quality objectives and criteria as defined in the Basin Plan, the Water Quality Control Plan for Ocean Waters of California (Ocean Plan), and the State Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP). The Regional Board recognizes that use of action levels will not necessarily result in detection of all unauthorized sources of non-storm water discharges because there may be some discharges in which pollutants do not exceed established action levels.

In June of 2006, the California Water Board's Blue Ribbon Storm Water Panel released its report titled 'The Feasibility of Numerical Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities.' The report only examined numerical limits as applied to storm water and not non-storm water. In the recommendations, the Blue Ribbon panel proposed storm water action levels which are computed using statistical based population approaches. For example, Section D of the Permit uses a recommended statistical approach to develop storm water action levels. The Blue Ribbon panel did not examine the efficacy of action levels or recommendations for development of action levels for non-storm water discharges.

For discharges to inland surface waters, action levels are based on the EPA water quality criteria for the protection of aquatic species, the EPA water quality criteria for the protection of human health, water quality criteria and objectives in the applicable

State plans, effluent concentration available using best available technology, and 40 CFR 131.38. Since the assumed initial dilution factor for the discharge is zero and a mixing zone is not allowed, a non-storm water discharge from the MS4 could not cause an excursion from numeric receiving water quality objectives if the discharge is in compliance with the action levels contained in the Order. Likewise, discharges in compliance with action levels to the surf zone cannot cause excursions from water quality objectives.

Dry weather monitoring of non-storm water MS4 effluent conducted under the previous Order (R9-2002-001), which relies on BMPs as controls to protect water quality standards, has identified pollutants that are found in non-storm water discharges. Monitoring of pH, Dissolved Oxygen, Phosphorus, Nitrate, Turbidity and Methylene Blue Active Substances (MBAS) in non-storm water MS4 discharges has shown that the effluent exceeds state water quality criteria. It is appropriate to establish numeric action levels for these pollutants to ensure that the Copermittees are complying with the requirement to effectively prohibit all types of unauthorized non-storm water discharges into the MS4s.

Water Quality Limited Segments on the current 303(d) list (2006) within the jurisdiction of this Order have been identified due to exceedances of Sulfate, Chloride and Total Dissolved Solids criteria from a source which is currently unknown (see Table 2a). These pollutants are not monitored for under the current non-storm water MS4 effluent monitoring program. While this Order does not establish a numeric action level for these constituents at this time, this Order now requires non-storm water MS4 discharge monitoring to include monitoring for Sulfates, Chlorides and Total Dissolved Solids.

Priority pollutants analyzed included Cadmium, Copper, Chromium, Lead, Nickel, Silver and Zinc. These priority pollutants are likely to be present in non-storm water MS4 discharges (see Finding C.3) and dissolved metal effluent monitoring is available from the previous Order. The most stringent applicable water quality criteria have been identified for these seven metals and, excluding Chromium (VI), and all are dependent on receiving water hardness. The conversion factors for Cadmium and Lead are also water hardness dependent (40 CFR 131.38(b)(2)). These levels are established as the action levels for these constituents.

While effluent monitoring is available from the previous Order, the monitoring was done for dissolved concentrations and lacked a measurement of receiving water hardness. Due to the multiple point source discharges of non-storm water from the MS4, a discharge may enter a receiving water whose hardness will vary temporally. In addition, hardness may vary spatially within and among receiving waters.

However, other information is available to determine the appropriateness of an action level. Existing effluent monitoring concentrations absent of receiving water data, no dilution credit or mixing zone allowance, current 303(d) listings of receiving waters for

other pollutants, receiving water monitoring data, and the classification of waters as critical habitat for endangered and species of concern, provide evidence that NALs are appropriate for these priority pollutants at this time in order to ensure that the Copermittees comply with the requirement to effectively prohibit all types of unauthorized non-storm water discharges into the MS4s.

Existing effluent data (see attachment F), absent receiving water hardness, provides evidence that it is appropriate to include NALs based on a conservative hardness level. Absent receiving water hardness, all analyzed metals, are discharged at concentrations which may be in exceedance of CTR criteria depending on receiving water hardness. Chromium effluent data that is available is in the form of total Chromium. However, per the SIP, Chromium criteria are for Chromium III and Chromium VI. Therefore, the total Chromium measurement is inadequate, but can be used as an estimate of Chromium III and VI concentrations.

As discussed, inland surface waters, enclosed bays, and estuaries have conservatively been allotted a mixing zone and dilution credit of zero. As such, any discharge of these priority pollutants is likely to impact the receiving water, regardless of the quantity or rate of discharge.

As discussed in Finding C.7 and discussion, multiple receiving waters within the County of Orange are 303(d) listed for a number of pollutants, including toxicity. The 303(d) listing of a waterbody as impaired provides evidence that the receiving water(s) are already experiencing negative impacts. These water quality limited segments are more susceptible to degradation from the synergistic addition of more pollutants, even from upstream discharges. It is therefore appropriate to include numeric action levels designed to ensure that the Copermittees are complying with the requirement to effectively prohibit all types of unauthorized discharges of non-storm water into the MS4s.

Copermittees have monitored the receiving waters for MS4 discharges pursuant to requirements under Order R9-2002-0002. Dry weather receiving water data indicates poor conditions within waters receiving non-storm water MS4 discharges. Urban stream bioassessment conducted under the Order (2002-2008) has documented all non-reference sites as consistently having poor or very poor Index of Biotic Integrity (IBI) scores, in part due to receiving water toxicity¹⁶⁸.

Receiving waters within the jurisdiction of this Order are classified as critical habitat, including being designated with the RARE beneficial use, for endangered, threatened and species of concern including, but not limited to, *O. mykiss irideus*, *E. newberryil*, *A. marmorata pallida* and *G. orcutti*.

¹⁶⁸ 2006-07 and 2007-08 Unified Annual Progress Reports.

The Regional Board evaluated discharges to the surf zone, per the California Ocean Plan, Appendix VI and in accordance with 40 CFR 122.44(d). Indicator bacteria, pH, turbidity (NTU), and metals were analyzed for the purpose of determining the levels of these constituents in non-storm water discharges from the MS4.

The Regional Board has determined that there is not sufficient information at this time to develop action levels for pH, turbidity and metals. While non-storm water MS4 effluent data is available, the data collected is for discharges to inland surface waters, enclosed bays and estuaries. Preliminary receiving water data and limited non-storm water MS4 discharge data collected under the Ambient Coastal Receiving Water Monitoring indicates some exceedances of criteria for metals in the discharge, and toxicity in receiving waters¹⁶⁹. However, the Regional Board believes the level of data available is insufficient, and is requiring additional monitoring of pH, turbidity and metals in non-storm water MS4 discharges to ocean waters (discharges to the surf zone).

Water Quality Limited Segments on the current 303(d) list (2006) for the Pacific Ocean shoreline within the jurisdiction of this Order have been identified due to exceedances of Indicator Bacteria criteria whose known source includes non-storm water discharges from the MS4. These 303(d) listed segments support extensive REC-1 beneficial uses and are located within State Marine Reserves and Conservation Areas. The listing of receiving waters as 303(d) listed for bacteria supports the inclusion of action levels to ensure that the Copermitttees are complying with the requirement to effectively prohibit all types of unauthorized non-storm water discharges into the MS4. In addition, no dilution credit or mixing zone allowance is included in developing numeric action levels for the discharge of a pollutant to waters which are 303(d) listed as impaired for that pollutant.

Dry Weather Non-Storm Water Action Levels Calculations for Discharges to Inland Surface Waters, Enclosed Bays, and Estuaries

On the basis of the foregoing discussion, the NALs were calculated with the following considerations and assumptions:

No dilution credit is considered for the discharge. Therefore, the discharge must comply with the Water Quality Objective at the point of discharge.

For NALs based on CTR, implementation was done using the procedure list as outlined in the SIP (see below example).

NAL CTR/SIP Calculation – Zinc Example:

Criteria for Priority Toxic Pollutants in the State of California is described in the CTR

¹⁶⁹ 2007-08 Unified Annual Progress Report.

table listed in 40 CFR 131.38.

A		B Freshwater		C Saltwater		D Human Health (10 ⁻⁶ risk for carcinogens) For consumption of:

1. Antimony	7440360					14 a,s	4300 a,t
2. Arsenic ^b	7440382	340 i,m,w	150 i,m,w	69 i,m	36 i,m		
3. Beryllium	7440417					n	n
4. Cadmium ^b	7440439	4.3 e,i,m,w,x	2.2 e,i,m,w	42 i,m	9.3 i,m	n	n
5a. Chromium (III)	16065831	550 e,i,m,o	180 e,i,m,o			n	n
5b. Chromium (VI) ^b	18540299	16 i,m,w	11 i,m,w	1100 i,m	50 i,m	n	n
6. Copper ^b	7440508	13 e,i,m,w,x	9.0 e,i,m,w	4.8 i,m	3.1 i,m	1300	
7. Lead ^b	7439921	65 e,i,m	2.5 e,i,m	210 i,m	8.1 i,m	n	n
8. Mercury ^b	7439976	[Reserved]	[Reserved]	[Reserved]	[Reserved]	0.050 a	0.051 a
9. Nickel ^b	7440020	470 e,i,m,w	52 e,i,m,w	74 i,m	8.2 i,m	610 a	4600 a
10. Selenium ^b	7782492	[Reserved] p	5.0 q	290 i,m	71 i,m	n	n
11. Silver ^b	7440224	3.4 e,i,m		1.9 i,m			
12. Thallium	7440280					1.7 a,s	6.3 a,t
13. Zinc ^b	7440666	120 e,i,m,w,x	120 e,i,m,w	90 i,m	81 i,m		

Saltwater criterion maximum concentration (CMC) = 90 ug/L
Saltwater criterion continuous concentration (CCC) = 81 ug/L

These criteria are expressed in terms of the dissolved fraction of the metal in the water column. [See footnote “m” to Table in paragraph (b)(1) of 40 CFR 131.38].

40 CFR 122.45(c) requires that this Order include effluent limitations as total recoverable concentration; therefore it is appropriate to include action levels also as total recoverable concentration.

The SIP requires that if it is necessary to express a dissolved metal value as a total recoverable and a site-specific translator has not yet been developed, the Regional Board shall use the applicable conversion factor from 40 CFR 131.38.

The term “Conversion Factor” (CF) represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column.

Total recoverable concentration * CF = Dissolved concentration criterion

or

Total recoverable concentration = Dissolved concentration criterion/ CF

§ 131.38

40 CFR Ch. I (7-1-08 Edition)

Metal	Conversion factor (CF) for freshwater acute criteria	CF for freshwater chronic criteria	CF for saltwater acute criteria	CF = for saltwater chronic criteria
Silver	0.85	(d)	0.85	(d)
Thallium	(d)	(d)	(d)	(d)
Zinc	0.978	0.986	0.946	0.946

CF for Zinc = .946, so the total recoverable concentrations for zinc:
 90 ug/L dissolved (CMC)/ 0.946 (CF) = 95 ug/L total recoverable CMC
 81 ug/L dissolved (CCC) / 0.946 (CF) = 86 ug/L total recoverable CCC

Effluent Variability multiplier and Coefficient of Variation (CV)

For each concentration based on an aquatic life criterion, the long-term average (LTA) is calculated by multiplying the concentration with a factor that adjusts for effluent variability. The multiplier can be found in Table 1 of the SIP. Since this Order does not have existing data to properly conduct a variability analysis in accordance with the SIP, the CV has been set equal to 0.6 per SIP requirements. The current effluent data is limited due to the small number of representative outfalls sampled, the lack of outfalls discharging to representative waterbodies within the Region, and the targeted nature of the sampling design.

Based upon a CV of 0.6, Table 1 of the SIP requires an effluent variability as follows:

Acute Multiplier = 0.321
 Chronic Multiplier = 0.527

The long-term average (LTA) is calculated by multiplying the total recoverable concentrations for zinc with the acute and chronic multipliers:

LTA Acute = 95 ug/L * 0.321 = 30.5
 LTA Chronic = 86 ug/L * 0.527 = 45.3

The MDAL and AMAL will be based on the most limiting of the acute and chronic LTA, in the case for copper the most limiting LTA is the acute of 30.5 ug/L

NALs are calculated by multiplying the most limiting LTA with a multiplier that adjusts for the averaging periods and exceedance frequencies of the criteria and the effluent limitations. The multiplier can be found in Table 2 of the SIP. Since this Order has insufficient data, the CV has been set to 0.6 and since sampling frequency is four times a month or less, n has been set equal to 4 per the SIP.

Table 2. Long-Term Average (LTA) Multipliers for Calculating Effluent Limitations

Coefficient of Variation	MDEL Multiplier	AMEL Multiplier			MDEL/AMEL Multiplier		
	99 th Percentile Occurrence Probability	95 th Percentile Occurrence Probability			MDEL = 99 th Percentile AMEL = 95 th Percentile Occurrence Probability		
(CV)		n = 4	n = 8	n = 30	n = 4	n = 8	n = 30
0.1	1.25	1.08	1.06	1.03	1.16	1.18	1.22
0.2	1.55	1.17	1.12	1.06	1.33	1.39	1.46
0.3	1.90	1.26	1.18	1.09	1.50	1.60	1.74
0.4	2.27	1.36	1.25	1.12	1.67	1.82	2.02
0.5	2.68	1.45	1.31	1.16	1.84	2.04	2.32
0.6	3.11	1.55	1.38	1.19	2.01	2.25	2.62

Therefore, from Table 2 of the SIP, the LTA multipliers will be as follows:

MDAL Multiplier = 3.11

AMAL Multiplier = 1.55

The MDAL and AMAL limits are calculated by multiplying the LTA with an LTA multiplier for each limit:

MDAL = 30.5 ug/L * 3.11 = 95 ug/L

AMAL = 30.5 ug/L * 1.55 = 47 ug/L

Dry Weather Non-Storm Water Action Levels Calculations for Discharges to the Surf Zone

Based on the foregoing discussion, the Average Monthly and Maximum Daily NALs were calculated with the following considerations and assumptions:

No dilution credit is considered for the discharge. Therefore, the discharge must comply with the Water Quality Objective at the point of discharge.

Whole Effluent Toxicity (WET) Testing Requirements

A WET limit is required if a discharge causes, has a reasonable potential to cause, or contributes to an exceedance of applicable water quality standards, including numeric and narrative. Since these types of discharges are prohibited under this Order, WET limits are not applicable.

Discussion of AMALs, MDALs and Instantaneous Maximums

Where practical, action levels in this Order have been expressed as both AMALs and MDALs. Certain action levels may not practicably be expressed as AMALs and MDALs due to specific BPO language, sampling requirements and/or a lack of Criteria. Based upon the likely sampling frequency of the Copermittees, the frequency of sampling will occur such that grab samples are taken once per sampling day. This single sample would then be subject to MDALs and Instantaneous Maximum levels. In this case, the more conservative action level would apply. In addition, it is expected that some effluent monitoring will occur less than or equal to once per month. In this scenario, the MDAL, AMAL and Instantaneous Maximum levels would need to be met based upon one sample, unless sampling did not occur. For some BPOs, AMALs have been excluded and only MDALs/Instantaneous Maximums set to prevent redundancy in action levels.

Compliance with Action levels (Priority Pollutants)

Compliance with action levels shall be determined as follows:

Dischargers shall be deemed out of compliance with this Order if the Copermittee failed to take the prescribed action in response to a concentration of the priority pollutant in the monitoring sample that is greater than the action level and greater than or equal to the reported Minimum Level (exceedance of an action level). Regardless of the Copermittee's actions in response to an exceedance, they are still subject to the prohibitions found in Section A and B of the Order.

When determining to take an action in response to the AMALs and more than one sample result is available in a month, the discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of DNQ or ND. In those cases, the discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

- (1) The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
- (2) The median value of the data set shall be determined. If the data set has an odd number of data points then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of those points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

D. Storm Water Action Levels

Section D has been added to establish storm water action levels (see also Finding D.1.h and Discussion).

Introduction

In response to comments at the initial public workshop, meetings with the principle Permittees, and comments from the July 01, 2009 Regional Board meeting, SAL concentrations, standards and constituents have been updated, Order language has been clarified and additions to the monitoring requirements have been made.

SAL Concentration/Standards Updates

SAL pollutant levels have been updated and now come from a regional subset of nationwide Phase I MS4 data. Regional Board staff have chosen to update SALs by using USEPA Climate Zone 6 (arid west) data when computing SALs. Utilizing data from USEPA Climate Zone 6 is expected to produce SALs which closely reflect the environmental conditions experienced in Orange County. The localized subset of data includes sampling events from multiple Southern California locations including Orange, San Diego, Riverside, Los Angeles and San Bernardino Counties. The dataset includes samples taken from highly built-out impervious areas and from storm events representative of Southern California conditions.

Additionally, utilization of regional data is appropriate due to the addition of data into the nationwide Phase I MS4 monitoring dataset in February 2008. This additional data increased the number of USEPA Climate Zone 6 samples to more than 400, and included additional monitoring events within Southern California (see Figure 2).

Figure 2. Sample Sizes Used to Calculate Storm Water Action Levels

Additional changes have been made by staff to update SALs to reflect the water quality standards in the San Diego Regional Water Quality Control Board Basin Plan, the California Toxic Rule and USEPA Water Quality Criteria. Since it is the goal of the SALs, through the iterative and MEP process, to have outfall storm water discharges meet all applicable water quality objectives, the list of constituents to be tested and protocol for testing has been updated to provide a reference point to evaluate the iterative MEP process. As such, Kjeldahl Nitrogen (TKN) and Total Suspended Solids (TSS) have been removed from the SAL table. There currently are no appropriate criteria for TKN or TSS, and alternate constituents are available which do have BPOs for comparative purposes. Instead, Nitrate/Nitrite and Turbidity, which have BPOs of 1.0 mg/L and 20 NTUs respectively, are included with associated SALs.

Metals included in SALs include Cadmium, Chromium, Nickel, Zinc, Lead and Copper. In receiving water quality monitoring collected by the Copermittees to date, these metals have been detected and shown to contribute to toxicity at mass loading stations within Southern Orange County.

Monitoring Updates

SAL language has been updated to require the measurement of hardness and to provide more specificity in the assessment of samples with SALs for total metal concentrations. While USEPA Climate Region 6 data includes a large sample size for concentrations of total metals, the impact the concentration will have on receiving waters will vary with receiving water hardness. Since it is the goal of the SALs,

through the iterative and MEP process, to have MS4 storm water discharges meet all applicable water quality objectives, the hardness of the receiving water should be used when assessing the total metal concentration of a sample. Thus, when an exceedance of a SAL concentration is detected for a metal the Copermittee must determine if that exceedance is above the existing applicable water quality limitation based upon the hardness of the receiving water. The water quality limitations Permittees must use to assess total metal SAL exceedances are the California Toxic Rule (CTR) and USEPA National Recommended Water Quality Criteria for Freshwater Aquatic Life 1 hour maximum concentrations. The 1 hour maximum concentration is to be used for comparison since it is expected to most replicate the impacts to waters of the State from the first flush following a precipitation event.

E. Legal Authority

The following legal authority applies to section E:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(A) provides that the Copermittees shall develop and implement legal authority to “Control through ordinance, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(D) provides that the Copermittees shall develop and implement legal authority to “Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system.”

Illicit discharge is defined under Federal NPDES regulation 40 CFR 122.26(b)(2) as “any discharge to a municipal separate storm sewer system that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.”

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(A - D) require municipalities to implement controls to reduce pollutants in storm water runoff from commercial, residential, industrial, and construction land uses or activities.

Federal NPDES regulation 40 CFR 122.26(d)(1)(ii) requires from the Copermittee “A description of existing legal authority to control discharges to the municipal separate storm sewer system.”

Section E.1.b Prohibit all identified illicit discharges not otherwise allowed pursuant to section B.2 including but not limited to:

- (1) Sewage;
- (2) Discharges of wash water resulting from the hosing or cleaning of gas stations, auto repair garages, or other types of automotive services facilities;
- (3) Discharges resulting from the cleaning, repair, or maintenance of any type of equipment, machinery, or facility including motor vehicles, cement-related equipment, and port-a-potty servicing, etc.;
- (4) Discharges of wash water from mobile operations such as mobile automobile washing, steam cleaning, power washing, and carpet cleaning, etc.;

- (5) Discharges of wash water from the cleaning or hosing of impervious surfaces in municipal, industrial, commercial, and residential areas including parking lots, streets, sidewalks, driveways, patios, plazas, work yards and outdoor eating or drinking areas, etc.;
- (6) Discharges of runoff from material storage areas containing chemicals, fuels, grease, oil, or other hazardous materials;
- (7) Discharges of pool or fountain water containing chlorine, biocides, toxic amounts of salt, or other chemicals; discharges of pool or fountain filter backwash water;
- (8) Discharges of sediment, pet waste, vegetation clippings, or other landscape or construction-related wastes; and

Duplicative language has been removed from this section.

Section E.1.j has been added to the Order to ensure that BMPs implemented by third parties are effective. Since the Copermittees cannot passively receive and discharge pollutants from third parties, the Copermittees must ensure discharges of storm water pollutants to the MS4 are reduced to the MEP. In order to achieve this, the Copermittees must be able to ensure that effective BMPs are being implemented by requiring the third parties to document BMP effectiveness. Regarding the Copermittees' ability to require documentation and reporting from third parties, USEPA states "municipalities should provide documentation of their authority to enter, sample, inspect, review, and copy records, etc., as well as demonstrate their authority to require regular reports."¹⁷⁰

¹⁷⁰ USEPA, 1992. Guidance Manual for the Preparation of Part 2 of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems. EPA 833-B-92-002.

F. Jurisdictional Runoff Management Program

F.1. Development Planning

The following legal authority applies to section F.1:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWA section 402(a), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F), 40 CFR 131.12, and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(2) provides that Copermittees develop and implement a management program which is to include “A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plans shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed.”

Federal NPDES regulation 40 CFR 122.44(d)(1) requires municipal storm water permits to include any requirements necessary to “[a]chieve water quality standards established under section 303 of the CWA, including State narrative criteria for water quality.”

Sections F.1.a and F.1.b (General Plan and Environmental Review Process) require the Copermittees to update and revise their General Plan (or equivalent plan) and environmental review processes to ensure water quality and watershed protection principles are included. The Copermittees are required to detail any changes to the General Plan or environmental review process in their Jurisdictional Runoff Management Program Annual Reports.

The change made to these sections requires updating the General Plan and Environmental Review Process on an as-needed basis, is supported by information provided in the Copermittees’ Report of Waste Discharge (ROWD) and Annual Reports. Each Copermittee has either updated, is in the process of updating, or has assessed its General Plan to ensure the General Plans include the required principles and are in compliance with Order No. R9-2002-0001. The ROWD also states that although all the Copermittees have reviewed their environmental review processes, a number of Copermittees want the overall planning approval process to more effectively ensure that water quality protection is considered in the earliest phases of project consideration.

Section F.1.a has been modified to include redevelopment projects in the General Plan. This change requires Copermitees to update their General Plan to include water quality and watershed protection for all new development and redevelopment projects.

Section F.1.c (Approval Process Criteria and Requirements) requires that all development projects (regardless of size) implement BMPs to reduce storm water pollutant discharges to the MEP. Source control and site design BMP requirements were not clearly described in this section of Order No. R9-2002-0001. Additional detail has been added to this section to better describe the source control and site design BMPs needed for implementation. This additional detail is consistent with the requirements of the SSMP, known in Orange County as the Water Quality Management Plan (WQMP). However, only source control and site design BMPs that apply to all types of development projects are required (i.e., properly designed trash storage areas).

The requirements are consistent with Order No. R9-2002-0001, section F.1.b.1. However, some elements are not contained in the current or proposed DAMP¹⁷¹ (e.g., buffer zones). One exception is that Order No. R9-2002-0001's requirement that applicants must provide evidence of coverage under the General Industrial Permit has been removed, since industrial tenants for a development project are usually not known during the planning stage.

The section has been modified to reflect the prohibition of over-irrigation runoff to the MS4, as well as LID requirements. Additionally, this section requires the use of native and/or low water use plants for landscaping, where feasible.

Sections F.1.d and F.1.d.(1) (Standard Storm Water Mitigation Plans) require the Copermitees to review and update their local SSMPs (also known in Orange County as Water Quality Management Plans – WQMPs) for compliance with the Order. The sections also require all Priority Development Projects falling under certain categories to meet SSMP requirements. The update is necessary to ensure that the Copermitees' local SSMPs are consistent with the changes that have been made to the Order's SSMP requirements. The requirement for the development/adoption of a Model SSMP has been removed since a model was completed and adopted in 2003.

The SSMP section of the Order has been reformatted for clarity. There are also some significant changes. Changes have been made in response to experience gained by the Orange County Storm Water program, USEPA program evaluations, recent BMP development and effectiveness studies, recent reports on the magnitude of problems caused by hydromodification, and reviews of annual reports and the ROWD submitted by the Copermitees.

¹⁷¹ Orange County Storm Water Copermitees. *Drainage Area Management Plan (DAMP) 2007*. July 21, 2006. The 2007 DAMP was submitted to the Regional Board with the Report of Waste Discharge as part of the application for NPDES Permit reissuance.

In addition, the Order requires that a one-acre threshold be phased in over three years for the priority development category. This threshold was selected to be consistent with the Phase II NPDES regulations for small municipalities. The one-acre determination applies to the amount of ground area disturbed, not the total size of the parcel or project. Each Copermittee may also lower this threshold if desired.

Section F.1.d.(2) (Priority Development Project Categories) includes several changes to improve, simplify, and clarify the Priority Development Project categories.

The most significant change is that where a new Development Project feature, such as a parking lot, falls into a Priority Development Project Category, the entire project footprint is subject to SSMP requirements. This criterion was not included in Order No. R9-2002-0001. It is included, however, in the Model San Diego SSMP that was approved by the Regional Board in 2002. It is included in this Order because existing development inspections by Orange County municipalities show that facilities included in the Priority Development Project Categories routinely pose threats to water quality. This permit requirement will improve water quality and program efficiency by preventing future problems associated with partly treated storm water runoff from redevelopment sites. This approach to improving storm water runoff from existing developments is practicable because municipalities have a better ability to regulate new developments than existing developments.

Industrial sites and retail gasoline outlets have been added to the priority development categories. This heavy industrial category was not included in Order No. R9-2002-0001 because industrial NPDES requirements already establish storm water criteria. This category is included in the Order to be consistent with Phase II rules and to close loopholes. A discussion of retail gasoline outlets is below.

The criterion for commercial developments has been lowered to one acre from 100,000 square feet (2.3 acres). It is modified in order to be consistent with USEPA Phase II guidance, and to reflect the findings from Permittees that smaller commercial developments pose high threats to storm water discharges.

Housing and restaurant criteria have been clarified. The two housing development categories are now combined into one category that includes 10 or more housing units. In addition, requirements which specifically apply to restaurants have been combined in this section. The section has been modified to clarify that restaurants with less than 5,000 square feet of development are subject to SSMP requirements, except for the treatment control BMP and hydromodification control requirements. This is consistent with Order No. R9-2002-0001's approach for applying SSMP requirements to restaurants.

Section F.1.d.(2)(j) includes Retail Gasoline Outlets (RGOs) as a Priority Development Project category because RGOs are points of confluence for motor vehicles for automotive related services such as repair, refueling, tire inflation, and radiator fill-up. RGOs consequently produce significantly greater pollutant loadings of hydrocarbons and trace metals (including copper and zinc) than other developed areas. To meet the storm water MEP standard, source control and structural treatment BMPs are needed at RGOs that meet the following criteria: (a) 5,000 square feet or more of developed area, or (b) a projected average daily traffic of 100 or more vehicles per day. These are appropriate thresholds since development size and volume of traffic are good indicators of potential impacts of runoff from RGOs on receiving waters. RGOs were proposed, but not included in Order No. R9-2002-0001 pending guidance from the State Board in its review of the San Diego MS4 Permit, Order No. 2001-0001.

In State Board WQ Order No. 2000-11, the State Board removed RGOs as a SSMP category because the State Board found that RGOs were already heavily regulated and limited in their ability to construct infiltration devices or perform treatment. Order No. 2000-11 also acknowledged that a threshold (size, average daily traffic, etc.) appropriate to trigger SSMP requirements should be developed, and that specific findings regarding RGOs should be included in MS4 permits to justify the requirement.¹⁷² The State Board also removed the RGO category from the San Diego County MS4 permit (Order No. 2001-01) because the Regional Board did not specifically address the issues raised in WQ Order No. 2000-11.

As discussed further below, the LARWQCB and the Regional Board have adequately addressed these issues. RGOs have been included as a SSMP category in the Los Angeles County MS4 permit (Order No. R4-01-182), the statewide general Phase II MS4 permit (WQ Order No. 2003-0005-DWQ), and the Regional Board Southern Riverside County MS4 permit (Order No. R9-2004-001). The State Board also addressed the inclusion of RGOs through the appeals of MS4 permits issued by the Los Angeles and San Francisco Bay Area Regional Boards. The State Board held a workshop addressing RGOs and identified RGOs as significant sources of pollutants. The State Board then dismissed the petitions for removal of RGOs from the SSMP requirements in the Los Angeles and San Francisco Bay Area MS4 permits.

Inexpensive and effective structural treatment BMPs which reduce storm water pollutants and control peak flow rates and velocities are available for use at RGOs. Studies have shown that some catch basin inserts can remove hydrocarbons and heavy metals, which are typical pollutants of concern at RGOs. Sand or media filters have also been found to be effective and available for use at RGOs. Site design measures to control flow include cisterns, small weirs, baffles, and redirecting roof runoff to pervious areas.

¹⁷² State Board, 2000. Order WQ 2000-11.

No evidence has been provided to indicate that use of these structural BMPs at RGOs will pose a safety risk. In fact, filter BMPs have been installed at RGOs in some municipalities without apparent adverse safety effects. In addition, similar BMPs such as oil/water separators have been used for years by RGOs without safety problems.

Threshold - Studies indicate that runoff from RGOs contains similar pollutants to runoff from commercial parking lots. In precedential WQ Order 2000-11, the State Board determined that parking lots with a size threshold of 5,000 square feet or more is an appropriate SUSMP category. Based in part on the similarity of pollutants, the 5,000 square feet size threshold was also included for RGOs in the Order. In addition, other municipalities currently use similar size thresholds for RGOs when requiring design standards to mitigate storm water runoff. To provide additional flexibility for the Copermittees, another threshold of 100 or more motor vehicles ADT has been added to the Order. This threshold is based on requirements used in Washington and Oregon for what are considered "high use" sites. This is an appropriate threshold since vehicular traffic is a good indicator of the amount of pollutants generated at a site.

The Regional Board followed the State Board's direction regarding RGOs by including the above discussion in this Fact Sheet, as well as a specific finding that justifies the regulation of runoff from RGOs that meet certain criteria. Considering all of the supporting documentation discussed above, it is appropriate to include RGOs as a Priority Development Project category.

Additional detailed supporting information can be found in the 2001 technical report titled *Retail Gasoline Outlets: New Development Design Standards for Mitigation of Storm Water Impacts* by the LARWQCB and the Regional Board.

Section F.1.d.(3) (Pollutants of Concern) requires Copermittees to update their procedures for identifying pollutants of concern for each Priority Development Project. This is important to do periodically because of changing water quality conditions and designations of impairments or areas of concern. Furthermore Copermittees continually learn more about pollutant-generating activities as they conduct inspections and investigations, and that information must be incorporated into the SSMP process.

Section F.1.d.(4) This Section has been modified to clarify some elements of low impact development. This section requires Copermittees to require or implement site design BMPs at Priority Development Projects in order to reduce the amount of polluted storm water runoff from those sites. The primary approach in site design BMPs is to limit the permanent loss of existing infiltration capacity because loss of infiltration is a major contributor to wet weather pollution discharges. General means to accomplish that goal include retaining natural infiltration areas of a site and limiting the amount of impervious surfaces. The Order does not require a specific or relative amount of pervious surfaces be added to a project. The Order seeks to retain on-site capture of the 85th percentile storm.

The site design BMP options listed in these sections are consistent with the site design BMPs currently required by the Copermittees in the Model WQMP. In the ROWD, the Copermittees propose to improve the process of selecting site design BMPs. Specifically, they propose to develop recommendations for incorporating low-impact design (LID) techniques and site design BMPs. However, the Model WQMP employs an open-ended approach to requirements for site design BMPs, requiring implementation of site design BMPs “where applicable and feasible” and “where appropriate.” Unfortunately, this approach has proven to be ineffective in integrating site design BMPs in project designs. Audits conducted in 2005 of four Copermittees found that municipalities need to work with project applicants to improve the quality of site design BMPs.¹⁷³ As a result, the Order establishes two sets of site design BMP criteria.

First, section F.1.d.(4)(b) of the Order directs the Copermittees to require, rather than consider, new development projects to employ certain classes of site design BMPs. The required site design BMPs take advantage of features that are incorporated into the Priority Development Project, such as landscaping or walkways. It also requires that projects seek to maintain natural water drainage features rather than instinctively convey water in buried pipes and engineered ditches that eliminate natural water quality treatment functions. These types of site design BMPs are both effective and achievable. These requirements are consistent with the guidelines of Order No. R9-2002-0001 and both the 2003 and 2007 DAMPs.¹⁷⁴

Next, section F.1.d.(4)(d) of the Order requires that LID BMPs be sized and designed to ensure onsite retention without runoff, of the volume of runoff produced from a 24-hour 85th percentile storm event. This is consistent with other municipal stormwater NPDES permits recently adopted by the Los Angeles and Santa Ana Regional Boards. In those permits, the stakeholders were involved in drafting the numerical performance criteria. The requirement for a numerical BMP design standard is well established for treatment control BMPs and is required in permits throughout the nation such as in Pennsylvania, West Virginia, Georgia, and Washington D.C. Since the 85th percentile storm event has previously been used as the numeric design standard for treatment control BMPs; the same size storm event can be applied as the numeric design standard for LID BMPs. According to information provided by the County of Orange, the 24 hour, 85th percentile rainfall is between 0.7 to 0.8 inches of rain for the majority of the area covered by this permit.

¹⁷³ Tetra Tech, Inc. 2005. Program Evaluation Report. Orange County Storm Water Program: Cities of Laguna Beach, Laguna Hills, Lake Forest, and Rancho Santa Margarita.

¹⁷⁴The 2003 and 2007 DAMPs include preserving natural drainage features as a recommended site design BMP requirement that was to be reviewed and used where applicable and feasible. The DAMPs note this as a way to mimic a site's natural hydrologic regime.

The retention of natural drainage features, such as ephemeral streams, wetlands, and depressions, can be particularly important because small tributaries are essential to the maintenance of the chemical, biological, and physical integrity of larger waterbodies.¹⁷⁵ The loss and modification of such natural water resources to accommodate post-development storm water management leads to direct and indirect adverse effects on water quality that are felt both on the project site and off the site within the watershed.^{176,177,178} Effects to aquatic beneficial uses from altered drainage features can occur downstream and upstream. The length of upstream or downstream effect of channel modifications is dependant on the specific structure type and channel slope.¹⁷⁹ For instance, road culverts can act as partial barriers to upstream distribution of native aquatic macroinvertebrates in urban streams, while bridges can provide adequate passage.¹⁸⁰ As a result of the adverse effects to water quality and beneficial uses, the State of California nonpoint source pollution program management measures for urban areas includes limiting the destruction of natural drainage features and natural conveyance areas.¹⁸¹

Through its process of conditioning development projects under the CWA section 401 Water Quality Certification program, the Regional Board finds that the level of site design BMP implementation in the Order is feasible for all projects. This site design BMP requirement will help ensure that site design BMPs are implemented for new development projects. Site design BMPs are a critical component of storm water runoff management at new development projects, since the BMPs provide multiple benefits including preservation of hydrologic conditions, reduction of pollutant discharges, cost effectiveness, and green space.

¹⁸¹ California Nonpoint Source Encyclopedia, Management Measure 3.1.b. Runoff from Developing Areas, Site Development and Management Measure 3.3.a. Runoff from Existing Development, Existing Development.

The site design BMP options listed do not need to be costly.¹⁸² Some design options, such as concave vegetated surfaces or routing rooftop or walkway runoff to landscaped areas, are cost neutral.¹⁸³ Other site design BMPs, such as minimizing parking stall widths or use of efficient irrigation devices, are oftentimes already required. In addition, use of site design BMPs reduces storm water runoff quantity, allowing for treatment control BMPs and other storm water infrastructure on site to be smaller, therefore savings costs for both developers and municipalities.^{184,185}

Because of the potential economic and environmental benefits of using low-impact development site design, the U.S. Department of Housing and Urban Development, Office of Policy Development and Research, developed “*The Practice of Low Impact Development (LID)*” to assist the housing industry during the land development process.¹⁸⁶ This document focuses specifically on technologies that affect both the cost impacts and environmental issues associated with land development. Much of the report focuses on storm water management because low-impact development storm water management systems can save capital costs for developers and maintenance costs for municipalities.¹⁸⁷ The executive summary of the HUD report notes:

This approach to land development, called Low Impact Development (LID), uses various land planning and design practices and technologies to simultaneously conserve and protect natural resource systems and reduce infrastructure costs. LID still allows land to be developed, but in a cost-effective manner that helps mitigate potential environmental impacts. LID is best suited for new, suburban development.

Developers can use site and structure designs that reduce building footprints, decrease the amount of paved infrastructure, and provide for dispersed drainage and infiltration of runoff from impervious surfaces to reduce the effective impervious surface.¹⁸⁸ The concept of effective impervious surface is important, because when runoff from these surfaces is directed to pervious areas rather to an impervious drainage system (i.e., curbs, gutters, street surfaces, storm drain pipes), it can infiltrate, evaporate, or be taken up by vegetation, thereby reducing the total volume of storm water runoff leaving a site.

The Order continues to provide the Copermittees with flexibility in implementing site design BMP requirements by providing a LID BMP waiver program.

Section F.1.d.(5) (Source Control BMP Requirements) requires that Priority Development Projects implement minimum source control BMPs. This section has been added to provide more detail and clarify the Order's requirements for source control BMPs. The minimum source control BMPs listed in the section are consistent with the Model WQMP.

Section F.1.d.(6) (Treatment Control BMP Requirements) is consistent with Order No. R9-2002-0001, with two exceptions. First, the Order limits the selections of methods used to determine the appropriate volume of storm water runoff to be treated. The modification ensures that priority development project proponents utilize the most accurate information to determine the volume or flow of runoff which must be treated. Using detailed local rainfall data, the County of Orange has developed the 85th Percentile Precipitation Isopluvial Map, which exhibits the size of the 85th percentile storm event throughout Orange County.¹⁸⁹ Since this map uses detailed local rainfall data, it is more accurate for calculating the 85th percentile storm event than other methods which were included in Order No. R9-2002-0001. The other methods found in Order No. R9-2002-0001 were included as options to be used in the event that detailed accurate rainfall data did not exist for various locations within Orange County. The development of the 85th Percentile Precipitation Isopluvial Map makes these other less accurate methods superfluous. Therefore, these other methods for calculating the 85th percentile storm event have been removed from the current Order.

Second, the Order requires that treatment control BMPs selected for implementation at Priority Development Projects have a removal efficiency rating that is higher than the "low removal efficiency," as presented in the Model SSMP/WQMP. The requirement allows exceptions for those projects that, with a feasibility analysis, can justify the use of a treatment control BMP with a low removal efficiency for a Priority Development Project. This requirement is needed because to date, the Copermittees have generally approved low removal efficiency treatment control BMPs without justification or evidence that use of higher efficiency treatment BMPs was considered and found to be infeasible. Specifically, it has been found during audits of the Copermittees' SSMP programs that many SSMP reports do not adequately describe the selection of treatment control BMPs.¹⁹⁰ Moreover, USEPA's contractor Tetra Tech, Inc. recommends that "project proponents should begin with the treatment control that is most effective at removing the pollutants of concern [...] and provide justification if that treatment control BMP is not selected."¹⁹¹

¹⁸⁹ The isopluvial map can be found as Exhibit 7.II in the Model WQMP.

¹⁹⁰ Tetra Tech, Inc. 2005. Program Evaluation Report. Orange County Storm Water Program: Cities of Laguna Beach, Laguna Hills, Lake Forest, and Rancho Santa Margarita.

¹⁹¹ Tetra Tech, Inc., 2005. Program Evaluation Report –San Diego Standard Urban Storm Water Mitigation Plan (SUSMP) Evaluation. P. 5.

In the ROWD, the Copermittees acknowledge the need for further attention to the selection and implementation of effective treatment BMPs. They propose to revise the model WQMP table of BMP effectiveness. The requirement is needed to provide clarification that selection of low efficiency treatment control BMPs over high efficiency BMPs without justification does not meet permit requirements and is not in compliance with the storm water MEP standard.

In addition, treatment control BMPs must be designed and implemented with measures to avoid the creation of nuisance or pollution associated with vectors, such as mosquitoes, rodents, and flies. Related guidelines are identified in guidance from CASQA.¹⁹² Additional considerations are outlined in publications from the California Department of Health Services and University of California Division of Agriculture and Natural Resources.¹⁹³

Section F.1.d.(7). (Low-Impact Design BMP Waiver Program) allows Copermittees to develop a LID BMP waiver program, under which projects where it is technically infeasible to implement the required LID BMPs could substitute with treatment control BMPs and a mitigation project, payment into an in-lieu funding program, and/or watershed equivalent BMPs. Some sites may be technically infeasible to implement the required LID BMPs due to the site constraints. For this reason, the Regional Board has added to the Order a requirement for the Copermittees to develop such a program. The program would provide the opportunity for development projects to avoid partial or full LID BMP implementation in exchange for implementation of treatment control BMPs and mitigation. The program would maintain equal water quality benefits as properly implemented LID BMPs when partial LID BMPs are coupled with a mitigation project or in-lieu funding.

The Order includes specific minimum requirements so that the program will achieve similar water quality benefits. Any program which allows development projects to forgo LID BMP implementation must include provisions which will achieve similar water quality benefits. To ensure that this is the case for the LID BMP waiver program, minimum provisions for the program have been added to the Order

¹⁹² For example, see the California Stormwater BMP Handbook guidelines for Extended Detention Basins (TC-22) at <http://www.cabmphandbooks.org>.

¹⁹³ Marco Metzger. "Managing Mosquitoes in Stormwater Treatment Devices." University of California Division of Agriculture and Natural Resources Publication No. 8125. Available at <http://anrcatalog.ucdavis.edu>.

Section F.1.d.(8). (BMP Design Standards) addresses a need for the Copermittees to develop and apply consistent criteria for the design and maintenance of structural treatment BMPs. Correct BMP design is critical to ensure that BMPs are effective and perform as intended. Without design criteria, there is no assurance that this will occur, since there is no standard for design or review. As an example, Ventura County has developed a BMP manual that includes standard design procedure forms for BMPs. Ventura County's *Technical Guidance Manual for Storm Water Quality Control Measures* is available at <http://www.vcstormwater.org/publications.htm>.¹⁹⁴ California Stormwater Quality Association (CASQA) also confirms the necessity of design criteria when it includes such criteria in its New Development and Redevelopment BMP Handbook.¹⁹⁵ This issue is noted in the ROWD, and the Copermittees propose to develop standard design checklist/plans/details for selected source control and treatment BMPs.

Section F.1.d.(9). (Implementation process) requires the Copermittee to implement a process to verify compliance with SSMP requirements. As part of the SSMP, requires identification at what point in the planning process that projects must meet SUSMP requirements and what are roles/responsibilities of municipal departments. The intent of this requirement is to provide consistency in the application of the SSMPs between the Copermittees. This requirement was included in previous Order No. R9-2002-0001.

Section F.1.d.(10) (Annual Review of Treatment BMPs) requires Copermittees to keep their SSMPs up to date with BMP effectiveness studies for low-impact design and treatment control BMPs. The ROWD includes commitments to develop a library of BMP performance reports and to revise the model WQMP table for the latest information on BMPs. This requirement will ensure that two important types of information be included in those efforts: Site design BMPs and treatment BMPs that are assessed as part of contracts with the State Board and Regional Board. The later types of projects include those funded with Clean Beach Initiative grants and other grants. Projects funded with such state grants must include effectiveness assessments using a quality assurance plan. As a result, such studies generally provide reliable sources of local data and should be included in local SSMPs.

¹⁹⁴ Ibid.

¹⁹⁵ California Stormwater Quality Association, 2003. Stormwater Best Management Practice Handbook – New Development and Redevelopment.

Sections F.1.e and F.1.f. (BMP Verification and Treatment BMP Maintenance Tracking) are included in the Order to improve the effectiveness of the BMP requirements. They are included in response to findings from the Audits¹⁹⁶ and recommendations from USEPA.¹⁹⁷ The Copermittees recognize a need to improve the verification of post-construction BMPs. The 2007 DAMP proposes to verify 90 percent of WQMPs (including structural and non-structural BMPs) by inspection, self-certifications, surveys or other means. The Regional Board finds that 90 percent is a reasonable annual target, but considers inspections to be essential to achieve optimal results. Therefore, the Order requires high priority sites to be inspected annually, and allows other measures to be used for lower priority treatment control BMPs.

Section F.1.h. (Hydromodification) expands and clarifies current requirements for control of MS4 discharges to limit hydromodification effects caused by changes in runoff resulting from development and urbanization. The requirements are based on findings and recommendations of the Orange County Storm Water Program, the Stormwater Monitoring Coalition (SMC),^{198,199} and the Storm Water Panel on Numeric Effluent Limits (Numeric Effluent Panel).²⁰⁰ Added specificity is needed due to the current lack of a clear standard for controlling hydromodification resulting from development. More specific requirements are also warranted because hydromodification is increasingly recognized as a major factor affecting water quality and beneficial uses, and the Copermittees have proposed only vague and voluntary modifications to the Model WQMP. The Order is intended to ensure the intent of the proposed modifications is incorporated into each Copermittees' SSMP.

¹⁹⁶ The 2005 audits performed by Tetra Tech, Inc. found that cities are not tracking post-construction BMPs. The final audit report recommended (Section 2.1.2) that each city should develop a system to verify implementation and track post-construction BMPs to ensure that they are adequately maintained.

¹⁹⁷ Federal Register / Vol. 64, No. 235 / Wednesday, December 8, 1999 / Rules and Regulations. P. 68845. USEPA recommends such practices in the Phase II storm water regulations, promoting "inspections during construction to verify BMPs are built as designed."

Hydromodification is the change in a watershed's runoff characteristics resulting from development, together with associated morphological changes to channels receiving the runoff. As the total area of impervious surfaces increases, infiltration of rainfall decreases, causing more water to run off the surface and at a higher velocity. Runoff from developed areas can produce erosive flows in channels under rainfall conditions which were not previously problematic. Moreover, runoff from developed areas increases the duration of time that channels are exposed to erosive flows. The increase in the volume of runoff and the length of time that erosive flows occur ultimately intensify sediment transport, causing changes in sediment transport characteristics and the hydraulic geometry (width, depth, and slope) of channels.²⁰¹

These types of changes have been documented in southern California. It has been reported that researchers studying flood frequencies in Riverside County have found that increases in watershed imperviousness of only 9-22 percent can result in increases in peak flow rates for the two-year storm event of up to 100 percent.²⁰² Such changes in runoff have significant impacts on channel morphology. It has recently been found that ephemeral/intermittent channels in southern California appear to be more sensitive to changes in imperviousness than channels in other areas. Morphology of small channels in southern California was found to change with only 2-3 percent watershed imperviousness, as opposed to 7-10 percent watershed imperviousness in other parts of the nation.²⁰³

Effects of hydromodification are evident in southern Orange County and recognized by the Copermittees. Analyses of bioassessment data, for example, indicate that physical changes to stream channels caused by hydromodification are likely responsible, in part, for the low bioassessment scores in urbanized settings.²⁰⁴ It is important to recognize that the physical changes are a direct result of MS4 discharges, but that two separate mechanisms are involved. First, is a change in the flow regime caused by the increase in impervious surfaces and loss of natural conveyance systems. Discharges to receiving waters from the MS4 outfalls do not mimic the natural discharges from former tributaries to that receiving water, and the change results in erosion. Second, the physical stream habitat in many places has been severely modified in order to efficiently convey those increased storm water discharges to the ocean. Where streams are hardened and/or buried to convey storm water, they cannot provide adequate water quality and other necessary conditions to support beneficial uses. Both of these issues are addressed in the Order.

²⁰⁴ See Chapter 11 of the ROWD and the 2005-06 Unified Annual Report for the analyses.

The Copermitees' recognize the need to improve management of hydromodification. The ROWD proposes to revise the Model WQMP to incorporate additional information from ongoing hydromodification studies conducted by the SMC. The Order allows the Copermitees to adopt criteria consistent with future SMC findings in the development of their Hydromodification Management Plan (see below).

Section F.1.h. requires the Copermitees to submit a Hydromodification Management Plan (HMP) within two years of permit adoption. This is consistent with other Southern California MS4 permits and in direct response to comments from the USEPA on Tentative Order R9-2008-001.

Section F.1.h (1) describes several elements that must be included in the HMP. For example, the HMP must identify a method for assessing susceptibility of channel segments which receive runoff discharges from Priority Development Projects, and include a channel standard to ensure that the stability of the channel is not compromised as a result of discharges from the Priority Development Projects. The HMP must also identify a range of flows where Priority Development Projects could cause hydromodification effects and subsequent stream instability.

Additionally, the HMP must require Priority Development Projects to implement hydrologic control measures (such as LID or detention basins) to prevent hydromodification and resultant degradation of stream conditions downstream of project sites. To compare post-project flow rates and durations to pre-project flow rates and durations, the HMP must specify that the pre-developed (naturally occurring) flow rates and durations shall be used when assessing pre-project conditions, so that the naturally occurring hydrology is eventually restored.

In cases where a stream has been armored with concrete, rip rap, or other man-made materials, the HMP shall require the assessment of a comparable soft-bottom channel as the channel standard, as opposed to using the characteristics of the hardened channel as the channel standard. This is to ensure that hydromodification management measures are already in place should any portion of the hardened channel be returned to its natural state, thereby restoring the physical integrity of the creek and its Beneficial Uses. For this reason, the waiver provision for hydromodification management measures for projects discharging into hardened channels was deleted from the Tentative Order. The remaining exception is for projects that discharge storm water runoff into underground storm drains discharging directly into bays or the ocean and for projects discharging to waters where the entire channel bed and banks have been concrete lined all the way to ocean receiving waters.

The HMP must also include metrics for assessing impacts to downstream watercourses from Priority Development Projects, as well as assessing improvements to these watercourses. One metric that must be included is the Index of Biotic Integrity (IBI) score for benthic macroinvertebrates. This is because historic hydromodification

impacts, such as concrete lining and channelization, have impacted the natural physical habitat of urban streams resulting in low IBI scores. The Copermittee's 2006-2007 monitoring indicated decreased IBI scores in the urbanized watersheds. In the absence of water chemistry and toxicity impacts, these low scores were attributed to be a result of poor physical habitat conditions.²⁰⁵ Therefore, the IBI score will be a useful metric in terms of assessing both impacts to streams from Priority Development Projects and improvements due to implementation of management measures.

In addition to the hydrologic control measures that must be included in the HMP to prevent or minimize hydromodification effects from Priority Development Projects, the HMP must also include additional measures to be used on Priority Development Projects based on a prioritized consideration of the following elements in this order: 1) site-design hydrologic control measures, 2) on-site management measures, 3) the use of regional controls upstream of receiving waters, and lastly, 4) in-stream controls (not to include reinforcement with non-naturally occurring materials). The suite of management measures must also include stream restoration as a viable option to achieve the channel standard and subsequently restore Beneficial Uses.

Section F.1.h (5) describes interim hydromodification criteria that must be implemented by the Copermittees within one year of adoption of the Tentative Order and concurrent to development of the local HMP. The values chosen for the interim criteria are those currently being implemented by Copermittees in the San Diego area.

Finally, the requirements included in section F.1.h do not supersede the requirements for LID presented in section F.1.d. (4). In certain situations, the requirements to incorporate LID will satisfy the requirements for hydromodification management. For example, detention basins are a common BMP used to manage high flow rates but behave hydrologically different than distributed systems used in LID. Using LID is a viable option for both accomplishing hydromodification management and pollutant load reductions.

F.2. Construction

The following legal authority applies to section F.2:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

²⁰⁵ Orange County Copermittees, November 15, 2007. 2006-2007 Unified Annual Progress Report Program Effectiveness Assessment (San Diego Region).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D) provides that the proposed management program include “A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(1) provides that the proposed management program include “A description of procedures for site planning which incorporate consideration of potential water quality impacts.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(2) provides that the proposed management program include “A description of requirements for nonstructural and structural best management practices.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(3) provides that the proposed management program include “A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(D)(4) provides that the proposed management program include “A description of appropriate educational and training measures for construction site operators.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(A) provides that each Copermitttee must demonstrate that it can control “through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from site of industrial activity.”

Federal NPDES regulation 40 CFR 122.26(b)(14) provides that “The following categories of facilities are considered to be engaging in ‘industrial activity’ for the purposes of this subsection: [...] (x) Construction activity including cleaning, grading and excavation activities [...].”

Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to “control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality.”

Section F.2 has additions to ensure the protection of threatened and endangered species and requires the consideration of potential impacts from the use of Active Treatment Systems. These requirements were added to ensure additional protection of the Beneficial Uses of waters of the State.

Section F.2.a. (Ordinance Update) requires each Copermittee to review and update its grading and storm water ordinances as necessary to comply with the MS4 permit. By updating the grading and storm water ordinances, the Copermittees will have the necessary legal authority to require construction sites to implement effective BMPs that will reduce pollutant discharges to the maximum extent practicable. The Order allows the Copermittees 365 days to review and update their ordinances. The 365 days should be adequate to allow for the relatively minor changes that might be needed since their ordinances were last updated under Order No. R9-2002-0001.

Section F.2.b. (Source Identification) requires the Copermittees to develop and update a watershed based inventory of all construction sites regardless of size or ownership. This section has been modified to require the inventory be updated regularly, rather than annually. More frequent updates will ensure the Copermittees have a more accurate inventory of construction sites within their jurisdiction. A regularly updated inventory of active construction sites will assist the Copermittees in ensuring that all sites are inspected per Order requirements. The Order does not specify the frequency of updates, and instead relies on each Copermittee to develop updates appropriate to local construction activity. The 2007 DAMP proposes that the inventory be updated “at a minimum” prior to the start of the rainy season. Such a minimum standard may not be appropriate for each Copermittee. Failure to maintain a useful inventory would be a violation of the Order.

Section F.2.c. (Site Planning and Project Approval Process) requires Copermittees to incorporate consideration of potential water quality impacts prior to approval and issuance of construction and grading permits. The Copermittees²⁰⁶ and our program evaluations in 2005²⁰⁷ recommend that storm water requirements need to be better incorporated into the pre-construction process.

²⁰⁶ Orange County Storm Water Copermittees. 2006. Report of Waste Discharge (San Diego Region), Section 7, New Development.

²⁰⁷ Tetra Tech, Inc. 2005. Program Evaluation Report. Orange County Storm Water Program: Cities of Laguna Beach, Laguna Hills, Lake Forest, and Rancho Santa Margarita.

This section now requires the Copermittees to review project proponents' runoff management plans for compliance with local regulations, policies, and procedures. USEPA recommends that it is often easier and more effective to incorporate storm water quality controls during the site plan review process or earlier.²⁰⁸ In the Phase I storm water regulations, USEPA states that a primary control technique is good site planning.²⁰⁹ USEPA goes on to say that the most efficient controls result when a comprehensive storm water management system is in place.²¹⁰ To determine if a construction site is in compliance with construction and grading ordinances and permits, USEPA states that the "MS4 operator should review the site plans submitted by the construction site operator before ground is broken."²¹¹ Site plan review aids in compliance and enforcement efforts since it alerts the "MS4 operator early in the process to the planned use or non-use of proper BMPs and provides a way to track new construction activities."²¹² During audits of Orange County Copermittee storm water programs, it was found that site plan and SWPPP review were inadequate and inconsistent.²¹³

Section F.2.d. (BMP Implementation) includes modifications to the requirements for each Copermittee to designate and ensure implementation of a set of minimum BMPs at construction sites. These modifications are based on Regional Board findings and experience during implementation of Order No. R9-2002-0001.

²⁰⁸ USEPA, 1992. Guidance 833-8-92-002. Section 6.3.2.1.

²⁰⁹ Federal Register / Vol. 55, No. 222 / Friday, November 16, 1990 / Rules and Regulations. P. 48034.

²¹⁰ Ibid.

²¹¹ USEPA, 2000. Guidance 833-R-00-002. Section 4.6.2.4, P. 4-30.

²¹² Ibid., P. 4-31.

²¹³ Tetra Tech, Inc. 2005. Program Evaluation Report. Orange County Storm Water Program: Cities of Laguna Beach, Laguna Hills, Lake Forest, and Rancho Santa Margarita.

Unlike Order No. R9-2002-0001, this Order does not require the Copermittee to designate a set of minimum BMPs for high, medium, and low threat to water quality construction sites. This change was made in recognition of most Copermittees' application of one consistent set of BMPs throughout their jurisdictions. The Copermittees also desire to move toward a risk-based approach to BMP requirements.²¹⁴ As a result, the Order requires a minimum set of BMPs to be designated for all sites and that enhanced BMPs, including advanced treatment systems, be designated for sites upstream of 303(d) impairments and ESAs. Advanced treatment has been effectively implemented extensively in the other states and in the Central Valley Region of California.²¹⁵ In addition, the Regional Board's inspectors have observed advanced treatment being effectively implemented at large sites greater than 100 acres and at small, less than 5 acre, in-fill sites. Advanced treatment is often necessary for Copermittees to ensure that discharges from construction sites are not causing or contributing to a violation of water quality standards. For example, the Basin Plan lists the water quality objective for turbidity as 20 NTU for all hydrologic areas and subareas except for the Coronado HA (10.10) and the Tijuana Valley (11.10). For certain construction sites with large slopes and exposed areas, the only technology that is likely to meet 20 NTU is advanced treatment combined with erosion and sediment controls. To ensure the MEP standard and water quality standards are met, the requirement for implementation of advanced treatment at high threat construction sites has been added to the Order, while still providing sufficient flexibility for each Copermittee's unique program.

²¹⁴ Orange County Storm Water Copermittees. 2006. Report of Waste Discharge (San Diego Region), Section 8, Construction

²¹⁵ SWRCB, 2004. Conference on Advanced Treatment at Construction Sites.

The Order does not include seasonal restrictions on grading. Seasonal restrictions on grading for storm water are difficult to implement due to the conflict between seasonal grading restrictions, endangered birds' breeding seasons and the seasonal passage of endangered salmonids; therefore the seasonal grading restrictions have not been included with the other BMPs in the Order. Found in southern California, the Least Bell's Vireo and the Coastal California Gnatcatcher are listed as federally endangered and threatened, respectively.²¹⁶ Permits issued by the California Department of Fish and Game (CDFG) restrict grading during these birds' breeding seasons, which is from April 10 to August 31 for the Least Bell's Vireo²¹⁷ and from February 15 to August 31 for the Coastal California Gnatcatcher.²¹⁸ Ideally storm water restrictions on grading would be during the wet season from October 1 through April 30.²¹⁹ Combined, these restrictions would limit construction grading to be during the month of September, which is infeasible. Section D.2.d of the Order still requires project proponents to minimize grading during the wet season and coincide grading with seasonal dry weather periods to the extent feasible.

Section F.2.e. (Inspections) establishes criteria for inspections based on risk factors including size, season, and location of the construction site. Modifications have been made to requirements of Order No. R9-2002-0001 based on the experience of the Copermitees and Regional Board construction programs.

The Order requires sites in active grading during the wet season that are over 30 acres be inspected every two weeks, rather than sites over 50 acres being inspected weekly. In south Orange County approximately 15 percent (34 sites) of construction sites over one acre are larger than 30 acres, whereas about 9 percent (21 sites) of sites are over 50 acres.²²⁰ This may result in a net decrease of inspections of large sites, although more sites will be covered. The reduction in inspection frequency for sites greater than 50 acres is justified because the sites have generally improved their erosion and sediment control measures since adoption of Order No. R9-2002-0001. Biweekly inspections of these sites in the future should be sufficient to ensure compliance with local regulations.

²¹⁶ State of California, Department of Fish and Game, 2005. State and Federally Listed Endangered and Threatened Animals of California.

²¹⁷ United States Department of the Interior, Fish and Wildlife Service, 2001. Least Bell's Vireo Survey Guidelines.

²¹⁸ United States Department of the Interior, Fish and Wildlife Service, 1997. Coastal California Gnatcatcher (*Polioptila californica californica*) Presence/Absence Survey Guidelines.

²¹⁹ Regional Board, 2001. Order No. 2001-01, San Diego County MS4 Permit. Directive F.2.g.(2).

²²⁰ Based on the State Board's database of sites covered by the Construction Storm Water General NPDES Permit, Order No. 99-08-DWQ. That general permit requires sites disturbing over one acre to file for coverage, so it provides a good basis for assessment.

The Order lowers the size of construction sites adjacent to or discharging directly to ESAs that receive scrutiny. Order No. R9-2002-0001 requires such sites five acres and more to be inspected weekly during the wet season. This Order requires such sites one acre and above to be inspected every two weeks during the wet season and once during August or September. The lower size threshold is consistent with Phase II storm water permits.

The Order omits Order No. R9-2002-0001's provision allowing a Copermittee to decrease the inspection frequency for high priority sites if the Copermittee certifies in writing to the Regional Board that they have recorded the site's Waste Discharge Identification Number, reviewed the site's Storm Water Pollution Prevention Plan (SWPPP), assured the site's SWPPP is in compliance, and assured the SWPPP is properly implemented at the site. Under Order No. R9-2002-0001, the Regional Board never received from any of the Copermittees a certification to decrease the inspection frequency at high priority sites. Since the certification process was never used, the language has been deleted from the Order.

This section also requires the Copermittees to track the number of inspections for each inventoried construction site. This requirement has been added to ensure that the Copermittees can demonstrate that construction sites are inspected at the minimum frequencies.

Section F.2.g.2 includes an additional requirement for notification to the Regional Board regarding construction sites has been added to this section. Copermittees are required to annually notify the Regional Board of construction sites that have suspected violations. This was added to enhance Regional Board and Permittee communication and coordination in regulating construction sites.

F.3 Existing Development

F.3.a. Municipal

The following legal authority applies to section D.3.a:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(1) provides that the proposed management program include "A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers."

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(3) provides that the proposed management program include “A description for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of de-icing activities.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(4) provides that the proposed management program include “A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(5) provides that the proposed management program include “A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A)(6) provides that the proposed management program include “A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides, and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications, and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.”

Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to “control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality.”

Section F.3.a.2. (General BMP Implementation) requires the Copermittees to designate minimum BMPs for general municipal areas and activities, regardless of their threat to water quality. The requirement that different types of BMPs be designated for different threats to water quality categories of municipal areas and activities has been removed from the Order. This was done to help simplify and clarify the Order’s requirements. BMPs required to be implemented at a site can now be based on the sources or activities present at the site. This is closer to the approach taken by the Copermittees in their JRMPs. Threat to water quality is used to determine inspection frequencies in section F.3.a.(7).

Section F.3.a.3, F.3.a.4, and F.3.a.5. (Specific BMP Implementation Categories) establishes requirements for specific categories of activities and areas. These are selected based on the CWA and findings of the Permittees in annual reports and ROWD that identify these activities as warranting special attention.

Pesticides, Herbicides, and Fertilizers. 40 CFR 122.26(d)(2)(iv)(A)(6) requires a description of a storm water program for pesticides, herbicides, and fertilizers. In addition, water quality data demonstrates widespread presence of such pollutants in receiving waters and MS4 discharges. In response to similar requirements of Order No. R9-2002-0001, the Copermitees have developed a specific model Integrated Pest Management, Pesticides, and Fertilizer guidelines.

Flood Control Structures. In order to more closely meet the intent of the federal regulations and guidance, the requirement has been modified. 40 CFR 122.26(d)(2)(iv)(A)(4) requires "A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible." Retrofitting flood control devices can reduce storm water pollutants and improve water quality. Copermitees have conducted many flood control retrofit projects, many of which have been partially funded with State grant awards.

USEPA expands on the federal provision with the following information: "Storm water management devices and structures that focus solely on water quantity are usually not designed to remove pollutants, and may sometimes harm aquatic habitat and aesthetic values" (1992). As flood control structures and other elements of the MS4 age and retrofitting becomes necessary, opportunities for water quality improvements arise.

Conveyance systems which take water quality consideration into account (such as grassed swales, vegetated detention ponds, etc.) can often cost less to construct than traditional concrete systems. Evaluation of the applicability of such systems during retrofitting must occur to ensure that pollutants in storm water runoff are reduced to the maximum extent practicable. USEPA supports utilizing BMPs for pollution reduction in flood management projects, stating that "The proposed management program must demonstrate that flood management projects take into account the effects on the water quality of receiving water bodies. [...] Opportunities for pollutant reduction should be considered".²²¹

²²¹ USEPA, 1992. Guidance Manual for the Preparation of Part II of the NPDES Permit Applications for Discharges from Municipal Separate Storm Sewer Systems. Washington D.C. EPA/833-B-92-002.

Existing Copermittee projects include two types of retrofits. The first type involves adding an engineered device to an existing structure in order to treat or divert runoff. Examples include catch basin inlet filters/screens, ultraviolet disinfection facilities, hydrodynamic separators, and diversions to the sanitary sewer. The second type involves re-installing pervious or natural treatment features to facilities. Examples include removing concrete portions of conveyances to create pervious conveyances; and creating treatment wetlands within flood detention facilities. The later type of retrofit is preferred by the Regional Board. They are likely more sustainable over the long-term because they may require less rigorous operation and maintenance than the former. They may also provide the additional benefit of providing significant or incidental opportunities for beneficial uses (e.g., recreation, wildlife, water supply).^{222,223}

Sweeping of Municipal Areas. Sweeping municipal areas would likely be done in the absence of the Order. However, in certain cases it is an important component of a jurisdictional runoff management program. The Order contains requirements to ensure that the use of street sweeping is optimized for runoff applications if it is to be used and reported as a BMP. The criteria in the Order are taken from industry guidance as reported by the Permittees in the Aliso Creek watershed.²²⁴

Section F.3.a.(6). (Operation and Maintenance of MS4 and Structural Controls) requires the Copermittees to inspect and remove waste from their MS4s prior to the rainy season.

Maintenance is critical to the successful implementation of every storm water runoff management program. USEPA finds that “Lack of maintenance often limits the effectiveness of storm water structural controls such as detention/retention basins and infiltration devices. [...] The proposed program should provide for maintenance logs and identify specific maintenance activities for each class of control, such as removing sediment from retention ponds every five years, cleaning catch basins annually, and removing litter from channels twice a year.

²²³ Stromberg, Juliet C. 2001. Restoration of Riparian Vegetation in the South-Western United States: the importance of flow regimes and fluvial dynamism. Journal of Arid Environments. Vol49, pp.17-34.

²²⁴ See 20th and 21st quarterly reports for the Aliso Creek watershed bacteria investigation, prepared by the Orange County Copermittees within the Aliso Creek watershed.

If maintenance activities are scheduled infrequently, inspections must be scheduled to ensure that the control is operating adequately. In cases where scheduled maintenance is not appropriate, maintenance should be based on inspections of the control structure or frequency of storm events. If maintenance depends on the results of inspections or if it occurs infrequently, the applicant must provide an inspection schedule. The applicant should also identify the municipal department(s) responsible for the maintenance program".²²⁵ The MS4 maintenance requirements are based on the above USEPA recommendations. This maintenance will help ensure that structural controls are in adequate condition to be effective year round, but especially at the beginning of and throughout the rainy season.

Two requirements have been added to the Order that were not within Order No. 2002-0001. Subsection (3) allows a decreased inspection frequency for facilities that are routinely clean, and Subsection (4) requires trash to be removed from channels in a timely manner. Typically, Copermittees have reported annual or semi-annual creek cleanups as significant BMPs. The large volumes of trash reported to be removed during these events demonstrates the significant amount of trash that accumulates in the channels. In addition, storm water runoff is a leading contributor to the accumulation of trash and debris along the beaches of Orange County.²²⁶ In order to reduce the effect of the trash, the Order requires that trash be removed more frequently.

Section F.3.a.(7). (Sewage Infiltration) requires the Copermittees to implement controls and measures to prevent and eliminate sewage infiltration or seepage from municipal sanitary sewers to MS4s through thorough, routine preventive maintenance of the MS4. This requirement is in Order No. R9-2002-0001 in the section on Illicit Discharge Detection and Elimination (section F.5.i).

Sections F.3.a.(8) and F.3.a.(9). (Inspections and Enforcement) establishes a minimum set of municipal areas and activities for oversight and inspection by the Copermittees and requires that Copermittees properly enforce runoff requirements at municipal areas and activities.

F.3.b. Industrial and Commercial

The following legal authority applies to section F.3.b:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(C) provides that the proposed management program include “A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(C)(1) provides that the Copermittee must “identify priorities and procedures for inspections and establishing and implementing control measures for such discharges.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(C)(2) provides that the proposed management program shall “Describe a monitoring program for storm water discharges associated with the industrial facilities identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of quantitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD5, TSS, total phosphorus, total Kjeldhal nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under 40 CFR 122.21(g)(7)(iii) and (iv).”

Federal NPDES regulation 40 CFR 122.26(d)(2)(ii) provides that the Copermittee “Provide an inventory, organized by watershed of the name and address, and a description (such as Standard Industrial Classification [SIC] codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity.”

Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to “control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(A) provides that each Copermitttee must demonstrate that it can control “through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from site of industrial activity.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A) provides that the Copermitttee develop a proposed management program which includes “A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls.”

Section F.3.b. (Industrial and Commercial) requires the Copermitttees to implement an industrial and commercial program to reduce pollutants in storm water runoff from all industrial and commercial sites/sources. The industrial and commercial sections of Order No. 2002-0001 have been combined into one section in this Order. This change will streamline and simplify the Order, without negatively impacting water quality. This change is not unprecedented because industrial and commercial facilities are commonly addressed together. For example, the Southern Riverside County MS4 Permit²²⁷ combined industrial and commercial programs into one section. In addition, in their Annual Reports and ROWD,²²⁸ the Copermitttees jointly address industrial and commercial components. USEPA contractor Tetra Tech also evaluated and reported on the industrial and commercial programs jointly during their program evaluations.²²⁹

Section F.3.b.(1)(a) (Source Identification) requires that building material retailers and storage, animal facilities, and power washing services be included in the Copermitttees' inventory of commercial sites/sources. These activities have been identified annual MS4 program reports and quarterly Aliso Creek watershed reports as potentially significant sources of pollutants. This is not a significant change because Order No. R9-2002-0001 requires that any commercial site or source determined by a Copermitttee to contribute a significant pollutant load to the MS4 be added to its inventory of commercial sites. Furthermore, the commercial BMP fact sheets developed by the Copermitttees generally address the types of activities occurring at these facilities and practices.

²²⁷ Regional Board, 2004. Order No. R9-2004-001; Riverside County MS4 Permit. Section H.2; P. 24.

²²⁸ Orange County Storm Water Copermitttees. 2006. Report of Waste Discharge (San Diego Region). Section 9.

²²⁹ Tetra Tech, Inc., 2005. Program Evaluation Reports Orange County Storm Water Programs: Cities of Laguna Beach, Laguna Hills, Lake Forest, and Rancho Santa Margarita.

The Order has revised requirements for identifying industrial sites/sources. The revised requirements are identical to those found in the Southern Riverside County MS4 permit.²³⁰ USEPA requires the same identification: "Measures to reduce pollutants in storm water discharges to municipal separate storm sewers from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA)."²³¹ USEPA "also requires the municipal storm sewer permittee to describe a program to address industrial dischargers that are covered under the municipal storm sewer permit."²³² In order to more closely follow USEPA's guidance, this Order also includes operating and closed landfills, and hazardous waste treatment, disposal, storage and recovery facilities.

Section F.3.b.3. (Mobile Businesses) requires each Copermittee to develop and implement a program to reduce the discharge of storm water pollutants from mobile businesses to the MEP and to prevent the discharge of non-storm water. Mobile businesses are service industries that travel to the customer to perform the service rather than the customer traveling to the business to receive the service. Examples of mobile businesses are power washing, mobile vehicle washers, carpet cleaners, port-a-potty servicing, pool and fountain cleaning, mobile pet groomers, and landscapers. These mobile services produce waste streams that could potentially impact water quality if appropriate BMPs are not implemented.

Order No. R9-2002-0001 also requires BMP implementation for certain mobile businesses (e.g., mobile vehicle washing and mobile carpet cleaning). These storm water requirements of Order No. R9-2009-0002 are not significantly different from the existing requirements. The Order specifies mobile businesses must prevent non storm water dry weather flows from entering the MS4 (see C.1.b) for special attention based on reports from the Copermittees that mobile businesses have been difficult to control with existing programs.

Mobile businesses present a unique difficulty in storm water regulation. Due to the transient nature of the business, the regular, effective practice of unannounced inspections is difficult to implement. Also, tracking these mobile businesses is difficult because they are often not permitted or licensed and their services cross Copermittee jurisdictions. Mobile businesses that operate within a municipality may be based in another municipality or even outside the Region. The Order takes into account the difficulties in regulating mobile businesses.

Because BMPs have been developed already, but communication with mobile businesses may be difficult, the Order provides broad flexibility to the Copermittees for developing a targeted program within the Commercial portion of each JRMP.

²³⁰ Regional Board, 2004. Order No. R9-2004-001; Riverside County MS4 Permit. Section H.2.b)(2); P. 25.

²³¹ Federal Register / Vol. 55, No. 222 / Friday, November 16, 1990 / Rules and Regulations. P. 48056.

²³² Ibid.

Section F.3.b.4. (Inspections) includes requirements for inspections of industrial and commercial sites/sources. The Order is similar to the Southern Riverside County MS4 permit²³³ in requiring that inspections check for coverage under the General Industrial Permit; assessment of compliance with Copermittee ordinances and permits related to storm water and non-storm water runoff; assessment of BMP implementation, maintenance, and effectiveness; visual observations for non-storm water discharges, potential illicit connections, and potential discharge of pollutants in storm water runoff; and education and outreach on storm water pollution prevention. The Order also requires that inspections include review of BMP implementation plans if the site uses or is required to use such a plan, and the review of facility monitoring data if the site monitors its runoff. Order No. 2002-0001 did not contain requirements for inspection procedures.

Changes in the Order's requirements for inspection procedures mimic USEPA's guidance: "Site inspections should include (1) an evaluation of the pollution prevention plan and any other pertinent documents, and (2) an onsite visual inspection of the facility to evaluate the potential for discharges of contaminated storm water from the site and to assess the effectiveness of the pollution prevention plan."²³⁴ In 1999, USEPA "recognized visual inspection as a baseline BMP for over 10 years," and "visual inspections are an effective way to identify a variety of problems. Correcting these problems can improve the water quality of the receiving water."²³⁵ Most, if not all, of the Order's procedures are being conducted by the Copermittees that follow the Model Existing Development Program of the DAMP.

With the exception of restaurants, the Order allows Copermittees to establish inspection frequencies, as long as at least 20 percent of the sites are inspected annually. Restaurants are now required to be inspected annually. Inspection frequencies in the Order have been modified from Order No. R9-2002-0001. Order No. R9-2002-0001 specifies frequencies for inspecting industrial sites based on threat to water quality and requires high priority commercial sites to be inspected as needed. Copermittees have been inspecting industrial sites according to Order No. R9-2002-0001. The Copermittees have been inspecting restaurants annually as part of the County Health Department inspections. For other commercial sites, the Copermittees have been focusing annual activities on certain commercial sectors, such as automobiles, with the goal of inspecting every high priority site at least once during the permit term. This change is not considered significant because it should allow the Copermittees to continue existing programs.

²³³ Regional Board, 2004. Order No. R9-2004-001; Riverside County MS4 Permit. Section H.2.d)(3);

²³⁴ USEPA, 1992. Guidance 833-8-92-002, section 6.3.3.4 "Inspection and Monitoring".

²³⁵ USEPA, 1999. 832-F-99-046, "Storm Water Management Fact Sheet – Visual Inspection".

Reports from the Aliso Creek watershed Copermittees demonstrate that as-needed inspections for restaurants means at least annually. Restaurants have been found to present many threats to water quality and standard educational efforts are not effective because restaurants are subject to frequent management changes. For these reasons, the Order requires restaurants to be inspected annually.

An additional notification to the Regional Board regarding industrial sites has been added. Copermittees are required to annually notify the Regional Board of industrial sites that have suspected violations. This was added to enhance Regional Board and Permittee communication and coordination in regulating industrial sites.

Section F.3.b.(6). (Training and Education) requires training and education measures generally consistent with the existing storm water programs. One distinction is that the Order requires each Copermittee to notify the owner/operator of each inventoried industrial and commercial site/source of the BMP requirements applicable to the site/source. This requirement is necessary to ensure that the owners and operators of commercial sites stay informed of appropriate BMPs. This is especially important because sites may be inspected as little as once every five years.

Section F.3.c. (Residential Component)

The following legal authority applies to section F.3.c:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(A) provides that the Copermittee develop a proposed management program which includes “A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls.”

Federal NPDES regulation 40 CFR 122.44(d)(1)(i) requires NPDES permits to include limitations to “control all pollutants or pollutant parameters (either conventional, nonconventional, or toxic pollutants) which the Director determines are or may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard, including State narrative criteria for water quality.”

Section F.3.c (Residential Component) moves the common interest areas / homeowners' association component and the requirement for proper management of used oil, toxic materials, and other household hazardous wastes to the residential section of the Order, since these requirements generally apply to residential areas. These changes improve the organization of the Order and have no net effect on its implementation and enforcement. Other requirements for prioritization, BMP implementation, and enforcement are consistent with Order No. R9-2002-01.

Section F.3.d. (Retrofitting Existing Development)

Legal Authority: The legal authority for retrofitting existing development is the same legal authority as that identified for municipal, industrial, commercial and residential development sections (See fact sheet discussion on those sections, F.3.a – c). In particular, CWA sections 402(p)(3)(B)(ii-iii), and CWC section 13377 give the Regional Board the legal authority to require retrofitting of existing development.

A section has been added to require the retrofit of existing development (see Finding D.3.i and Discussion). This section contains specific requirements for the retrofit process. Retrofitting existing development is a widespread practice across the United States. Successful retrofitting programs have been implemented in such diverse locations as Seattle, Washington²³⁶; Portland Oregon²³⁷, Santa Monica, California²³⁸; Kansas City, Kansas²³⁹; and Montgomery County, MD²⁴⁰. When appropriately applied as the draft Tentative Order, retrofitting existing development meets the maximum extent practicable standard.

Existing BMPs are not sufficient, as evidenced by 303(d) listings and exceedances of Water Quality Objectives from the Copermitees monitoring reports. More advanced BMPs, including the retrofitting of existing development with LID, are part of the iterative process. Previous permits limited the requirement of treatment control BMPs to new development and redevelopment. Based on the current rate of redevelopment compared to existing BMPs, the use of LID only on new and redevelopment will not adequately address current water quality problems, including downstream hydromodification. Retrofitting existing development is practicable for a municipality through a systematic evaluation, prioritization and implementation plan focused on impaired water bodies, pollutants of concern, areas of downstream hydromodification, feasibility and effective communication and cooperation with private property owners.

F.4. Illicit Discharge Detection and Elimination

The following legal authority applies to section F.4:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B) provides that the proposed management program “shall be based on a description of a program, including a schedule, to detect and remove (or require the discharger to the municipal storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(1) provides that the Copermitttee include in its proposed management program “a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal storm sewer system.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(2) provides that the Copermitttee include in its proposed management program “a description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv)(B)(3) provides that the Copermitttee include in its proposed management program “procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water.”

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(4) provides that the Copermitttee include in its proposed management program “a description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer.”

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(5) provides that the Copermitttee include in its proposed management program “a description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers.”

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(6) provides that the Copermittee include in its proposed management program “a description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials.”

Federal NPDES regulations 40 CFR 122.26(d)(2)(iv)(B)(7) provides that the Copermittee include in its proposed management program “a description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary.”

Section F.4.a-b. (Prevent and Detect Illicit Discharges) requires the Copermittees to implement a program to actively seek and eliminate illicit connections and discharges (IC/ID). Additional wording has been added to this section to clarify and ensure that all appropriate (i.e., field personnel) municipal personnel are utilized in the program to observe and report these illicit discharges and connections. requirement has been added requiring submittal of the GIS layers of the MS4 map within 365 days of Order adoption.

Section F.4.e (Investigations) requires the Copermittees to conduct follow up investigations and inspect portions of the MS4 for illicit discharges and connections, based on dry weather effluent analytical monitoring results. The section also requires the Copermittees to establish criteria for triggering follow up investigations. Additional language has been added to this section to clarify the minimum level of effort and timeframes for follow up investigations when dry weather limitations are exceeded. Timely investigation and follow up of exceedances is necessary to identify sources of illicit discharges, especially since many of the discharges are transitory. The requirements for a 48-hour minimum response time when action levels are exceeded and for immediate response to obvious illicit discharges is necessary to ensure timely response by the Copermittees.

The Copermittees currently use action levels to facilitate the determination of when source investigation studies are warranted based on data from the dry-weather monitoring program. One set of criteria is based on regional averages of constituent concentrations that were developed based on randomly selected storm drains. Another set of criteria is based on trends at a particular station. These are reasonable criteria if decision-makers are properly trained and action levels set by the County are in compliance with dry weather non-storm water action levels as required in Section C. The ability of the local managers to interpret dry-weather monitoring data collected by the County has greatly improved in the last two years, and continued training is required in section F.4.i.

Section F.4.h. (Spill Response) requires each Copermittee to implement measures to prevent and respond to spills into its MS4. These requirements are similar to Order No. R9-2002-0001 and based on federal regulations at 40 CFR 122.26(d)(2)(iv)(B)(4). Those federal NPDES regulations clearly require that owners and operators of MS4s have procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer.

The Tentative Order includes sewage and non-sewage spills in the requirement for spill prevention and response. Federal regulations clearly define sewage as an illicit discharge that must be addressed by municipalities (see Phase II Final Rule, p.68758). Sewage is an illicit discharge to the MS4 that threatens public health. As such, the Copermittees must implement measures to prevent sewage from entering the MS4 system and must respond to illicit discharges that have entered the system. This section has been revised to clarify that management measures and procedures must be implemented to prevent, respond to, and cleanup spills.

This same requirement was adopted by the Regional Board in Order No, 2002-0001, but was subsequently stayed by the State Board in Order WQO 2002-0014. The City of Mission Viejo challenged the requirement to prevent and respond to sewage spills on the grounds that since the sanitary sewer systems in the City are operated by three water districts already regulated by a NPDES permit from the Regional Board, this requirement would cause delayed spill responses as the City and agencies try to determine jurisdiction and responsibilities. The State Board found that the costs of this requirement did not constitute harm, but agreed that harm could ensue from potential response delay and confusion. Although the entire permit requirement was stayed, neither the State Board, nor the Petitioner discussed spills other than sewage.

Subsequently, the Copermittees and the local sewer agencies have developed mature relationships and implemented procedures for spill response and sewage spill response.²⁴¹ As a result, the concerns expressed by the State Water Board are no longer warranted. The Model Sewage Spill Response Procedure is outlined in the Copermittees' Proposed 2007 Drainage Area Management Plan (DAMP). According to the 2007 DAMP, regardless of where the spill originates, if the spill has entered or may enter the storm drain system, the Copermittees respond to assist with the cleanup and remediation of the area.

Only three Permittees (Laguna Beach, San Clemente, and San Juan Capistrano) own or operate their own sewage collection systems, yet all Copermittees implement the programs for spill response. For the Copermittees that do not own or operate sewage systems, the Regional Board expects that they will continue to respond appropriately to reported or identified spills to the MS4 system.

²⁴¹ Sections 10.2.4 and 10.2.5 in the 2007 DAMP.

Section F.3.a.7 of the Tentative Order includes requirements for measures that must be taken to prevent sewage spills. Examples of measures being implemented by Copermittees include inspections of fats, oils, and grease management at restaurants. Other preventative measures can be implemented during routine planning efforts for new development and redevelopment projects. Similarly, building permit inspections should be used to verify the integrity of the sanitary and storm sewer infrastructure and ensure that cross-connections between the two are avoided.

G. Watershed Runoff Management Programs

The following legal authority applies to section G:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(a)(3)(ii) states: “The Director may [...] issue distinct permits for appropriate categories of discharges [...] including, but not limited to [...] all discharges within a system that discharge to the same watershed [...]”

Federal NPDES regulations 40 CFR 122.26(a)(3)(v) states: “Permits for all or a portion of all discharges from large or medium municipal separate storm sewer systems that are issued on a system-wide, jurisdiction-wide, watershed, or other basis may specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas [watersheds] which contribute storm water to the system.”

Federal NPDES regulation 40 CFR 122.26(a)(5) states: “The Director may issue permits for municipal separate storm sewers that are designated under paragraph (a)91)(v) of this section on a system-wide basis, a jurisdiction-wide basis, watershed basis, or other appropriate basis.”

Federal NPDES regulation 40 CFR 122.26(d)(2)(iv) states: “Proposed programs may impose controls on a system-wide basis, a watershed basis, a jurisdiction basis, or on individual outfalls.”

Section G. (Watershed Runoff Management Program) requires Copermittees to continue implementation of their watershed runoff management programs (WRMPs), however the implementation approach has changed. Order No. R9-2002-01 required watershed RMPs to include a collaborative strategy to abate the sources and reduce the discharges causing high priority water quality problems. This strategy was to guide Watershed Copermittee’s selection and implementation of Watershed Activities, so that the activities selected and implemented would remove that pollutant contribution responsible for the identified high priority water quality problem. Outcomes of these requirements were not able to demonstrate improvements to water quality.

Revised language in Order R9-2009-002 attempts to focus watershed copermittee's efforts and resources on addressing the highest water quality problems in the watershed by focusing attention on the health of the receiving water body and the most efficient use of the Watershed Copermittee's time and resources. Order R9-2009-002 requires the Watershed Copermittee's to follow a workplan approach towards assessing receiving water body conditions, prioritizing the Watershed Management Area's (WMAs) highest priority water quality problems, implementing effective BMPs, and measuring water quality improvement in the receiving water.

G1. (Lead Watershed Copermittee Identification) requires the watershed copermittee's to identify a Lead Watershed Copermittee for their WMA.

This requirement is the same to that found in Order 2002-01.

G.2 a-f. (Watershed Workplan) requires the Watershed Copermittees to develop and implement a collective watershed strategy to assess and prioritize the water quality problems within the watershed's receiving waters, identify and model sources of the highest priority water quality problem(s), develop a watershed-wide BMP implementation strategy to abate highest priority water quality problems, and a monitoring strategy to evaluate BMP effectiveness and changing water quality prioritization in the WMA. Development of a workplan rather than watershed activities will allow the Copermittees flexibility to iteratively modify their watershed strategy over the course of future planning years as priorities change.

G.3. Watershed Workplan Implementation – Watershed Copermittee's shall begin implementing the Watershed Workplan within 30-days of approval by the Regional Board Executive Officer. Since the Copermittees are already familiar with the watershed program requirements implementing the watershed workplan within 30-days of approval by the Regional Board Executive Officer is reasonable.

G.4. Copermittee Collaboration – Watershed Copermittees shall collaborate to develop and implement the Watershed Workplan. Watershed Copermittee collaboration shall include frequent regularly scheduled meetings.

This requirement is the same to that found in Order 2002-01.

G.5. Public Participation – Watershed Copermittees shall implement a watershed-specific public participation mechanism within each watershed. A required component of the watershed-specific public participation shall be a minimum 30-day public review of the Watershed Workplan. Opportunity for the public to review and comment on the Watershed Workplan must occur before the workplan is implemented.

This requirement is similar to that found in Order 2002-01.

G.6. Watershed Workplan Review and Updates – Watershed Copermittees shall

review and update the Watershed Workplan annually to identify need changes to the prioritized water quality problem(s) listed in the workplan. All updates to the Watershed Workplan shall be presented during an Annual Watershed Review Meeting. Annual Watershed Review Meetings shall be conducted by the Watershed Copermittees, open to the public and adequately noticed, and occur once every calendar year. Individual Watershed Copermittees shall also review and modify their jurisdictional programs and JRMP Annual Reports, as necessary, so that they are consistent with the updated Watershed Workplan.

This section requires the copermittee's to review and update their workplan each year to incorporate changing priorities and evolving watershed strategies. This requirement is meant to take the place of Order No. 2002-01 requirement to submit Watershed Annual Reports.

G.7. Aliso Creek Watershed RMP Provisions. This requirement is the same to that found in Order 2002-01.

H. Fiscal Analysis

The following legal authority applies to section H:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(vi) provides that “[The Copermittee must submit] for each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2)(iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.”

Section H has been expanded in order to develop more useful and meaningful fiscal reporting. The Copermittees have identified a need to assess the current fiscal reporting process and have proposed to prepare a fiscal reporting strategy to better define the expenditure and budget line items included in the fiscal reports.²⁴² The Regional Board agrees that the process should be improved. A revamped fiscal reporting strategy will provide the Regional Board and the Copermittees with better capability to manage performance of the programs.

The Copermittees’ effort is expected to provide standardization of reporting so that figures between Copermittees are comparable, which is one of many types of information which can be used by the Regional Board to better understand Copermittee program implementation. Standardization and comparison of fiscal analysis reporting is supported by the State Board funded NPDES Stormwater Cost Survey, which finds that “standards for reporting costs and stormwater activities are needed to allow accurate cost comparisons to be made between stormwater activities.”²⁴³ This document also provides guidance regarding categorization of expenditures for tracking and reporting.

The Order establishes criterion for when Copermittees must add narrative evaluations to the tables. This will address some of the variability in reporting and will provide the public and Regional Board with improved understanding of how resources are shifted in response to annual assessments. This will also help ensure that projected annual costs adequately reflect planned program modifications described in the annual reports.

²⁴² Orange County Storm Water Copermittees. 2006. Report of Waste Discharge (San Diego Region), section 2.3.4.

²⁴³ Currier, et al., 2005. *NPDES Storm Water Cost Survey Final Report*. Prepared for California State Water Resources Control Board by Office of Water Programs, California State University, Sacramento. P. 63.

The Regional Board has chosen not to require a description of fiscal benefits realized from implementation of the storm water protection program. This is a recommendation from the National Association of Flood and Stormwater Management Agencies.²⁴⁴ For instance, the current fiscal assessment does not address city-wide fiscal benefits of protection (e.g., public health, tourism, property values, economic activity, beneficial uses, etc.), even though many costs currently reported to the Regional Board are for related activities. This type of assessment may help Copermittees improve the allocation of resources and it may help the Copermittees secure adequate funding for the program. Finally, it will provide a clearer picture of the storm water and non-storm water runoff program to the public and Regional Board. However, qualitative assessments could be overly subjective and most Copermittees likely lack the ability to provide accurate quantitative assessments. The Regional Board encourages Copermittees to consider means for conducting assessments of fiscal benefits derived from the programs. Such assessments could be conducted on a regional scale similar to studies of program costs conducted by the State Water Board²⁴⁵ or community indicators by the Community Indicators Project.²⁴⁶

Currently, each Orange County municipality's annual report includes a table based on a template developed by the principal Copermittee. The template was meant to facilitate reporting consistency among the 13 Copermittees. The annual report table contains estimates of spending during the reported period and estimates of the next year's spending. The tables separate capital costs from operations and maintenance costs and are arranged by program element. In addition to the tables, each municipality reports on the sources of the funds, (e.g., general fund, special fee, grants, etc.) to demonstrate that resources have been secured. There is very heavy reliance on general funds.

Review of the fiscal analysis tables included in the annual reports has not been as straightforward as expected, and the value of the information is moderate. Generally, questions regarding the financial reporting process of individual Permittees have been adequately resolved during meetings to discuss the annual reports. Based on those meetings, the Regional Board staff has found that cities do not use consistent methods to fill in the tables because they use different accounting and budgeting processes, and certain stormwater program expenditures are not easily categorized into the table formats. Furthermore, stormwater permit-related activities involve several departments, which makes it difficult for the storm water manager to gather and decipher actual costs.

²⁴⁴ National Association of Flood and Stormwater Management Agencies. 2006. *Guidance for Municipal Stormwater Funding*. Prepared under a grant provided by the USEPA.

²⁴⁵ State Water Board, 2005. NPDES Stormwater Cost Survey.

²⁴⁶ Orange County 2006 Community Indicators Project. 2006. Sponsored by the County of Orange, the Orange County Business Council, and the Children and Families Commission of Orange County. Available on-line at www.oc.ca.gov/ceocommunity.asp

These issues also make it difficult for the Copermittees to accurately compartmentalize expenditures within the format. The Copermittees are aware of the reporting discrepancies and have planned to modify the reporting template and guidelines. As a result, the current financial reporting provides estimates at best and cannot be reliably used to compare program implementation among most municipalities.

I. Total Maximum Daily Loads

This section has been added to address any TMDLs that are adopted by the Regional Board. See Finding E.10 and Discussion.

J. Program Effectiveness Component

The following legal authority applies to section J:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(d)(2)(v) provides that the Copermittees must include “Estimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.” Under Federal NPDES regulation 40 CFR 122.42(c) applicants must provide annual reports on the progress of their storm water management programs.

Section J.1 (jurisdictional program effectiveness assessments) of the Order requires the Copermittees to assess the effectiveness of the implementation of their jurisdictional programs and activities. The section requires that the effectiveness strategy of the programs be designed around four classes of objectives and that the results are used to direct program modifications. The section does not specify the assessments to be conducted, but does require that assessment measures conform to the guidance developed by the California Storm Water Quality Association (CASQA). The Orange County Storm Water Program is supportive of the CASQA effort, and use of CASQA assessment techniques is consistent with the methodology proposed in the ROWD.^{247 248}

The section is also consistent with the plan of the Copermittees to improve the efficacy of the assessment process.²⁴⁹ The Copermittees currently report a series of metrics for spatial and temporal assessments across the County. The Program Effectiveness requirements of the Order provide the Copermittees with the framework for improving their standard assessment metrics.

²⁴⁷ The structure of planned program effectiveness is proposed in section 1.2.2 of the 2007 ROWD. The ROWD then identifies current and potential assessment outcome levels within each major program chapter (e.g., new development, construction, etc.).

²⁴⁸ CASQA 2007. Municipal Stormwater Program Effectiveness Assessment Guidance.

²⁴⁹ Orange County Storm Water Copermittees. 2006. Report of Waste Discharge (San Diego Region), section 3.3.2.

The Order provides focus to the assessment methodology by requiring that impaired waterbodies and environmentally-sensitive areas are specifically addressed. In this way, the high priority water quality issues will receive a high level of attention, consistent with USEPA and CASQA guidance for prioritization. The Order provides flexibility to establish the actual metrics for each assessment outcome level. The Order also provides the Copermittees flexibility to develop objectives for the general program components based on the CASQA guidance, as is proposed in the ROWD and DAMP.

In addition, Section J.1 requires that an effectiveness assessment strategy is developed and implemented in response to actions taken by a Copermittee to comply with Section A.3 (Prohibitions and Receiving Water Limitations) of the Order. Section A.3 outlines the procedure for addressing instances when jurisdictional programs implement control actions in response to determinations that discharges from the MS4 are causing or contributing to violations of water quality standards.

This section includes a requirement for the Copermittees to develop and implement a workplan identifying and addressing the highest priority issues in the watershed. The workplan requirement in the JRMP section has been added to ensure Copermittees are allocating resources and effort to address priority problems and pollutants identified in the watershed analysis. This section has been added to ensure Copermittees use the annual watershed water quality assessment to assess, adjust and tailor their JRMP programs.

Section J.2 (program modification) of the Order requires the Copermittees to improve jurisdictional activities or BMPs when they are found to be ineffective or when water quality impairments are continuing. This requirement fulfills the purpose of conducting effectiveness assessments – to improve and refine the Copermittees’ programs. The requirement is consistent with USEPA’s Phase II regulations, which state: “If the permittee determines that its original combination of BMPs are not adequate to achieve the objectives of the municipal program, the MS4 should revise its program to implement BMPs that are adequate [...]”²⁵⁰

Section J.3 (reporting) of the Order describes the information required to be submitted in jurisdictional annual reports pertaining to program effectiveness assessments, review, and response. The reporting will demonstrate whether Copermittees have appropriately responded to the effectiveness assessments.

²⁵⁰ Federal Register / Vol. 64, No. 235 / Wednesday, December 8, 1999 / Rules and Regulations. P. 68762.

K. Reporting

The following legal authority applies to section K:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.42(c) requires that “The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer system that has been designated by the director under § 122.26(a)(1)(v) of this part must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report shall include: (1) The status of implementing the components of the storm water management program that are established as permit conditions; (2) Proposed changes to the storm water management program that are established as permit condition. Such proposed changes shall be consistent with § 122.26(d)(2)(iii) of this part; (3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under § 122.26(d)(2)(iv) and (d)(2)(v) of this part; (4) A summary of data, including monitoring data, that is accumulated throughout the reporting year; (5) Annual expenditures and budget for year following each annual report; (6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; (7) Identification of water quality improvements or degradation.”

California Water Code section 13267 provides that “the Regional Board may require than any person who has discharged [...] shall furnish, under penalty of perjury, technical or monitoring reports which the regional board requires.”

Section K.1 (Jurisdictional Runoff Management Plans and Watershed Workplans) outlines the process and due dates for submitting plans. The information to be included in the Jurisdictional and Watershed plans must be sufficient to demonstrate the capacity to implement the requirements of Section G and Section J, respectively, of the Order.

Two general modifications from Order No. R9-2002-0001 result in reduced reporting effort by the Copermittees. First, in many cases, the requirements of the Order should not necessitate a complete rewrite of the plans, as was basically done in 2003. Only sections of the Order which are new or have been significantly changed should warrant rewriting of plans' sections. Second, the WRMP annual reporting is no longer due in January. Annual reporting will occur during a watershed review meeting conducted some time during the calendar year. The Regional Board plans to work with the Copermittees and provide guidance regarding where JRMPs must be updated in accordance with the Order. This will help ensure that rewriting, reporting, and review efforts are minimized.

The reporting requirements include two significant additions. The first addition is a summary reporting checklist which has been added to the reporting requirements. The checklist has been added to ensure that Copermittees evaluate and demonstrate compliance with all requirements in the Order.

Section K.2 (Other Required Reports) include requirements for information to be included in the SSMP update and the Report of Waste Discharge for the next permit reissuance. The Order requires submittal of a ROWD prior to the expiration of the Order. The section identifies the minimum information to be included in the ROWD, based on USEPA's May 17, 1996 guidance "Interpretive Policy Memorandum on Reapplication Requirements for Municipal Separate Storm Sewer Systems."

Section K.3 (Annual Reports) outlines the process and roles of the Copermittees for developing and submitting the JRMP annual report. Information to be included in the annual reports is described in Section K.3.a.3. The due dates have been changed. The JRMP is due approximately six weeks earlier than under Order No. R9-2002-0001. This change is necessary because the existing timelines prevented efficient response by the Copermittees to comments from the Regional Board and the Copermittees' own review. However, the Copermittees may propose alternate reporting criteria and schedules, as part of their updated JRMP, for the Executive Officer's acceptance.

Each Copermittee is required to maintain records demonstrating that Permit activity requirements have been met, which allows the Regional Board to confirm compliance as needed, such as via inspections, program audits, or requests for information per California Water Code Sections 13225 and 13267.

Reporting requirements in the Order focus on results and responses to the effectiveness assessments conducted by the Copermittees. This will allow the Regional Board to determine how appropriately municipalities adapt and tailor their programs to findings from activities and monitoring results. Assessment of progress toward meeting the objectives is possible because the data collected by the Copermittees under Order No. R9-2002-0001 can be used to establish baseline conditions. Compared to activity-based reporting, this will greatly enhance the ability of the Regional Board, Copermittees, and the public to determine whether the programs are successful.

The Order reduces the amount of program activity-based reporting from Order No. R9-2002-0001. Under the CASQA assessment model, activity-based reporting includes primarily outcomes that document compliance with permit requirements (Level 1 outcomes), rather than being indicators of the impact of activity implementation.²⁵¹ This approach is consistent with guidance from the USEPA, which notes that annual reports should highlight program effectiveness as well as describing activities.²⁵² This emphasis is also consistent with recommendations from the National Academy of Public Administration in its report to USEPA on Evaluating Environmental Progress, which suggest that reviewing activities data provides limited value when evaluating the effectiveness of programs and resulting environmental conditions.²⁵³

The Order maintains some reporting requirements for certain activity-based outcomes. These are mostly focused on activities that establish or revise municipal processes related to storm water runoff and management. The processes required by the Order are especially important in situations where sustaining water quality improvements may require activities that extend beyond the five-year period of the NPDES permit.

In addition, the Order maintains many activity-based reporting requirements related to enforcement of local requirements, with an emphasis on the results from such activities. This is intended to facilitate review of the contributions that inspection and enforcement activities have made toward meeting the goals of the Order. Reporting of these types of activities is supported by recommendations from the National Academy of Public Administration in its report to the USEPA: *Evaluating Environmental Progress: How EPA and the States Can Improve the Quality of Enforcement and Compliance Information* (June 2001).²⁵⁴ Other activity-based reporting has been reduced to selected items based on consideration of program priorities.

Another source of prioritization for activity-based reporting is the *Storm Water Panel Recommendations to the California State Water Resources Control Board The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities* (June 19, 2006). In particular, the panel highlighted needs to improve the design, maintenance, and inspections of best management practices.

²⁵¹ Level 1 outcomes under the CASQA guidance include documentation that required activities have been implemented.

²⁵² USEPA 2007. *MS4 Program Evaluation Guidance*. USEPA Office of Wastewater Management EPA-833-R-07-003. January 2007 field test version.

²⁵³ National Academy of Public Administration 2001. *Evaluating Environmental Progress: How EPA and the States Can Improve the Quality of Enforcement and Compliance Information* (June 2001). <http://www.napawash.org>

L. Modification of Programs

The following legal authority applies to section L:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Section L of the Order provides a process for the Copermitees to modify their runoff management programs. This process will be useful so that the Copermitees can continue to refine and improve their programs based on the findings of their annual program effectiveness assessments. The process allows for minor modifications to the Copermitees' programs where the Copermitees can exhibit that the modifications meet or exceed existing legal requirements under the Order. Such a process avoids lengthy and time consuming formal approvals of proposed modifications before the Regional Board, while still ensuring compliance with applicable legal standards and the Order. The process included in the Order is based on a process utilized by the San Francisco Bay Area Regional Water Quality Control Board in their MS4 permit for Alameda County.²⁵⁵

²⁵⁵ San Francisco Bay Area Regional Water Quality Control Board, 2003. Order No. R2-2003-0021. P. 45.

M. Principal Permittee Responsibilities

The following legal authority applies to section M:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.26(a)(3)(iii)(C) provides that "A regional authority may be responsible for submitting a permit application."

Federal NPDES regulation 40 CFR 122.26(d)(2)(i)(D) provides that "[The Copermitttee must demonstrate that it can control] through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system."

No significant changes were made to this section.

N. Receiving Waters Monitoring and Reporting

The following legal authority applies to section N:

Broad Legal Authority: CWA sections 402, 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Copermitees must conduct a comprehensive monitoring program as required under Federal NPDES regulations 40 CFR 122.26(d)(2)(iii) and 122.44.

See section T of this Fact Sheet/Technical Report for a discussion of changes to the Receiving Waters Monitoring and Reporting Program.

O. Standard Provisions, Reporting Requirements, And Notifications

The following legal authority applies to section O:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Standard provisions, reporting requirements, and notifications are consistent to all NPDES permits and are generally found in Federal NPDES regulation 40 CFR 122.41.

Section L.2 of the Order has been changed to remove the statement that all plans and reports submitted in compliance with the Order are an enforceable part of the Order. This statement has been removed because it is unnecessary. The Order itself contains sufficient detailed requirements to ensure that compliance with discharge prohibitions, receiving water limitations, non-storm water action levels and the narrative standard of MEP for storm water are achieved. Implementation by the Copermittees of programs in compliance with the Order's requirements, prohibitions, and receiving water limitations is the pertinent compliance standard to be used under the Order, as opposed to assessing compliance by reviewing the Copermittees' implementation of their plans alone.

Rather than being substantive components of the Order itself, the Copermittees' management plans are simply descriptions of their runoff management programs required under the Order. These plans serve as procedural correspondence which guides program implementation and aids the Copermittees and Regional Board in tracking implementation of the programs. In this manner, the plans are not functional equivalents of the Order. For these reasons, the Copermittees' runoff management plans need not be an enforceable part of the Order.

P. Attachment A – Basin Plan Prohibitions

The following legal authority applies to Attachment A:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: California Water Code Section 13243 provides that “A regional board, in a water quality control plan or in waste discharge requirements, may specify certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted.”

California Water Code Section 13263(a) provides that waste discharge requirements prescribed by the SDRWQCB implement the Basin Plan.

No significant changes were made to this attachment.

Q. Attachment B – Standard Provisions

The following legal authority applies to Attachment B:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Specific Legal Authority: Standard provisions, reporting requirements, and notifications are consistent to all NPDES permits and are generally found in Federal NPDES regulation 40 CFR 122.41.

Attachment B includes Standard Provisions which have been developed by the State Board. These Standard Provisions ensure that NPDES permits are consistent and compatible with USEPA's federal regulations. Some Standard Provisions sections specific to publicly owned sewage treatment works are not included in Attachment B.

R. Attachment C – Definitions

The following legal authority applies to Attachment C:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv).

Attachment C contains definitions for terms found in the Order. In addition, definitions for terms previously defined in Order No. R9-2002-0001 Attachment D, but which are not found in the current Order, have been deleted.

An additional section which includes acronyms and abbreviations has been added. This is to ensure clarity and prevent confusion of terms. Definitions have been added for new terms used in the permit to provide a clear understanding of their meaning and use.

S. Attachment D – Summary of Submittals

The following legal authority applies to Attachment D:

Broad Legal Authority: CWA sections 402(p)(3)(B)(ii-iii), CWC section 13377, 13383, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv) and 122.44(i).

Specific Legal Authority: Federal NPDES regulation 40 CFR 122.42(c) requires that “The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer system that has been designated by the director under § 122.26(a)(1)(v) of this part must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report shall include: (1) The status of implementing the components of the storm water management program that are established as permit conditions; (2) Proposed changes to the storm water management program that are established as permit condition. Such proposed changes shall be consistent with § 122.26(d)(2)(iii) of this part; (3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under § 122.26(d)(2)(iv) and (d)(2)(v) of this part; (4) A summary of data, including monitoring data, that is accumulated throughout the reporting year; (5) Annual expenditures and budget for year following each annual report; (6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; (7) Identification of water quality improvements or degradation.”

California Water Code section 13267 provides that “the regional board may require than any person who has discharged [...] shall furnish, under penalty of perjury, technical or monitoring reports which the regional board requires.”

Attachment D to the Order provides a table summary of scheduled submittals required by the Order. Unscheduled submittals are no longer added to the table, since there is no proper due date for such submittals. A task summary has not been created for the Order, since the previous task summary was found to be redundant, repeating information found in the submittal summary and elsewhere in the Order.

A Jurisdictional Runoff Management Program (JRMP) Annual Report Checklist has been added to the reporting requirements. This addition is to determine and ensure that all requirements of the permit are being met. A Jurisdictional Runoff Management Program (JRMP) Annual Report Checklist has been added to the reporting requirements. This addition is to determine and ensure that all requirements of the permit are being met.

T. Attachment E - Receiving Waters and MS4 Discharge Monitoring and Reporting Program

The following legal authority applies to the Receiving Waters and MS4 Discharge Monitoring and Reporting Program:

Broad Legal Authority: CWA sections 402, 402(p)(3)(B)(ii-iii), CWC section 13377, and Federal NPDES regulations 40 CFR 122.26(d)(2)(i)(B, C, E, and F) and 40 CFR 122.26(d)(2)(iv), 122.44 and 122.45.

Specific Legal Authority: Copermitttees must conduct a comprehensive monitoring program as required under Federal NPDES regulations 40 CFR 122.26(d)(2)(iii).

Federal NPDES regulation 40 CFR 122.42(c) requires that “The operator of a large or medium municipal separate storm sewer system or a municipal separate storm sewer system that has been designated by the director under § 122.26(a)(1)(v) of this part must submit an annual report by the anniversary of the date of the issuance of the permit for such system. The report shall include: (1) The status of implementing the components of the storm water management program that are established as permit conditions; (2) Proposed changes to the storm water management program that are established as permit condition. Such proposed changes shall be consistent with § 122.26(d)(2)(iii) of this part; (3) Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit application under § 122.26(d)(2)(iv) and (d)(2)(v) of this part; (4) A summary of data, including monitoring data, that is accumulated throughout the reporting year; (5) Annual expenditures and budget for year following each annual report; (6) A summary describing the number and nature of enforcement actions, inspections, and public education programs; (7) Identification of water quality improvements or degradation.”

California Water Code section 13267 provides that “the regional board may require than any person who has discharged [...] shall furnish, under penalty of perjury, technical or monitoring reports which the regional board requires.”

1. Purpose

According to USEPA, the benefits of sampling data include, but are not limited to:

1. Providing a means for evaluating the environmental risk of storm water discharges by identifying types and amounts of pollutants present;
2. Determining the relative potential for storm water discharges to contribute to water quality impacts or water quality standard violations;
3. Identifying potential sources of pollutants; and

4. Eliminating or controlling identified sources more specifically through permit conditions.²⁵⁶

Equally important, monitoring programs are an essential link in the improvement of storm water management efforts. Data collected from monitoring programs can be assessed to determine the effectiveness of management programs and practices, which is vital for the success of the iterative approach used to meet the MEP standard for storm water. Specifically, when data indicates that a particular BMP or program component is not effective, improved efforts can be selected and implemented. Also, when water quality data indicate that water quality standards or objectives are being exceeded, particular pollutants, sources, and drainage areas can be identified and targeted for specific management efforts.

Considering the benefits described above, the Receiving Waters Monitoring and Reporting Program (MRP) has been designed to determine impacts to receiving water quality and beneficial uses from storm water runoff and to use the results to refine the Copermittees' storm water runoff management programs for the reduction of storm water pollutant loadings to the MEP. For non-storm water discharges, monitoring has been designed for the identification of prohibited illicit discharges and to determine appropriate actions to take in response to dry weather non-storm water action levels. Additionally, the results from dry weather non-storm water monitoring can be used to evaluate exempted non-storm water discharges as a source or conveyance of pollutants. The primary goals of the MRP include:

1. Assess compliance with Order No. R9-2009-0002;
2. Measure and improve the effectiveness of the Copermittees' runoff management programs;
3. Assess the chemical, physical, and biological impacts of receiving waters from MS4 discharges;
4. Characterize storm water runoff discharges;
5. Identify sources of specific pollutants;
6. Prioritize drainage and sub-drainage areas that need management actions;
7. Detect and eliminate illicit discharges and illicit connections to the MS4;
8. Assess the overall health of receiving waters; and
9. Provide information to implement required BMP improvements

²⁵⁶ USEPA, 1992. NPDES Storm Water Sampling Guidance Document. EPA/833-B-92-001.

Each of the components of the MRP is necessary to meet the objectives listed above. In addition, the MRP has been designed in accordance with the guidance provided by the Southern California Stormwater Monitoring Coalition's Model Monitoring Technical Committee in its August 2004 "Model Monitoring Program for Municipal Separate Storm Sewer Systems in Southern California." This guidance document was developed in response to Senate Bill 72 (Kuehl), which addressed the standardization of sampling and analysis protocols in municipal stormwater monitoring programs. The technical committee which developed the guidance included representatives from Southern California Regional Water Quality Control Boards (including San Diego), municipal storm water Permittees (including the County of Orange), Heal the Bay, and the Southern California Coastal Water Research Project.

As its title suggests, the guidance essentially developed a model municipal storm water monitoring program for use in Southern California. The model program is structured around five fundamental management questions, outlined below. The MRP is designed as an iterative step towards ensuring that the Copermittees' monitoring program can fully answer each of the five management questions.

1. Are conditions in receiving waters protective, or likely to be protective, of beneficial uses?
2. What is the extent and magnitude of the current or potential receiving water problems?
3. What is the relative storm water runoff contribution to the receiving water problem(s)?
4. What are the sources of storm water runoff that contribute to receiving water problem(s)?
5. Are conditions in receiving waters getting better or worse?

The justifications for each component of the monitoring program are discussed below.

2. Monitoring Program

Mass Loading Station Monitoring

The intent of current mass loading monitoring as conducted by the Copermittees is to use water chemistry data from storm events and dry weather flows to calculate pollutant loads and to assess water quality with respect to applicable acute and chronic toxicity criteria from the California Toxics Rule (CTR).²⁵⁷

²⁵⁷ Orange County Storm Water Permittees. 2006. Report of Waste Discharge, section C-11.3.2.

Section II.A.1 of the MRP requires mass loading and toxicity monitoring at monitoring stations located at the bottom of major watersheds within Orange County. The mass loading monitoring will provide data representing event mean concentrations of pollutants, total pollutant loadings, and toxicity conditions from specific drainage areas. Mass loading monitoring stations are recommended by the Model Monitoring Technical Committee in order to answer management questions 1, 2, and 5.²⁵⁸ The stations are also expected to contribute towards meeting MRP goals 1, 2, 3, 4, 6, and 8. The locations of the mass loading monitoring stations are not changed from Order No. R9-2002-0001. However, the frequency of monitoring has been changed, and some revisions to the constituents have been made.

The frequency of mass loading monitoring in Order No. 2009-0002 has been modified to include two wet and two dry weather events. Currently three wet events have been targeted (though usually two or less have been sampled). This modification is not expected to affect long-term trend analyses for storm events since the monitoring to date has been sporadic.²⁵⁹ Dry weather monitoring is necessary because dry-weather flows in these watersheds are now perennial and changes have been made to the Order for non-storm water discharges. The addition of dry weather monitoring provides a more comprehensive temporal view of the watershed, which will improve the Copermittees' ability to understand the dynamics of annual pollutant loading.

In addition, the required constituents include some revisions to Order No. R9-2002-0001. The changes are made to be compatible with the federal NPDES regulations and in response to data collected during the current permit term. The changes include:

1. All events must now include Biological Oxygen Demand, 5-day Chemical Oxygen Demand, Total Organic Carbon, Dissolved Organic Carbon. These are specifically identified in 40 CFR 122.26(d)(2)(iii)(B), but were omitted from Order No. R9-2002-01.
2. Carbamate and Pyrethroid pesticides must initially be monitored in Prima Deshecha and Segunda Deshecha watersheds. If carbamate and/or pyrethroid pesticides are found to correlate with observed acute or chronic toxicity, then sampling and analysis for that pesticide must be added to all stations displaying toxicity. The Copermittees suggest adding these pesticides to Prima and Segunda Deshecha watersheds in an attempt to find a cause for observed persistent toxicity at those stations.²⁶⁰ If these pesticides are found in these watersheds, then they will likely be present in the other developed watersheds of the Region.

²⁵⁸ Model Monitoring Technical Committee, 2004. Model Monitoring Program for Municipal Separate Storm Sewer Systems in Southern California. Chapter 5.

²⁵⁹ Mass loading monitoring has been hampered by technical difficulties. For instance, only four of six stations were operational during the 2004-05 season, and only three stations were operational during 2002-04 season.

²⁶⁰ Orange County Storm Water Permittees. 2006. Report of Waste Discharge, section C-11.4.1.

3. Impaired water body pollutants. Specific pollutants have been added in response to the U.S. Environmental Protection Agency approval of California's 2004-2006 Section 303(d) Water Quality Limited Waters List. Monitoring for these pollutants is specific to the watershed in which the impairment is located.
4. Dimethoate monitoring has been eliminated because data collected to date has not observed any significant levels at the mass emissions stations.
5. A requirement to collect a grab sample for total petroleum hydrocarbons whenever a sheen is observed has been added at the suggestion of the County of Orange.

Bioassessment

Section II.A.2 of the MRP requires the Copermitttees to conduct bioassessment monitoring. Bioassessment monitoring is a cost-effective tool that measures the effects of water quality over time.²⁶¹ It is an important indicator of stream health and impacts from storm water and non-storm water runoff. It can detect impacts that chemical and toxicity monitoring cannot. USEPA encourages permitting authorities to consider requiring biological monitoring methods to fully characterize the nature and extent of impacts from runoff.²⁶² Therefore, the Regional Board commonly requires bioassessment monitoring in MS4 and other types of discharge permits.

Bioassessment is the direct measurement of the biological condition, physical condition, and attainment of beneficial uses of receiving waters (typically using benthic macroinvertebrates, periphyton, and fish). Bioassessment monitoring integrates the effects of both water chemistry and physical habitat impacts (e.g., sedimentation or erosion) of various discharges on the biological community native to the receiving waters. Moreover, bioassessment is a direct measurement of the impact of cumulative, sub-lethal doses of pollutants that may be below reasonable water chemistry detection limits, but that still have biological affects.

²⁶¹ California Department of Fish and Game, 2002. California Regional Water Quality Control Board, San Diego Region 2002 Biological Assessment Report: Results of May 2001 Reference Site Study and Preliminary Index of Biotic Integrity.

²⁶² USEPA, 1999. Rapid Bioassessment Protocols for Use in Wadeable Streams and Rivers. EPA 841-B-99-002. P. 2-5.

Because bioassessment focuses on communities of living organisms as integrators of cumulative impacts resulting from water quality or habitat degradation, it defines the ecological risks resulting from storm water and non-storm water MS4 runoff. Bioassessment not only identifies that an impact has occurred, but also measures the effect of the impact and tracks recovery when control or restoration measures have been taken. These features make bioassessment a powerful tool to assess compliance, evaluate the effectiveness of BMPs, and to track both short and long-term trends (MRP goals 1,2,3, and 8). Bioassessment can also help answer management questions 1, 2, and 5.

The Order also identifies the most current established protocol to be used in identifying bioassessment reference stations. The protocol referenced in the Order is specified because it provides a qualitative and repeatable method for identifying reference sites. Moreover, the protocol is well established, since it has been peer reviewed and published.

The Order includes four modifications to the bioassessment monitoring required under Order 2002-0001. These changes include:

1. Bioassessment monitoring must utilize the targeted riffle composite approach, which is consistent with the State Board's Surface Water Ambient Monitoring Program (SWAMP) Quality Assurance Management Plan (QAMP), as amended. Through SWAMP, various bioassessment methods were evaluated and it was found that the targeted riffle composite approach was a particularly efficient method, providing accurate data in a cost efficient manner.
2. Bioassessment monitoring to include assessment of periphyton (algae). Advantages of bioassessment using periphyton include: (1) they have rapid reproduction rates and very short life cycles, making them valuable indicators of short-term impacts; (2) as primary producers, they are most directly affected by physical and chemical factors; (3) sampling is easy and inexpensive; and (4) algal assemblages are sensitive to some pollutants which may not visibly affect other aquatic assemblages.²⁶³ Future bioassessment must use algal IBI scores, when developed.

²⁶³ USEPA, 1999. Rapid Bioassessment Protocols for Use in Wadeable Streams and Rivers. EPA 841-B-99-002. P. 3-3.

3. One of the two required annual monitoring events has been eliminated for streams exhibiting perennial flows. The Copermittees suggest this approach in response to analyses that indicate that the physical habitat conditions are better correlated than aquatic chemistry data with IBI scores.²⁶⁴ The Copermittees analyses indicate that although biological communities are different in the Fall and Spring, both seasonal communities indicate the same common relationships to spatial biological patterns and potential variables that explain the differences. For instance, downstream urbanized locations which exhibit perennial flows display lower IBI scores than reference sites regardless of the season, even if the biological community at a downstream site differs between the Fall and Spring.
4. The number of bioassessment stations has been reduced from 12 to six. This will allow resources to be available to implement the Stormwater Monitoring Coalition's program for Regional Monitoring of Southern California's Coastal Watersheds (Section II.D.3). The Regional Monitoring program calls for six sites to be sampled each year and includes each of the basic elements within the Copermittees' bioassessment monitoring program. Although the amount of toxicity tests are reduced, wetland status analyses will also be analyzed. The Regional Monitoring program is discussed in Section II.D.3 below.

Follow-up Analyses and Actions

Section II.A.3 of the MRP requires the Copermittees to use the results of the chemistry, toxicity, and bioassessment monitoring to determine if impacts from MS4 discharges are occurring and when follow-up actions are necessary. The triad approach allows a wide range of measurements to be combined to more efficiently identify pollutants, their sources, and appropriate follow-up actions. Results from the three types of monitoring shall be assessed to evaluate the extent and causes of pollution in receiving waters and to prioritize management actions to eliminate or reduce the sources. The framework provided is to be used to determine conclusions from the data and appropriate follow-up actions. The framework is proposed by the Copermittees and derived from the Model Monitoring Program for Municipal Separate Storm Sewer Systems in Southern California.²⁶⁵ These follow-up actions are expected to primarily help answer management questions 2 and 4, as well as address MRP goals 2, 4, 5, 6 and 7.

²⁶⁴ Orange County Storm Water Copermittees. 2006. Report of Waste Discharge (San Diego Region), section 11 and 2005-06 Annual Report section 11.3

²⁶⁵ Model Monitoring Technical Committee, 2004. Model Monitoring Program for Municipal Separate Storm Sewer Systems in Southern California. P. 5-61.

When, based on the framework in Table 2 of the M&R Program, data indicates the presence of toxic pollutants in runoff, the Copermittees are required to conduct a Toxicity Identification Evaluation (TIE). A TIE is a set of procedures used to identify the specific chemical(s) responsible for toxicity to aquatic organisms. When discharges are toxic to a test organism, a TIE must be conducted to confirm potential constituents of concern and rule out others, therefore allowing Copermittees to determine and prioritize appropriate management actions. If a sample is toxic to more than one species, it is necessary to determine the toxicant(s) affecting each species. If the type and source of pollutants can be identified based on the data alone and an analysis of potential sources in the drainage area, a TIE is not necessary.

When a TIE identifies a pollutant associated with MS4 discharge as a cause of toxicity, it is then necessary to conduct follow-up actions to identify the causative agents of toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. Follow-up actions should analyze all potential source(s) causing toxicity, potential BMPs to eliminate or reduce the pollutants causing toxicity, and suggested monitoring to demonstrate that toxicity has been removed.

Ambient Coastal Receiving Waters Monitoring

The Copermittees have been implementing a phased Ambient Coastal Monitoring Program that initially involved monitoring chemistry and aquatic toxicity of dry and storm water discharges to ecologically sensitive areas along the coastline. Later, aerial photographs of storm water plumes were taken to estimate the spatial extent of the impact of storm water runoff. The results were used to identify storm drains for source and toxicity identification studies, including sampling of storm water plumes.

Section II.A.4 of the MRP allows the Copermittees to continue the existing program, while requiring that the special studies be consistent with the MRP goals and that stations be located within Areas of Special Biological Significance.

Coastal Storm Drain Monitoring

Section II.A.5 of the MRP has been extensively modified and changed to a Regional Monitoring Program.

Section II.A.5.a. Coastal storm drain monitoring has been replaced with a Regional Bacteria Monitoring section. Coastal storm drain monitoring is critical because one of the primary impacts to coastal receiving waters is the loss of recreational beneficial uses resulting from high levels of bacteria in storm water and non-storm water MS4 runoff. The regional monitoring program is expected to help answer management questions 1, 2, 3, 4 and 5, as well as address MRP goals 1, 2, 3, 4, 5, 6, 7, and 8.

The changes to the coastal storm drain monitoring program have been made in response to the Copermittees' request. The Copermittees recommend participation in the regional program to save cost, prevent redundancy, improve notification times and provide more effort toward intensive investigations of problematic storm drains.²⁶⁶ This section has been modified to allow the Copermittees to participate in the development and subsequent regional bacteria monitoring program upon review and approval from the Executive Officer. An adaptive approach is consistent with the Model Monitoring Technical Committee's recommendations.

High Priority Inland Aquatic Habitats

Section II.A.6 of the MRP has been removed.

Wet Weather MS4 Runoff Discharge Monitoring

Section II.B of the MRP requires the Copermittees to develop and implement a program to monitor and characterize pollutant discharges from MS4 outfalls. Currently the Copermittees do not monitor the discharge of storm water from the MS4 outfalls. As a result, a substantial amount of information regarding the quality of MS4 effluent is unknown. The collection of wet-weather data will enable the Copermittees to assess the effectiveness of existing storm water BMP measures. This data can be used to more effectively target storm water management program efforts. The MRP also requires compliance with Section D of the Order for Storm Water Action Levels.

The monitoring of outfalls is expected to be used to identify storm drains that are discharging pollutants in concentrations that may pose a threat to receiving waters. Source investigations are expected to be conducted as a response to the data.

The MRP provides the Copermittees great flexibility in assigning stations for wet-weather monitoring. Copermittees are to choose the number and frequency of monitoring stations, thus determining the overall cost of their program.

The monitoring requirements also include a requirement to measure receiving water hardness when comparing storm water MS4 discharge data to Storm Water Action Levels for priority pollutants (e.g. metals). The effect of these constituents upon receiving waters will vary depending upon the hardness of receiving waters.

²⁶⁶ Ibid

Section II.B.2 requires the Copermittees to develop and implement a program to identify sources of discharges of pollutants causing the high priority water quality problems within each watershed. This requirement should be easily met because of the foundation already developed by the Copermittees in response to Order No. R9-2002-0001. To some extent, the Copermittees do conduct follow-up monitoring in response to dry-weather outfall data. The ROWD and 2007 DAMP describe some guidance that is provided by the County to the Copermittees, and it is expected that the Copermittees will develop follow-up monitoring programs for storm water discharges. The ROWD does recommend that additional training be provided for the municipalities with respect to interpreting and using the data collected by the County. In addition, many of the Copermittees have developed procedures and experience in conducting follow-up investigations in response to the bacteria investigations in the Aliso Creek watershed.²⁶⁷

Identification of sources causing high priority water quality problems is a central purpose of storm water runoff management programs. Monitoring which enables the Copermittees to identify sources of water quality problems aids the Copermittees in focusing their management efforts, improving their programs and choosing additional and/or better BMPs. In turn, the Copermittees' programs can abate identified sources, which will improve the quality of storm water runoff discharges and receiving waters. This monitoring is needed to address management question 4. Moreover, in its review of the San Diego County Copermittees' monitoring proposal, Tetra Tech, Inc. finds that "after some years of assessment monitoring, it is time to look more systematically at determining the relative urban contributions and the sources of urban runoff that contribute to identified receiving water problems."²⁶⁸

Non-storm Water Dry Weather Action Levels

Section II.C of the MRP describes the monitoring to be conducted by the Copermittees to determine compliance with dry weather, non-storm water action levels.

Section II.B.3 has been changed by removal of the Dry Weather Field Screening and Analytical Monitoring and subsequent replacement with section II.C for Dry Weather Non-Storm Water Action Level Monitoring. This change is required to assess compliance with action levels for non-storm water discharges from the MS4 into receiving waters. The required sampling frequency has been changed to allow Copermittees to sample a representative number of discharge points and the sampling methodology has been changed to grab sampling. This is expected to allow Copermittees to maintain a cost-neutral dry weather monitoring program that is similar to their existing IC/ID monitoring program.

²⁶⁷ Copermittees in the Aliso Creek watershed include the County of Orange and the Cities of Aliso Viejo, Laguna Beach, Laguna Hills, Laguna Niguel, Laguna Woods, Lake Forest, and Mission Viejo.

²⁶⁸ Tetra Tech Inc., 2006. Review of San Diego County MS4 Monitoring Program.

Special Studies

Section II.D.1 of the MRP absorbs the bacteria monitoring and reporting program currently in place in the Aliso Creek watershed.²⁶⁹ This monitoring effort has been required by the Regional Board pursuant to authorities provided under California Water Code sections 13225 and 13267. The monitoring and reporting is focused solely on the MS4s in the Aliso Creek watershed and has effectively been integrated already into the Copermittees' programs. Inclusion of it into the MRP is done for organizational purposes and will have no other net effect.

Section II.D.3 includes a requirement to participate in the program for Regional Monitoring of Southern California's Coastal Watersheds developed by the Stormwater Monitoring Coalition. That program calls for the sampling of six locations within the Permit area each year. All sampling will be SWAMP comparable. Sampling includes water chemistry, aquatic toxicity (*Ceriodaphnia dubia*), physical habitat, benthic macroinvertebrates, wetland status (based on California Rapid Assessment Method protocols), and periphyton.

Section II.D.4 includes a requirement that the Copermittees conduct a sediment toxicity special study. This study has been added to the Monitoring and Reporting requirements to assess the quality of urban stream sediments and possible contamination due to runoff from the MS4. Toxicity tests focusing on aqueous toxicity may not account for the full toxicity of receiving waters if constituents, such as heavy metals or pesticides, are bound to sediments. Southern California studies have shown that stream sediments can exhibit significant levels of toxic metals and pesticides.^{270,271}

Section II.D.5 includes a requirement that the Copermittees conduct a Trash and Litter Impairment Investigation (see Finding C.8 and Discussion).

Monitoring Provisions

Section II.E of the MRP includes monitoring provisions which are standard requirements for all municipal storm water permits.

²⁶⁹ On October 12, 2005, the Regional Board accepted the revised Aliso Creek watershed bacteria monitoring plan proposal from the MS4 Permittees. The Regional Board concluded that the scope of the current bacteria monitoring in the watershed was no longer warranted and that the proposed changes would constitute an effective interim program until adoption of a Total Maximum Daily Load, requiring a bacteria reduction and assessment program for the watershed. In addition, the Regional Board recognized that as a result of reduced monitoring costs, the municipalities expect to direct additional resources toward implementation of management practices to reduce indicator bacteria and pathogens.

2. Reporting Program

Section III of the MRP discusses submittal of the Jurisdictional Runoff Management Program Annual Reports and the Receiving Waters Monitoring Annual Reports. In effect, a description of the monitoring program will be submitted with the Jurisdictional RMPs, and the monitoring data and assessment will be submitted one month later. The MRP continues the reporting approach utilized under the requirements of Order No. R9-2002-0001, where Lead Permittees for each watershed submit their annual reports to the Principal Permittee to be unified into one document.

The reporting requirements for the Aliso Creek watershed are also specified in this section. These reporting requirements are identical to the current reporting required by the Regional Board for the bacteria investigation. They are specified in this section because the requirements are more specific than reporting required for other watershed RMPs.

U. Attachment F - Source Data

Attachment F contains data utilized for the development of Storm Water Action Levels and Non-storm Water Action Levels.

Response to Comments IV

Section X.4 of the Fact Sheet / Technical Report for

Tentative Order No. R9-2009-0002

July 01, 2009

A. Background

This document provides responses to the fifth round of written comments received on draft permits for reissuance of NPDES Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) draining the watersheds of the County of Orange, the Orange County Flood Control District, and the incorporated Cities of Aliso Viejo, Dana Point, Laguna Beach, Laguna Hills, Laguna Niguel, Laguna Woods, Lake Forest, Mission Viejo, Rancho Santa Margarita, San Clemente, and San Juan Capistrano within the San Diego Region. (Tentative Order No. R9-2009-0002, formerly Tentative Order Nos. R9-2008-0001 & R9-2007-0002, NPDES Permit No. CAS0108740).

The revised Tentative Order was distributed on March 13, 2009. This is the fourth version of the Tentative Order. The original Tentative Order was distributed on February 9, 2007. Three previous responses to comments documents (RTC I, II and III) have addressed comments from the prior comment periods.

This document summarizes and responds to written comments received between March 13, 2009 and May 15, 2009 on the fourth revised Tentative Order. A public workshop was held on April 3, 2009 at the City of Mission Viejo. At the request of the Copermittees, Regional Board staff met separately with them on April 16, 2009, April 20, 2009, and May 12, 2009. Further public meetings were held on May 6, 2009 and May 26, 2009.

B. Contents of This Document

A total of 18 commenters submitted over 300 comments. Commenters included members of the public, representatives of the MS4 Copermittees, governmental and non-governmental organizations, and businesses. Every written comment received has been reviewed and considered. Responses to specific comments are provided within this document for comments received. Each specific comment has been assigned a comment number, and comments are generally ordered according to commenter. A legend for commenters can be found on the

coversheet and in Table 1(below).

Comments received were concerned with a variety of topics in the Tentative Order. Some comments reiterated concerns that were previously addressed in RTC I, II and III. Some comments requested changes that had already been made in RTC I, II and III. New responses have not been drafted for repeat comments that lacked sufficient new information. Many comments have already been addressed by Regional Board staff in response to comments from the public and Copermittees during the meetings following the distribution of the Tentative Order on March 13, 2009. Consideration of written and oral comments has resulted in proposed revisions to the requirements in the Tentative Order and can be found in the Tentative Errata Sheet and updated Tentative Supplemental Fact sheet.

In this document, the comments have not been summarized or paraphrased. When comments received from one commenter were similar to other comments received, the Regional Board response usually references back to a previous comment number in order to minimize redundancy.

C. Order Adoption

The California Regional Water Quality Control Board, San Diego Region (Regional Board) is tentatively scheduled to consider adoption of the Tentative Order on October 14, 2009.

Draft Response to Comments R9-2009-0002

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
1	1	Hydromod	F.1	<p>The MS4 System of the Aliso Watershed represents a failed engineering design. Too much water from storm events and dry weather nuisance flows are systematically directed to Aliso Creek and coastal receiving waters under the regulatory responsibility of the SDRWQCB. Remediation must first re-engineer anthropogenic induced flows to remain within the residential development boundaries utilizing a variety of Low Impact Development practices. Peak storm flows can be re-conceptualized as a critical resource in a drought stricken, semi-arid ecology and source of revenues from local rainwater capture techniques. Each gallon of rainwater captured for beneficial reuse saves on costly repairs to Aliso Creek and surrounding infrastructure. Rainwater polished for local reuse will also generate funding for operations and maintenance of filtration equipment.</p>	<p>The draft Tentative Order Errata sheet includes changes to the permit language that require low impact development practices to retain onsite and/or biofilter the volume of runoff produced from a 24-hour 85th percentile storm event. Onsite retention may be accomplished through BMPs that infiltrate, evapotranspire or as the commenter suggests harvest the rainwater for reuse. Due to the current drought conditions and the natural semi arid environment in Southern California, development and redevelopment proponents should consider rainwater harvest and reuse projects. In addition, the draft Tentative Order requires the Copermittees to examine opportunities for retrofitting existing development projects. Rainwater harvesting for reuse can be as simple as installing a rainbarrel on existing rain gutters. The Copermittees also may require new development and redevelopment projects that are unable to implement the required LID BMPs to contribute to a mitigation fund that may be used as incentives for retrofitting existing development. Nothing in the permit expressly prohibits an agency or community from implementing a larger watershed based water harvesting project provided all necessary permits are obtained.</p>
2	2	LID	F.1	<p>While immediate interventions with a sense of the imperative are urgently in need of support from the SDRWQCB and other regulatory agencies, new developments and redevelopments including residential remodels can benefit from incorporation of Low Impact Development (LID) Standards and Strategies. Immediate, short term interventions coupled with LID Standards can restore the natural semi-arid ecology of the Aliso Watershed.</p>	<p>The draft Tentative Order and Errata has updated Low Impact Development requirements for new development and redevelopments. Low Impact Development practices can prevent pollutant discharges and minimize hydromodification impacts. Where a watershed is experiencing impacts from hydromodification, Low Impact Development practices should be considered to alleviate those impacts prior to in stream measures that further degrade beneficial uses.</p>
3	2	LID	F.1	<p>SDRWQCB interventions can include: Strategic capture of MS4 discharges for filtration and local beneficial reuse until Copermittees demonstrate measurable results over the next 3 to 10 years capable of removing dry weather urban runoff for beneficial reuse and water/energy conservation mandates.</p>	<p>While strategic capture of MS4 discharges for filtration and local beneficial reuse may be protective of water quality, the Copermittees are required to prohibit non-storm water illicit discharges into, through and thus from the MS4 (40 CFR 122.26(d)(iv)(B) and 55 Fed Reg 47995). Furthermore, the Regional Board cannot dictate the manner that Copermittees capture and/or reuse non-storm water discharges that are exempted (and not a source of pollution) or that are covered under a separate NPDES permit.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
4	2	LID	F.1	<p>Relative to Low Impact Development (LID):</p> <p>A. Expand the definition of "Priority Development Project" to include all new development and redevelopment projects.</p> <p>B. Adopt a standard of 3% maximum allowable Effective Impervious Area (EIA) in all Priority Development Projects and Redevelopment Projects</p> <p>C. Identify all LID BMPs as the principle storm drain management strategy for development and redevelopment projects</p> <p>D. Require a three month timeline for Copermittees to develop guidelines for LID strategies</p>	<p>The definition of Priority Development Project has been expanded to be consistent with other Southern California MS4 permits. The modified definition of Priority Development Project includes any development greater than 10,000 square feet. Through discussions with the Copermittees and the interested parties, a metric using Effective Impervious Area (EIA) was not included in the Tentative Order's requirements. In lieu of the EIA metric, the draft Tentative Order requires Low Impact Development BMPs to retain and/or biofilter the volume of runoff produced from the 24 hour 85th percentile storm. A three month timeline for Copermittees to develop guidelines for LID strategies is unreasonable. The Copermittees will need longer than three months to adequately develop the LID guidelines. The draft Tentative Order allows the Copermittees up to 2 years to develop the LID guidelines. This timeframe coincides with the hydromodification management plan due date in order to expedite public review and staff resources.</p>
5	2	LID	F.1.	<p>Treatment BMP Review: The Copermittees must review and update the BMPs that are listed in their local SUSMPs as options for treatment control during the first year of implementation of this Order. At a minimum, the update must include removal of obsolete or ineffective BMPs and replacement with LID BMPs that can be used for treatment, such as bioretention cells, bioretention swales, cisterns, etc. Promote cisterns networks in hydrologic sub units scaled to receive all dry weather flows, first flush events and peak flows to measurably reduce creek erosion and to create a local water supply for beneficial reuse and mandated water conservation purposes.</p>	<p>We agree with the commenter that Copermittees must review and update the BMPs that are listed in their local SUSMPs as options for treatment control. The draft Tentative Order allows the Copermittees two years to accomplish this review along with inclusion of LID BMPs, substitution programs and the hydromodification management plan. The modified Low Impact Development language requires onsite retention and/or LID Biofiltration of the volume of runoff produced from a 24-hour 85th percentile storm event. Onsite retention may be accomplished by the Copermittees through a network of cisterns in hydrologic sub units.</p>
6	1	General	General	<p>Built settings must be rebuilt to correct past deficiencies. An improperly wired house will not be permitted for occupancy by any city until remediation of deficiencies is implemented. Likewise, when cities accept significant increases in the property tax base from large-scale residential developments they are obliged to insure these revenue sources are properly built to eliminate negative environmental impacts to downstream habitats, communities and recreational users. Environmental justice requires the SDRWQCB to enforce measures capable of immediate clean-up and abatement of nonpermitted flows. The absences of full enforcement throughout the present permit cycle by the SDRWQCB to demand cessation of dry weather nuisance flows with known pollutants is among the primary causes for the past seven years of habitat degradation and ocean pollution. Over 1.5 billion gallons each year of dry weather flows are illegally discharged at the mouth of Aliso Creek allowing Co-permittees to economically benefit from pollution by avoiding basic expenditures for point source controls.</p>	<p>The San Diego Regional Board has a long history of progressive enforcement throughout the region. For example in the past year, the Regional Board has assessed civil liabilities greater than \$200,000 for violations of non-stormwater discharge permits. The Regional Board has a progressive enforcement policy with multiple levels to ensure fair, firm and consistent enforcement. The possible enforcement actions at the Regional Board's discretion range from a verbal warning, staff enforcement letter, notice of violation, cleanup and abatement order, cease and desist order, time schedule order, referral to the State of California's attorney general's office, and assessment of civil liability up to \$10,000 per day per violation. When considering what enforcement action to take, the Regional Board examines the nature, extent and gravity of the violation, the magnitude of the violation, the water quality impacts resulting from the violation, and the compliance history of the violator.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
7	1	General	F.1	The costs associated with educating and savings in water conservation offsets enforcing wise water management. Moreover, the expensive restoration of damaged ecosystems, loss of safe and healthy recreation opportunities and, eventually, diminished property values from polluted water tax strained public revenue sources. The right to live in South Orange County carries the responsibility to respect the rights of others, including natural wildlife and seafit communities, to live in a non-polluted, healthy environment. The SDRWQCB cannot allow use of wildlife mitigation parks and natural creeks as flood control channels for the residential development industry's liquid waste.	The Regional Board agrees that the use of mitigation areas to compensate for impacted creeks should be minimized and that natural creeks should not be used strictly as flood control channels for runoff. The Tentative Order contains several provision to reduce or eliminate "liquid waste," or excess runoff. Please see the response to Comment No. 21.
8	1	Hydromod	F.1	The MS4 System of the Aliso Watershed represents a failed engineering design. Too much water from storm events and dry weather nuisance flows are systematically directed to Aliso Creek and coastal receiving waters under the regulatory responsibility of the SDRWQCB. Remediation must first re-engineer anthropogenic induced flows to remain within the residential development boundaries utilizing a variety of Low Impact Development practices. Peak storm flows can be re-conceptualized as a critical resource in a drought stricken, semi-arid ecology and source of revenues from local rainwater capture techniques. Each gallon of rainwater captured for beneficial reuse saves on costly repairs to Aliso Creek and surrounding infrastructure. Rainwater polished for local reuse will also generate funding for operations and maintenance of filtration equipment.	Please see response to comment #1.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
9	1	Monitoring	Attachment E	<p>Extensive monitoring activities waste precious limited local revenues needed for infrastructure repairs. Rather than monitoring an obviously distressed and dying watershed, funds should be reallocated to support clean up and abatement initiatives. A "Zero tolerance" dry weather discharge policy with dramatic, punitive penalties and fines can reduce reporting requirements to a minimum while advancing immediate solutions to water pollution.</p> <p>With over 20 years of monitoring data, the SDRWQCB can identify subwatershed residential developments with special needs in relation to waste water. "Special need" communities must be required to intercept, treat and promote beneficial reuse of low flows at individual residential, neighborhood and development levels of analysis. Copermittees must upgrade and commit funds for installation; operations and maintenance over the prescribed five year permit timeframe.</p> <p>Funding can be derived from fines, subwatershed "Urban Runoff Special Districts for Gross Dischargers" within specific residential development boundaries, runoff/capture/reuse revenues and bond funding among rainwater utility districts are among potential capital resources. Simple low flow diversion inserts consisting of stormdrain T-fittings and shallow dry wells can transport non-permitted flows to centralized package treatment plants or POTW facilities.</p>	<p>Comment noted.</p> <p>Storm water monitoring is required in order to assess watershed pollutant loading, measure effectiveness of Best Management Practice (BMP) selection and implementation, and identify areas which require additional and/or better tailored BMPs to reduce storm water pollutants to the maximum extent practicable as part of the iterative process. The goal of the iterative process is to reduce storm water pollutants discharged from the MS4 to meet applicable water quality standards. Thus, the Regional Board feels that storm water monitoring should not be eliminated.</p> <p>Current regulations (see Code of Federal Regulation 40 CFR 122.26(d)(2)(I) and (iv)) require that non-storm water discharges into the MS4 system be prohibited unless specifically exempted. Exempted discharges are allowable unless identified as a source of pollutants in the United States. Dry weather monitoring is conducted by the Copermittees to identify illicit discharges, illegal connections and exempted categories of pollutants that are a source of pollution. Thus, the Regional Board feels elimination of dry weather monitoring is not warranted.</p> <p>The federal Clean Water Act (CWA) requires States to identify and make a list of polluted surface water bodies. These water bodies, referred to in law as "water quality limited segments," do not meet water quality standards even after discharges of wastes from point sources have been treated by the minimum required levels of pollution control technology. Wastewater treatment plants, a city's storm drain system, or a boat yard, are a few examples of point sources that discharge wastes to surface waters. States are required to compile these water bodies into a list, referred to as the "Clean Water Act Section 303(d) List of Water Quality Limited Segments" (List). States must also prioritize the water bodies on the List and develop Total Maximum Daily Loads (TMDLs) to improve the water quality. Monitoring conducted has contributed to identifying "water quality limited segments" and Copermittees are required to use monitoring information to identify areas in the watershed that are "special need" and implement BMPs to the MEP for storm water flows. It is expected that Low Impact Development (LID) requirements for new and existing development will intercept, treat and promote beneficial reuse of storm flows.</p> <p>The Regional Board is not involved with funding determinations of the Copermittees.</p>

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
10	1	Economic	General	The SDRWQCB has access to funding mechanisms to promote wise water management. Co-permittees should be provided with incentives and prompt, efficient technical assistance to acquire state and federal funding in remediating impacts caused by failed engineering projects and infrastructure within the watershed.	The Regional Board manages grant projects that receive funding through public proposition bonds. The Copermittees are encouraged to apply for grants when available. The Copermittees have received grant funding for projects in the past. For example, the Municipal Water District of Orange County received a grant to retrofit up to 12 urban subwatersheds with smart landscape irrigation controllers, irrigation distribution improvements and/or landscape modifications to reduce nuisance runoff and reduce bacteria/nutrient pollutant loads discharged to receiving waters. Other projects funded through grants in Southern Orange County include, the South Orange County IRWM plan, Munger Storm Drain Filtration basin in Aliso Creek, Bell, Dove, and Tick Creek Water Reclamation and Habitat Restoration projects, Upper Sulphur Creek Restoration, Wetland Capture & Treatment Network, and Heisler Park ASBS Protection and Preservation Project. The Regional Board will continue to support worthy Copermittee projects in the grant competition process.
11	2	NEL	B	The SLCA joins other environmental organizations and responsible citizen groups demanding immediate cessation of illegal MS4 Discharges to creek and coastal receiving waters and adoption of Low Impact Development (LID) Standards for all new development and redevelopment projects along with other Recommended Actions as previously submitted.	The Code of Federal Regulations (40 CFR 122.26(d)(iv)) requires Copermittees to prohibit through ordinance, order or similar means, illicit (illegal) discharges and connections to the MS4 system. It is expected that non-storm water dry weather numeric effluent limitations will evaluate whether discharges from the MS4 into creek and coastal receiving waters are causing or contributing to a condition of pollution. This would indicate an illicit discharge of waste is occurring into the MS4 system, a currently exempted non-storm water discharge needs to be removed from the exempted list and prohibited, and/or an existing discharge is exceeding its NPDES permit (other than the MS4 Permit) limitations for its discharge into the MS4.

12	2	Legal	Legal	The proposed Draft MS4 Permit is inappropriate and improper in that it violates laws and regulations pertaining to enforcement of Cleanup and Abatement Orders (California Water Code Section 13304); the SWRCB Water Quality Enforcement Policy (February 19, 2002; pages 3,4,11,26, 39,42); the Porter-Cologne Clean Water Act; and is a discriminatory violation of the State of California definition governing Environmental Justice (Government Code Section 65040.12 and Public Resources Code Section 72000).	<p>Although the California Water Code authorizes the Regional Board to issue Cleanup and Abatement Orders, the enforcement action is taken at the discretion of the Regional Board. As the Enforcement Policy states,</p> <p>"Every violation deserves an appropriate enforcement response. However, because resources are limited, the RWQCBs must continuously balance the need to complete non-enforcement program tasks with the need to address violations. Within available resources for enforcement, the RWQCBs must then balance the importance or impact of each potential enforcement action with the cost of that action. Informal enforcement actions are usually very cost effective and are therefore the most frequently used enforcement response. Most formal enforcement actions are relatively costly and must therefore be targeted to the RWQCB's highest priority violations."</p> <p>We fail to understand how the Regional Board can be in violation of the water code by not conducting a discretionary enforcement action.</p> <p>The accusation that the proposed draft MS4 permit is a discriminatory violation of the Environmental Justice code is vague. It clearly is not the intent of the Regional Board to violate the Environmental Justice code. Without more specific information detailing this accusation, the Regional Board cannot address this comment.</p> <p>All references to the use of Cleanup and Abatement Orders to implement TMDLs have been deleted from the Tentative Order.</p>
13	2	General	General	The pattern of negligence and waste characterizing systematic failed measures by Copermitees demands intervention by the SDRWCB to institute Cleanup and Abatement measures aimed at numerical reductions of contaminated flow rates in a prompt, specific timetable at known inland MS4 facility "point sources".	The Regional Board has the discretion to issue Cleanup and Abatement Orders after considering all aspects of the violation. The Regional Board has yet to issue a cleanup and abatement order for the alleged violations. Nevertheless, the draft Tentative Order does include dry weather non-stormwater numeric effluent limits.

Comment No.	Commenter	Subject	Section	Specific Comment	Comment Response
14	2	General	General	To encourage compliance with basic water quality protection measures, mandatory citations must be issued against Copermittees for creating and perpetuating an attractive public nuisance by knowingly allowing inland dry weather MS4 discharges to accumulate and pollute a coastal estuarine wetland, Aliso Beach and the South Laguna Beach State Marine Park.	<p>Comment Noted.</p> <p>The inclusion of non-storm water dry weather numeric effluent limits will require all non-storm water discharges from the MS4 to meet effluent limits that are based upon applicable water quality criteria (Basin Plan Objective, California Toxic Rule, etc.). Thus, any non-storm water discharge from the MS4 that is in compliance with effluent limitations will not be causing a condition of pollution in the downstream receiving waters. Copermittees are currently required to prohibit all non-storm water discharges (see response to Comment No. 77), and must have a program in place to educate the public regarding such illicit discharges. The Copermittees must also conduct active investigative monitoring, maintain a public reporting hotline and inspect for illicit non-storm water discharges. Furthermore, the identification and subsequent removal of landscape and lawn irrigation water as a source and conveyance of pollutants by the Copermittees will require Copermittees to prohibit said irrigation water entering their MS4 system.</p>
15	2	General	General	<p>SDRWQCB interventions can include:</p> <p>Diversions to inland SOCWA facilities for treatment and reuse as reclaimed water. The City of Laguna Beach received SDRWQCB Approvals for 13 dry weather/first flush diversions to the Coastal Treatment Plant for beneficial reuse as reclaimed water. The Aliso Watershed, as the largest watershed in the City, has yet to receive approvals for any diversions. The inconsistent application of regulatory actions raises issues of fairness and legal propriety. The Aliso Watershed must target proximate historic natural flow regimes to achieve any reasonable restoration of the habitat: creeks, canyons, coast and ocean.</p>	<p>The Regional Board to date has yet to receive an application for a waste discharge requirement, NPDES permit, or CWA section 401 certification regarding a diversion for reuse in the Aliso watershed. Therefore, the Regional Board cannot take an action without an application. It should be noted that diversion from the MS4 to the sanitary sewer for treatment is allowable from a Regional Board perspective, provided the effluent from the sewage treatment facility can meet its NPDES requirements. Any diversion of in-stream flows for reuse is subject to review and approval by the State Board Division of Water Rights and is not addressed under a NPDES MS4 permit. A CWA Section 401 Water Quality Certification will be required if a federal permit (e.g. 404 or Section 10) is needed. The City of Laguna Beach's dry weather diversions from the MS4 did receive funding from proposition 84 - Areas of Special Biological Significance grant program. The commenter is encouraged to apply for funding from future grant programs.</p>

16	2	General	General	<p>SDRWQCB interventions can include:</p> <p>Immediate fines levied against offending subwatersheds, cities, homeowner associations, golf courses and others with elevated dry season discharge rates detected during monitoring activities at known point sources.</p> <p>Fines levied against offending inland water districts for failing to control urban runoff (i.e. "imported water byproduct") through monitoring, punitive pricing structure and more aggressive recycled water programs.</p>	<p>Except for mandatory minimum penalties, the assessment of civil liability is at the discretion of the Regional Board. The Regional Board has a progressive enforcement policy with multiple levels to ensure fair, firm and consistent enforcement. The possible enforcement actions at the Regional Board's discretion range from a verbal warning, staff enforcement letter, notice of violation, cleanup and abatement order, cease and desist order, time schedule order, referral to the State of California's attorney general's office, and assessment of civil liability up to \$10,000 per day per violation. When considering what enforcement action to take, the Regional Board examines the nature, extent and gravity of the violation, the magnitude of the violation, the water quality impacts resulting from the violation, and the compliance history of the violator. Assessment of civil liability is a possible enforcement action at the Regional Board's disposal. Since, the MS4 permit only directly regulates the Copermittees, any enforcement action due to violations of the MS4 permit would be issued to the offending Copermittee. Although homeowner associations, private golf courses, and water districts may be indirectly regulated through the MS4 permit, enforcement of the MS4 permit would not be directly on those entities. The Copermittee is expected to conduct any necessary enforcement using their jurisdiction.</p>
17	2	Legal	Legal	<p>During the current permit period, Copermittees have failed to achieve measurable reductions in MS4 discharges. SDRWQCB must exercise authority and assume control over the present, clearly defective watershed management programs. Private subcontractor services can be retained with stipulations for numerical reductions of flows and constituents within time certain performance parameters. Funds for such services can be recovered by reallocating funds presently wasted by failed Copermittee watershed management practices.</p>	<p>The California Water Code does not provide the Regional Board the powers to assume control over defective watershed management programs, nor can it require that the discharges hire private subcontractors to implement the MS4 permit. The water code does provide the Regional Board with a suite of enforcement actions to induce compliance with permits.</p>
18	2	General	General	<p>As mitigation for a pattern of failed watershed management programs that flood creek and coastal waters, Copermittees should be directed to restore the Aliso Coastal Estuary Wetlands to 1970 water levels for the reintroduction of the federally listed tidewater goby (designated "Potential Reintroduction Site" – US Fish and Wildlife Service, South Coast Recovery Unit: Sub-Unit SC 1 (Eastern Half), 2005).</p>	<p>The Regional Board is aware of the status of and the possibility of re-introduction of the tidewater goby. While the Tentative Order regulates discharges from the MS4, the comment is unclear as to what "water levels" are/were. The Tentative Order does not require mitigation for failed Best Management Practices, but does require additional and better tailored BMPs be implemented to treat storm water pollutants to the MEP. It is expected that municipal action levels and non-storm water numeric effluent limits will attain water quality that will fully support re-introduction of the tidewater goby. The Basin Plan for the San Diego Region currently does not have water quality objectives or criteria for maintaining or reducing "water levels" if "water levels" are referring to the amount of flow within receiving waters.</p>

19	2	Monitoring	Attachment E	In support of recommended action C.2., revise timeframes to require each Copermittee, beginning no later than the First not 3rd year following adoption of this Order, shall begin the non-storm water dry weather numeric effluent monitoring as described in Attachment E of the Order.	Comment noted. The Regional Board has made a concerted effort to maintain consistency between the Copermittees existing non-storm water IC/ID monitoring program and that required under the Tentative Order to determine compliance with numeric limits. It is expected, however, that some changes will be required, and the Regional Board recognizes that time may be needed to implement such changes. This does not, however, exempt Copermittees from prohibiting non-storm water discharges into the MS4, conducting IC/ID investigations, nor identifying any additional exempted discharges that are a source of pollution.
20	2	Legal	E.	Relative to item E.1. f., Utilize aggressive enforcement mechanisms to require compliance with Copermittee storm water ordinances, permits, contracts, or orders; To save municipal funds for staff enforcement, provide rewards and bountys to citizen monitors for information leading to identification of prohibited runoff discharges to MS4 infrastructure.	The Regional Board has a progressive enforcement policy with multiple levels to ensure fair, firm and consistent enforcement. The possible enforcement actions at the Regional Board's discretion range from a verbal warning, staff enforcement letter, notice of violation, cleanup and abatement order, cease and desist order, time schedule order, referral to the State of California's attorney general's office, and assessment of civil liability up to \$10,000 per day per violation. When considering what enforcement action to take, the Regional Board examines the nature, extent and gravity of the violation, the magnitude of the violation, the water quality impacts resulting from the violation, and the compliance history of the violator. The Regional Board does not have the authority or resources to provide rewards and bounties to citizen watchdog groups.
21	2	Hydromod	F.	Throughout the Order, water quantity is rarely mentioned or given adequate consideration as it relates to transportation of pollutants and erosion of local receiving waters.	Scientific data and knowledge is increasingly aware that water quantity is an issue intimately related to water quality. Importing water from other areas can cause harm to beneficial uses in those areas due to pumps and water diversions. Imported water containing high dissolved salts can have a negative impact on groundwater supplies and native beneficial uses. Excess water quantity can cause a habitat type change from saline or brackish habitat to freshwater. Excess water quantity can cause devastating hydromodification impacts. To that end, the draft Tentative Order contains several provisions to address water quantity. First, the draft Tentative Order has removed over-irrigation from the list of non-storm water discharges exempted from prohibition. Second, the draft Tentative Order has requirements for the Copermittees to draft and implement a hydromodification management plan. Third, the draft Tentative Order requires priority development projects to implement low impact development BMPs that retain onsite and/or biofilter the volume of runoff from the 24 hour 85th percentile storm event. Lastly, the draft Tentative Order requires the Copermittees to examine retrofitting opportunities within their jurisdiction.

22	2	General	General	<p>Twenty years and \$20 million represents too much time and too much money wasted on mismanagement of dry weather urban runoff pollution contaminating Aliso Creek, Aliso Beach and the South Laguna Beach State Marine Park. According to Stream Gage Information (Appendix D, Aliso Creek Watershed Chapter), "Data consisting of periodic discharge measurements was measured at one site on Aliso Creek between the years of 1932 and 2002....Historically (pre-urbanization), Aliso Creek was an ephemeral creek". Water quality laws and regulations are not intended to be implemented for the convenience of Copermittees, inland Water Districts and their cohorts among the Residential Development and Building Industries. Dry weather MS4 discharges are directly attributable to the collective practices of these entities and constitutes an industrial wastewater by product from known point sources.</p> <p>Arguments to perpetuate and allow ongoing water pollution based upon "Maximum Extent Practicable", while being a scientifically imprecise concept, does not on balance take into account "practical" protection of irreplaceable coastal wetlands and ocean resources unnecessarily flooded by dry weather MS4 discharges. Nor does this argument account for the "unpractical" and costly poisoning of local sea mammals, birds and humans with water borne illnesses.</p> <p>The San Diego Watershed Treatment System, supervised by the Santa Ana Regional Water Quality Control Board, demonstrates the effectiveness of strategic interventions sited among known inland point sources. Removing harmful dry weather urban runoff water quality constituents and elevated flows is possible through aggressive leadership by Regional Boards.</p>	<p>The draft Tentative Order includes numeric effluent limits for non-storm water dry weather discharges. In addition, since over-irrigation has been identified by the Copermittees as a source and conveyance of pollutants, the draft Tentative Order now prohibits over-irrigation discharges. These two measures show leadership by the San Diego Regional Board in addressing pollutants in the MS4 discharge. Treatment devices within receiving waters are not allowed by the draft Tentative Order. As the discussion of Finding E.7 in the fact sheet states:</p> <p>"Allowing polluted runoff to enter receiving waters prior to treatment to the MEP will result in degradation of the water body and potential exceedances of water quality standards, from the discharge point to the point of dissipation, infiltration, or treatment. Furthermore, the construction, operation, and maintenance of a pollution control facility in a water body can negatively impact the physical, chemical, and biological integrity, as well as the beneficial uses, of the water body. This requirement is supported by federal regulation 40 CFR 131.10(a) and USEPA guidance. According to USEPA,146 "To the extent possible, municipalities should avoid locating structural controls in natural wetlands. Before considering siting of controls in a natural wetland, the municipality should demonstrate that it is not possible or practicable to construct them in sites that do not contain natural wetlands... Practices should be used that settle solids, regulate flow, and remove contaminants prior to discharging storm water into a wetland."</p>
