We reversed, rejecting the state's theories that the funding shift to the county of the subject program's costs does not constitute a new program. "[There can be no] doubt that although the schools for the handicapped have been operated by the state for many years, the program was new insofar as plaintiffs are concerned, since *at the time section 59300 became effective* they were not required to contribute to the education of students from their districts at such schools. [¶] ... To hold, under the circumstances of this case, that a shift in funding of an existing program from the state to a local entity is not a new program as to the local agency would, we think, violate the intent underlying section 6 of article XIIIB. That article imposed spending limits on state and local governments, and it followed by one year the adoption by initiative of article XIIIA, which severely limited the taxing ***353** power of local governments. ... [¶] The intent of the section would plainly be violated if the state could, while retaining administrative control [11] of programs it has supported with state tax money, simply shift the cost of the programs to local government on the theory that the shift does not violate section 6 of article XIIIB because the programs are not 'new.' Whether the shifting of costs is accomplished by compelling local governments to pay the cost of entirely new programs created by the state, *or by compelling them to accept financial responsibility in whole or in part for a program which was funded entirely by the state before the advent of article XIIIB, the result seems equally violative of the fundamental purpose underlying section 6 of that article.*" (*Lucia Mar Unified School Dist. v. Honig, supra,* 44 Cal.3d at pp. 835- 836, fn. omitted, italics added.)

The state seeks to distinguish *Lucia Mar* on the ground that the education of handicapped children in state schools had never been the responsibility of the local school district, but overlooks that the local district had previously been required to contribute to the cost. Indeed the similarities between *Lucia Mar* and the present case are striking. In *Lucia Mar,* prior to 1979 the state and county shared the cost of educating handicapped children in state schools; in the present case from 1971-1979 the state and county shared the cost of caring for MIA's under the Medi-Cal program. In 1979, following enactment of Proposition 13, the state took full responsibility for both

programs. Then in 1981 (for handicapped children) and 1982 (for MIA's), the state sought to shift some of the burden back to the counties. To distinguish these cases on the ground that care for MIA's is a county program but education of handicapped children a state program is to rely on arbitrary labels in place of financial realities.

The state presents a similar argument when it points to the following emphasized language from *Lucia Mar Unified School Dist. v. Honig, supra,* 44 Cal.3d 830: "[B]ecause section 59300 shifts partial financial responsibility for the support of students in the state-operated schools from the state to school districts-*an obligation the school districts did not have at the time article XIII B was adopted*-it calls for plaintiffs to support a 'new program' within the meaning of section 6." (P. 836, fn. omitted, italics added.) It urges *Lucia Mar* reached its result *only* because the "program" requiring school district funding in that case *was not required by statute* at the effective date of ***354** article XIII B. The state then argues that the case at bench is distinguishable because it contends Alameda County had a continuing obligation *required by statute* antedating that effective date, which had only been "temporarily" [12] suspended when article XIII B became effective. I fail to see the distinction between a case-*Lucia Mar*-in which no existing statute as of 1979 imposed an obligation on the local government and one-this case-in which the statute existing in 1979 imposed no obligation on local government.

The state's argument misses the salient point. As I have explained, the application of section 6 of article XIII B does not depend upon when the program was created, but upon who had the burden of funding it when article XIII B went into effect. Our conclusion in *Lucia Mar* that the educational program there in issue was a "new" program as to the school districts was not based on the presence or absence of any antecedent statutory obligation therefor. *Lucia Mar* determined that whether the program was new *as to the districts* depended on *when* they were compelled to assume the obligation to partially fund an existing program which they had not funded at the time article XIII B became effective.

The state further relies on two decisions, *Madera Community Hospital v. County of Madera* (1984) 155 Cal.App.3d 136 [201 Cal.Rptr. 768] and *Cooke v. Superior Court* (1989) 213 Cal.App.3d 401 [261 Cal.Rptr. 706], which hold that the county has a statutory obligation to provide medical care for indigents, but that it need not provide precisely the same level of services as the state provided under Medi-Cal. [13] Both are correct, but irrelevant to this case. [14] The county's obligation to MIA's is defined by Welfare and Institutions Code section 17000, not by the former Medi-Cal program. [15] If the ***355** state, in transferring an obligation to the counties, permits them to provide less services than the state provided, the state need only pay for the lower level of services. But it cannot escape its responsibility entirely, leaving the counties with a state-mandated obligation and no money to pay for it.

The state's arguments are also undercut by the fact that it continues to use the approximately $1 billion in spending authority, generated by its previous total funding of the health care program in question, as a portion of its initial *base spending limit* calculated pursuant to sections 1 and 3 of article XIII B. In short, the state may maintain here that care for MIA's is a county obligation, but when it computes its appropriation limit it treats the entire cost of such care as a state program.

IV. Conclusion

This is a time when both state and county governments face great financial difficulties. The counties, however, labor under a disability not imposed on the state, for article XIII A of the Constitution severely restricts their ability to raise additional revenue. It is, therefore, particularly important to enforce the provisions of article XIII B which prevent the state from imposing additional obligations upon the counties without providing the means to comply with these obligations.

The present majority opinion disserves the public interest. It denies standing to enforce article XIII B both to those persons whom it was designed to protect-the citizens and taxpayers-and to those harmed by its violation-the medically indigent adults. And by its reliance on technical grounds to avoid coming to grips with the merits of plaintiffs' appeal, it permits the state to continue to violate article XIII B and postpones the day when the medically indigent will receive adequate health care.

Footnotes

1 The complaint also sought a declaration that the county was obliged to provide health care services to indigents that were equivalent to those available to nonindigents. This issue is not before us. The County of Alameda aligned itself with plaintiffs in the superior court and did not oppose plaintiffs' effort to enforce section 6.

2 On November 23, 1987, the County of Los Angeles filed a test claim with the Commission. San Bernardino County joined as a test claimant. The Commission ruled against the counties, concluding that no state mandate had been created. The Los Angeles County Superior Court subsequently granted the counties' petition for writ of mandate (Code Civ. Proc., § 1094.5), reversing the Commission, on April 27, 1989. (No. C-731033.) An appeal from that judgment is presently pending in the Court of Appeal. (*County of Los Angeles v. State of California,* No. B049625.)

3 Plaintiffs argue that they seek only a declaration that AB 799 created a state mandate and an injunction against the shift of costs until the state decides what action to take. This is inconsistent with the prayer of their complaint which sought an injunction requiring defendants to restore Medi-Cal eligibility to all medically indigent adults until the state paid the cost of full health services for them. It is also unavailing.

An injunction against enforcement of a state mandate is available only after the Legislature fails to include funding in a local government claims bill following a determination by the Commission that a state mandate exists. (Gov. Code, § 17612.) Whether plaintiffs seek declaratory relief and/or an injunction, therefore, they are seeking to enforce section 6.

All further statutory references are to the Government Code unless otherwise indicated.

4 The test claim by the County of Los Angeles was filed prior to that proposed by Alameda County. The Alameda County claim was rejected for that reason. (See § 17521.) Los Angeles County permitted San Bernardino County to join in its claim which the Commission accepted as a test claim intended to resolve the issues the majority elects to address instead in this proceeding. Los Angeles County declined a request from Alameda County that it be included in the test claim because the two counties' systems of documentation were so similar that joining Alameda County would not be of any benefit. Alameda County and these plaintiffs were, of course, free to participate in the Commission hearing on the test claim. (§ 17555.)

5 " 'Local agency' means any city, county, special district, authority, or other political subdivision of the state." (§ 17518.)

6 " 'School district' means any school district, community college district, or county superintendant of schools." (§ 17519.)

7 Plaintiffs' argument that the Legislature's failure to make provision for individual enforcement of section 6 before the Commission demonstrates an intent to permit legal actions, is not persuasive. The legislative statement of intent to relegate all mandate disputes to the Commission is clear. A more likely explanation of the failure to provide for test cases to be initiated by individuals lies in recognition that (1) because section 6 creates rights only in governmental entities, individuals lack sufficient beneficial interest in either the receipt or expenditure of reimbursement funds to accord them standing; and (2) the number of local agencies having a direct interest in obtaining reimbursement is large enough to ensure that citizen interests will be adequately represented.

8 Plaintiffs are not without a remedy if the county fails to provide adequate health care, however. They may enforce the obligation imposed on the county by Welfare and Institutions Code sections 17000 and 17001, and by judicial action. (See, e.g., *Mooney v. Pickett* (1971) 4 Cal.3d 669 [94 Cal.Rptr. 279, 483 P.2d 1231].)

9 For this reason, it would be inappropriate to address the merits of plaintiff's claim in this proceeding. (Cf. *Dix v. Superior Court* (1991) 53 Cal.3d 442 [279 Cal.Rptr. 834, 807 P.2d 1063].) Unlike the dissent, we do not assume that in representing the state in this proceeding, the Attorney General necessarily represented the interests and views of these officials.

1 The majority states that "Plaintiffs are not without a remedy if the county fails to provide adequate health care .... They may enforce the obligation imposed on the county by Welfare and Institutions Code sections 17000 and 17001, and by judicial action." (Maj. opn., *ante,* p. 336, fn. 8)

The majority fails to note that plaintiffs have already tried this remedy, and met with the response that, owing to the state's inadequate subvention funds, the county cannot afford to provide adequate health care.

2 It is of no importance that plaintiffs did not request issuance of a writ of mandate. In *Taschner v. City Council* (1973) 31 Cal.App.3d 48, 56 [107 Cal.Rptr. 214] (overruled on other grounds in *Associated Home Builders etc., Inc. v. City of Livermore* (1976) 18 Cal.3d 582, 596 [135 Cal.Rptr. 41, 557 P.2d 473, 92 A.L.R.3d 1038]), the court said that "[a]s against a general demurrer, a complaint for declaratory relief may be treated as a petition for mandate [citations], and where a complaint for declaratory relief alleges facts sufficient to entitle plaintiff to mandate, it is error to sustain a general demurrer without leave to amend."

In the present case, the trial court ruled on a motion for summary judgment, but based that ruling not on the evidentiary record (which supported plaintiffs' showing of irreparable injury) but on the issues as framed by the pleadings. This is

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

essentially equivalent to a ruling on demurrer, and a judgment denying standing could not be sustained on the narrow ground that plaintiffs asked for the wrong form of relief without giving them an opportunity to correct the defect. (See *Residents of Beverly Glen, Inc. v. City of Los Angeles* (1973) 34 Cal.App.3d 117, 127-128 [109 Cal.Rptr. 724].)

3 The majority's argument assumes that the state will comply with a judgment for plaintiffs by providing increased subvention funds. If the state were instead to comply by restoring Medi-Cal coverage for MIA's, or some other method of taking responsibility for their health needs, plaintiffs would benefit directly.

4 The majority emphasizes the statement of purpose of Government Code section 17500: "The Legislature finds and declares that the existing system for reimbursing local agencies and school districts for the costs of state-mandated local programs has not provided for the effective determination of the state's responsibilities under section 6 of article XIII B of the California Constitution. The Legislature finds and declares that the failure of the existing process to adequately and consistently resolve the complex legal questions involved in the determination of state-mandated costs has led to an increasing reliance by local agencies and school districts on the judiciary, and, therefore, in order to relieve unnecessary congestion of the judicial system, it is necessary to create a mechanism which is capable of rendering sound quasi-judicial decisions and providing an effective means of resolving disputes over the existence of state-mandated local programs." The "existing system" to which Government Code section 17500 referred was the Property Tax Relief Act of 1972 (Rev. & Tax. Code, §§ 2201-2327), which authorized local agencies and school boards to request reimbursement from the state Controller. Apparently dissatisfied with this remedy, the agencies and boards were bypassing the Controller and bringing actions directly in the courts. (See, e.g., *County of Contra Costa v. State of California* (1986) 177 Cal.App.3d 62 [222 Cal.Rptr. 750].) The legislative declaration refers to this phenomena. It does not discuss suits by individuals.

5 "(a) The initial decision by a county to opt into the system pursuant to Section 77300 *shall constitute a waiver of all claims for reimbursement for state-mandated local programs not theretofore approved by the State Board of Control, the Commission on State Mandates, or the courts to the extent the Governor, in his discretion, determines that waiver to be appropriate*; provided, that a decision by a county to opt into the system pursuant to Section 77300 beginning with the second half of the 1988-89 fiscal year shall not constitute a waiver of a claim for reimbursement based on a statute chaptered on or before the date the act which added this chapter is chaptered, which is filed in acceptable form on or before the date the act which added this chapter is chaptered. A county may petition the Governor to exempt any such claim from this waiver requirement; and the Governor, in his discretion, may grant the exemption in whole or in part. The waiver shall not apply to or otherwise affect any claims accruing after initial notification. Renewal, renegotiation, or subsequent notification to continue in the program shall not constitute a waiver. [¶] (b) The initial decision by a county to opt into the system pursuant to Section 77300 shall constitute a waiver of any claim, cause of action, or action whenever filed, with respect to the Trial Court Funding Act of 1985, Chapter 1607 of the Statutes of 1985, or Chapter 1211 of the Statutes of 1987." (Gov. Code, § 77203.5, italics added.)

"As used in this chapter, 'state-mandated local program' *means any and all reimbursements owed or owing by operation of either Section 6 of Article XIII B of the California Constitution,* or Section 17561 of the Government Code, or both." (Gov. Code, § 77005, italics added.)

6 It is true that these officials would participate in a proceeding before the Commission on State Mandates, but they would do so as members of an administrative tribunal. On appellate review of a commission decision, its members, like the members of the Public Utilities Commission or the Workers' Compensation Appeals Board, are not respondents and do not appear to present their individual views and positions. For example, in *Lucia Mar Unified School Dist. v. Honig* (1988) 44 Cal.3d 830 [244 Cal.Rptr. 677, 750 P.2d 318], in which we reviewed a commission ruling relating to subvention payments for education of handicapped children, the named respondents were the state Superintendent of Public Instruction, the Department of Education, and the Commission on State Mandates. The individual members of the commission were not respondents and did not participate.

7 Welfare and Institutions Code section 17000 provides that "[e]very county ... shall relieve and support all incompetent, poor, indigent persons, and those incapacitated by age, disease, or accident, lawfully resident therein, when such persons are not supported and relieved by their relatives or friends, by their own means, or by state hospitals or other state or private institutions."

8 Article XIII B, section 1 provides: "The total annual appropriations subject to limitation of the state and of each local government shall not exceed the appropriations limit of such entity of government for the prior year adjusted for changes in the cost of living and population except as otherwise provided in this Article."

9 Section 3 of article XIII B reads in relevant part: "The appropriations limit for any fiscal year ... shall be adjusted as follows: "(a) In the event that the financial responsibility of providing services is transferred, in whole or in part ... from one entity of government to another, then for the year in which such transfer becomes effective the appropriation limit of the transferee

entity shall be increased by such reasonable amount as the said entities shall mutually agree and the appropriations limit of the transferor entity shall be decreased by the same amount. ..."

10 Section 6 of article XIII B further provides that the "Legislature may, but need not, provide such subvention of funds for the following mandates: (a) Legislative mandates requested by the local agency affected; (b) Legislation defining a new crime or changing an existing definition of a crime; or (c) Legislative mandates enacted prior to January 1, 1975, or executive orders or regulations initially implementing legislation enacted prior to January 1, 1975." None of these exceptions apply in the present case.

11 The state notes that, in contrast to the program at issue in *Lucia Mar,* it has not retained administrative control over aid to MIA's. But the quoted language from *Lucia Mar,* while appropriate to the facts of that case, was not intended to establish a rule limiting article XIII B, section 6, to instances in which the state retains administrative control over the program that it requires the counties to fund. The constitutional language admits of no such limitation, and its recognition would permit the Legislature to evade the constitutional requirement.

12 The state's repeated emphasis on the "temporary" nature of its funding is a form of post hoc reasoning. At the time article XIII B was enacted, the voters did not know which programs would be temporary and which permanent.

13 It must, however, provide a *comparable* level of services. (See *Board of Supervisors v. Superior Court* (1989) 207 Cal.App.3d 552, 564 [254 Cal.Rptr. 905].)

14 Certain language in *Madera Community Hospital v. County of Madera, supra,* 155 Cal.App.3d 136, however, is questionable. That opinion states that the "Legislature intended that County bear an obligation to its poor and indigent residents, *to be satisfied from county funds,* notwithstanding federal or state programs which exist concurrently with County's obligation and alleviate, to a greater or lesser extent, County's burden." (P. 151.) Welfare and Institutions Code section 17000 by its terms, however, requires the county to provide support to residents only "when such persons are not supported and relieved by their relatives or friends, by their own means, or by state hospitals or other state or private institutions." Consequently, to the extent that the state or federal governments provide care for MIA's, the county's obligation to do so is reduced pro tanto.

15 The county's right to subvention funds under article XIII B arises because its duty to care for MIA's is a state- mandated responsibility; if the county had no duty, it would have no right to funds. No claim is made here that the funding of medical services for the indigent shifted to Alameda County is not a program " 'mandated' " by the state; i.e., that Alameda County has any option other than to pay these costs. (*Lucia Mar Unified School Dist. v. Honig, supra,* 44 Cal.3d at pp. 836-837.)

Supreme Court of California

LONG BEACH POLICE OFFICERS ASSOCIATION, Plaintiff and Appellant,
v.
CITY OF LONG BEACH et al.,
Defendants and Appellants;
Los Angeles Times Communications LLC,
Real Party in Interest and Respondent.

No. S200872.
|
May 29, 2014.

Synopsis

Background: City police officers association brought action against city, seeking an injunction against disclosure, pursuant to the California Public Records Act (CPRA), of names of officers involved in shooting incidents over a five-year period. Newspaper company intervened and filed opposition, and city filed memorandum aligning itself with association. The Superior Court, Los Angeles County, No. NC055491, Patrick T. Madden, J., denied injunction without prejudice to future requests relating to individual officers. Association and city petitioned for writ of mandate, and the Court of Appeal affirmed. Association and city filed separate petitions for review, and the Supreme Court granted review, superseding the opinion of the Court of Appeal.

[Holding:] The Supreme Court, Kennard, J., held that CPRA did not protect officers' names from disclosure.

Affirmed.

Chin, J., dissented with opinion.

West Headnotes (6)

[1] Records
Judicial enforcement in general

Any failure to serve newspaper with police lieutenant's declaration did not adversely affect newspaper in Public Records Act action regarding disclosure of names of officers involved in shootings, as trial court concluded that the facts asserted in the declaration were too general and speculative to support the request for injunctive relief prohibiting disclosure. West's Ann.Cal.Gov.Code § 6250.

[2] Records
Discretion and equitable considerations; balancing interests

Records
Evidence and burden of proof

Public Records Act's "catchall exemption" allowing withholding of records if the public interest served by nondisclosure clearly outweighs the interest served by disclosure contemplates a case-by-case balancing process, with the burden of proof on the proponent of nondisclosure to demonstrate a clear overbalance on the side of confidentiality. West's Ann.Cal.Gov.Code § 6255(a).

4 Cases that cite this headnote

[3] Records
Exemptions or prohibitions under other laws

Public Records Act provision which protects records "exempted or prohibited pursuant to federal or state law" incorporates other disclosure prohibitions established by law. West's Ann.Cal.Gov.Code § 6254(k).

3 Cases that cite this headnote

[4] Records

Personal privacy considerations in general;personnel matters

California Public Records Act required disclosure of names of city police officers involved in shootings over five-year period; names themselves were not necessarily linked to information in personnel records, as they likely could be found in documents such as initial incident reports and could be provided without revealing any investigatory or disciplinary matter, public's substantial interest in the conduct of the officers involved in the shootings outweighed the officers' personal privacy interests, and there was no evidence of a specific safety concern regarding any particular officer which justified nondisclosure. West's Ann.Cal.Gov.Code §§ 6254(c), 6255; West's Ann.Cal.Penal Code § 832.7(a), 832.8(d).

Opinion

KENNARD, J. *

*64 **461 A newspaper asked a city to release the names of police officers involved in certain **462 shootings while on duty. The police union then sought injunctive relief against the city in superior court, attempting to prevent release of the names. The newspaper intervened (seeking disclosure of the names), and the city then aligned itself with the union (opposing disclosure). The trial court denied the union's request for a permanent injunction; that denial was upheld on appeal. We granted the separate petitions for review filed by the city and the union. We now affirm the judgment of the Court of Appeal.

I

Shortly before 5:00 p.m., on December 12, 2010, two City of Long Beach police officers responded to a resident's telephone call about an intoxicated man brandishing a "six-shooter" on neighboring property. At the sight of the two officers, the man (35–year–old Douglas Zerby) pointed at them an object resembling a gun. The officers immediately fired multiple rounds at Zerby, killing him. It turned out that the object Zerby was holding was a garden hose spray nozzle with a pistol grip.

Three days later, reporter Richard Winton of the Los Angeles Times (the Times), asked the Long Beach City Attorney's Office for "[t]he names of Long Beach police officers involved in the December 12[, 2010,] office[r-]involved shooting in the 5300 block of East Ocean Boulevard" (the Zerby shooting), as well as "[t]he names of Long Beach police officers involved in officer [-]involved shootings from Jan[uary] 1[,] 2005 to Dec[ember] 11, 2010" (the nearly six-year period leading up to the Zerby shooting). The request was made under the California Public Records Act (Gov.Code, § 6250 et seq.).

On December 30, 2010, plaintiff Long Beach Police Officers Association (the Union), the bargaining agent for all Long Beach police officers, sought injunctive relief in the superior court. Named as defendants were the City of Long Beach, the Long Beach Police Department, and its chief of police (collectively, the City). In its complaint, the Union asserted that the City had informed it that, unless prohibited by a court, the City would disclose the information sought by the Times. Accompanying the Union's request for injunctive relief was a declaration by Lieutenant Steve James, the Union's president, expressing concern that release of the officers' names could result *65 in "threats against the well being of officers or their families," as occurred in one recent police shooting case in which release of an officer's name led to "death threats" against ***59 the officer. James also mentioned an anonymous post on an Internet Web site, wishing that the children of an officer involved in a particular police shooting would experience Christmas without their father. James asserted that the Internet offers broad access to personal information, using only a person's name as an Internet search term.

The superior court issued a temporary restraining order prohibiting the City from disclosing to the Times the names of the officers involved in the Zerby shooting. The court then continued the case to a later date to determine whether to issue a preliminary or permanent injunction, and it allowed the Times to intervene in the action.

Defendant City supported plaintiff Union's request for injunctive relief. The City asserted that the names of the two officers involved in the December 2010 fatal shooting of Zerby were exempt from disclosure under the California Public Records Act. With respect to the names of the City's police officers involved in *earlier* shootings, the City asserted that those names, too, were likely subject to the same statutory exemptions but that its practice was to evaluate each disclosure request on a "case-by-case basis."

The City submitted a declaration by Long Beach Police Lieutenant Lloyd Cox, who was in charge of "the criminal and administrative investigations related to all Officer Involved Shootings." The declaration stated that the police department conducts an administrative investigation of every officer-involved shooting, and, if warranted, an internal criminal investigation follows. Documents resulting from these investigations are treated by the police department as personnel records that are statutorily exempt from disclosure. ****463** Cox's declaration also stated that revealing the name of an officer involved in a shooting could expose the officer and the officer's family to harassment, because the officer's home address and other personal information could easily be found using the Internet. The declaration further stated that when, for example, an officer is involved in a shooting of a gang member, it is not uncommon for the gang to retaliate against the officer. Cox mentioned eight "Officer Safety Bulletins ... about potential retaliation/ threats against officers," two of which were related to shootings, and he also described graffiti in the City of Long Beach that read "Strike Kill a Cop."

In arguing against disclosure of the names of the officers involved in the Zerby shooting, the Union and the City cited Government Code section 6255, subdivision (a), which authorizes denial of a public records request when "the public interest served by not disclosing the record clearly outweighs the public interest served by disclosure of the record." The Union and the City ***66** argued that the public interest in preventing harassment, threats, or violence against officers and their families outweighed any benefit the public would gain from disclosure.

[1] The Times moved to strike Lieutenant James's declaration (filed by the Union), but the Times did not object to the declaration of Lieutenant Cox (filed by the City).[1] The trial court struck those *****60** portions of the James declaration that mentioned (1) the general safety concerns associated with releasing the names of officers involved in shootings, (2) the death threats made against specific officers involved in past shootings, and (3) the ease with which a name can be used to gather personal information over the Internet. The trial court then denied the Union's request for a preliminary or permanent injunction, and it discharged the temporary restraining order. The court ruled that none of the disclosure exemptions in the California Public Records Act protected the names of officers involved in shootings. With respect to the potential harassment facing those officers and their families, the court considered such harassment to be speculative in the absence of a particularized showing regarding a specific officer. Recognizing that such a showing might be made in the future, the superior court denied injunctive relief "without prejudice" to a renewed request demonstrating that "releasing the names of particular officers will create a likelihood of harm."

The Union and the City appealed, without success. We then granted their petitions for review.[2]

II

A. Statutory Law

The California Legislature in 1968, recognizing that "access to information concerning the conduct of the people's business is a fundamental and ***67** necessary right of every person in this state" (Gov.Code, § 6250), enacted the California Public Records Act, which grants access to public records held by state and local agencies (*id.,* § 6253, subd. (a)). The act broadly defines " '[p]ublic records' " as including "any writing containing information relating to the conduct of the public's business prepared, owned, used, or retained by any state or local agency...." (*Id.,* § 6252, subd. (e).) The act has certain ****464** specific exemptions (*id.,* §§ 6254–6254.30), but a public entity claiming an exemption must show that the

requested information falls within the exemption (*id.,* § 6255, subd. (a)).

[2] Government Code section 6255's subdivision (a) contains a "catchall exemption." (*Michaelis, Montanari & Johnson v. Superior Court* (2006) 38 Cal.4th 1065, 1071, 44 Cal.Rptr.3d 663, 136 P.3d 194.) It allows a public agency to "justify withholding any record by demonstrating that ... on the facts of the particular case the public interest served by not disclosing the record clearly outweighs the public interest served by disclosure of the record." (Gov.Code, § 6255, subd. (a).) As we have said in the past, "this provision contemplates a case-by-case balancing process, with the burden of proof on the proponent of nondisclosure to demonstrate a clear overbalance on the side of confidentiality." (*Michaelis, Montanari & Johnson, supra,* at p. 1071, 44 Cal.Rptr.3d 663, 136 P.3d 194.)

[3] Also relevant here is Government Code section 6254, subdivision (c), which ***61** protects "[p]ersonnel, medical, or similar files, the disclosure of which would constitute an unwarranted invasion of personal privacy." But the Union and the City place their greatest reliance on Government Code section 6254, subdivision (k). That provision protects "[r]ecords, the disclosure of which is exempted or prohibited pursuant to federal or state law, including, but not limited to, provisions of the Evidence Code relating to privilege." Succinctly put, subdivision (k) " 'incorporates other [disclosure] prohibitions established by law.' " (*Copley Press, Inc. v. Superior Court* (2006) 39 Cal.4th 1272, 1283, 48 Cal.Rptr.3d 183, 141 P.3d 288 (*Copley*), quoting *CBS, Inc. v. Block* (1986) 42 Cal.3d 646, 656, 230 Cal.Rptr. 362, 725 P.2d 470.) The "prohibitions" pertinent here are those set forth in a set of discovery statutes that the Legislature enacted in 1978 in response to our 1974 decision in *Pitchess v. Superior Court* (1974) 11 Cal.3d 531, 113 Cal.Rptr. 897, 522 P.2d 305 (*Pitchess*).

In *Pitchess,* a defendant charged with battery on four sheriff's deputies (Pen.Code, §§ 242, 243, subd. (b)) claimed he was defending himself against the deputies' use of excessive force. We held that defendants in similar situations had a right, albeit limited, to discover from a peace officer's employer the existence of any previous complaints about the officer's use of excessive force. (*Pitchess, supra,* 11 Cal.3d at pp. 537–538, 113 Cal.Rptr. 897, 522 P.2d 305.) In response to our ***68** decision, the Legislature enacted several statutes, which we hereafter refer to as the "*Pitchess* statutes" and which we summarize below.

Under the *Pitchess* statutes, a public entity that employs peace officers must investigate and retain citizen complaints of any officer misconduct, such as the use of excessive force. (Pen.Code, § 832.5.) Litigants, upon a showing of good cause, are given limited access to records of such complaints and investigations (Evid.Code, §§ 1043, 1045), but such records are otherwise "confidential" and may "not be disclosed" (Pen.Code, §§ 832.7, subd. (a), 832.8, subd. (e)). Also protected as "confidential" are "[p]eace officer ... personnel records" and "information obtained from these records." (*Id.,* § 832.7, subd. (a).) Such "personnel records" include an officer's personal and family information, medical history, election of benefits (*id.,* § 832.8, subds. (a), (b) & (c)), as well as matters related to the officer's "advancement, appraisal, or discipline" (*id.,* subd. (d)). In addition, confidentiality applies to any information that "would constitute an unwarranted invasion of [a peace officer's] personal privacy." (*Id.,* § 832.8, subd. (f).)

One other piece of legislation merits mention here. In 2004, California's voters passed an initiative measure that added to the state Constitution a provision directing the courts to broadly construe statutes that grant public access to government information and to narrowly construe statutes that limit such access. (Cal. Const., art. I, § 3, subd. (b)(2).) That provision, however, does not affect the construction of any statute "to the extent ... it protects [the] right to privacy, including any statutory procedures governing discovery or disclosure of information concerning the official performance or professional qualifications of a peace officer." (**465 Cal. Const., art. I, § 3, subd. (b)(3).) Thus, by its express terms, the constitutional provision excludes from the requirement of narrow construction those statutes that protect the privacy interests of peace officers, including Government Code section 6254's subdivision (c) and the *Pitchess* statutes, both of which are at issue here.

B. Decisional Law

Relevant here are two of this court's recent decisions, which considered the interplay ***62** between the *Pitchess* statutes and requests under the California Public Records Act for disclosure of peace officers' names.

In *Copley, supra,* 39 Cal.4th 1272, 48 Cal.Rptr.3d 183, 141 P.3d 288 (decided in 2006), a newspaper publisher sought access to a civil service commission's records of an administrative appeal brought by a county sheriff's deputy who had been terminated for disciplinary reasons. After the commission denied the request, the publisher unsuccessfully petitioned the superior court for a writ of mandate, seeking to compel disclosure. The publisher then appealed, and the Court of Appeal ***69** directed the civil service commission to give the publisher access to the records, and also to disclose the deputy's name. The Court of Appeal reasoned that because the *Pitchess* statutes define "personnel records" as any file maintained under the officer's name *by the officer's employing agency* (Pen.Code, § 832.8) and because the civil service commission was not the officer's employing agency, the civil service commission's records did not qualify as "personnel records" protected by the *Pitchess* statutes. At the request of two police unions that had intervened in the action, we granted review and, with one justice dissenting, reversed the Court of Appeal.

Copley held that the civil service commission's records of the deputy's appeal were confidential "personnel records" under the *Pitchess* statutes (Pen.Code, §§ 832.7, 832.8) and therefore exempt from disclosure. (*Copley, supra,* 39 Cal.4th at pp. 1286–1296, 48 Cal.Rptr.3d 183, 141 P.3d 288.) *Copley* explained that neither the language nor the legislative history of the *Pitchess* statutes suggested that a peace officer's privacy rights should have less protection simply because the officer's employer uses an outside agency like the civil service commission to conduct its administrative appeals. (*Copley,* at p. 1295, 48 Cal.Rptr.3d 183, 141 P.3d 288.) *Copley* also rejected the Court of Appeal's conclusion that *the name* of the officer who brought the appeal had to be disclosed, noting that the *Pitchess* statutes were "designed to protect, among other things, 'the identity of officers' subject to [citizen] complaints." (*Copley,* at p. 1297, 48 Cal.Rptr.3d 183, 141 P.3d 288, quoting Pen.Code, § 832.7, subd. (a); see *Copley,* at p. 1297, 48 Cal.Rptr.3d 183, 141 P.3d 288, quoting Pen.Code, § 832.7, subd. (c).)

Copley then discussed the Court of Appeal's reliance on an earlier appellate decision, *New York Times Co. v. Superior Court* (1997) 52 Cal.App.4th 97, 60 Cal.Rptr.2d 410 (*New York Times*), which broadly declared that the *Pitchess* statutes do not prevent disclosure of *the names* of peace officers. (*Copley, supra,* 39 Cal.4th at pp. 1297–1298, 48 Cal.Rptr.3d 183, 141 P.3d 288.) That categorical statement was made, we said, "[w]ithout any analysis," and was "simply incorrect, at least insofar as it applies to disciplinary matters like the one at issue [in *Copley*]." (*Id.* at p. 1298, 48 Cal.Rptr.3d 183, 141 P.3d 288.) We disapproved *New York Times* to the extent that decision conflicted with our analysis in *Copley.* (*Copley,* at p. 1298, 48 Cal.Rptr.3d 183, 141 P.3d 288.)

In 2007, just one year after *Copley, supra,* 39 Cal.4th 1272, 48 Cal.Rptr.3d 183, 141 P.3d 288, we again addressed the issue of a newspaper's request, made under the California Public Records Act, for disclosure of the names of certain peace officers. In *Commission on Peace Officer Standards and Training v. Superior Court* (2007) 42 Cal.4th 278, 64 Cal.Rptr.3d 661, 165 P.3d 462 (*Commission on Peace Officer Standards*), a newspaper sought certain information about peace officers hired statewide by various California public entities during a specified 10–year period. *****63** The information was contained in a database maintained by a public agency. When the agency denied the newspaper's request, the ***70** newspaper challenged that decision in superior court, which ordered disclosure ****466** of each officer's name, the appointing agency, the date of new appointment, and, if applicable, the date of termination. The Court of Appeal reversed, but a majority of this court disagreed with the Court of Appeal. (*Id.* at p. 303, 64 Cal.Rptr.3d 661, 165 P.3d 462.)

In *Commission on Peace Officer Standards,* the public agency that had compiled the peace officer database did not employ any of the peace officers, and therefore the entries in its database were not "personnel records" under a literal reading of the *Pitchess* statutes (Pen.Code, § 832.8 [limiting personnel records to records held in files maintained by an individual's employer]). Nonetheless, a majority of this court concluded that the information in the database would fall within the protections afforded personnel records if the information was "obtained from" personnel records maintained by the employing agencies of the peace officers in question. (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 289, 64 Cal.Rptr.3d 661, 165 P.3d 462.) The majority further concluded, however, "that peace officer personnel records include only the types of information enumerated in [Penal Code] section 832.8" (*id.* at p. 293, 64 Cal.Rptr.3d 661, 165 P.3d 462), and because the specific information the trial court ordered disclosed (the names of the officers,

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

their employing agencies, and their employment dates) did not fall into any of the enumerated categories, it was not information obtained from protected personnel records (*id.* at pp. 294–299, 64 Cal.Rptr.3d 661, 165 P.3d 462), and therefore it was subject to disclosure.

Commission on Peace Officer Standards next held that Government Code section 6254's subdivision (c), which is part of the California Public Records Act, also did not preclude disclosure of the information covered by the superior court's order. (See *Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 303, 64 Cal.Rptr.3d 661, 165 P.3d 462.) As noted (see 172 Cal.Rptr.3d at p. 60, 325 P.3d at p. 464, *ante*), that statutory provision authorizes denial of a public records request when the information sought consists of "[p]ersonnel, medical, or similar files, the disclosure of which would constitute an unwarranted invasion of personal privacy." (Gov.Code, § 6254, subd. (c).) *Commission on Peace Officer Standards* assumed for purposes of its analysis that the records at issue "may be characterized as '[p]ersonnel ... or similar files.' " (*Commission on Peace Officer Standards,* at p. 299, 64 Cal.Rptr.3d 661, 165 P.3d 462.) But it noted that the exemption set forth in section 6254's subdivision (c) requires a balancing of "the privacy interests of peace officers in the information at issue against the public interest in disclosure," and it further noted that the party opposing disclosure "has the burden" of showing that the records at issue fall within the exemption—a showing the agency failed to make in *Commission on Peace Officer Standards.* (*Commission on Peace Officer Standards,* at p. 299, 64 Cal.Rptr.3d 661, 165 P.3d 462.)

Against this background of relevant statutes and court decisions, we now consider the disclosure request of the Times.

*71 III

[4] The Times, citing the California Public Records Act, seeks disclosure of the names of the two Long Beach police officers involved in the December 12, 2010, fatal shooting of Zerby, as well as the ***64** names of any Long Beach officers involved in shootings occurring between January 1, 2005, and December 11, 2010. The Union and the City oppose disclosure. They rely largely on the confidentiality protections afforded peace officers under the *Pitchess* statutes, focusing in particular on Penal Code section 832.7's subdivision (a) (protecting from disclosure a peace officer's "personnel records") and Penal Code section 832.8's subdivision (d) (defining "personnel records" as including records of employee "appraisal[ ] or discipline").

The Union and the City also attach significance to the italicized language in this quote from *Commission on Peace Officer Standards:* "[T]he legislative concern [in adopting sections 832.7 and 832.8] appears to have been with *linking a named officer to the private or sensitive information listed in section 832.8.* ... It seems unlikely that the Legislature contemplated that the identification of an individual as a peace officer, *unconnected* ***467** *to any of the information it defined as part of a personnel record,* would be rendered confidential by section 832.8." (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 295, 64 Cal.Rptr.3d 661, 165 P.3d 462, italics added.) The Union and the City contend that disclosing the names of officers involved in on-duty shootings necessarily *links* the named officers to private or sensitive information in their personnel files, information made confidential under Penal Code section 832.7's subdivision (a). The Union and the City reason that because every on-duty shooting is routinely investigated by the employing agency, the details of every such incident (including the names of the officers involved) are "records relating to" officer "appraisal[ ] or discipline" (Pen.Code, § 832.8, subd. (d)), which, by definition, are confidential "personnel records" (*id.,* § 832.8). We are not persuaded.

Although the *Pitchess* statutes limit public access to personnel records (Pen.Code, § 832.7, subd. (a)), including officer names if they are *linked* to information in personnel records (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 295, 64 Cal.Rptr.3d 661, 165 P.3d 462), many records routinely maintained by law enforcement agencies are not personnel records. For example, the information contained in the initial incident reports of an on-duty shooting are typically not "personnel records" as that term is defined in Penal Code section 832.8. It may be true that such shootings are routinely investigated by the employing agency, resulting eventually in some sort of officer appraisal or discipline. But only the records *generated* in connection with that appraisal or discipline would come within the statutory definition of personnel records (Pen.Code, § 832.8, subd. (d)). We do not read the phrase "records relating to ... [¶] ... *72 [¶] ... [e]mployee ... appraisal[ ] or discipline" (*ibid.*) so broadly as to include every record that might be *considered* for

purposes of an officer's appraisal or discipline, for such a broad reading of the statute would sweep virtually all law enforcement records into the protected category of "personnel records" (*id.,* § 832.8).

Government Code section 6254's subdivision (f) lends some support to our conclusion. Under that statute, when a shooting by a peace officer occurs during an arrest (Gov.Code, § 6254, subd. (f)(1)) or in the course of responding to a complaint or request for assistance (*id.,* § 6254, subd. (f)(2)), and when the officer's name is recorded as one of the "factual circumstances" of the incident, disclosure of the officer's name is generally required. It thus appears that the Legislature draws a distinction between (1) records of factual information about an incident (which generally must be disclosed) and (2) records generated as part of an internal investigation ***65** of an officer in connection with the incident (which generally are confidential). We therefore agree with this point made in a 2008 opinion by the California Attorney General: "Generally speaking, a response to a request just for the names of officers involved in a particular incident may be provided without revealing any investigatory or disciplinary matter that may have arisen out of the incident. Disclosure would merely communicate a statement of fact that the named officers were involved in the incident. It would not imply any judgment that the actions taken were inappropriate or even suspect." (91 Ops.Cal.Atty.Gen. 11, 16–17 (2008), fn. omitted.) An employing agency is, of course, free to emphasize, when complying with a California Public Records Act request, that its disclosure of the names of officers involved in an incident does not imply any wrongdoing by those officers.

Significantly, the *Pitchess* statutes are silent as to whether the names of officers involved in shootings are protected "personnel records." (Pen.Code, § 832.8.) That silence is important because, as this court observed in *Commission on Peace Officer Standards,* the personnel records exemption is limited to the categories of information that are expressly "enumerated" in Penal Code section 832.8. (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 293, 64 Cal.Rptr.3d 661, 165 P.3d 462.) That the Legislature did not intend to protect peace officers' identities can also be inferred from the Legislature's enactment of Penal Code section 830.10, which requires uniformed officers to display their name or identification **468 number. That statute reflects a legislative policy that, generally, the public has a right to know the identity of an officer involved in an on-duty shooting.

Misplaced is the reliance by the Union and the City on this court's decision in *Copley, supra,* 39 Cal.4th 1272, 48 Cal.Rptr.3d 183, 141 P.3d 288. There, as we noted earlier, a newspaper publisher sought records of an administrative appeal brought by a sheriff's *73 deputy who had been terminated. This court concluded that the records (including the deputy's name) were confidential personnel records under the *Pitchess* statutes. (*Copley,* at pp. 1297–1298, 48 Cal.Rptr.3d 183, 141 P.3d 288.) Later, in *Commission on Peace Officer Standards,* this court emphasized that the records requested in *Copley* would have "linked" the deputy's name to "private or sensitive" personnel matters, thus explaining why the name at issue in *Copley* was protected. (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 295, 64 Cal.Rptr.3d 661, 165 P.3d 462; see *id.* at pp. 298–299, 64 Cal.Rptr.3d 661, 165 P.3d 462.) Here, by contrast, disclosing the names of officers involved in various shootings would not imply that those shootings resulted in disciplinary action against the officers, and it would not link those names to any confidential personnel matters or other protected information.

In arguing here against disclosure of the officers' names, the Union and the City note this court's disapproval in *Copley, supra,* 39 Cal.4th at page 1298, 48 Cal.Rptr.3d 183, 141 P.3d 288, of the Court of Appeal's statement in *New York Times, supra,* 52 Cal.App.4th at page 101, 60 Cal.Rptr.2d 410, that " 'an individual's name is not exempt from disclosure' " under the *Pitchess* statutes. But, as we explained in *Commission on Peace Officer Standards, supra,* 42 Cal.4th at page 298, 64 Cal.Rptr.3d 661, 165 P.3d 462, this court disapproved the statement from *New York Times* only " 'insofar as it applie [d] to disciplinary matters like the one at issue' " in *Copley.* (See *Copley,* at p. 1298, 48 Cal.Rptr.3d 183, 141 P.3d 288.) The records sought in *Copley* linked the officer's name, not just to an on-duty shooting, but to a ***66** confidential disciplinary action involving the officer, and therefore they were exempt from disclosure. (See *Commission on Peace Officer Standards, supra,* 42 Cal.4th at pp. 295, 298–299, 64 Cal.Rptr.3d 661, 165 P.3d 462.) Thus, *Copley*'s disapproval of the statement from *New York Times* did not alter the latter case's core holding, generally permitting disclosure of the names of peace officers involved in on-duty shootings.

(See 91 Ops.Cal.Atty.Gen. 11, 13–15 (2008) [discussing *Copley*'s effect on *New York Times*].)

[5] Nor does Government Code section 6254's subdivision (c), which is part of the California Public Records Act, help the Union and the City in their effort to prevent disclosure of the names of officers involved in shootings. As noted (see 172 Cal.Rptr.3d at p. 60, 325 P.3d at p. 464, *ante*), that provision exempts from disclosure "[p]ersonnel ... or similar files" if disclosure "would constitute an unwarranted invasion of personal privacy." (Gov.Code, § 6254, subd. (c).) A serious question arises as to whether the names of peace officers involved in particular law enforcement incidents can be characterized as "[p]ersonnel ... or similar files" (*ibid.*). Moreover, when it comes to the disclosure of a peace officer's name, the public's substantial interest in the conduct of its peace officers outweighs, in most cases, the officer's personal privacy interest. As we noted in *Commission on Peace Officer Standards:* "Peace officers 'hold one of the most powerful positions in our society; our dependence on them is high and the potential for abuse of power is far from insignificant.' ***74** *City of Hemet v. Superior Court* (1995) 37 Cal.App.4th 1411, 1428 [44 Cal.Rptr.2d 532].) A police officer 'possesses both the authority and the ability to exercise force. Misuse of [this] authority can result in significant deprivation of constitutional rights and personal freedoms, not to mention bodily injury and financial loss.' (*Gray v. Udevitz* (10th Cir.1981) 656 F.2d 588, 591.)" (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at pp. 299–300, 64 Cal.Rptr.3d 661, 165 P.3d 462.) Thus, the public's significant interest in the conduct of its peace officers "diminishes and counterbalances" an officer's privacy interest in keeping his or her name confidential. (*Id.* at p. 299, 64 Cal.Rptr.3d 661, 165 P.3d 462.)

****469** In a case such as this one, which concerns officer-involved shootings, the public's interest in the conduct of its peace officers is particularly great because such shootings often lead to severe injury or death. Here, therefore, in weighing the competing interests, the balance tips strongly in favor of identity disclosure and against the personal privacy interests of the officers involved. Of course, if it is essential to protect an officer's anonymity for safety reasons or for reasons peculiar to the officer's duties —as, for example, in the case of an undercover officer —then the public interest in disclosure of the officer's name may need to give way. (See *International Federation of Professional and Technical Engineers, Local 21, AFL–CIO v. Superior Court* (2007) 42 Cal.4th 319, 337, 64 Cal.Rptr.3d 693, 165 P.3d 488.) That determination, however, would need to be based on a particularized showing, which was not made here.

We next consider the City's assertion that Government Code section 6254's subdivision (f) permits it to withhold the names of officers involved in on-duty shootings. That provision exempts from disclosure "[r]ecords ... of investigations conducted by ... any state or local police agency." (*Ibid.*) The Times here is not seeking the records of any administrative or criminal investigation, so that exemption is inapplicable.

*****67** **[6]** Finally, we consider the catchall exemption in Government Code section 6255's subdivision (a), which allows a public agency to withhold any public record if the agency shows that "on the facts of the particular case the public interest served by not disclosing the record clearly outweighs the public interest served by disclosure of the record." The catchall exemption sets forth a balancing test, and we have already concluded that, generally, the balance of interests favors disclosing the names of peace officers involved in on-duty shootings. (See 172 Cal.Rptr.3d at pp. 65–66, 325 P.3d at pp. 467–468, *ante.*) Vague safety concerns that apply to all officers involved in shootings are insufficient to tip the balance against disclosure of officer names. As we have said in the past, "[a] mere assertion of possible endangerment does not 'clearly outweigh' the public interest in access to ... records." (*CBS, Inc. v. Block, supra,* 42 Cal.3d at p. 652, 230 Cal.Rptr. 362, 725 P.2d 470.)

The Union and the City assert that disclosing the names of peace officers involved in shootings could lead to harassment of those officers and their ***75** families. In rejecting that argument, the trial court found that the Union and the City had offered "no evidence" of a "specific safety concern regarding any particular officer." We agree. The declaration by Long Beach Police Lieutenant Cox (submitted by the City) described the possibility of gang retaliation against officers involved in shooting gang members, but those concerns were general in nature. The December 2010 Zerby shooting did not involve a gang member, and the Union and the City did not identify other shootings that did involve a gang member. The Cox declaration also mentioned two safety bulletins warning of "potential retaliation/threats" against

officers involved in shootings, and it described graffiti that read "Strike Kill a Cop," but those vague concerns do not establish any specific danger to the officers involved in the Zerby shooting or any shooting that occurred in the six years before the Zerby shooting (see the Times's public records request, quoted at 172 Cal.Rptr.3d at p. 58, 325 P.3d at p. 462, *ante*).

We do not hold that the names of officers involved in shootings have to be disclosed in every case, regardless of the circumstances. We merely conclude, as did the trial court and the Court of Appeal, that the particularized showing necessary to outweigh the public's interest in disclosure was not made *here,* where the Union and the City relied on only a few vaguely worded declarations making only general assertions about the risks officers face after a shooting. The public records request by the Times is broadly worded and covers a wide variety of incidents. Thus, the Union and the City sought a blanket rule preventing the disclosure of officer names *every time* an officer is involved in a shooting. Such a rule would even prevent disclosure of the name of an officer who acted in a heroic manner that was unlikely to provoke retaliation of any kind, in which case officer ****470** safety would not be an issue. We reject that blanket rule.

The trial court's denial of injunctive relief was without prejudice to any later evidentiary showing that disclosing a particular officer's name would compromise that officer's safety or the safety of the officer's family. That ruling permits further litigation by the Union, and it reflects the trial court's recognition, which we share, that the public's interest in access to public records is not absolute and must be weighed against the countervailing privacy and safety interests of peace officers. Understandable are the general safety concerns of officers who fear retaliation from angry members of the community *****68** after an officer-involved shooting, especially when the shooting results in the death of an unarmed person. But the Legislature, whose laws we must construe, has not gone so far as to protect the names of all officers involved in such shootings. That the Legislature generally considers it important for the public to know the identities of the officers serving the community is reflected in the statutory provision requiring a uniformed officer to display either a name or an identification number (Pen.Code, § 830.10).

***76 DISPOSITION**

We affirm the judgment of the Court of Appeal, which upheld the trial court's denial of the Union's requested injunctive relief.

WE CONCUR: CANTIL–SAKAUYE, C.J., BAXTER, WERDEGAR, CORRIGAN, LIU, JJ.

Dissenting Opinion by CHIN, J.

I disagree with the majority's conclusion that the City of Long Beach (the City) and the Long Beach Police Officers Association (the Union) have failed to show that the information the Los Angeles Times (the Times) has requested—the names of the officers "involved in" the December 12, 2010, shooting of Douglas Zerby and the names of all police officers "involved in" shootings from January 1, 2005, until December 11, 2010—is exempt from disclosure under the California Public Records Act (CPRA) (Gov.Code, § 6250 et seq.).[1] In my view, the evidence in the record of the safety threat faced by police officers identified as having been involved in a shooting establishes that the requested information is exempt from disclosure under section 6254, subdivision (c), which provides that the CPRA does not require disclosure of "[p]ersonnel, medical, or similar files, the disclosure of which would constitute an unwarranted invasion of personal privacy." I therefore dissent.

In relying on this section, the Union acknowledges that the majority in *Commission on Peace Officer Standards and Training v. Superior Court* (2007) 42 Cal.4th 278, 64 Cal.Rptr.3d 661, 165 P.3d 462 (*Commission on Peace Officer Standards*) held that "the privacy and safety interests of peace officers" as a group regarding the mere fact of their employment "do not outweigh the public's interest in the disclosure of [that] information." (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 303, 64 Cal.Rptr.3d 661, 165 P.3d 462.) The Union argues, however, that the "heightened safety concerns of officers who have been involved in shootings" warrant striking a different "balance" with regard to this "subgroup." In support of its argument, the Union relies on the declaration of Long Beach Police Lieutenant Lloyd Cox (Cox declaration), which states in relevant part: (1) "A number of officer involved shootings

involve gang members or violent criminals"; (2) "When an officer is involved in a shooting with a gang member, it is not uncommon for the gang to retaliate against law enforcement officers"; (3) "Since late 2007, the Long Beach Police Department has issued eight Officer Safety Bulletins to the department about potential retaliation/ threats against officers, two of which were directly related to shootings involving police officers. As recently as January 10, 2011, the department was notified of graffiti at 5100 Appian Way ***77** that was approximately 4 feet high and 6 inches long which read 'Strike Kill a Cop' "; and (4) "Today, in the age of the internet, knowing an individual's name can be the gateway to a world of information. Public documents *****69** are readily ****471** accessible on line and can provide anyone with the home address of an individual, including a police officer. The address of a police officer in the hands of a gang member, violent offender, or angry friend, relative, or associate of a person who was shot by a police officer is of great concern for the personal safety of both the officer and their [*sic*] family. Therefore the Long Beach Police Department insists on protecting the identity of its officers, when those officers are involved in critical incidents, including shootings, in order to ensure their safety and the safety of their families."

I agree with the Union's argument. As I explained in *Commission on Peace Officer Standards,* "in 1990, the Legislature amended subdivision (a) of [Penal Code] section 832.8 by adding [officers'] 'home addresses' to the list of examples of confidential '[p]ersonal data.' (Stats.1990, ch. 264, § 1, p. 1535.) According to the amendment's legislative history, one of the Legislature's purposes in adding 'home addresses' to the list was to protect officers and their families. (Assem. Com. on Public Safety, Analysis of Sen. Bill 1985 (1989–1990 Reg. Sess.) as amended May, 16, 1990, p. 2.) Given that publicly available databases on the Internet make it easy to link a name to an address, the release of an officer's name would not seem to pose much, if any, less of a safety risk than would disclosing an officer's home address. (See *Frank v. City of Akron* (6th Cir.2002) 290 F.3d 813, 819 ['Most individuals' addresses ... are readily available on the Internet'].) ... [I]n light of the accessibility of information through the Internet, it would be entirely 'feasible' for someone hostile toward the police to use the list of names to locate peace officers' addresses in order to 'harass them' or their families. [Citation.] Moreover, in light of the Legislature's acknowledgment of the dangers faced by officers and their families, ... we [cannot] simply dismiss this threat as being 'purely speculative.' (See *King County v. Sheehan* [(2002) 114 Wash.App. 325, 340, 57 P.3d 307] [it is 'naïve ... to believe that police officers who are identified on anti-police web sites ... by name and home address ... could not thereby be placed in danger or subjected to harassment'].)" (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 317, 64 Cal.Rptr.3d 661, 165 P.3d 462 (dis. opn. of Chin, J.).) The evidence in the record here amply supports this analysis.

Nothing in the majority's brief discussion of section 6254, subdivision (c), convinces me otherwise. The majority first asserts that there is a "serious question" as "to whether the names of peace officers involved in particular law enforcement incidents can be characterized as '[p]ersonnel ... or similar files' " within the meaning of section 6254, subdivision (c). (Maj. opn., *ante,* 172 Cal.Rptr.3d at p. 65, 325 P.3d at p. 467.) However, for reasons I have explained in a previous case, I have no trouble concluding that the names of officers who have been involved in a ***78** shooting constitute "personnel ... or similar files" under section 6254, subdivision (c). (See *International Federation of Professional and Technical Engineers, Local 21, AFL–CIO v. Superior Court* (2007) 42 Cal.4th 319, 350–351, 64 Cal.Rptr.3d 693, 165 P.3d 488 (conc. & dis. opn. of Chin, J.) (*International Federation*).)

The majority then moves on to its primary focus: the public's interest. Relying on *Commission on Peace Officer Standards,* the majority first identifies the public's interest generally in "the conduct of its peace officers"—specifically, the " '[m]isuse' " of their authority—and asserts that, "when it comes to the disclosure of a peace officer's name," this interest "outweighs, in most cases, the officer's personal privacy interest." (Maj. opn., *****70** *ante,* 172 Cal.Rptr.3d at p. 66, 325 P.3d at p. 468.) The majority next asserts that this general public interest "is particularly great" in connection with "officer-involved shootings" because "such shootings often lead to severe injury or death." (Maj. opn., *ante,* at p. 66, 325 P.3d at p. 468.) This heightened public interest, the majority states, "tips" the balance here "strongly in favor of identity disclosure." (*Id.* at p. 66, 325 P.3d at p. 469.)

The majority's discussion is unpersuasive for several reasons. First, the majority fails to explain how disclosing the name of an officer who has in any way been "involved in ****472** officer involved shootings"—which is what the

Times seeks—provides any information about whether the involved officers " ' [m]isuse[d]' " their authority. (Maj. opn., *ante,* 172 Cal.Rptr.3d at p. 65, 325 P.3d at p. 467.) Thus, merely knowing which officers were "involved in officer involved shootings" does little, if anything, to advance the public's interest in "the conduct of its peace officers." (Maj. opn., *ante,* at p. 66, 325 P.3d at p. 468.)

Second, the majority's assessment of the public's interest is inconsistent with the Legislature's and the voters' view of that interest. Through the *Pitchess* statutes (see maj. opn., *ante,* 172 Cal.Rptr.3d at pp. 60–61, 325 P.3d at pp. 464–465), the Legislature has precluded the general public from obtaining "[p]eace officer ... personnel records" or "information obtained from these records." (Pen.Code, § 832.7, subd. (a).) It has specified that this restriction protects records "relating to" (1) an officer's "advancement, appraisal, or discipline" (*id.,* § 832.8, subd. (d)), and (2) "[c]omplaints, or investigations of complaints, concerning an event or transaction in which [an officer] participated, or which he or she perceived, and pertaining to the manner in which he or she performed his or her duties" (*id.,* § 832.8, subd. (e)). It has authorized law enforcement agencies to "disseminate data regarding the number, type, or disposition of complaints ... made against [their] officers" *only* "if that information is in a form which does not identify the individuals involved." (*Id.,* § 832.7, subd. (c).) These provisions clearly express *the Legislature's* view regarding the public's interest in discovering whether particular officers have misused their power or even have been the subject of complaints about their conduct. ***79** The voters have ratified the Legislature's view by passing a constitutional provision that expressly preserves "statutory procedures governing discovery or disclosure of information concerning the official performance or professional qualifications of a peace officer." (Cal. Const., art. I, § 3, subd. (b)(3).) The majority improperly ignores these expressions of policy by the Legislature and the voters, and improperly substitutes its own view of policy. As a court, we have neither prerogative nor power "to substitute our public policy judgment" for that of the Legislature and the voters. (*Thomas v. City of Richmond* (1995) 9 Cal.4th 1154, 1165, 40 Cal.Rptr.2d 442, 892 P.2d 1185.)

The majority errs in asserting that Penal Code section 830.10 "reflects a legislative policy that, generally, the public has a right to know the identity of an officer involved in an on-duty shooting." (Maj. opn., *ante,* 172 Cal.Rptr.3d at p. 65, 325 P.3d at p. 468.) That section provides: "Any uniformed peace officer shall wear a badge, nameplate, or other device which bears clearly on its face the identification number or name of the officer." (Pen.Code, § 830.10.) On its face, the section applies only to "uniformed" officers. (*Ibid.*) Thus, to the extent it has any relevance to officers who are *not* in uniform, it indicates a legislative intent to protect their identities. Even as to uniformed officers, *****71** it fails to support the majority's broad conclusion that the public, "generally," has a right to know the identity of officers involved in shootings. (Maj. opn., *ante,* at p. 64, 325 P.3d at p. 467.) Under the section, police departments may choose not to require their uniformed officers to display their names, and may instead require them only to display their "identification number[s]." (Pen.Code, § 830.10.) Even were the statute to require officers to display their names, a statute affording the immediate participants in a police encounter access to the officers' names does not reflect a far broader legislative policy that, "generally, the public has a right to know the identity of an officer involved in an on-duty shooting." (Maj. opn., *ante,* at p. 65, 325 P.3d at p. 468.) This conclusion is obvious from the fact that, as noted above, the *Pitchess* statutes allow law enforcement agencies to "disseminate data regarding the number, type, or disposition of complaints ... made against [their] officers" *only* "if that information is in a form which does not identify the individuals involved." (Pen.Code, § 832.7, subd. (c).) In other words, the Legislature has precluded release of identifying information *generally to the public* even though the names of officers against whom complaints have been made are known to those who have filed complaints. As the ****473** majority recognized in *Commission on Peace Officer Standards,* "the mere fact that officers' names" may be displayed on their uniforms does not mean "that the information cannot be considered personal or private. (See *Department of Defense v. FLRA* (1994) 510 U.S. 487, 500, 114 S.Ct. 1006, 127 L.Ed.2d 325 ... ['An individual's [privacy] interest in controlling the dissemination of information regarding personal matters does not dissolve ***80** simply because that information may be available to the public in some form'].)" [2] (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 296, fn. 5, 64 Cal.Rptr.3d 661, 165 P.3d 462.)

Nor do I agree with the majority that, under section 6254, subdivision (f), "when a shooting by a peace

officer occurs during an arrest [citation] or in the course of responding to a complaint or request for assistance [citation], and when the officer's name is recorded as one of the factual circumstances of the incident, disclosure of the officer's name is generally required." (Maj. opn., *ante,* 172 Cal.Rptr.3d at p. 64, 325 P.3d at p. 467.) Section 6254, subdivision (f), generally exempts from disclosure under the CPRA "[r]ecords of complaints to, or investigations conducted by, ... any state or local police agency." As here relevant, it further provides that, "[n]otwithstanding any other provision of this subdivision," a law enforcement agency "shall" disclose the following: (1) "the factual circumstances surrounding the arrest" of each person the agency arrests (§ 6254, subd. (f)(1)); and (2) the "nature of the response" to all complaints or requests for assistance the agency receives, "including, *****72** to the extent the information regarding crimes alleged or committed or any other incident investigated is recorded, ... the factual circumstances surrounding the crime or incident" (*id.,* subd. (f)(2)). Where one of the specified incidents involves a shooting, it is not at all clear that the "factual circumstances surrounding" the incident (*id.,* subd. (f)(1), (2)) include the names of officers involved in the shooting. The majority cites, and I have found, no case supporting that view. Moreover, the language stating that these disclosure provisions apply "[n]otwithstanding any other provision of *this subdivision* " (*id.,* subd. (f), italics added) indicates that the section's disclosure requirement does not override the confidentiality provisions found in other statutes. Our courts of appeal have so construed the statute. (*County of Los Angeles v. Superior Court* (1993) 18 Cal.App.4th 588, 600, 22 Cal.Rptr.2d 409 ["we cannot construe section 6254, subdivision (f), to require" disclosure of "law enforcement information" the *Pitchess* statutes make confidential].) Finally, the statute itself authorizes nondisclosure "to the extent that disclosure of a particular item of information would endanger the safety of a person involved in an investigation or would endanger the successful completion of the ***81** investigation or a related investigation." (§ 6254, subd. (f).) Because, in my view, this would include the names of officers involved in shootings, I do not agree that, even under the circumstances the majority posits, section 6254, subdivision (f), "generally require[s]" disclosure of the information the Times seeks. [3] (Maj. opn., *ante,* at p. 64, 325 P.3d at p. 466.)

****474** The majority also makes several errors in evaluating the other side of the balance: the interests of the officers in nondisclosure. Although relying principally on a heightened public interest in officer-involved shootings, the majority fails to consider or even acknowledge *the officer's* heightened privacy and safety interests in such cases. In this regard, *Commission on Peace Officer Standards,* on which the majority principally relies (maj. opn., *ante,* 172 Cal.Rptr.3d at pp. 65–66, 325 P.3d at pp. 467–468), actually supports the Union. There, in holding that "the typical peace officer has [no] more than an insubstantial privacy interest in the fact of his or her employment as an officer" (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 300, 64 Cal.Rptr.3d 661, 165 P.3d 462), the majority reasoned that the fact of employment is "innocuous information" (*id.* at p. 302, 64 Cal.Rptr.3d 661, 165 P.3d 462) because "it would not reveal [the *****73** officer's] involvement *in any particular case* " (*id.* at p. 302, fn. 12, 64 Cal.Rptr.3d 661, 165 P.3d 462, italics added). In this regard, the majority reasoned, disclosure of basic employment information is different from the disclosure sought in *Stone v. F.B.I.* (D.D.C.1990) 727 F.Supp. 662 (*Stone*): the names of FBI agents "who participated in the investigation of the assassination of Robert F. Kennedy." (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 302, fn. 12, 64 Cal.Rptr.3d 661, 165 P.3d 462.) In *Stone,* " '[w]hat could reasonably be expected to constitute an unwarranted invasion of an agent's privacy is not that he or she is revealed as an FBI agent but that he or she is named as an FBI agent *who participated in the RFK investigation.*' [Citation.]" (*Commission on Peace Officer Standards, supra,* at p. 302, fn. 12, 64 Cal.Rptr.3d 661, 165 P.3d 462.) The " 'concern is not with the identifying information *per se,* but with the connection between such information and some other detail—a statement, an event, or otherwise—which the individual would not wish to be publicly disclosed.' " (*Ibid.,* quoting *Halloran v. Veterans Admin.* (5th Cir.1989) 874 F.2d 315, 321.) Here, the information the ***82** Times seeks *would* reveal the participation of the named officers in "particular case[s]" and *would* reveal their connection to an event —a shooting—they may " 'not wish to be publicly disclosed.' " (*Commission on Peace Officer Standards, supra,* at p. 302, fn. 12, 64 Cal.Rptr.3d 661, 165 P.3d 462.) As the majority opinion in *Commission on Peace Officer Standards* establishes, the officers therefore have a heightened privacy interest in nondisclosure. Moreover, the potentially incendiary nature of the information the Times seeks—an officer's involvement in a shooting—further heightens an officer's already elevated privacy

interest in not being linked to "particular case[s]." (*Ibid.*) The majority errs in failing even to acknowledge this heightened interest.

Finally, the majority's conclusion that the Union's claim under section 6254, subdivision (c), fails for lack of a "particularized showing" regarding the need for confidentiality (maj. opn., *ante,* 172 Cal.Rptr.3d at p. 65, 325 P.3d at p. 468) is both erroneous and inconsistent with our prior decisions. The majority acknowledges both the existence and validity of the "safety concerns of officers who fear retaliation from angry members of the community after an officer-involved shooting." (Maj. opn., *ante,* at p. 66, 325 P.3d at p. 469.) It also acknowledges that *the record contains evidence* of " 'potential retaliation/threats' against officers involved in shootings." (Maj. opn., *ante,* at p. 67, 325 P.3d at p. 469.) However, the majority finds this evidence too "vague" and insists that more is required; as to each officer whose name is to be withheld, there must be evidence to "establish" a "specific danger" to the officer or to the members of the officer's family. (Maj. opn., *ante,* at p. 67, 325 P.3d at p. 469.)

****475** The specificity of proof the majority demands is inconsistent with our decision in *Times Mirror Co. v. Superior Court* (1991) 53 Cal.3d 1325, 283 Cal.Rptr. 893, 813 P.2d 240 (*Times Mirror*). There, we held that, because of safety concerns, the Governor of California had properly refused to disclose his daily, weekly, and monthly appointment calendars and schedules. (*Id.* at pp. 1329, 1346–1347, 283 Cal.Rptr. 893, 813 P.2d 240.) The only evidence supporting our conclusion was the declaration of the Governor's security director, which stated in the most general terms that disclosing this information " 'would seriously impair [his] ... ability to assure the Governor's security, and would constitute *a potential threat* to the Governor's safety, because the information ... will enable the *****74** reader to know in advance and with relative precision when and where the Governor may be found, those persons who will be with him, and when he will be alone.' " (*Id.* at p. 1346, 283 Cal.Rptr. 893, 813 P.2d 240, italics added.) Based on this evidence of a " 'potential threat to the Governor's safety' " (*ibid.*), and without requiring evidence of a particular or "specific" threat (maj. opn., *ante,* 172 Cal.Rptr.3d at p. 66, 325 P.3d at p. 468), we concluded that, even as to "outdated calendars and schedules," nondisclosure was justified because "it is plausible to believe that an individual intent on doing harm [to the Governor] could use such information to discern activity patterns of the Governor and identify areas of particular vulnerability." (*Times Mirror, supra,* at p. 1346, 283 Cal.Rptr. 893, 813 P.2d 240.) Here, based on ***83** the Cox declaration, it is plausible to believe there are individuals, intent on doing harm to police officers in retaliation for their involvement in a shooting, who could use the requested information to exact revenge on the officers or members of their families. The "showing" in this case regarding safety concerns is certainly no more "vague," and is at least as, if not more, "particularized" (maj. opn., *ante,* at p. 66, 325 P.3d at p. 469), than the showing we found sufficient in *Times Mirror.* [4]

The majority does not contend otherwise or explain why *Times Mirror* is inapplicable. Instead, in applying a different and far stricter standard, it simply ignores *Times Mirror.* It fails to explain why police officers and their family members are entitled to less protection than the Governor. Surely, their lives are not worth less. Nor is it less "plausible to believe" there are "individual[s] intent on doing harm" to police officers involved in shootings than it is to believe there are "individual[s] intent on doing harm" to the Governor. (*Times Mirror, supra,* 53 Cal.3d at p. 1346, 283 Cal.Rptr. 893, 813 P.2d 240.) On the contrary, as already noted, the majority acknowledges both the existence and validity of the "safety concerns of officers who fear retaliation from angry members of the community after an officer-involved shooting." (Maj. opn., *ante,* 172 Cal.Rptr.3d at p. 66, 325 P.3d at p. 469.)

Contrary to the majority's suggestion (maj. opn., *ante,* 172 Cal.Rptr.3d at pp. 65–66, 325 P.3d at pp. 467–468), *Commission on Peace Officer Standards* and *International Federation* are consistent with, and supportive of, this analysis. In neither case was there any *evidence* submitted regarding the alleged safety concerns, a circumstance the court stressed in refusing to apply a disclosure exemption. (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 302, 64 Cal.Rptr.3d 661, 165 P.3d 462; *International Federation, supra,* 42 Cal.4th at pp. 337–338, 64 Cal.Rptr.3d 693, 165 P.3d 488.) Notably, after stating that " '[a] mere assertion of possible endangerment' is insufficient to justify nondisclosure," the majority in *Commission on Peace Officer Standards* cited *Times Mirror* as a case in which *****75** disclosure ****476** *was* justified because *the evidence*—the "declaration of [the] Governor's security director"—"supported [the]

conclusion that release of his schedules would present a potential security threat." (*Commission on Peace Officer Standards, supra,* at p. 302, 64 Cal.Rptr.3d 661, 165 P.3d 462.) As earlier explained, here, even more than in *Times Mirror, evidence* regarding the dangers of disclosure was submitted. Moreover, in *Commission on Peace Officer Standards,* the majority held that, on remand, nondisclosure as to officers in certain "categories" could be justified "because the safety or ***84** efficacy of" officers in those categories "would be jeopardized by disclosure." (*Commission on Peace Officer Standards, supra,* 42 Cal.4th at p. 284, 64 Cal.Rptr.3d 661, 165 P.3d 462.) The majority in *Commission on Peace Officer Standards* identified one such category: officers "operating undercover." (*Id.* at p. 301, 64 Cal.Rptr.3d 661, 165 P.3d 462.) The Times's broad request for the names of all officers "involved in" shootings from January 1, 2005, until December 11, 2010, surely includes such officers. Moreover, the evidence in the record here establishes another category of officers whose safety would be jeopardized by disclosure: those who have been involved in a shooting.

Contrary to the majority's suggestion, there is no basis for excluding from this category officers who, in using their weapons, "acted in a heroic manner that was unlikely to provoke retaliation." (Maj. opn., *ante,* 172 Cal.Rptr.3d at p. 67, 325 P.3d at p. 469.) The majority asserts that safety is not "an issue" for such officers. (Maj. opn., *ante,* at p. 66, 325 P.3d at p. 468.) But the majority fails to explain how to distinguish between heroic acts that are likely to provoke retaliation and those that are not. And it is naïve to believe that the desire for revenge of friends, family members, and gang associates of those shot by police will be reduced, much less eliminated, by the fact that the officers acted heroically. Indeed, the majority's bald assertion will surely come as surprising news to the many officers who, having heroically used their weapons in confronting gang-related crime, face retaliation from other gang members. It simply is not true, as the majority asserts, that officer safety is "not ... an issue" whenever a shooting may be characterized as "heroic" and "unlikely to provoke retaliation." (Maj. opn., *ante,* at p. 67, 325 P.3d at p. 469) Of course, as to individual officers who do not perceive a safety threat to themselves or their families, and who do not oppose public recognition of their heroism, section 6254, subdivision (c), would not prevent disclosure. Releasing an officer's name under those circumstances would not constitute "an unwarranted invasion of personal privacy." (*Ibid.*)

Finally, there are good reasons for not requiring, as to each officer whose name is to be withheld, evidence of an actual and specific threat to the officer or the members of his or her family. Where, as here, the disclosure request covers all officer-involved shootings during a six-year period, requiring such individualized proof will impose an obvious and substantial burden on law enforcement agencies that want to protect their officers.[5] More importantly, *****76** as the Union observes, "killers do not usually announce their intentions in advance." Thus, in most cases, although the threat to officer safety is real, the ***85** kind of evidence the majority demands is not available. Because the lives of our officers and their families are at stake, I would not require a law enforcement agency to wait until there is a specific threat—or worse, an actual attack—before allowing it to withhold information that puts its officers and their families at risk. Absent a showing of some greater public need for the information, we should allow law enforcement agencies to protect the very officers who are out there every day protecting us. They deserve at least that much for their brave service.

I therefore dissent.[6]

Footnotes

* Retired Associate Justice of the Supreme Court, assigned by the Chief Justice pursuant to article VI, section 6 of the California Constitution.

1 The Times contends that it was not properly served with the Cox declaration. The Times does not, however, assert that it raised that issue in the trial court, and hence the issue appears to have been forfeited. In any case, as discussed below, the trial court concluded that the facts asserted in the Cox declaration were too general and speculative to support the

Union's request for injunctive relief. Therefore, any failure to properly serve the Cox declaration did not adversely affect the Times.

2 Both the trial court and the Court of Appeal rejected the Times's legal issue that Government Code sections 6258 and 6259 set forth the exclusive means for litigating whether requested records must be disclosed and that therefore declaratory relief was inappropriate. (See *Filarsky v. Superior Court* (2002) 28 Cal.4th 419, 121 Cal.Rptr.2d 844, 49 P.3d 194 [holding that a *city* is not entitled to declaratory relief regarding its disclosure obligations under the California Public Records Act, but not deciding whether a *third party*—such as the Union here—is entitled to such relief].) We did not grant review to decide that legal issue, and we express no view on the matter. The issue remains open, and the Times can reassert it in any future proceedings.

1 All further unlabeled statutory references are to the Government Code.

2 The majority cites no legislative history to support its view of the "legislative policy" Penal Code section 830.10 "reflects." (Maj. opn., *ante,* 172 Cal.Rptr.3d at p. 65, 325 P.3d at p. 468.) The statute derives from its substantively identical predecessor, Penal Code former section 830.7, which provided: "Any uniformed peace officer shall wear a badge, nameplate, or other device which bears clearly on its face the identification number or name of such officer." (Stats.1969, ch. 1458, § 1, p. 2978.) In the only illuminating item of legislative history I could find—a letter to the Governor urging him to sign the passed bill containing the statute—the bill's legislative author stated that it would "aid[ ] morale in that it goes far to halt the deindividualization of our law enforcement personnel." (Assemblyman John Miller, letter to Governor Ronald Reagan re Assem. Bill No. 1830 (1969 Reg. Sess.) Aug. 8, 1969, p. 1.) This letter does not support the majority's assertion.

3 The majority asserts that the disclosure exemption of section 6254, subdivision (f), does not apply because the requested information comes from a source other than "the records of any administrative or criminal investigation" of officer-involved shootings (maj. opn., *ante,* 172 Cal.Rptr.3d at p. 66, 325 P.3d at p. 469), perhaps "the initial incident reports" of such shootings (maj. opn., *ante,* at p. 61, 325 P.3d at p. 464). The appellate record offers no basis for the majority's speculation regarding the source of the requested information, as to either the Zerby shooting or any of the other officer-involved shootings that occurred during the six-year period the request identifies. Nor does the majority offer any legal basis for construing the broadly worded phrase "records *relating to* ... [¶] ... [¶] ... [e]mployee ... appraisal[ ] or discipline," which defines one category of confidential personnel records under Penal Code section 832.8, subdivision (d), to apply narrowly "only" to "the records *generated* in connection with" officer appraisal or discipline (maj. opn., *ante,* at pp. 63–64, 325 P.3d at pp. 466–467). Had the Legislature intended to so limit the scope of confidentiality under this section, it easily could have used the majority's far narrower phrase.

4 Moreover, although there is a *greater* showing in this case regarding safety than in *Times Mirror,* the showing needed to justify nondisclosure here arguably *is less than* the showing that was needed in *Times Mirror.* Nondisclosure is proper under section 6254, subdivision (c), upon a showing that disclosure "would constitute an unwarranted invasion of personal privacy." In *Times Mirror,* we held that nondisclosure was proper under section 6255, which requires a showing that "on the facts of the particular case the public interest served by not disclosing the record *clearly outweighs* the public interest served by disclosure of the record." (Italics added; see *Times Mirror, supra,* 53 Cal.3d at pp. 1346–1347, 283 Cal.Rptr. 893, 813 P.2d 240.)

5 For example, according to reported statistics, the Los Angeles Police Department averaged 70 officer-involved shootings per year for the years 2005–2008. (L.A. Police Dept., Use of Force Annual Report, p. 16 < http:// www.lapdonline.org/ assets/pdf/2009YearEndReportFinal.pdf> as of May 29, 2014.) In 42 officer-involved shootings internally reviewed in 2009 for compliance with department policy, "[t]here were 278 substantially involved officers," 85 of whom "discharged their firearms." (*Id.* at p. 19.)

6 Given my conclusion, I do not further address the majority's analysis regarding the applicability of the exemptions set forth in Government Code section 6255 and Penal Code sections 832.7 and 832.8.

THE CITY OF NATIONAL CITY et al., Petitioners,
v.
GILBERT E. FRITZ, as City Mayor, etc., et al., Respondents.

L. A. No. 20857.
Supreme Court of California
Mar. 22, 1949.

HEADNOTES

(1)
Municipal Corporations § 161--Funds--Capital Outlays.
The term "utilities," as used in the statutory restriction on the use of a municipal fund established for capital outlays (Stats. 1937, p. 1995, Deering's Gen. Laws, Act 8496a) means "public utilities," and does not include sewers; hence such a fund may be used for the construction of sewers.

See 18 **Cal.Jur.** 870, 1076.

SUMMARY

PROCEEDING in mandamus to compel the signing of a contract and the transfer of a fund to meet payments thereunder. Writ granted.

COUNSEL
Burke, Marshall & Burke and Daniel G. Marshall for Petitioners.
Merideth L. Campbell, City Attorney, for Respondents.

CARTER, J.

The controversy in this proceeding involves the interpretation of a statute authorizing the establishment by municipal corporations of capital outlay funds (Stats. 1937, p. 1995, as amended last in 1945; Stats. 1945, p. 1867).

That act provides that the governing body of any city "empowered to levy and collect assessments or taxes may by ordinance provide for the levy and collection of assessments or taxes for the creation and accumulation of a fund for capital outlays." The general limitation on the right to impose taxes applies. "At any time after the creation of such a fund such governing body may transfer to such fund any unincumbered surplus funds remaining on hand in such city, ... at the end of any fiscal year.

"Whenever such fund is created in the manner aforesaid it shall remain inviolate for the making of any capital outlays and no moneys shall be disbursed therefrom excepting for such a purpose; ....

"The term 'capital outlays' shall not be construed to include the construction, acquisition, extensions of, or additions to, ***636** *utilities, other than utilities for the furnishing of water supply."* (Emphasis added.)

In the instant case the city council passed an ordinance purporting to create a capital outlay fund pursuant to the act. There is a dispute in regard to whether the ordinance in fact achieved that end inasmuch as it did not provide for the levy of taxes or assessments for the creation of the fund. It merely created the fund. But in view of the result reached herein, it is not necessary to resolve that question. From the receipts from sale of real property of the city to the United States, $983,800.29 was ordered deposited in the fund by the city council and it is now there and unencumbered. The council has awarded contracts for the construction of sewers in the city in the sum of $675,287.77 but respondent mayor of the city refuses to sign the contracts, and respondent clerk refuses to transfer said sum to the general fund to meet the payments under those contracts, claiming that moneys in the capital outlay fund cannot be used for sewer purposes under the above quoted act for the reason that a sewer is a utility as used in the last sentence dealing with things for which the fund cannot be used. Petitioners, on the other hand, take the position (among others) that a sewer is not a utility as that term is used in the act. With the latter contention we agree for the following reasons.

([1]) The unqualified word "utility" has a broad meaning. It is defined as " quality or state of being useful; usefulness; profitableness to some desired end." (Webster's New Internat. Dict. (2d ed.) p. 2808.) (See also *Interstate National Gas Co. v. Gulley,* 4 F.Supp. 697, 699.) If that definition were applied to the statute in question, there would be practically no activity in which the city could use

the money from the capital outlay fund because practically all of its property and public services are presumably for useful purposes. Thus the exception in the act (the italicized part thereof) for which funds may not be used would be broader than the main purpose of the act to authorize the creation of, and levy of taxes for, a capital outlay fund. Practically the only use that could be made of the fund would be for a water supply which is an exception carved out of an exception. These factors, coupled with the rule that exceptions in a statute are to be strictly construed (*Hurst v. City & County of San Francisco, ante,* p. 298 [201 P.2d 805]; *McAlpine v. Baumgartner,* 10 Cal.2d 409 [74 P.2d 753]; *Dufton v. Daniels,* 190 Cal. 577 [213 P. 949]; *Forbes v. City of Los* ***637** *Angeles,* 101 Cal.App. 781 [282 P. 528]; Crawford, Statutory Construction, § 299), require that the word "utility" be interpreted to mean a "public utility, " for as will be seen, that term as used here has a more narrow meaning than " utility."

We are convinced that the construction and maintenance of a sewer system is not a "public utility" within the meaning of the act. Generally speaking statutes should be construed in the light of other statutes dealing with the same subject matter. (*In re Phyle,* 30 Cal.2d 838 [186 P.2d 134]; *Stillwell v. State Bar,* 29 Cal.2d 119 [178 P.2d 313].) The term "public utilities," with reference to the power of a municipal corporation to acquire and operate them, customarily embraces an enterprise which was usually engaged in by private corporations or individuals such as supplying water and electricity to the inhabitants. In this state it never has been the custom to have sewers operated privately. There was some doubt whether municipal corporations could acquire and operate such enterprises (public utilities) until the amendment to the Constitution (Cal. Const., art. XI, § 19) in 1911 authorizing such corporations to supply their inhabitants with light, water, power, heat, transportation and means of communications (18 Cal.Jur. 1076), but the power of municipal corporations to construct and maintain sewers has always been broad and unquestioned; the power may be derived from the authority to construct and maintain streets. (See *Harter v. Barkley,* 158 Cal. 742 [112 P. 556]; *Kramer v. Los Angeles,* 147 Cal. 668 [82 P. 334]; *McBean v. City of Fresno,* 112 Cal. 159, 163 [44 P. 358, 53 Am.St.Rep. 191, 31 L.R.A. 794]; *City of Madera v. Black,* 181 Cal. 306, 313 [184 P. 397]). The Public Utilities Act of this state lists many activities as "public utilities " but no mention is made of sewers (Stats. 1915, p. 115, as amended).

For the foregoing reasons it is clear that the term "utilities" as used in the exception in the statute in question does not include sewers. The fund here involved may, therefore, be used for construction of sewers.

Let a peremptory writ of mandate issue as prayed for.

Gibson, C. J., Shenk, J., Traynor, J., Schauer, J., and Spence, J., concurred.

EDMONDS, J.

Again the court has rendered what I consider to be an advisory opinion in a collusive proceeding ***638** brought by a city against two of its officers. The result is a decision which places the stamp of the highest judicial approval upon financial transactions which affect every taxpayer of the city without any truly adversary presentation of the merits of the controversy. Moreover, the construction of the statute authorizing the establishment of a capital outlay fund may now be the unquestioned basis for action by the governing body of other cities. For the reasons I have stated in *City of Whittier v. Dixon,* 24 Cal.2d 664, 668 [151 P.2d 5, 153 A.L.R. 956]; *City and County of San Francisco v. Boyd,* 22 Cal.2d 685, 707 [140 P.2d 666]; *City and County of San Francisco v. Linares,* 16 Cal.2d 441, 448 [106 P.2d 369], I believe that this procedure is contrary to fundamental principles of the administration of justice.

SIMPSON STRONG–TIE COMPANY, INC., Plaintiff and Appellant,
v.
Pierce GORE et al., Defendants and Respondents.

No. S164174.
|
May 17, 2010.

Synopsis

Background: Manufacturer of name-brand galvanized screws brought claims for defamation, trade libel, false advertising, and unfair business practices against attorney, relating to attorney's newspaper advertisement stating that owners of wood decks, built with certain brand-name galvanized screws, "may" have legal rights to compensation or other relief. The Superior Court, Santa Clara County, No. CV057666, John F. Herlihy, J., granted attorney's special motion to strike under the anti-SLAPP (strategic lawsuit against public participation) statute. Manufacturer appealed. The Court of Appeal affirmed. The Supreme Court granted review, superseding the opinion of the Court of Appeal.

Holdings: The Supreme Court, Baxter, J., held that:

[1] plaintiff has burden of establishing the applicability of a statutory exemption from anti-SLAPP statute, disapproving *Brill Media Co., LLC v. TCW Group, Inc.*, 132 Cal.App.4th 324, 33 Cal.Rptr.3d 371, and

[2] "commercial speech" exemption from anti-SLAPP statute was inapplicable.

Affirmed.

Opinion, 76 Cal.Rptr.3d 292, superseded.

West Headnotes (16)

[1] Pleading
Frivolous pleading

For purposes of anti-strategic lawsuit against public participation (SLAPP) statute, a "SLAPP" is a civil lawsuit that is aimed at preventing citizens from exercising their political rights or punishing those who have done so. West's Ann.Cal.C.C.P. § 425.16.

48 Cases that cite this headnote

[2] Pleading
Frivolous pleading

The commercial speech exemption, like the public interest exemption, is a statutory exception to the anti-strategic lawsuit against public participation (SLAPP) statute and should be narrowly construed. West's Ann.Cal.C.C.P. §§ 425.16, 425.17(b, c).

11 Cases that cite this headnote

[3] Pleading
Application and proceedings thereon

The plaintiff has the burden of establishing the applicability of the "commercial speech" statutory exemption from the anti-strategic lawsuit against public participation (SLAPP) statute, in opposing the defendant's anti-SLAPP motion; disapproving *Brill Media Co., LLC v. TCW Group, Inc.*, 132 Cal.App.4th 324, 33 Cal.Rptr.3d 371. West's Ann.Cal.C.C.P. § 425.17(c); West's Ann.Cal.Evid.Code § 500.

63 Cases that cite this headnote

[4] Contracts
Presumptions and burden of proof

Statutes
Burden of proof

It is a legal principle that when a proviso carves an exception out of the body of a

statute or contract those who set up such exception must prove it.

3 Cases that cite this headnote

[5] **Statutes**
Burden of proof

The enactment of the statute providing that except as otherwise provided by law, "a party has the burden of proof as to each fact the existence or nonexistence of which is essential to the claim for relief or defense that he is asserting," did not upset the traditional rule of statutory construction that when a proviso carves an exception out of the body of a statute or contract those who set up such exception must prove it. West's Ann.Cal.Evid.Code § 500.

8 Cases that cite this headnote

[6] **Evidence**
Elements of cause of action or claim

Evidence
Matters of Defense and Rebuttal

The general principle of the statute providing that except as otherwise provided by law, "a party has the burden of proof as to each fact the existence or nonexistence of which is essential to the claim for relief or defense that he is asserting," is that a party who seeks a court's action in his favor bears the burden of persuasion thereon. West's Ann.Cal.Evid.Code § 500.

6 Cases that cite this headnote

[7] **Evidence**
Nature and scope in general

The ordinary rules governing allocation of the burden of proof may be disregarded for policy reasons in exceptional circumstances, yet such exceptions are few, and narrow, and the reasons justifying a shift in the normal allocation of the burden of proof must be compelling.

3 Cases that cite this headnote

[8] **Pleading**
Frivolous pleading

The "commercial speech" exemption from the anti-strategic lawsuit against public participation (SLAPP) statute does not prescribe "content" and "delivery" exemptions with distinctly different elements. West's Ann.Cal.C.C.P. § 425.17(c)(1).

8 Cases that cite this headnote

[9] **Statutes**
Purpose and intent

In any case involving statutory interpretation, the court's fundamental task is to determine the Legislature's intent so as to effectuate the law's purpose.

Statements or conduct made during the delivery of goods or services would qualify as statements or conduct made "in the course of" delivering goods or services, within meaning of the "commercial speech" statutory exemption from the anti-strategic lawsuit against public participation (SLAPP) statute. West's Ann.Cal.C.C.P. § 425.17(c)(1).

35 Cases that cite this headnote

[12] Pleading

Frivolous pleading

The "commercial speech" exemption from the anti-strategic lawsuit against public participation (SLAPP) statute exempts a cause of action arising from commercial speech when (1) the cause of action is against a person primarily engaged in the business of selling or leasing goods or services; (2) the cause of action arises from a statement or conduct by that person consisting of representations of fact about that person's or a business competitor's business operations, goods, or services; (3) the statement or conduct was made either for the purpose of obtaining approval for, promoting, or securing sales or leases of, or commercial transactions in, the person's goods or services or in the course of delivering the person's goods or services; and (4) the intended audience for the statement or conduct meets the definition set forth in the statute. West's Ann.Cal.C.C.P. § 425.17(c).

45 Cases that cite this headnote

[13] Pleading

Frivolous pleading

Galvanized screw manufacturer's claims against attorney for defamation, trade libel, false advertising, and unfair business practices, relating to attorney's newspaper advertisement stating that owners of wood decks built with the screws "may" have legal rights to compensation or other relief, did not arise from representations of fact about attorney's "business operations, goods, or services," and thus were not within the "commercial speech" exemption from the anti-strategic lawsuit against public participation (SLAPP) statute; even if the advertisement created the inference that attorney had investigated manufacturer, any implication that manufacturer's screws were defective was a representation about manufacturer's products rather than about attorney's business operations. West's Ann.Cal.C.C.P. § 425.17(c)(1).

See Cal. Civil Practice (Thomson Reuters 2010) Civil Rights Litigation, § 14:10; 5 Witkin, Cal. Procedure (5th ed. 2008) Pleading, § 1026; Weil & Brown, Cal. Practice Guide: Civil Procedure Before Trial (The Rutter Group 2009) ¶ 7:555 et seq. (CACIVP Ch. 7(II)-B); Cal. Jur. 3d, Constitutional Law, § 270.

5 Cases that cite this headnote

[14] Pleading

Frivolous pleading

The representation that an attorney would investigate "whether you have a potential claim," in attorney's newspaper advertisement seeking potential plaintiffs for class action against galvanized screw manufacturer, did not constitute a representation of fact about attorney's business operations, goods, or services, and thus was not within the commercial speech exemption to the anti-strategic lawsuit against public participation (SLAPP) law; the statement was not a representation of fact, but an agreement to take certain actions in the future. West's Ann.Cal.C.C.P. § 425.17(c)(1).

3 Cases that cite this headnote

[15] Pleading

Frivolous pleading

Under the "commercial speech" exemption from the anti-strategic lawsuit against public participation (SLAPP) statute the statement or conduct giving rise to the cause of action must consist of factual representations about

Opinion

BAXTER, J.

*16 **1120 In this case we consider the scope of the commercial speech exemption to the anti-SLAPP statute. (See Code Civ. Proc., §§ 425.16, 425.17, subd. (c).) [1]

In February 2006, plaintiff Simpson Strong–Tie Company, Inc. (Simpson) filed this action for defamation and related claims against defendants Pierce Gore and The Gore Law Firm arising from a newspaper advertisement placed by Gore a few weeks earlier. The advertisement, which was directed to owners of wood decks constructed after January 1, 2004, advised readers that "you may have certain legal rights and be entitled to monetary compensation, and repair or replacement of your deck" if the deck was built with galvanized screws manufactured by Simpson or other specified entities, and invited those persons to contact Gore "if you would like an attorney to investigate whether you have a potential claim."

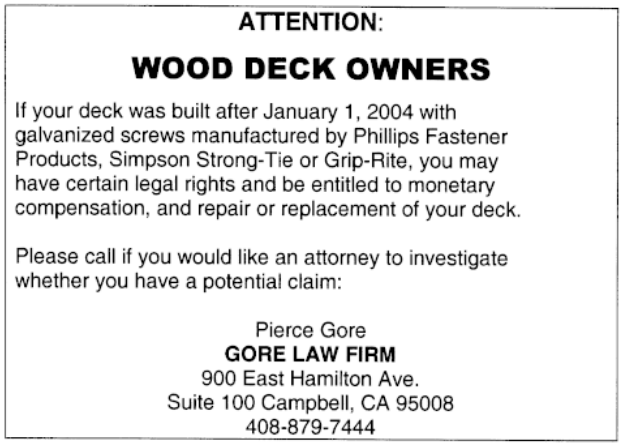
*17 Gore moved successfully in the superior court to have the entire complaint stricken under section 425.16, the anti- ***333** SLAPP statute, and the Court of Appeal affirmed. We granted review to consider the limited issue whether Simpson's complaint was exempt from the anti-SLAPP statute because of section 425.17, subdivision (c) (section 425.17(c)), which excludes causes of action arising from representations of fact about the speaker's or a competitor's "business operations, goods, or services ... made for the purpose of obtaining approval for, promoting, or securing sales or leases of, or commercial transactions in, the person's goods or services" or "made in the course of delivering the person's goods or services." Having found that the complaint is not exempt from dismissal under the anti-SLAPP statute, we affirm.

BACKGROUND

Plaintiff Simpson is a California corporation in the business of designing, manufacturing, and marketing building products, including metal connectors and other hardware for use in wood frame construction. According to Simpson, it is well known in the wood frame construction industry that pressure-treated wood, which is commonly used in outdoor decks to protect against termites and fungal decay, can have a corrosive effect on steel products, including galvanized screws. Corrosion potentially shortens the service life of these fasteners and connectors and compromises their ability to support their

recommended loads or endure seismic and environmental stresses.

In early 2004, at the recommendation of the United States Environmental Protection Agency, the construction industry stopped selling lumber treated with chromium copper arsenate, due to health hazards posed by its arsenic content. Alternative lumber products, such as wood treated with alkaline copper quaternary and copper azole, were substituted, but, as Simpson explains, these chemicals are "more corrosive" to galvanized steel products. Simpson states that it communicated this potential problem to the building industry and to the public generally through its Web site, annual catalog, articles in engineering and building magazines, bulletins issued to the building industry, point-of-sale information, and annual report.



Gore, a California attorney, learned from television reports about the potential for corrosion of galvanized deck fasteners and connectors when used on wood pressure treated with alkaline copper quaternary or copper azole, and contacted Ted Todd, a senior inspector with the Contra Costa ***18** County District Attorney's Office who was featured in the television reports. At that time, the district attorney's office was conducting an investigation into the risk posed by galvanized fasteners and connectors when used with these types of pressure-treated wood. The office ultimately issued a "Consumer Alert" warning of the corrosive effect of the ****1121** new pressure-treated wood products "on the metal connector brackets typically used in construction." The alert noted that advisories had been posted in some retail stores about the potential incompatibility of the two products but cautioned that the advisories "tend to be in very small print or somewhat inconspicuously posted."

Gore also visited the company Web site, where Simpson had advised in bold type that "[m]any of the new Pressure Treated Woods use chemicals that are corrosive to steel. By selecting connectors that offer greater corrosion resistance ... you can extend the service life of your connectors. However, corrosion will still occur. You should perform periodic inspection of your connectors and fasteners to insure their strength is not being adversely affected by corrosion. In some cases, it may be necessary to have a local professional perform *****334** the inspections. Because of the many variables involved, Simpson Strong–Tie cannot provide estimates on service life of connectors, anchors or fasteners."

In addition, Gore discovered that a class action complaint had been filed in Massachusetts against one of Simpson's competitors, Phillips Fastener Products, Inc., which sought relief on behalf of consumers allegedly damaged by defective galvanized fasteners and connectors used with pressure-treated lumber, and that Gore's former law firm, Lieff, Cabraser, Heimann & Bernstein, LLP, was investigating claims that some of the newly designed fasteners were failing, in spite of the manufacturers' representations that the "special coatings" were intended to resist corrosion.

Based on this information, Gore arranged for an advertisement to be placed in the San Jose Mercury News in order to locate individuals who had purchased galvanized fasteners and connectors manufactured by Simpson and two other companies, which together were responsible for most of the metal fasteners sold to consumers in California. The advertisement, which commenced Christmas Day 2005 and ran four more times over a 28–day period in the Mercury News and once in the Los Gatos Weekly–Times, read as follows:

***19**

ATTENTION:

WOOD DECK OWNERS

If your deck was built after January 1, 2004 with galvanized screws manufactured by Phillips Fastener Products, Simpson Strong-Tie or Grip-Rite, you may have certain legal rights and be entitled to monetary compensation, and repair or replacement of your deck.

Please call if you would like an attorney to investigate whether you have a potential claim:

Pierce Gore
GORE LAW FIRM
900 East Hamilton Ave.
Suite 100 Campbell, CA 95008
408-879-7444

Gore has asserted that the wording of the advertisement was modeled after notices he or his cocounsel had used in this state and in others during the preceding three years in connection with potential class actions based on consumer fraud or product defects.

****1122** In a letter dated January 9, 2006, counsel for Simpson advised Gore that the advertisement falsely implied that Simpson's galvanized screws fail to meet

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

appropriate industry standards and that a valid claim may exist against Simpson based upon negligence or product liability. The letter demanded that Gore cease publication of any further defamatory advertisements directed at Simpson and reserved Simpson's right to recover against Gore for any costs ***335 or damages that may have already resulted from this or any similar publication. Gore did not respond to the letter. In a letter dated January 27, 2006, counsel for Simpson declared that Gore's failure to respond "suggests that your claims are without merit, and that your newspaper advertisement is false, misleading, and defames Simpson.... Unless you can present specific evidence to support your charges, Simpson intends to pursue its defamation claim against your firm[ ] and vindicate its rights." Again, Gore did not respond.

Prior to filing this action, Simpson retained an opinion survey firm to confirm that the advertisement had caused injury to Simpson's reputation. The survey firm intercepted 214 randomly selected shoppers at nine different *20 home improvement stores in January and February 2006 and obtained their responses to a set of questions with and without exposure to the Gore advertisement. The survey revealed that the shoppers, after reading the advertisement, were significantly more likely to believe that Simpson's galvanized screws were defective or of low quality and were significantly less likely to purchase galvanized screws manufactured by Simpson.

Two days after the survey was completed, Simpson filed this action for defamation, trade libel, false advertising, and unfair business practices. The complaint sought compensatory and punitive damages as well as injunctive relief.

When Gore moved to strike the complaint under section 425.16, Simpson invoked the exemption to the anti-SLAPP law for commercial speech under section 425.17(c). The trial court granted the special motion to strike and entered a judgment of dismissal, finding Gore had made a threshold showing that the statements were made in furtherance of his right of petition or free speech on an issue of public interest (§ 425.16, subd. (e)(4)), that Simpson had failed to demonstrate a probability of prevailing on the merits (§ 425.16, subd. (b)(1)), and that the commercial speech exemption did not apply because the advertisement made no statement about a business competitor's products or services.

The Court of Appeal affirmed in a published opinion. The court first considered "who bears the burden of persuasion with respect to the applicability of [the section 425.17(c)] exemption—the party invoking the anti-SLAPP law (i.e., the defendant), or the party invoking the exemption (the plaintiff)?" In assigning the burden to the plaintiff, the Court of Appeal disagreed with *Brill Media Co., LLC v. TCW Group, Inc.* (2005) 132 Cal.App.4th 324, 33 Cal.Rptr.3d 371 (*Brill*), which had assigned the burden to the defendant to establish that the cause of action is *not* exempt. The court next determined that while the advertisement was "made for the purpose of ... promoting ... [Gore's] services" (§ 425.17(c)(1)), Simpson's causes of action did not " 'aris[e] from' " any representation of fact " 'about' Gore's or a competitor's services or business operations."

In construing the exemption in section 425.17(c)(1) for causes of action arising from statements or conduct "made in the course of delivering the person's goods or services," the Court of Appeal once again disagreed with *Brill,* which had found this prong was satisfied where "the statements were made and conduct engaged in as part of....the type of business transaction engaged in by defendants." (*Brill, supra,* 132 Cal.App.4th at p. 341, 33 Cal.Rptr.3d 371.) The Court of Appeal reasoned that the Legislature had enacted instead "a much narrower exemption, predicated by its plain terms on conduct in the course of *21 *delivering* the *goods or services* the defendant is in the business of *selling or* ***336 *leasing.*" The court then found that the advertisement here "was *seeking business from* prospective clients, not *delivering services to* them." Concluding that the anti-SLAPP statute applied and that Simpson had failed to establish a probability **1123 of prevailing on any of its claims, the Court of Appeal affirmed the order granting the special motion to strike and the judgment of dismissal.

We granted review to address the conflict in the case law concerning the construction of the commercial speech exemption to the anti-SLAPP statute.

DISCUSSION

[1] A SLAPP is a civil lawsuit that is aimed at preventing citizens from exercising their political rights or punishing those who have done so. " 'While SLAPP suits masquerade as ordinary lawsuits such as defamation

and interference with prospective economic advantage, they are generally meritless suits brought primarily to chill the exercise of free speech or petition rights by the threat of severe economic sanctions against the defendant, and not to vindicate a legally cognizable right.' " (*Castillo v. Pacheco* (2007) 150 Cal.App.4th 242, 249–250, 58 Cal.Rptr.3d 305, quoting Sen. Com. on Judiciary, Analysis of Sen. Bill No. 1296 (1997–1998 Reg. Sess.) as amended May 12, 1997, pp. 1–2.)

In 1992, out of concern over "a disturbing increase" in these types of lawsuits, the Legislature enacted section 425.16, the anti-SLAPP statute. (§ 425.16, subd. (a).) The statute authorized the filing of a special motion to strike to expedite the early dismissal of these unmeritorious claims. (§ 425.16, subds. (b)(1), (f).) To encourage "continued participation in matters of public significance" and to ensure "that this participation should not be chilled through abuse of the judicial process," the Legislature expressly provided that the anti-SLAPP statute "shall be construed broadly." (§ 425.16, subd. (a).)

A special motion to strike involves a two-step process. First, the defendant must make a prima facie showing that the plaintiff's "cause of action ... aris[es] from" an act by the defendant "in furtherance of the [defendant's] right of petition or free speech ... in connection with a public issue." [2] (§ 425.16, subd. (b)(1).) If a defendant meets this threshold showing, the cause of action shall be stricken unless the plaintiff can establish "a probability that the plaintiff will prevail on the claim." (*Ibid.*)

In 2003, concerned about the "disturbing abuse" of the anti-SLAPP statute, the Legislature enacted section 425.17 to exempt certain actions from it. ***22** (§ 425.17, subd. (a).) We recently discussed the exemption for public interest lawsuits in *Club Members for an Honest Election v. Sierra Club* (2008) 45 Cal.4th 309, 86 Cal.Rptr.3d 288, 196 P.3d 1094, where we "narrowly construed" section 425.17, subdivision (b) and held that it applied "only when the entire action is brought in the public interest." (*Club Members for an Honest Election, supra,* 45 Cal.4th at pp. 312, 316, 86 Cal.Rptr.3d 288, 196 P.3d 1094.)

This case involves the scope and operation of the exemption for commercial speech under section 425.17(c), which provides: "Section 425.16 does not apply to any cause of action brought against a person primarily engaged in the business of selling or leasing goods or services, including, but not limited to, insurance, securities, or financial instruments, arising from any statement or conduct by that person if both of the following conditions exist: [¶] *****337** (1) The statement or conduct consists of representations of fact about that person's or a business competitor's business operations, goods, or services, that is made for the purpose of obtaining approval for, promoting, or securing sales or leases of, or commercial transactions in, the person's goods or services, or the statement or conduct was made in the course of delivering the person's goods or services. [¶] (2) The intended audience is an actual or potential buyer or customer, or a person likely to repeat the statement to, or otherwise influence, an actual or prospective buyer or customer, ..."

[2] The commercial speech exemption, like the public interest exemption, "is a statutory exception to section 425.16" and "should be narrowly construed." (*Club Members for an Honest Election v. Sierra Club, supra,* 45 Cal.4th at p. 316, 86 Cal.Rptr.3d 288, 196 P.3d 1094; see also ****1124** *Major v. Silna* (2005) 134 Cal.App.4th 1485, 1494, 36 Cal.Rptr.3d 875; accord, Sen. Com. on Judiciary, Analysis of Sen. Bill No. 515 (2003–2004 Reg. Sess.) as amended May 1, 2003, pp. 7–8 ["before us for consideration in [Senate Bill] 515 is a measure that seeks to trim off a few bad branches as argued and identified by the [Consumer Attorneys of California]"].)

A. Which Party Bears the Burden to Establish the Applicability of the "Commercial Speech" Exemption Under Section 425.17(c)?

[3] The Court of Appeal determined that Simpson, as the plaintiff, bore the burden of establishing that Gore's advertisement fell within the commercial speech exemption to the anti-SLAPP law, relying on the general rule that " '[o]ne claiming an exemption from a general statute has the burden of proving that he comes within the exemption.' " Simpson argues that the burden should have been placed on Gore, as the defendant, to establish that the exemption does *not* apply. He relies in particular on our summary in *Equilon Enterprises v. Consumer Cause, Inc.* (2002) 29 Cal.4th 53, 67, 124 Cal.Rptr.2d 507, 52 P.3d 685 (*Equilon*), of the "two-step process" for ***23** analyzing anti-SLAPP motions: "First, the court decides whether the *defendant* has made a threshold showing that the challenged cause of action is one arising from protected activity.... If the court finds such a showing has been made, it then determines whether the *plaintiff*

has demonstrated a probability of prevailing on the claim." (Italics added.) We agree with the Court of Appeal's construction.

[4] It is a "familiar" and "longstanding" legal principle that " '[w]hen a proviso ... carves an exception out of the body of a statute or contract those who set up such exception must prove it.' " (*Meacham v. Knolls Atomic Power Laboratory* (2008) 554 U.S. 84, 128 S.Ct. 2395, 2400, 171 L.Ed.2d 283; see also *Trade Comm'n v. Morton Salt Co.* (1948) 334 U.S. 37, 44–45, 68 S.Ct. 822, 92 L.Ed. 1196 ["the burden of proving justification or exemption under a special exception to the prohibitions of a statute generally rests on one who claims its benefits ..."]; accord, 29 Am.Jur.2d (2008) Evidence § 176, p. 193.) Likewise, in California, "it has been declared that where the statute has exemptions, exceptions or matters which will avoid the statute the burden is on the claimant to show that he falls within that category." (*Colonial Ins. Co. v. Ind. Acc. Com.* (1945) 27 Cal.2d 437, 441, 164 P.2d 490; see also *Briggs v. McCullough* (1869) 36 Cal. 542, 551–552; *In re Lorenzo C.* (1997) 54 Cal.App.4th 1330, 1345, 63 Cal.Rptr.2d 562 ["one who claims an exemption from a general statute has the burden of proving that he or she comes within the exemption"].)

***338** Simpson does not dispute that section 425.16 sets forth a general statute or that section 425.17 creates specified exemptions to it. Simpson contends, though, that the familiar and long-standing rule of statutory construction governing exemptions to a general statute was abrogated by the enactment in 1965 of Evidence Code section 500, which provides: "Except as otherwise provided by law, a party has the burden of proof as to each fact the existence or nonexistence of which is essential to the claim for relief or defense that he is asserting."

[5] Although it is true that Evidence Code section 500 superseded former section 1981, which had provided that the burden of proof was on the party holding the affirmative of the issue, the change in wording did not upset the traditional rule of statutory construction. As the Law Revision Commission Comments to Evidence Code section 500 explain, the phrase the " 'affirmative of the issue' " in former section 1981 had been criticized "as establishing a meaningless standard," inasmuch as " 'practically any proposition may be stated in either affirmative or negative form.' " (Cal. Law Revision Com. com., reprinted at 29B West's Ann. Evid.Code (1995 ed.) foll. § 500, p. 554.) Evidence Code section 500 was intended to make the allocation of the burden of proof "easier to ascertain" than the "classic formulation," but *24 not to signal a sea change in the law. (*Conservatorship of Hume* (2006) 140 Cal.App.4th 1385, 1388, fn. 5, 44 Cal.Rptr.3d 906; see also *Los Angeles Unified School Dist. v. Workers' Comp. Appeals Bd.* (1984) 150 Cal.App.3d 823, 829, 198 Cal.Rptr. 116 [citing the two formulations together].) Tellingly, Simpson **1125 cites nothing to support its novel claim that Evidence Code section 500 abrogated the ordinary rule of statutory construction. (Cf. 31 Cal.Jur.3d (2002) Evidence § 90, p. 151 ["What facts are essential to a particular party's claim for relief or defense is generally a matter to be determined by the substantive law, not the law of evidence; Evid.Code, § 500 does not purport to determine which facts are 'essential' to the plaintiff's claim for relief and which facts are 'essential' to a claimed defense, but rather leaves those substantive determinations to be resolved in light of the particular cause of action or defense at issue," (fns. omitted)].) Indeed, the Law Revision Commission Comments note that Evidence Code section 500 "follows th[e] basic rule"—i.e., " 'that whatever facts a party must affirmatively plead he also has the burden of proving' "—and is even broader, in that it " appl[ies] to issues not necessarily raised in the pleadings." (Cal. Law Revision Com. com., reprinted at 29B West's Ann. Evid.Code, *supra,* foll. § 500, p. 554.) Inasmuch as Simpson concedes that "[t]he initial burden should be on the plaintiff to invoke the exemption in opposition to the anti-SLAPP motion," it follows that the plaintiff also has the burden of proving the applicability of the exemption.

[6] Furthermore, the "general principle" of Evidence Code section 500 is "that a party who seeks a court's action in his favor bears the burden of persuasion thereon." (*Aguilar v. Atlantic Richfield Co.* (2001) 25 Cal.4th 826, 850, 107 Cal.Rptr.2d 841, 24 P.3d 493.) Because establishing the commercial speech exemption is essential to Simpson's defense to the special motion to strike, Evidence Code section 500 places the burden of proof on Simpson. (See generally *City of Lafayette v. East Bay Mun. Utility Dist.* (1993) 16 Cal.App.4th 1005, 1017, 20 Cal.Rptr.2d 658 [" ' "One seeking to be excluded from the sweep of the general statute must establish that the exception applies" ' "].)

Nothing in *Equilon* or its discussion of the "two-step process" alters the analysis. (*Equilon, supra,* 29 Cal.4th

at p. 67, 124 Cal.Rptr.2d 507, 52 P.3d 685.) In *Equilon,* ***339** we explained that the defendant has the burden to show that the cause of action being challenged under the anti-SLAPP statute is one arising from protected activity. (*Equilon, supra,* at p. 67, 124 Cal.Rptr.2d 507, 52 P.3d 685.) In discussing the defendant's burden at the first stage, *Equilon* construed only section 425.16, and did not purport to identify the party with the burden to establish the existence or nonexistence of the public interest exemption in section 425.17, subdivision (b), or the commercial speech exemption in section 425.17(c), inasmuch as *Equilon* predated the enactment of section 425.17. It is worth noting, though, that *25 nothing in *Equilon* purported to abrogate the long-standing rule of construction that the party seeking to benefit from an exception to a general statute bears the burden to establish the exception. [3]

[7] Simpson argues, correctly, that the ordinary rules governing allocation of the burden of proof may be disregarded for policy reasons in exceptional circumstances. (*Adams v. Murakami* (1991) 54 Cal.3d 105, 119–120, 284 Cal.Rptr. 318, 813 P.2d 1348; *Cassady v. Morgan, Lewis & Bockius LLP* (2006) 145 Cal.App.4th 220, 234, 51 Cal.Rptr.3d 527 (*Cassady*).) Yet such exceptions are "few, and narrow" (*Sargent Fletcher, Inc. v. Able Corp.* (2003) 110 Cal.App.4th 1658, 1670, 3 Cal.Rptr.3d 279), and the reasons justifying a shift in the normal allocation of the burden of proof must be "compelling." **1126 (*Aydin Corp. v. First State Ins. Co.* (1998) 18 Cal.4th 1183, 1193, 77 Cal.Rptr.2d 537, 959 P.2d 1213; accord, *Meacham v. Knolls Atomic Power Lab., supra,* 554 U.S. at pp. 90–92, 128 S.Ct. at p. 2400.) Simpson fails to identify any compelling justification.

Simpson does assert that the facts underlying the commercial speech exemption are "peculiarly" within the speaker's knowledge. But Simpson does not explain how a plaintiff would be significantly disadvantaged in demonstrating that the statement or conduct underlying its cause of action "consists of representations of fact about [the defendant]'s or a business competitor's business operations, goods, or services"; that the defendant's statement or conduct was "made for the purpose of obtaining approval for, promoting, or securing sales or leases of, or commercial transactions in, the person's goods or services" or "in the course of delivering the persons' goods or services"; or that the "intended audience" was "an actual or potential buyer or customer, or a person likely to repeat the statement to, or otherwise influence, an actual or potential buyer or customer." (§ 425.17(c)(1), (2); see generally *Schaffer v. Weast* (2005) 546 U.S. 49, 60, 126 S.Ct. 528, 163 L.Ed.2d 387 [" 'Very often one must plead and prove matters as to which his adversary has superior access to the proof' "].) In sum, Simpson does not persuade us that section 425.17(c) presents ***340** one of those " 'rare occasions' " *26 justifying a deviation from the normal allocation of the burden of proof. (*Cassady, supra,* 145 Cal.App.4th at p. 234, 51 Cal.Rptr.3d 527.)

The burden of proof as to the applicability of the commercial speech exemption, therefore, falls on the party seeking the benefit of it—i.e., the plaintiff.

B. Were Simpson's Causes of Action Exempted from the Anti–SLAPP Statute by Section 425.17(c)?

As noted, section 425.17(c) provides, in pertinent part: "Section 425.16 does not apply to any cause of action brought against a person primarily engaged in the business of selling or leasing goods or services ... arising from any statement or conduct by that person if both of the following conditions exist: [¶] (1) The statement or conduct consists of representations of fact about that person's or a business competitor's business operations, goods, or services, that is made for the purpose of obtaining approval for, promoting, or securing sales or leases of, or commercial transactions in, the person's goods or services, or the statement or conduct was made in the course of delivering the person's goods or services. [¶] (2) The intended audience is an actual buyer or potential buyer or customer, or a person likely to repeat the statement to, or otherwise influence, an actual buyer or customer...."

There are no disputed issues of fact here. We review the applicability of the commercial speech exemption independently. (*Soukup v. Law Offices of Herbert Hafif* (2006) 39 Cal.4th 260, 269, fn. 3, 46 Cal.Rptr.3d 638, 139 P.3d 30.)

[8] The Court of Appeal held, and the parties' initial briefing assumed, that section 425.17(c)(1) prescribes a "content exemption" and a "delivery exemption" and that these exemptions have distinctly different elements. The content exemption shields a cause of action from the anti-SLAPP statute if the cause of action arises from a statement or conduct that "consists of representations of

fact about that person's or a business competitor's business operations, goods, or services, that is made for the purpose of obtaining approval for, promoting, or securing sales or leases of, or commercial transactions in, the person's goods or services." (§ 425.17, subd. (c)(1).) The delivery exemption provides a similar shield for *any* statement or conduct "made in the course of delivering the person's goods or services." (*Ibid.*) In other words, this approach divided the first 47 words of subdivision (c)(1) from the last 17 to create two independent and parallel theories of exemption from the anti-SLAPP law.

Although section 425.17(c)(1) is grammatically susceptible of such a construction, that construction was not necessarily the only plausible one. ***27** Gore had observed, in a footnote in its initial briefing, that the statute might also be read to exempt a cause of action arising from a statement or conduct ****1127** that consists of representations of fact about that person's or a competitor's business operations, goods, or services that was made *either* "for the purpose of obtaining approval for, promoting, or securing sales or leases of, or commercial transactions in, the person's goods or services" *or* "in the course of delivering the person's goods or services." (§ 425.17(c)(1).) We granted the parties the opportunity to file supplemental briefing as to which construction was the correct one and, as will appear, agree with Gore's construction.

[9] **[10]** As in any case involving statutory interpretation, our fundamental task is to determine the Legislature's intent so as to effectuate the law's purpose. *****341** (*People v. Lewis* (2008) 43 Cal.4th 415, 491, 75 Cal.Rptr.3d 588, 181 P.3d 947.) "We begin with the text of the statute as the best indicator of legislative intent" (*Tonya M. v. Superior Court* (2007) 42 Cal.4th 836, 844, 69 Cal.Rptr.3d 96, 172 P.3d 402), but we may reject a literal construction that is contrary to the legislative intent apparent in the statute or that would lead to absurd results. (*Ornelas v. Randolph* (1993) 4 Cal.4th 1095, 1105, 17 Cal.Rptr.2d 594, 847 P.2d 560.)

Simpson's argument, at least at the outset, relies on the plain language of section 425.17(c)(1) and the canon of construction of avoiding surplusage. According to Simpson, section 425.17(c)(1) creates two independent commercial speech exemptions, each introduced by the phrase "the statement or conduct," and to hold otherwise would render the second iteration of "the statement or conduct" in the subdivision redundant. In Simpson's view, therefore, the delivery exemption encompasses a cause of action arising from "*any* statement or conduct made in the course of delivering the person's goods or services." Gore argues that such a construction would contravene the legislative intent and lead to absurd results.

The Legislature's findings supporting the enactment of section 425.17 are set forth in subdivision (a), which states that "there has been a disturbing abuse of Section 425.16, the California Anti–SLAPP Law, which has undermined the exercise of the constitutional rights of freedom of speech and petition for the redress of grievances, contrary to the purpose and intent of Section 425.16. The Legislature finds and declares that it is in the public interest to encourage continued participation in matters of public significance, and that this participation should not be chilled through abuse of the judicial process or Section 425.16."

The construction favored by Simpson does not effectively fulfill the statute's purposes. Under that construction, the Legislature can be seen to have carefully devised specific requirements in order to exempt a cause of ***28** action under the content prong—i.e., the statement or conduct underlying the cause of action must (1) consist of representations of fact (2) about that person's or a business competitor's business operations, goods, or services, and (3) have been made for the purpose of obtaining approval for, promoting, or securing transactions in the person's goods or services. Yet, under Simpson's construction of the delivery prong, the Legislature apparently imposed no particular requirements—i.e., a cause of action arising from *any* statement or conduct on *any* subject for *any* purpose is exempted from the anti-SLAPP statute, as long as it was made in the course of delivering goods or services. Simpson has not offered any rationale for why the stage of the transaction should play such a critical factor in determining whether to exempt a cause of action from the reach of the anti-SLAPP law.

Moreover, under Simpson's approach, a business that was sued because of political or religious statements made by an employee *in the course of delivering* the product or service to a customer would be deprived of the protection of the anti-SLAPP law, but that same business would be able to invoke the anti-SLAPP law if the same statements were made for the purpose of obtaining approval for, promoting, or securing transactions in its

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

products. Neither the Legislature's findings nor common sense endorses or justifies such a result.

[11] Simpson effectively concedes that such a result would be problematic, but argues that the statements in these hypotheticals "are *not a part of* the delivery of ***342** goods **1128** or services" and thus fall outside the delivery exemption as Simpson would interpret it. But, as we recently observed, " '[d]uring' means 'at some point in the course of.' " (*People v. Lewis, supra,* 43 Cal.4th at p. 514, 75 Cal.Rptr.3d 588, 181 P.3d 947.) Statements or conduct made *during* the delivery of goods or services thus would qualify as statements or conduct made *in the course of* delivering the goods or services. (Cf. § 425.17(c)(1).)

Simpson attempts to narrow the definition of the delivery exemption by combining language that appears in two different sentences in *Brill, supra,* 132 Cal.App.4th at page 341, 33 Cal.Rptr.3d 371, to argue that the exemption extends only to " 'statements ... made and conduct engaged in *as part of* ... the type of business transaction engaged in by defendants.' " But this formulation does not appear anywhere in the text of section 425.17(c)(1). If, as Simpson effectively concedes, the delivery prong requires an interpretive gloss to avoid absurd results, it seems more consonant with legislative intent to adopt the restriction the Legislature articulated earlier in the sentence setting forth the exemption rather than to rummage about elsewhere for new limitations arising out of whole cloth.

Moreover, Simpson's construction of the delivery prong would render the first part of section 425.17(c)(1)—the so-called "content and purpose" ***29** prong—surplusage. Statements or conduct that are " 'part of ... the type of business transaction engaged in by defendants' " would necessarily encompass "representations of fact about that person's ... business operations, goods, or services, that [are] made for the purpose of obtaining approval for, promoting, or securing sales or leases of, or commercial transactions in, the person's goods or services" (§ 425.17(c)(1)) inasmuch as *every* business engages in efforts to obtain approval for, promote, or secure sales or transactions in its goods or services. Indeed, Simpson concedes that "a grocer's advertisement in advance of intended sales" falls within its broad definition of the delivery prong "to the extent the advertising informs the public about the availability of the product for delivery" *or* "to the extent the advertising keeps the product in the public eye and bolsters its prestige." With such a broad definition of the delivery prong, there would be no need for the content and purpose prong.

The legislative history further undermines Simpson's interpretation of the statute. Summaries of the bill prepared for various legislative committees consistently stated that section 425.17(c) would prohibit "the anti-SLAPP motion from being used in specified causes of action against businesses sued for statements or conduct consisting of representations of fact about their goods, services or business operations, or those of a competitor, when *those* statements or conduct were for the purpose of obtaining approval for, promoting, or securing sales or leases of the person's goods or services, *or* in the course of delivering the person's goods or services, if the intended audience is an actual or potential buyer or customer, or a person likely to repeat the statement to, or otherwise influence, an actual or potential buyer or customer, ..." (Legis. Analyst, 3d reading analysis of Sen. Bill No. 515 (2003–2004 Reg. Sess.) as amended July 8, 2003, p. 1, italics added; Assem. Com. on Judiciary, Analysis of Sen. Bill No. 515 (2003–2004 Reg. Sess.) as amended June 27, 2003, p. 2, italics added; Assem. Republican Caucus, analysis of Sen. Bill No. 515 (2003–2004 Reg. Sess.) as amended June 27, 2003, p. 1, italics added; see also Sen. Sheila Kuehl, letter to Governor Gray Davis, Sept. 3, 2003, p. 2.) In addition, an analysis prepared for the Senate Committee on the Judiciary noted that Senate Bill 515 was ***343** "consistent with the recommendation of the Senate Judiciary Committee analysis last year on [Senate Bill] 1651[,] which urged the sponsors to look at *the content and context* of the statement or conduct when crafting an exemption, rather than enacting a wholesale exclusion of a class of defendants[,] which had been proposed in [Senate Bill] 1651." (Sen. Com. on Judiciary, Analysis of Sen. Bill No. 515 (2003–2004 Reg. Sess.) as amended May 1, 2003, p. 9, italics added.) Simpson offers no explanation why the Legislature would have been so concerned about the content of the statement or conduct in the first part of section 425.17(c)(1) but would **1129** have abandoned any such concern in the remainder of the sentence.

[12] ***30** For these reasons, we interpret section 425.17(c) to exempt from the anti-SLAPP law a cause of action arising from commercial speech when (1) the cause of action is against a person primarily engaged in the business of selling or leasing goods or services; (2) the cause of action arises from a statement or conduct by

that person consisting of representations of fact about that person's or a business competitor's business operations, goods, or services; (3) the statement or conduct was made either for the purpose of obtaining approval for, promoting, or securing sales or leases of, or commercial transactions in, the person's goods or services or in the course of delivering the person's goods or services; and (4) the intended audience for the statement or conduct meets the definition set forth in section 425.17(c)(2).

[13] Gore does not dispute that he is in the business of selling legal services, that Simpson's causes of action arise from Gore's advertisement, that the purpose of the advertisement was to promote Gore's legal services, or that the advertisement was addressed to a qualifying audience under section 425.17, subdivision (c)(2). The point of contention concerns whether the causes of action "aris[e] from ... representations of fact about [Gore's] ... business operations, goods, or services." (§ 425.17(c)(1).) We find that they do not.

Simpson's complaint asserts claims for defamation, trade libel, false advertising, and unfair business practices. The common theme among these causes of action is the allegation that the advertisement "communicates that Simpson's galvanized screws are defective." The complaint alleges in particular that the advertisement "is libelous on its face in that it falsely communicates to the reader that Simpson's products are defective"; that the advertisement "disparaged Simpson's goods in that the Advertisement falsely communicates to the reader that Simpson's galvanized screws are defective"; that these assertions in the advertisement "are false and misleading"; and that using "the false and misleading Advertisement to recruit potential plaintiffs to participate in an unjustified class action lawsuit against Simpson" was an unfair business practice.

We will assume arguendo that the advertisement implies that Simpson's galvanized screws are defective. As the Court of Appeal recognized, however, even an implication that Simpson's screws are defective "is not 'about' Gore's or a competitor's 'business operations, goods, or services....' (§ 425.17(c)(1).) It is, rather, a statement 'about' *Simpson*—or, more precisely, Simpson's products." It therefore falls squarely outside section 425.17(c)' s exemption for commercial speech.

Simpson contends that the advertisement does nonetheless satisfy the commercial speech exemption in that it "expressly states that 'an attorney' will 'investigate whether you have a potential claim" and that it also ***31** supports the inference "that Gore has investigated the named companies and has discovered that they are selling *****344** defective screws." Both of these statements are "about" Gore's business operations, but neither satisfies the elements of the commercial speech exemption to the anti-SLAPP law.

[14] Simpson's causes of action plainly do not "arise from" (§ 425.17(c)) the representation that an attorney will investigate "whether you have a potential claim." Simpson's complaint does not allege that this statement is false or even that it is defamatory. In addition, a promise of what an attorney will do if the reader were to respond to the advertisement "is not a representation of fact, but an agreement to take certain actions in the future." (*Navarro v. IHOP Properties, Inc.* (2005) 134 Cal.App.4th 834, 841, 36 Cal.Rptr.3d 385.) Consequently, it does not constitute "representations of fact about that person's ... business operations, goods, or services." (§ 425.17(c)(1).)

The alleged inference that Gore has investigated Simpson and discovered that the galvanized screws are defective is not obvious from the advertisement itself, which asserts only that users of these fasteners "may" have certain (but unspecified) legal rights and that an attorney would need to "investigate whether you have a potential claim." Even if ****1130** one were to draw this inference, however, it would be no more than an attempt to layer the allegedly defamatory inference itself—i.e., that Simpson's galvanized screws are defective—with an alleged inference that Gore had *discovered* the defect. Simpson cites no authority for expanding the scope of the commercial speech exemption in this manner. (Cf. *Stewart v. Rolling Stone LLC* (2010) 181 Cal.App.4th 664, 676, 105 Cal.Rptr.3d 98 [the commercial speech exemption did not apply to a claim that the defendant magazine wrongfully used plaintiffs' names for a Camel advertisement; "as plaintiffs concede, the goods they sell are copies of Rolling Stone magazine, not Camel cigarettes. More significantly, the statement or conduct at issue here did not consist of 'representations of fact about the business operations, goods, or services' of Rolling Stone or of any of defendants' business competitors. Instead, the representation at the center of this lawsuit is the representation that plaintiffs and their fellow musicians

endorse the sale and use of Camel cigarettes"]; accord, *New.Net v. Lavasoft* (C.D.Cal.2004) 356 F.Supp.2d 1090, 1104 [the commercial speech exemption did not apply because "the purportedly offending statements are not statements made about Defendant's product, but rather statements about Plaintiff and its products" and the two were not competitors]; see also *Troy Group, Inc. v. Tilson* (C.D.Cal.2005) 364 F.Supp.2d 1149, 1151, 1155 [defendant investment adviser's e-mail asking whether plaintiff corporation is one of "the biggest crooks on the planet or what?" is "clearly not about [defendant]'s business, rather it is about [plaintiff], which, as [plaintiffs] admit, is not a business competitor of [defendant]"].) We are reluctant to allow plaintiffs to evade the limitations of the statutory ***32** text by mere wordplay, especially given our obligation to construe the commercial speech exemption narrowly.

Moreover, Simpson has not attempted to recover damages here because of any implied representation that Gore allegedly *discovered* that Simpson's products were defective, but because Gore allegedly *implied* that they were defective. Whether the Simpson products are in fact defective is beyond the scope of this proceeding, but the inference that they are defective is not a representation of fact about *Gore's* business operations, goods, or services. The Court of Appeal stated the issue succinctly: "To the extent that Gore's advertisement 'consists of' representations about his services, Simpson's action does not 'aris[e] *****345** from' it; to the extent that Simpson's action 'aris[es] from' a representation by Gore, the representation was not 'about' Gore's or a competitor's services or business operations." [4]

Simpson argues next that the commercial speech exemption from dismissal under the anti-SLAPP statute should not require that the statement itself giving rise to the cause of action include factual representations about the defendant's or a business competitor's business operations, goods, or services, as long as the statement giving rise to the cause of action is *accompanied* by factual representations about the defendant's or a business competitor's business operations, goods, or services. The statute's plain language, however, is otherwise. The commercial speech exemption applies only to a cause of action "arising from" a statement (or conduct) that "consists of representations of fact about that person's or a business competitor's business operations, goods, or services...." (§ 425.17(c)(1).)

Simpson complains, with rhetorical flourish, that the advertisement "defam[es] Simpson in order to tout Gore and his services.... The tout and the defamation were of an inseparable whole, with the defamation serving as bait for the tout. The Court of Appeal's approach is as if to parse cheese from a mousetrap." But this is merely another way of saying that the speaker made a representation of fact about a *noncompetitor's* goods for the purpose of promoting the speaker's own services. Had the Legislature intended the commercial speech exemption to encompass representations of fact about *any* ****1131** business operations, goods, or services made for the purpose of promoting sales, leases, or transactions in the speaker's own goods or services, then it would not have limited the exemption to statements or conduct consisting of "representations of fact about *that person's or a business competitor's* business operations, goods, or services ...." (§ 425.17(c)(1); see *Mendoza v.* ***33** *ADP Screening and Selection Services, Inc.* (2010) 182 Cal.App.4th 1644, 1652, 107 Cal.Rptr.3d 294 ["the Legislature appears to have enacted section 425.17, subdivision (c), for the purpose of exempting from the reach of the anti-SLAPP statute cases involving comparative advertising by businesses."].)

[15] **[16]** The legislative history accords with the statute's plain language. As stated earlier, committee reports summarized the bill as "[p]rohibit[ing] the anti-SLAPP motion from being used in specified causes of action against businesses sued for statements or conduct *consisting of* representations of fact about their goods, services or business operations, or those of a competitor, *when those statements* ... were for the purpose of obtaining approval for, promoting, or securing sales or leases of the person's goods or services, or in the course of delivering the person's goods or services...." (Assem. Com. on Judiciary, Analysis of Sen. Bill No. 515 (2003–2004 Reg. Sess.) as amended June 27, 2003, p. 3, italics added.) The plain language and the legislative history each confirm that the statement or conduct giving rise to the cause of action must consist of factual representations about the speaker's (or a competitor's) goods, services, or business operations. Nothing in the plain language or the legislative history suggests it would be enough to protect against dismissal under the anti-SLAPP statute if the factual representations about the speaker's or a competitor's business simply appeared in the *****346** same publication as the statements actually giving rise to the cause of action. [5]

Indeed, Simpson's proposed construction would seriously undermine the anti-SLAPP statute itself. As Gore points out, a press release critical of a political candidate—i.e., core political speech—would lose the protection of the anti-SLAPP statute if the press release *also* mentioned the products sold by the business. We therefore reject Simpson's expansive construction of the commercial speech exemption and conclude, in accordance with the trial court and the Court of Appeal, that Simpson's complaint was not exempted from the anti-SLAPP statute by section 425.17(c)(1).

The trial court went on to consider Gore's special motion to strike the complaint under section 425.16, determined that Simpson had failed to establish a probability of prevailing on the merits, and granted the special motion to strike. The Court of Appeal affirmed. The correctness of those rulings is beyond the scope of our grant of review, which was limited to the ***34** applicability of the commercial speech exemption to the anti-SLAPP statute set forth in section 425.17(c)(1).

DISPOSITION

The judgment of the Court of Appeal is affirmed.

WE CONCUR: GEORGE, C.J., KENNARD, WERDEGAR, CHIN, MORENO, and CORRIGAN, JJ.

Footnotes

1 SLAPP is an acronym for “strategic lawsuit against public participation.” (*Jarrow Formulas, Inc. v. LaMarche* (2003) 31 Cal.4th 728, 732, fn. 1, 3 Cal.Rptr.3d 636, 74 P.3d 737.) All further statutory references are to the Code of Civil Procedure unless otherwise indicated.

2 See *Leoni v. State Bar* (1985) 39 Cal.3d 609, 624, 217 Cal.Rptr. 423, 704 P.2d 183 (lawyer advertising is protected by the First Amendment).

3 As Simpson points out, *Brill* did place the burden on the defendant. But *Brill* analyzed only whether the applicability of the commercial speech exception was part of *Equilon's* first step, where the court decides whether the defendant has made a threshold showing the challenged cause of action arises from protected activity, or part of *Equilon's* second step, where the court determines whether the plaintiff has demonstrated a probability of prevailing on the claim. (*Brill, supra,* 132 Cal.App.4th at pp. 329–331, 33 Cal.Rptr.3d 371.) *Brill's* conclusion that the defendant had the burden of proof to establish the nonapplicability of the commercial speech exception was based solely on its classification of the issue as a first-step determination and did not at all consider section 425.17's status as an exception to section 425.16 or any canons of construction. (*Brill, supra,* at p. 331, 33 Cal.Rptr.3d 371.) *Brill Media Co., LLC v. TCW Group, Inc., supra,* 132 Cal.App.4th 324, 33 Cal.Rptr.3d 371, is therefore disapproved to the extent it is inconsistent with our holding here.

4 One can conceive of a cause of action arising from a representation of fact about the attorney's own services—such as a false claim that the attorney had already recovered a judgment against the manufacturer for the defective product—but the advertisement in this case did not contain such a representation.

5 Simpson complains that a party should not be able to defeat the commercial speech exception to the anti-SLAPP statute by parsing a two-sentence advertisement into its component parts. We agree. The proper test does not turn on the punctuation used in the advertisement, but on the basis for the cause of action. Here, the causes of action all arise from the inference that Simpson's products are defective, an inference that Simpson alleges is implied from the text of the advertisement. This inference, though, contains no representations of fact about *Gore's* business operations, goods, or services.

34 Cal.App. 660, 168 P. 595

WILLIAM D. STEPHENS, Governor of the State of California, Petitioner,
v.
JOHN S. CHAMBERS, State Controller, Respondent.

Civ. No. 1757.
Court of Appeal, Third District, California.
September 17, 1917.

CONSTITUTIONAL LAW--APPROPRIATION OF PUBLIC MONEY FOR PEACE JUBILEE AT VICKSBURG--VALID LEGISLATIVE ENACTMENT--GIFT PROVISION NOT VIOLATED.
The act of the legislature which became effective July 31, 1917 (Stats. 1917, p. 1608), appropriating the sum of fifteen thousand dollars, to be expended by the Governor, in his discretion, for the purpose of assisting to defray the expenses of a public nature incident to the holding of the national memorial reunion and peace jubilee at Vicksburg, Mississippi, in October, 1917, is a valid enactment, and is not within the inhibition of section 31 of article IV of the Constitution, prohibiting any gift of public money to any individual or corporation, and interdicting the appropriation of public money for the purpose or benefit of any corporation or institution not under the exclusive management and control of the state as a state institution.

ID.--REQUIREMENTS OF BILL APPROPRIATING PUBLIC MONEY--CONSTITUTIONAL PROVISION NOT CONTRAVENED.
The act of the legislature which became effective July 31, 1917, appropriating public money for the purpose of assisting to defray the expenses of a public nature incident to the national memorial and peace jubilee at Vicksburg, Mississippi, in October, 1917, is not inconsistent with section 34 of article IV of the Constitution, declaring that no bill making an appropriation of money, except the general appropriation bill shall contain more than one item of appropriation, and that for a single and certain purpose to be expressed therein, because of the indefiniteness of the language of the act.

ID.--EXPENDITURE OF MONEY--DISCRETION OF GOVERNOR--VALIDITY NOT AFFECTED.
The act of the legislature which went into effect July 31, 1917, appropriating public money for the national peace jubilee celebration at Vicksburg, Mississippi, in October, 1917, is not void because it vests the Governor with discretion in the expenditure of the money appropriated.

APPLICATION for a Writ of Mandamus originally made to the District Court of Appeal for the Third Appellate District.

The facts are stated in the opinion of the court.

***661** L. T. Hatfield, for Petitioner.
U. S. Webb, Attorney-General, and Robert W. Harrison, Deputy Attorney-General, for Respondent.

HART, J.

This is an application for a writ of mandate requiring respondent, as state controller, to draw his warrant in favor of petitioner "for such portion of the sum of fifteen thousand dollars, as petitioner may require."

At the recent session of the legislature there was regularly passed an act entitled "An act to provide for the celebration of the national memorial reunion and peace jubilee at Vicksburg, Mississippi, and making an appropriation therefor," which act was by the Governor approved and took effect July 31, 1917 (Stats. 1917, p. 1608). Section 1 thereof reads, in part, as follows: "There is hereby appropriated … the sum of fifteen thousand dollars, to be expended by the Governor, in his discretion, for the purpose of assisting to defray the expenses of a public nature incident to the holding of the national memorial reunion and peace jubilee to commemorate the victories and virtues leading to the half century of peace and prosperity to the American nation, and further to strengthen the fraternal ties of amity in the United States," said reunion to be held at Vicksburg in October, 1917, on certain named days.

Section 2 provides that the Governor shall "demand from the state controller, and the state controller is hereby authorized and instructed upon such demand, to draw his warrant in favor of the Governor for the sum of fifteen thousand dollars to be expended by him as above provided, and the treasurer is hereby authorized and directed to pay the same."

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

By way of answer and return to the petition for a writ of mandate, respondent alleges that said petition "does not state facts sufficient to entitle the petitioner to the relief prayed for," and it is contended that the attempted appropriation of money is contrary to the provisions of section 34, article IV, of the Constitution, which reads: "No bill making an appropriation of money, except the general appropriation bill, shall contain more than one item of appropriation, and that for one single and certain purpose, to be therein expressed."

Thus it will be observed that, so far as the pleadings in this proceeding are concerned, the legality of the statute or appropriation ***662** in question is attacked upon one ground only. Indeed, in his brief, the attorney-general appears to concede that it is within the constitutional competence of the legislature of this state to appropriate money from the funds of the state for the purpose and object for which the appropriation is made by the act under attack here, for he says: "In the determination of the validity of this appropriation, it is not necessary to question the objects and purposes of the reunion to be held at Vicksburg. It may well be admitted that such reunion tends to do all of the things expressed in the act as the reasons for holding such reunion. Nor do we here contend that the holding of such reunion is not a matter of state and national importance and one which it might well be to the state's advantage to encourage, even to the extent of appropriations of money to defray the expenses incident thereto." In thus expressing himself, the attorney-general doubtless took into consideration, as properly he should, the act of the Sixty-fourth Congress of the United States (Session of 1915-16)--Act Cong. Sept. 8, 1916, c. 464, 39 Stat. 812--whereby money was appropriated for defraying the expenses of the "National Memorial Celebration and Peace Jubilee at Vicksburg, in the year 1917, by the survivors of the armies of the Tennessee and of the Mississippi," who participated in the memorable battle of Vicksburg in the month of July, 1863, for the reason that the appropriation involved in the act whose validity is here challenged is in aid of the purposes and objects of said act of the national Congress. With this concession of the attorney-general that there legally reside in the state the power and the right to appropriate a reasonable amount of the public moneys to aid in the achievement of the purposes of the act of Congress referred to, further consideration herein thereof might well be waived or dismissed, but, in view of the strictness with which the Constitution, by certain provisions therein contained, guards the disposal of the public revenues, and of certain cases expounding those provisions, some observations with respect to that proposition need not be deemed out of place herein.

From what has already been said, it is doubtless plain enough that we are in full accord with the concession of the attorney-general that the legislature may, without offending any of the inhibitory mandates of the Constitution with regard to the appropriations of the public moneys, make such ***663** an appropriation as the one whose legality is challenged in this proceeding; and so we express ourselves because of the conviction that, while the legislature will not be permitted to go beyond the bounds expressly established by the people through their Constitution in the matter of the disposal of the revenues raised for the support of the state government. it would be opposed to and, indeed, conceivably in many instances, subversive of the highest ends and the best interests of, a government whose sovereignty and general policies are outlined and controlled by a written constitution, framed in language necessarily general, if it were found requisite, in constitutional construction, to hold that the terms of the organic law should on all occasions be accepted and applied in their literal sense, or that there are not certain matters incidental and necessary to every well-governed state and its subjects as to which the Constitution is silent, in so far as express language is concerned, and as to which legislation looking to the highest welfare of the governed is absolutely necessary. A written constitution, like a statute, cannot so deal with particulars as to meet or provide for every case or contingency which may arise and of which legislative cognizance is allowable if necessary to the complete enjoyment of those privileges, immunities, and rights which are of the essence, and, indeed, the primary and foremost objects of a government in which, like ours, ultimate sovereignty is in the people themselves. By this we do not mean to say that the limitations or barriers contained in the Constitution against the exercise of legislative power may be set aside or disregarded, or that the intent of the organic law, as it is to be gathered from the instrument itself, shall not in all cases prevail. Nor do we intend thus to imply that the courts, in the construction of a written constitution, may be governed by a change in public sentiment as to any subject to which express attention is given and as to which limitations are fixed by the Constitution. But what we do maintain is that, since a written constitution is intended as and is the mere framework according to whose

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

general outlines specific legislation must be framed and modeled, and is therefore, as stated and as is essentially true, necessarily couched in general terms or language, it is not to be interpreted according to narrow or super-technical principles, but liberally and on broad general lines, so that it may accomplish in full measure ***664** the objects of its establishment and so carry out the great principles of government.

The Constitution of the United States involves a grant and limitation of powers. The federal government, through its Congress, can exercise or exert no power which is not clearly within the grant of the federal Constitution; and this means that Congress may exercise only the powers expressly conferred upon the federal government and such incidental or auxiliary powers as may be essential to the exercise and execution of the powers expressly granted. There is no provision in the national Constitution expressly authorizing the expenditure of public moneys for the purposes and objects stated in the act of Congress above referred to. Nor is there any single provision of that Constitution within the spirit or reason of which does authority for such an appropriation of the public moneys fall. The same is true as to the several acts of Congress pensioning soldiers who fought to uphold the Union in our domestic Civil War. But the latter acts, as well as the one giving rise to the appropriation herein attacked, have never been challenged upon the ground that they were *ultra vires,* or beyond the authority of Congress to enact. Perhaps, by applying to them the touchstone of strict technical principles of construction, their force as legal enactments might be destroyed. But no such view or method of construction as applied to those acts would by any court be accepted or resorted to. To the contrary, in comparing them with the Constitution, if, indeed, the solution of the question whether they are or are not valid involves a matter of constitutional construction, the courts, if discovering even no indirect or inferential authority for their enactment in the language of that instrument, would nevertheless find ample sanction for them in the general spirit of our national government and in the genius of our political institutions, as outlined and promulgated by the Constitution itself and so sustain them as treating with subjects which clearly fall, not within the letter of the organic law, but within the spirit and reason of those general policies which inhere, and of necessity must inhere, in every government framed and formed upon the lines of enlightened general principles--policies consistent and in harmony with the nature and form of the government as outlined by the primary law of the land and the absence of which would greatly and seriously curtail or ***665** restrict that full enjoyment of the rights of persons and of property which can only come from a government deriving its force from the consent of the governed. It would, indeed, come as a shock if the courts felt compelled to declare and so hold that laws pensioning those who fought to preserve the integrity of the American Union and who, from their accumulated years or disease, are unable to care for themselves, were beyond the power of Congress to enact. Such a judicial fiat would be universally denounced as repugnant to every consideration of governmental duty, obligation, and gratitude. But the motive underlying such legislation is much broader and more far-reaching in its effect upon the government of society than the mere consideration of gratitude. Undeniably, the stability of every civilized government and its political institutions wholly depends upon the patriotism and loyalty thereto of its subjects; hence it is the first duty of every government so to administer its affairs as to inspire in its citizens patriotism and loyalty to the fundamental political principles upon which it is founded, and, to that end, through appropriate policies, teach and exemplify the duty which every citizen owes to his country and its government. Therefore, as stated, legislation which provides for the pensioning of those who have fought the battles of their country for the preservation of its governments and who are in need of assistance involves not only the quality of gratitude, but a just and substantial recognition of services inspired by patriotism, without which battles cannot, as a rule, successfully be fought. If it may be said as to the present crisis with which our country is confronted that patriotism in our citizens has not been aroused, how infinitely worse would the conditions in that regard now be if, in the past, our government had wholly failed in a proper way to recognize and reward, in proper cases, those who had gone to the front and fought our battles in the past?

As we understand the congressional act in aid of the purposes and objects of which the appropriation challenged here was made by our own legislature, the great object and desideratum thereof is to bring about a sentiment of amity between those sections of our country who opposed each other in one of the most bitterly fought domestic wars of which history gives any record; for it is a matter of common historical knowledge that the bitterness of sentiment brought ***666** about between the northern and southern sections by that war existed in

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

full vigor down to the opening of hostilities between this country and Spain, which ended with the late Spanish-American war. And there can hardly be any doubt that that same old feeling in some degree still lingers or exists. The governments of the Union and of the states could adopt no more effective policy for reuniting the two sections in one common political sentiment than that which is involved in and represented by the legislation in question. That the inevitable effect of such a gathering, annually held, as seems to be the policy of Congress, so long as there is a considerable number of the survivors of both sides of that war, will be ultimately to destroy every vestige of that old feeling of antagonism in political sentiment (we here use the word "political" in its more comprehensive sense), there cannot be the shadow of a doubt; and that the inevitable consequence of a condition so brought about will be to establish throughout the whole country a deeper, more abiding and a universal love for our common country and its government, is equally plain. Congress could have exercised no power or established no other policy more conducive to the general welfare of our government and the people, for no government can long exist with its people radically divided in sentiment upon the fundamental political doctrines upon which it is founded.

If, then, Congress, circumscribed as it is within the narrow bounds of granted and limited powers, may rightfully, in the absence of express authority therefor, but solely by the exertion of that power which must inhere in every government if the general welfare is on all occasions and in every emergency to be subserved as intended by the very nature and spirit of our form of government, appropriate moneys from the public revenues for the purpose of accomplishing the great ultimate object of the act in question, why may not a state, essentially a constituent part of the Union--which, indeed, goes to the making of the Union--make a like appropriation as in aid of the object thus to be achieved?

While the governments of the Union and the states are independent of each other, operate within distinctly different spheres, and are designed for the accomplishment of different specific objects, yet, upon general political or governmental policies their interests are common, and what in a political sense stands for the general welfare of the Union necessarily ***667** stands for the general welfare of the states. Unquestionably, the states, as separate entities and as component parts of the Union, are each equally with the Union interested in the crystallization and execution of any policy of the federal Union that will tend to perpetuate the permanency of the latter, for largely if not wholly upon the perpetuity of the Union depends the permanency of the states as governmental organizations. It follows, therefore, that the policy of the general government with respect to the subject matter of the act of Congress above mentioned is necessarily the policy of each of the states, and that within the latter, no less than within the federal government, resides the power of effectuating and applying that policy. In other words, the duty, if it be a duty, of contributing to the carrying out or execution of that policy rests no less upon the states than upon the federal government. And the right of the states to do so does not depend upon any authority vested in them by express language in their constitutions, nor is it to be controlled by the restrictions or limitations upon the legislative power contained in those instruments, but, as in the case of the federal government, arises from that inherent, dormant power which may legally be aroused to action, exerted and applied by all democratic governments, controlled by written constitutions, whenever the exigencies of government imperatively require its exertion and exercise--that power which, in a general sense, is analogous to the general war powers of the federal government, under which, as war measures, the latter may, as it is now doing, properly control trade principles and execute an infinite variety of other acts which, under normal conditions, approach if not in truth involve paternalism in government or unwarranted abridgments of individual rights as assured and guaranteed by the Constitution.

Thus, it is clear, the inhibitions of our state Constitution against any gift of public money to any individual, municipal or other corporation (article IV, section 31), and interdicting the appropriation of public money "for the purpose or benefit of any corporation, association, … or other institution not under the exclusive management and control of the state as a state institution" (Const., art. IV, sec. 22) have no application to this case. Indeed, it has been so held in a decision treating a proposition quite analogous in principle to that submitted for solution here. (***668** *Daggett v. Colgan,* 92 Cal. 53, [27 Am. St. Rep. 95, 14 L. R. A. 474, 28 Pac. 51].) That case involves an interesting and instructive discussion of the propositions to which we have hereinabove given considerable attention, and we may, therefore,

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

pardonably and with advantage, reproduce herein an extended excerpt from the learned opinion therein. It should first be explained that the legislature of 1891 (Stats. 1891, p. 24) passed an act appropriating a large sum of money to be paid to the California Commission of the World's Fair Columbian Exposition, held in the city of Chicago, and to be used by said commission in the construction of buildings at said fair in which to maintain an exhibit of the industrial products of this state and to defray the expenses arising in connection with such exhibit. The state controller, claiming that the appropriation made by the act was in direct contravention of that part of section 22, article IV, of the Constitution above quoted herein, declined to draw his warrant in favor of said commissioners on the fund so appropriated. After discussing that proposition adversely to the position of the controller, the court, in its opinion, made these significant observations:

"The defendant further contends that the statute is unconstitutional for the reason that the appropriation thereby made is not for a public use, such as the state is authorized to make; that the maintenance of an exhibition of the products of the state in the manner contemplated does not fall within the legitimate authority of the state government.

"In passing upon this proposition, it is necessary to bear in mind that what is for the public good, and what are public purposes, 'are questions which the legislature must decide upon its own judgment, in respect to which it is vested with a large discretion which cannot be controlled by the courts, except, perhaps, where its action is clearly *evasive*.... Where the power which is exercised is legislative in its character, the courts can enforce *only* those limitations which the Constitution imposes; not those implied restrictions which, resting in theory only, the people have been satisfied to leave to the judgment, patriotism, and sense of justice of their representatives.' (Cooley's Constitutional Limitations, 154.)

"It is undoubtedly true that public money can be rightfully expended only for public purposes, but as well said by that eminent jurist, Judge Cooley, in delivering the opinion of the court in ***669** *People v. Salem,* 20 Mich. 452, [4 Am. Rep. 400]: '*Necessity* alone is not the test by which the limits of state authority in this direction are to be defined, but a wise statesmanship must look beyond the expenditures which are absolutely needful to the continued existence of organized government, and embrace others which may tend to make that government *subserve the general well-being of society,* and advance the present and *prospective happiness and prosperity of the people.*'

"In view of these principles of constitutional law, which are so well settled as to be placed beyond discussion or dispute, it is manifest, we think, that the court is not authorized to declare the act under consideration void, upon the theory that the expenditure thereby authorized can in no manner be considered as tending to promote the public welfare, which it is one great object of government to secure. The question whether the public interests of the state would be at all advanced by an exhibition of its products such as is contemplated by the act was an appropriate one for discussion in the halls of the legislature before its enactment, and for the consideration of the Governor before approving it, but it is not one for this court to decide, upon the individual views of its members concerning the wisdom or expediency of such legislation.

"There is no difference, except in degree, between the appropriation contained in this act and those which for years have been made without any question as to their validity, for the support of the state agricultural fair, and the various district agricultural societies throughout the state. The fact that this exhibit of the products of the state is to be made without the limits of the state does not change its essential character, or make it any less an occasion or purpose in which, in an enlarged sense, it may be said that the people of the state have an interest. So, also, it would be hard to distinguish this appropriation in principle from those appropriations which have been made from time to time for the maintenance of horticultural, viticultural, and other similar commissions. None of these, strictly speaking, are required for the proper administration of the government of the state, and possibly, in the opinion of many, call for an unjustifiable and useless expenditure of money. But the power of the legislature to create such commissions has never been doubted.

***670** "We know from the express declaration of the act of Congress authorizing the Columbian Exposition that the purpose of the exposition is to commemorate the four hundredth anniversary of the discovery of America,

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

'by an exhibition of the resources of the United States of America, their development, and of the progress of civilization in the New World'; and that such exhibition is to be of a 'national and international character, so that not only the people of the Union and of this continent, but those of all nations, as well, can participate.'

"We have no doubt that it was fairly a matter within the power of the legislature to determine whether, as a matter of public policy and as tending to advance the best interests of its citizens, this state should join with its sister states, and with the government of the United States, in celebrating in the way suggested the historical event referred to.

"It has been held in many cases that a municipal corporation has no authority, under the general powers usually given such corporations, to appropriate money for the celebration of the anniversary of important events in the history of our country, such as the Fourth of July (*Hodges v. Buffalo,* 2 Denio (N. Y.), 110; *Hood v. Lynn,* 1 Allen (Mass.), 103) and the surrender of Cornwallis. (*Tash v. Adams,* 10 Cush. (Mass.) 252. See, also, *The Liberty Bell,* 23 Fed. 844.)

"These decisions, however, all rest upon the principle that municipal corporations have no powers except such as are specifically granted by the act of incorporation, or are necessary for the purpose of carrying into effect the powers expressly granted. *But it has never been doubted that the state could confer upon a city or town the authority to celebrate such important events in the history of the country as appeal to the patriotism or higher sentiments of the people, and to tax their citizens to pay the expense thereof.* Thus it was held that the city of Philadelphia had the power under its charter to provide for the entertainment of distinguished visitors upon the occasion of the celebration of the Centennial Anniversary of American Independence. (*Tatham v. Philadelphia,* 11 Phila. (Pa.) 276.) So, also, in Massachusetts, by general statutes, the power has been conferred upon towns to celebrate the centennial anniversary of their incorporation (*Hill v. East Hampton,* 140 Mass. 381, [4 N. E. 811]), and also to appropriate money for the celebration of holidays, and for ***671** other public purposes. (*Hubbard v. Taunton,* 140 Mass. 467, [5 N. E. 157].)

"These cases are authority for the proposition that the state itself, unless restrained by its Constitution, has the power to make appropriations for such purposes, because unless it possesses the power, it could not confer it upon its municipal corporations. Such expenditures are justified under the general power which the state has to provide for the public welfare--the limits of which are perhaps not capable of exact definition--*and are the same in principle as appropriations made for the building of monuments to commemorate great historical events, or for the erection in public places of the statues of those who by common consent are classed among the patriots or benefactors of the nation.*

"Undoubtedly this power may be the subject of great abuse, but this is no argument against its existence. The only protection against reckless and improvident appropriations for public purposes must be found in the character of those intrusted with the power of legislation, and in the integrity and firmness of the chief executive of the state."

Obviously, there is a distinction between the act questioned in the Daggett case and the act involved in this proceeding with respect to the specific objects of the respective appropriations of the public money. Both, however, aim at the accomplishment of the same general object, viz., the promotion of the general public welfare. For, so far as the promotion of the public welfare is concerned, no distinction in importance or effect between the two acts can logically be pointed out. The exploitation of the industrial resources of a state is surely a matter which directly affects and, where such resources are in magnitude such as to demonstrate the natural material wealth and prosperity of the state, promotes the public welfare. No less may be said of public acts looking to the promotion and fostering in the citizens of a state or nation sentiments of patriotism, which, as we have shown, and as is most obviously true, constitutes the essential mainspring of every stable government. What, indeed, would industrial prosperity count for in a country whose government was without the support of the patriotism and loyalty of its subjects? The past political history of Russia, at this writing in the throes of bitter political disturbances and turbulences, may well stand as an answer to the question.

***672** As stated in the opinion in the Daggett case, *supra,* the question whether the public interests of the state as well as of the nation of which the former is an essential part will be advanced by the meeting in reunion at Vicksburg of the survivors of both sides of the Civil War that fought

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

at the battle known in history by the name of that city was an appropriate one for discussion in the halls of the legislature before the appropriation was made by a legislative act, and for the consideration of the executive before approving it. We must assume that the legislature and the Governor had before them facts and data upon which they were enabled to predicate their judgment that the state and the Union would be materially benefited by the reunion and thus the public welfare and general well-being of society subserved. Their conclusion regarding the act cannot, therefore, be impeached by the courts.

There is no language or provision in the statute appropriating the money indicating that any individual will or can, if the appropriation be properly expended, or dispensed according to the face of the act, receive a single cent as a gratuity or by way of assistance, but that the money appropriated shall be expended in such manner as the executive shall determine will the better and the more effectively effectuate the specific objects of the appropriation and the ultimate purpose to be thereby subserved. And herein lies the distinction between the appropriation in question and that considered and properly held invalid by this court in the case of *McClure v. Nye,* 22 Cal. App. 248, [[[133 Pac. 1145]. The act in that case attempted to appropriate the sum of fifteen thousand dollars, out of the state treasury "for the purpose of paying the transportation of certain veterans of the Civil War to Gettysburg, Pennsylvania, on the occasion of the fiftieth anniversary of the battle fought on that battlefield." Obviously, upon the very face of that provision the appropriation amounted to nothing less than a gift of public moneys, and hence flew squarely in the face of the provision of our Constitution against thus disposing of our public revenues. In the present case, as seen, the appropriation is to be used on the occasion of the reunion at Vicksburg for the purpose of effectuating the great, central object of the gathering, as pointed out by the act of Congress and the act here in question, viz., to strengthen the fraternal ties of amity in the United States. ***673** As shown, no express provision is made by the act for the payment of the transportation of veterans or other persons to Vicksburg, though we doubt not that if, in furtherance of the paramount and ultimate object of the reunion, it be necessary to apply some of the money in sending representatives from California to the reunion or convention, such expenditure would come within the legitimate purposes of the appropriation and the right of the state to bear.

We are now brought to the consideration of the principal point upon which the attorney-general relies to impeach the constitutional validity of the appropriation, viz.: That the act making the appropriation is inconsistent with the provisions of section 34 of article IV of the Constitution, which is above reproduced in full herein. The gravamen of the attorney-general's argument in support of this position is that the language of the act is so uncertain and indefinite that it cannot be determined therefrom whether the appropriation thereby provided for is or is not for a public purpose. This argument, no doubt, comes from the language of the act, "for the purpose of assisting to defray the expenses of a *public nature,"* etc. It may be conceded that this language is so general as to be ambiguous as to the specific purpose of the appropriation, and if the act contained no further amplification of the purpose for which the appropriation is designed than may be implied from those words-- that is, that the appropriation was for some unexpressed or undiscovered purpose--it might be necessary to hold that the position of the attorney-general is well taken. But the language referred to is immediately followed by other language which clearly and with certainty expresses the specific purpose of the appropriation--a purpose which the legislature has found refers to the general welfare of the state and, therefore, the expenses necessary for its execution a burden which may properly be borne by the state.

There is no ground to support the argument that the appropriation is not for a "single" purpose within the meaning of that word as it is employed in the section of the Constitution mentioned. The sole and only purpose of the appropriation, as is clearly deducible from the language of the act, is to assist in defraying the expenses of a convention of persons who are so to meet in reunion to effectuate a purpose by the execution of which, according to the tenor of the act here in ***674** question and the act of Congress above referred to, the public welfare of the state will be subserved.

Nor is there any legal reason which will uphold the objection that the act is invalid because it vests in the Governor discretion as to the expenditure of the money appropriated. This provision was doubtless inserted in the act for the purpose of committing to the judgment of the executive the determination of the manner in which the appropriation may be expended to the best and highest interests of the state. If, for illustration, it becomes

 © 2017 Thomson Reuters. No claim to original U.S. Government Works.

necessary to send representatives from the state to the reunion, it is only proper that the Governor, upon whom the act fixes the responsibility for the expenditure of the money, should be clothed with some discretionary power as to the number of persons so to be sent, and as to the amount of money that should reasonably be expended for defraying the expenses of such representatives to Vicksburg and back and while there during the progress of the convention. This should be true, since the act itself does not undertake to point out specifically how the money shall be used. Of course, the presumption is that the executive will perform his duty under the act faithfully and in furtherance of the objects and purposes intended to be subserved thereby.

Our conclusion is that the appropriation is perfectly valid, and, accordingly, a writ of mandate will issue out of this court commanding and requiring the respondent, state controller, to draw his warrant or warrants on the fund appropriated by the act in favor of the Governor of the state of California, as provided by said act, and, in accordance with the stipulation heretofore filed herein by the attorneys of the respective parties, said writ is ordered to issue forthwith.

Chipman, P. J., and Burnett, J., concurred.

Exhibit B

RECEIVED
October 10, 2017
Commission on State Mandates

Ms. Heather Halsey
Executive Director
Commission on State Mandates
980 Ninth Street, Suite 300
Sacramento, CA 95814

California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049, 16-TC-03

Dear Ms. Halsey:

The Department of Finance (Finance) has reviewed the test claim on the California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049. The claimants allege the test claim permit is a reimbursable state mandate because the test claim permit requirements exceed federal law, were not included in the prior permit and, therefore, impose a new program or higher level of service on local agency dischargers.

Finance defers to the State Water Resources Control Board and the California Regional Water Quality Control Board, San Francisco Bay Region, on the impact of the Supreme Court decision *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749 on the federal law component of the state mandate determination. Finance also defers to the Boards on the assertion that the test claim activities impose a new program or higher level of service. Finance comments primarily on the adequacy of fee authority issue raised by the claimants.

Claimants argue they have no fee authority or revenue source other than their general fund to fully cover the alleged mandated costs incurred for the claimed activities. Finance believes claimants do have stormwater fee authority undiminished by Propositions 218 or 26. Notably, Proposition 26 specifically excludes assessments and property-related fees imposed in accordance with Proposition 218 from the definition of taxes (Art. XIIIC, § 1, subd. (e)(7)). Further, claimants have authority to impose property-related fees under their police power for alleged mandated permit activities whether or not it is politically feasible to impose such fees via voter approval as may be required by Proposition 218. Local governments can choose not to submit a fee to the voters and voters can indeed reject a proposed fee, but not with the effect of turning permit costs into state reimbursable mandates.

In *Clovis Unified School Dist. v. Chiang* (2010) 188 Cal. App.4th 794, college districts challenged the State Controller's mandate claiming instructions that automatically reduced reimbursement claims by the amount the districts are statutorily authorized to charge students for health fees, regardless of whether the districts chose to charge the fees or not. The court held that "[to] the extent a local agency or school district 'has the authority' to charge for the mandated program or increased level of service, that charge cannot be recovered as a state-mandated cost. (*Clovis* at p. 812). The court reasoned that "this basic principle flows from common sense as well. As the Controller succinctly puts it, 'Claimants can choose not to require these fees, but not at the state's expense.'" (*Ibid.*)

The same reasoning applies to claimants here. They can choose not to put a fee to the voters, or the voters can reject a fee, but not at the state's expense. The application of Proposition 218 does not result in alleged mandate costs recoverable solely from tax proceeds. Sufficient fee authority exists, regardless of political feasibility. Under Government Code section 17556, subdivision (d), claimants have authority to impose fees sufficient to pay for permit activities and they are not eligible for mandate reimbursement.

If the Commission were to conclude the permit imposes reimbursable mandated costs, claimants identified potentially offsetting revenue, including Proposition 84 grant funds, other grant funds, and the Clean Water Fund that should reduce those costs and be identified by the Commission.

Sincerely,

JUSTYN HOWARD
Program Budget Manager

Re: San Francisco Bay Regional Water Quality Control Board Response to Union City Test Claim 16-TC-03 (Order No. R2-2015-0049)

Dear Ms. Halsey,

The San Francisco Bay Regional Water Quality Control Board (Regional Water Board) resubmits this response to Test Claim 16-TC-03 (Claim) and supporting attachments. These attachments include the Regional Board's record for Order No. R2-2015-0049 (Permit or MRP 2.0) as well as petitions for review of the Permit filed with the State Water Resources Control Board (State Board) and the Regional Board's response to the petitions. The complete State Board record has not been included because the State Board has not taken any action related to the petitions or the Permit. If the Permit is modified by action of the State Board, the Regional Board, or a court, we will advise the Commission accordingly.

As anticipated in our January 16 and January 24, 2018 notices, we have reformatted the attachments to make them searchable, to remove password protections, and to add Bates Numbers; corrected minor errors in the index; and made changes to the brief to include an omitted argument (pp. 7-8), to refine some of the information in the permit table (pp. 22-31), to correct errors in citations, and to add citations to Bates Numbers.

The Test Claim arises from a National Pollutant Discharge Elimination System (NPDES) Permit (Permit or MRP 2.0) (Order No. R2-2015-0049). The Permit authorizes the discharge of stormwater runoff from the municipal separate storm sewer systems (MS4s) of 76 municipalities and local agencies in the San Francisco Bay Area (Bay Area) (collectively Permittees). The Regional Water Board issued the Permit pursuant to the requirements of the Clean Water Act[1],

[1] Federal Water Pollution Control Act (FWPCA; 33 USCA §§ 1251 *et seq.*). The federal Act is referred to herein as the Clean Water Act (CWA) and the code sections used are for the CWA, which differ from the United States Annotated Code.

its implementing regulations, and guidance from the United States Environmental Protection Agency (U.S. EPA).

The first section of the Clean Water Act states Congress's intent "that the discharge of pollutants into the navigable waters be *eliminated* by 1985." Fundamentally, the Clean Water Act prohibits *any* discharge into navigable waters.[2] Claimant even concedes that Section 402(p) of the Clean Water Act mandates that an MS4 permit "*shall* include a requirement to effectively *prohibit* non-storm water discharges into the storm sewers[3]." On its face, therefore, the Clean Water Act *prohibits all* non-storm water discharges into the storm sewers. No trash. No PCBs.[4] No mercury.

The Ninth Circuit noted that "Stormwater runoff is one of the most significant sources of water pollution in the nation, at times "comparable to, if not greater than, contamination from industrial and sewage sources … Storm sewer waters carry suspended metals, sediments, algae-promoting nutrients (nitrogen and phosphorous), *floatable trash*, used motor oil, raw sewage, pesticides, and other *toxic contaminants* into streams, rivers, lakes and estuaries across the United States."[5] The requirements to control trash, mercury and PCBs thus are at the heart of a stormwater program.

Over the past two hundred years, thousands of mercury- and PCBs-containing buildings have been built and millions of trash-creating residents have settled in the Bay Area. The Regional Water Board and Permittees recognize that achieving zero discharge into the storm sewers is not a threshold that the Permittees can reach instantaneously. A permit that is completely consistent with the Clean Water Act – prohibiting *any* discharge – would result in Clean Water Act citizen suits against every discharger – none of whom could comply with such a permit requirement for years. It is only by virtue of permit provisions – including those at issue here - that any discharger may discharge *at all.*[6] The Permit therefore, not unlike a compliance schedule, gives the dischargers time and assists in developing methodologies to reach the end goal established by the Clean Water Act. Through each iteration of the San Francisco Bay MS4 permit, dischargers have improved the water quality of the MS4 discharges, gaining ground toward the Clean Water Act's fundamental prohibition. Ironically, the Regional Water Board finds itself defending a permit that is more *lenient* than what the Clean Water Act actually requires. It is incomprehensible that complying with a *less stringent permit* than the strict prohibition in the Clean Water Act could impose *additional* costs to the dischargers not required by federal law. But that is what Claimant argues here.

The Test Claim seeks reimbursement by the State of California for expenses Claimant contends it has incurred or will incur in implementing a select few provisions of the Permit. Specifically,

---

[2] CWA § 301, subd. (a).

[3] Test Claim, p. 5.3.

[4] Polychlorinated biphenyls are commonly referenced as "PCBs."

[5] *Environmental Defense Center, Inc. v. U.S. E.P.A.* (9th Cir. 2003) 344 F.3d 832, 840-841 (emphases added).

[6] CWA § 402, subd. (a)(1) and (2).

Claimant contests the trash load reduction provision (C.10) and mercury and PCB controls (included in Provisions C.3.j, C.11 and C.12).[7] There is also a prophylactic argument that monitoring provisions of C.8 are unfunded mandates. Claimant concedes that the MRP 2.0 adds nothing to the same requirements included in the 2009 version of the Permit (2009 MRP).[8]

To obtain reimbursement, Claimant must prove all of the following:

1. Claimant is required to use tax monies for Permit implementation. Here, 2017 legislation "reaffirms and reiterates" that municipalities are able to raise fees for all costs associated with implementing the Permit. Many other authorities and Permittees' own experience demonstrates this is true.
2. The costs are mandated by the State, rather than federal law, and must provide that any additional costs beyond the federal mandate are substantial and not *de minimis*. In fact, federal law requires each of the contested Permit provisions.
3. Either that (1) the program must carry out a governmental function of providing services to the public; or (2) the requirements, to implement a state policy, impose unique requirements on local governments and do not apply generally to all residents and entities in the State. In this case, NPDES permits governing private entities contain similar provisions requiring that those entities manage stormwater to avoid discharges of trash, PCBs and mercury, and monitor and report on those efforts. The contested provisions of the Permit are not unique to municipalities.
4. That the requirements constitute a new or higher level of service. Claimant's own papers admit that numerous provisions were already required and evidence demonstrates that Claimant voluntarily chose to perform various activities.

In order to prevail, Claimant would have to prove that it meets *all* of the above criteria. Here, the evidence is to the contrary and the Commission therefore should reject the Test Claim.

I. Background

U.S. EPA is the federal agency responsible for administering the Clean Water Act. Pursuant to federal law, U.S. EPA authorized the Regional Water Board to issue NPDES permits, including the Permit here. Federal authority forms the entire legal basis for the Permit provisions.[9] The Permit regulates the discharge of stormwater runoff from the MS4s of 76 cities, counties and special districts. The Clean Water Act requires that local agencies must apply for and receive permits regulating discharges of pollutants from the MS4s to waters of the United States.[10]

---

[7] Test Claim, p. 5.10.

[8] *Ibid.*

[9] See Item 467, MRP 2.0 Fact Sheet, Bates No. 83728 ("[T]his Permit implements federally-mandated requirements under CWA section 402, subdivision (p)(3)(B)") and 83724 ("The Basin Plan's comprehensive program requirements are designed to be consistent with federal regulations (40 CFR Parts 122-124) and are implemented through issuance of NPDES permits to owners and operators of MS4s").

[10] CWA § 402; *NRDC v. U.S. EPA* (9th Cir.) 966 F.2d 1292, 1295-96.

In response to the Clean Water Act amendments, the Regional Water Board issued municipal storm water Phase I permits to the entire county-wide urban areas of Santa Clara (1990), Alameda County (1991), Contra Costa County (1993), San Mateo County (1993), and the cities of Fairfield (1995), Suisun City (1995) and Vallejo (1998).[11] Starting in 2009, the Water Board began regulating Permittees under region-wide MS4 permits. That permit, the 2009 Municipal Regional Stormwater Permit (2009 MRP), regulated 76 municipalities and local agencies (Permittees) in the San Francisco Bay region.[12] Between 1987 and 2015, those permits were updated and refined to take into account EPA guidance and improved understanding of stormwater controls and monitoring.

To develop MRP 2.0, Regional Water Board staff worked with all municipalities to identify the common actions and controls in the plans and translated them into specific permit requirements in provisions for each of the base program elements. Regional Water Board Staff had approximately "100 meetings over two years with the Permittees, U.S. EPA, and other interests. These were both broad meetings about the entirety of the permit, as well as subject-specific work group meetings such as on PCBs, trash, or Green Infrastructure."[13] The resulting requirements specified applicability, scope, and minimum levels of effort required of actions and controls based on practicability, effectiveness, and costs of the actions and controls. As hoped, the resulting requirements also provided a tangible means of tracking and evaluating compliance with requirements and significantly reduced the burden of producing and reviewing annual reports.

On November 19, 2015, the Regional Water Board unanimously adopted Order No. R2-2015-0049, reissuing NPDES Permit No. CAS612008, and governing discharges from the MS4s of 76 jurisdictions and entities. As required by federal statute and regulations, the Permit contains requirements for the Permittees to take actions to reduce the flow of pollutants into waters in the San Francisco Bay region. The Permit is the fifth generation of municipal stormwater permits in the San Francisco Bay region, largely a continuation of the 2009 MRP, and therefore is colloquially referenced as "MRP 2.0."

While most requirements of MRP 2.0 are identical to the previous iteration, the Permit also contains new requirements pursuant to federal law, and adds implementation alternatives. These provisions incorporate key findings of the State Water Resources Control Board's (State Water Board's) issuance of State Water Board Order WQ 2015-0075 (Order WQ 2015-0075), pertaining to the Los Angeles MS4 (LA MS4). The Permit made only minimal adaptions and modifications from the 2009 MRP to require more targeted measures with documented success. In its comments on the draft Permit, U.S. EPA "underscore[d] [its] support for Water Board's position of including clear milestones and deadlines to evaluate pollutant-specific progress

[11] For more on the history of the earlier permit iterations, please see the Water Board's December 20, 2016 submission to the Commission.

[12] Item 721, 2009 MRP, Bates No. 109543-109833.

[13] Item 469, Nov. 18 Transcript, Bates No. 84006.

towards necessary water quality improvements and restoring beneficial uses."[14] The Permit provides minimum implementation levels (measurable outcomes), but allows Permittees flexibility to take into account the size of their respective jurisdictions and resources available to each. A number of permittees petitioned MRP 2.0 to the State Board, but as stated in nearly every petition Permittees filed, "the vast majority of MRP 2.0 was not the subject of significant dispute and is a tribute to an otherwise high level of cooperation between [Permittees] and the Regional Board staff." A number of Permittees petitioned the State Board, contesting MRP 2.0's adoption of numeric effluent limits (as opposed to narrative), the adequacy of the Permit's trash and various procedural issues.

Among other issues raised, and in contrast to Claimant's assertion that MRP 2.0 is an unfunded State mandate, San Francisco Baykeeper has also challenged the adequacy of monitoring provisions and the legality of the "safe harbor," claiming that the Regional Water Board failed to comply with federal authorities which require more *stringent* provisions. Specifically, Baykeeper claims the Regional Water Board:

> A. Improperly adopted safe harbor provisions in Section C.1 of the Permit that excuse compliance with the Permit's Receiving Water Limitations and Discharge Prohibitions for specific pollutants and receiving waters, in violation of the anti-backsliding requirements of the Federal WaterPollution Control Act, 33 U.S.C. § 1251 et seq. ("Clean Water Act" or "Act") (see 33 U.S.C. § 1342(o); 40 C.F.R. 122.44(l));
>
> C. Failed to include monitoring provisions in Sections C.8 and C.10 of the Permit that "assure compliance with permit limitations" or "yield data which are representative of the monitored activity," in violation of the Clean Water Act (see 40 C.F.R. §§ 122.44(i)(1), 122.48(b));[15]

The State Water Board has not issued an order or held a hearing on the petition as of this writing.[16]

Most permittees have funded their stormwater programs via fees on inspection and redevelopment. Permittees' Annual Reports demonstrate that nearly all are in compliance.[17]

---

[14] Item 729, U.S. EPA Letter to SF Water Board, Bates No. 110608.

[15] Item 666, Baykeeper Petition, Bates No. 104302.

[16] Permittees' Petitions to State Water Board are included as Items 657-668, starting at Bates No. 103750, and the Regional Water Board's Response to those Petitions is Item 656, Bates No. 103656.

[17] E.g., Item 884, Union City 2016-2017 Annual Report, Bates No. 131982-131984, 132016 (documenting compliance with green infrastructure requirements, including implementation of GI projects, and 74.35% trash load reduction); Item 727, Berkeley 2016-2017 Annual Report, Bates No. 110487 ("The City is currently in compliance with all requirements of the Order."); Item 857, Oakland 2016-2017 Annual Report, Bates No. 128106-128110, 128183 (demonstrating 74.7% trash reduction, completion of green infrastructure tasks); Clayton 2016-2017 Annual Report, Item 891, Bates No. 133632 ("I want to assure the board staff that the City of Clayton has done all the tasks required for FY 16-17 in the Annual Report…."); Item 910, Walnut Creek 2016-2017 Annual Report, at Bates No. 135417, 135456 (confirming approval of Green Infrastructure Framework/Work Plan and other GI-related tasks and 96.3% trash load reduction); Item 838, 2017 Foster City Annual Report, at Bates No. 125976 ("The Annual Report provides documentation of compliance activities during FY16/17 and related accomplishments."); Item 868, San Jose 2016-

(footnote continued on next page)

The seven permittees[18] not in compliance have plans to come into compliance. A better showing needs to demonstrate actual costs incurred from general funds before granting any of the test claims.[19]

II. The Fee Authority Exception Applies to the Test Claim

Claimant contends that, "[t]o the extent the Regional Water Board contends that the fee authority exception in section 17556, subdivision (d), is applicable to Union City's test claim …, the Regional Water Board bears the burden of proving the exception applies."[20] The Claimant states that it is "not aware of any state, federal or non-local agency funds that are or will be available to fund the MRP2 new activities at issue in this Test Claim" and further claims that it "has no authority to increase … revenue sources without seeking voter approval under Proposition 218."[21] In fact, the Claimant has fee authority, as the Legislature recently affirmed in Senate Bill 231, approved by the Governor October 6, 2017. Costs are not mandated by the State when the local agency has "authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service.[22]

A. Senate Bill 231 Affirms Claimant's Ability to Increase Sewer Fees Without Voter Approval

Proposition 218 amended the California Constitution to require an election by impacted property owners for property-related fee increases.[23] Article XIII D, Section 6, subdivision (c) (referenced herein as Section 6), however, provides an exception to the election requirements "for fees or charges for sewer, water, and refuse collection services." Senate Bill 231 "reaffirms and reiterates" that the definition of "sewer" for purposes of Article XIII D includes "systems, all real estate, fixtures, and personal property owned, controlled, operated, or managed in connection with or to facilitate sewage collection, treatment, or disposition for sanitary *or drainage*

(footnote continued from previous page)
2017 Annual Report, Bates No. 129469-129470, 129475, 129477-129478 (indicating compliance with trash load reduction, green infrastructure planning, and mercury and PCBs controls).

[18] These permittees are: Livermore, East Palo Alto, Pinole, Hercules, Unincorporated Alameda County, the City of Vallejo and Vallejo Sanitation and Flood Control District. See, e.g. City of Pinole 2017 Trash Addendum, Item 902, at Bates No. 134910 (plan to achieve compliance with trash provisions is already underway).

[19] There are a number of issues with the claimed costs. For example, Claimant identifies the purchase of a new Vactor truck to replace its old one as a cost associated with compliance. (Test Claim, pp. 5.13-5.14.) Claimant states that the cost was about $432,000 for the new truck, implicitly assigning this cost to MRP 2.0 requirements. They then indicate the new truck would be used about 3 months/year for trash capture device cleanout (and presumably 9 months/year for other projects), but do not pro-rate the costs. This is but one example of the types of questions that are not briefed here and should be resolved at the parameters and guidelines stage of the Commission's process. (Cal. Code Regs., tit. 2, § 1183.8) Should the Commission prefer that the Regional Water Board provide briefing on that issue before the P&G stage, the Regional Water Board respectfully requests an opportunity to do so.

[20] Test Claim, p. 5.7.

[21] Test Claim, pp. 5.23-5.24.

[22] See Gov. Code, § 17556, subd. (d).

[23] Cal. Const. §§ XIII C and D.

purposes, including lateral and connecting sewers, interceptors, trunk and outfall lines, sanitary sewage treatment or disposal plants or works, drains, conduits, outlets for *surface or storm waters*, and any and all other works, property, or structures necessary or convenient for the collection or disposal of sewage, industrial waste, *or surface or storm waters*."[24]

To the extent Claimant relies on *Howard Jarvis Taxpayers Ass'n v. City of Salinas* (2002) 98 Cal.App.4th 1351 as precluding the ability of a municipality to raise fees related to stormwater, the Legislature statutorily overturned that court's interpretation, finding that the court "failed to follow long-standing principles of statutory construction by disregarding the plain meaning of the term 'sewer,' and improperly substituted its own judgment for the judgment of voters.[25]

Accordingly, Claimant has the ability to increase sewer fees or charges without voter approval to cover any increased costs of implementing the permit.

B. The Permittees May Also Levy Regulatory Fees

The permittees are capable of crafting fees to cover the trash, mercury, PCB and green infrastructure provisions. The Supreme Court has validated the adoption of regulatory fees, providing they are not levied for unrelated revenue purposes.[26] It is reasonable to collect fees from developers for the costs associated with implementing the mercury, PCBs and green infrastructure provisions. Similarly, the costs of full trash capture can be allocated to businesses responsible for generating high trash areas. Asking these entities to bear the costs directly related to their activities "is comparable in character to similar police power measures imposing fees to defray the actual or anticipated adverse effects of various business operations."[27] Permittees' police power is "broad enough to include mandatory remedial measures to mitigate the *past, present or future* adverse impact of the fee payer's operations" in situations, like those present here, where there is a causal connection or nexus between the adverse effects and the fee payer's activities.[28]

---

[24] Gov. Code, § 53750, subd. (f) and § 53751, subd. (i), added by Stats. 2017, Ch. 536, § 2 (emphasis added). The Legislature noted the numerous authorities predating Proposition 218 that use this same definition, including (1) Section 230.5 of the Public Utilities Code, added by Chapter 1109 of the Statutes of 1970; (2) Section 23010.3, added by Chapter 1193 of the Statutes of 1963; (3) The Street Improvement Act of 1913; (4) *L.A. County Flood Control Dist. v. Southern Cal. Edison Co*. (1958) 51 Cal.2d 331("no distinction has been made between sanitary sewers and storm drains or sewers"); (5) Many other cases where the term "sewer" has been used interchangeably to refer to both sanitary and storm sewers including, but not limited to, *County of Riverside v. Whitlock* (1972) 22 Cal.App.3d 863, *Ramseier v. Oakley Sanitary Dist*. (1961) 197 Cal.App.2d 722, and *Torson v. Fleming* (1928) 91 Cal.App. 168; and (6) Dictionary definitions of sewer, which courts have found to be an objective source for determining common or ordinary meaning, including Webster's (1976), American Heritage (1969), and Oxford English Dictionary (1971).

[26] *Sinclair Paint Co. v. State Bd. Of Equalization* (1997) 15 Cal.4th 866, 876-77. See also *Cal. Farm Bur. Federation v. State Water Resources Control Bd.* (2011) 51 Cal. 4th 421, 437-438; *California Association of Professional Scientists v. Department of Fish and Game* (2000) 79 Cal.App.4th 935, 945 (distinguishing regulatory fees from taxes); *Schmeer v. County. of Los Angeles* (2013) 213 Cal. App. 4th 1310, 1326 (finding plastic bag charge retained by businesses not to be a tax).

[27] *Sinclair Paint Co., supra,* 15 Cal.4th at 877.

[28] *Id* at p. 877-878. Examples of non-tax fees within the police power of municipalities to impose include: single-use carryout bag ordinances charging fee for use of plastic or paper bags (e.g., Item 868, San Jose 2017 Annual Report, Bates No. 129616; Item 864, 2016-2017 Santa Clara Annual Report, Bates No. 129336); fines for violations of

(footnote continued on next page)

Public Resources Code section 40059, subdivision (a)(1), and Health and Safety Code section 5471 provide additional authority to charge fees for the costs associated with the contested provisions. Public Resources Code section 40059, subdivision (a)(1), confers fee authority on the permittees; "[a]spects of solid waste handling . . . are a local concern."[29] As discussed above, Permittees each have authority to regulate handling of waste that is generated and collected within their jurisdictions.

Similarly, Health and Safety Code section 5471, subdivision (a), gives the permittees fee authority for "services . . . furnished . . . in connection with . . . storm drainage." This authority is consistent with the above discussion concerning the Legislature's ratification of existing fee authority over matters pertaining to managing the storm system and protecting beneficial uses of the receiving waters.

C. Subvention Is Not Required Here, Where Claimant Has the Ability to Fund Additional Costs, if Any, of Implementing MRP 2.0.

Subvention is only required if expenditure of tax monies is required, and not if the costs can be reallocated or funded through service charges, fees, or assessments.[30] Subvention of funds is only required if expenditure of tax monies is required, and not if the costs are simply reallocated or funded through other means.[31]

In the case of the LA MS4 permit, the Supreme Court noted the Commission's conclusion that although the inspection requirements were new programs or higher levels of service, it found that the claimants in that case were not entitled to state reimbursement for the costs of

---

(footnote continued from previous page)
prohibitions on use of foam/polystyrene food containers (e.g., Item 868, San Jose 2016-2017 Annual Report, Bates No. 129617-129619); hazardous waste disposal fees for businesses that generate less than 100 kg of waste per month (Item 874, SCVURPPP 2016-2017 Annual Report, Bates No. 130322; Item 877, SMCWPPP 2016-2017 PCBs Control Measure Plan, Bates No. 131415); vehicle registration fees used to fund combined road safety/green infrastructure projects (Item 877, SMCWPPP 2016-2017 Annual Report, Bates No. 131083). See also generally, Item 874, SCVURPPP 2016-2017 Annual Report, Bates No. 130251 (describing effort to "develop a guidance memorandum on possible options for funding mechanisms to design, construct, and maintain prioritized GI projects, including in-lieu fees and alternative compliance, in order to assist co-permittees with the local funding options section of their GI Plans."); Item 841, 2016-2017 Fairfield-Suisun Urban Runoff Management Annual Report, Bates No. 126356 (evaluating funding options "such as a potential GI impact fee that would be assessed.")

[29] Pub. Resources Code, § 40059, subd. (a)(1).

[30] See Gov. Code, § 17556, subd. (d) (costs not mandated by the state when the local agency has "authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service"); *County of Los Angeles v. Comm'n on State Mandates*, *supra*, 110 Cal.App.4th at p. 1189 ("in order for a state mandate to be found, the local governmental entity must be required to expend the proceeds of its tax revenues"); *Redevelopment Agency v. Comm'n on State Mandates* (1997) 55 Cal.App.4th 976, 987 ("No state duty of subvention is triggered where the local agency is not required to expend its proceeds of taxes").

[31] See Gov. Code, § 17556, subd. (d).

compliance with the inspection requirements because "they could levy fees to cover the costs of the required inspections."[32]

> The Commission also finds that the remainder of the permit (parts 4C2a, 4C2b & 4E) does not impose costs mandated by the state … because the claimants have fee authority (under Cal. Const. article XI, § &) within the meaning of Government Code section 17556, subdivision (d), sufficient to pay for the activities in those parts of the permit.[33]

In the originating action, the Commission issued a Final Statement of Decision in a stormwater permit Test Claim filed by the County of Los Angeles and several additional co-permittee test claimants.[34] In the Commission's Statement of Decision, the Commission found that all but one of the challenged provisions issued by the Los Angeles Water Board in its MS4 permit did not qualify as unfunded state mandates as they did "not impose costs mandated by the state within the meaning of article XIII B, Section 6 of the California Constitution because the claimants have fee authority (under Cal. Const. article XI, § 7) within the meaning of Government Code section 17556, subdivision (d), sufficient to pay for the activities in those parts of the permit."[35]

Similarly, in this case, Claimant is not *required* to use taxes to pay for the costs of the programs, and can levy fees, such as inspection, trash, or permitting fees, in addition to sewer fees.[36] At the April 2017 Stormwater Finance Forum in Oakland, John Bliss of SCI Consulting, gave a presentation about how to implement stormwater control projects by imposing trash- and sewer-related fees or surcharges that would be exempt from the balloting required under Proposition 218. His presentation advocated funding a variety of stormwater-related programs in this way, including street sweeping, installing and maintaining full trash capture devices, and maintain catch basins.[37]

[35] County of Los Angeles Test Claim, Statement of Decision, p. 2.

[36] For a general overview of funding mechanisms that have been employed by municipalities, see Item 705, Black and Veatch 2005 Stormwater Utility Survey, Bates No. 107813 (72% cited stormwater user fees as major [at least 90% of total income] revenue sources and the majority of utilities resported funding was adequate to meet all or most needs). (See also Item 677, Agenda for Stormwater Financing Forum, Bates No. 106470-106472 [identifying ways to pay for stormwater controls].)

[37] Item 679, Bliss Presentation, Bates No. 106486-106509.

As described in the PCBs TMDL Staff Report, "urban runoff management agencies are expected to conduct or cause to be conducted a program to manage PCBs in building materials through their inspection programs."[38] In addition, Claimant may impose the cost of of storm drain connections on new development.[39] Mercury treatment requirements in MRP 2.0 were based on levels achievable via new and redevelopment controls, which are excluded from a mandate claim.[40] For other Provisions, cities can and do adopt fees from their residents and businesses that fund their stormwater programs. For example, the City of Alameda has adopted fees for implementation of their programs[41] and Palo Alto raised its stormwater fee.[42]

Union City's own test claim is weakened by the documentation it submitted, indicating that it has paid for many of its stormwater improvements with grant funding and has thus avoided having to levy such a fee.[43] Claimant cites several green streets projects, which were supported, in part, by State grants.[44] Claimant received a Proposition 84 grant for $3 million for the H Street green street improvements,[45] and $3 million for the South Decoto Green Streets.[46] Moreover, these project costs are not necessarily representative of what an ordinarygreen infrastructure retrofit might cost, because they are pilot/demonstration-scale projects that incorporated significant elements that would not have been incorporated in projects where cost was a leading concern.[47]

Other municipalities have found ways to fund compliance with their permit obligations. For example, the City of Oakland has, since 2006, had an "Excess Litter Fee" for defined types of typically high-trash generating busisnesses, such as fast food restaurants.[48] Eligible

[38] Item 685, PCBs TMDL Staff Report, Bates No.106610.

[39] See, e.g., Item 702, San Jose website (describing fee schedule for storm drain connections), Bates No. 107804. In its Final Statement of Decision in 07-TC-09, issued March 30, 2010, the Commission found that the Copermittees have authority to fund these programs. In that case, the claimants cross-petitioned, seeking a writ of mandate overturning the Commission's determination. The trial court has not resolved these issues.

[40] Item 467, MRP 2.0, Provision C.11, Bates No. 83813-83820.

[41] See, e.g., Item 703, Alameda website (describing stormwater fee structure), Bates No. 107805-107806.

[42] See Item 704, Mercury News article, Bates No. 107807-107808.

[43] Test Claim, p. 5.23

[44] Test Claim, p. pp. 5.18-19.

[45] Test Claim, p. 5.23. See also Item 724, Round 1 Proposition Grant Award List, Bates No. 110226; Item 726, Round 2 Proposition Grant Award List, Bates No. 110485.

[46] Test Claim, p. 5.23. See also Item 724, Round 2 Proposition 2 Grant Award List, Bates No. 110226.

[47] Claimant attempts to discount the significance of the grants in the accounting presented to the Commission, stating without support that it is "unlikely the City will be able to avail itself of future grant opportunities" and that "there are no other nonlocal agency funds that are or will be available to the City to pay for these increased costs." Test Claim, pp. 5.23-5.24. However the test of whether or not a program is reimbursable or a state mandate does not require the non-availability of "nonlocal agency funds." Finally, Claimant chose to do more expensive designs than the minimum required by the Permit. (See Item 723, Bates No. 109928, 109951, 109953 and Item 725, Bates No. 110243, 110246.) Regardless, the appropriate time for briefing these matters in detail is in the parameters and guidelines phase. (Cal. Code Regs., tit. 2, § 1183.8.)

[48] Item 673, 2016-2017 Oakland Annual Report, p. 106241.

businesses may reduce their fees by participating in a Business Improvement District (BID) and may be exempt from the fees if the BID has an adequate litter control program.[49]

Oakland's BIDs and Community Benefit Districts (CBDs), which cover 650 acres, are additional means of funding street cleaning, trash management, and green infrastructure.[50] Participating businesses vote to pay an additional assessment to fund maintenance and beautification projects within the district. There are currently more than 10 BIDs and CBDs in Oakland, with several more planned.[51] As one example, the Jack London Square BID has an annual budget of approximately $780,000 to fund "intensive cleaning of sidewalks, gutters, and fixtures in the public right-of way," graffiti removal, pressure washing of the 880 underpass, and planting of the street medians.[52] The Lake Merritt/Uptown CBD installed trash cans, planted medians, and organizes patrols for litter and graffiti removal.[53] The Temescal BID removed litter and debris, landscaped and installed and maintained planters.[54] At a forum on stormwater finance held by U.S. EPA in Oakland on April 5, 2017, Leslie Estes of the City of Oakland gave a presentation describing how to use litter fees and BIDs to fund stormwater improvements.[55]

Other jurisdictions have been equally successful. For instance, the City of Richmond partnered with Caltrans to install two high-density separators, a type of full-trash capture device, in areas that drained parts of Interstate 580. Caltrans funded the cost of installing the devices, a total of $2.3 million.[56] The City's September 30, 2017 Annual Report indicated that both of these full trash capture devices had been installed, and that Richmond had achieved 88% trash reduction as a result.[57] Atherton is receiving funding from Caltrans for green infrastructure.[58] San Jose was awarded $4 million to fund three green infrastructure projects.[59] The City and County governments in San Mateo County used $2 million in vehicle registration fees to fund grants for projects incorporating green infrastructure into road safety improvements.[60] The City of Half Moon Bay identified numerous funding sources for its green infrastructure projects, including

federal, state and local grants, Measure A and J funds, the gas tax, vehicle registration taxes, and development impact fees.[61]

Claimants have not demonstrated that they are precluded from establishing or raising fees to cover any increased costs to comply with the Permit. Whether circumstances make it difficult to assess fees is not relevant to the inquiry.[62] Claimant must establish that it is required to use tax monies to pay for implementation of permit provisions.[63] Here, the Legislature unequivocally proclaimed that Claimant has always had the ability to raise fees. Evidence of other similarly-situated municipalities demonstrates overwhelmingly that Claimant is able to raise any necessary funds to comply with MRP 2.0. There is no unfunded State mandate in these circumstances.

III. The Contested Permit Provisions Are Compelled by Federal Law.

Claimant concedes that if a permit requirement "is compelled by federal law, the state must implement a federal mandate and no reimbursement is required."[64] Claimant is correct; MRP 2.0 cannot be an unfunded State mandate if it imposes a requirement that is mandated by a federal law or regulation and results in costs mandated by the federal government.[65] Here, the Clean Water Act and its regulations require the Permit itself and federal law compels each of the contested provisions. The contested provisions of MRP 2.0 cannot be unfunded State mandates because they: 1) include provisions required by TMDLs; 2) are required Basin Plan Prohibitions approved by U.S. EPA; 3) are required by the Clean Water Act and 4) are mandated by other federal statutes. These are separate, independent federal requirements.

A. MRP 2.0 Provisions C.3.j, C.11.c, C.12.a, C.12.c, C.12.d, and C.12.e Implement A Federal Mandate

Provisions C.3.j, C.11.c, C.12.a, C.12.c, C.12.d, and C.12.e implement the Total Maximum Daily Load requirements under Clean Water Act section 1313, subdivision (d) (Section 303(d)). Section 303(d) requires states to determine which water bodies are not meeting applicable water quality standards, meaning that the water bodies are "impaired" for a particular pollutant, and to develop a "total maximum daily load" (TMDL) for that pollutant.

A TMDL establishes load allocations for the sources of the pollutant; achievement of these load allocations will ensure that water quality standards within the waterbody are met. In other

[62] *Connell v. Sup. Ct.* (1997) 59 Cal.App.4th 382, 398 (where statute on its face authorized water districts to levy fees sufficient to pay the costs associated with a regulatory change, there was no right to reimbursement); *Clovis Unified School Dist. v. Chiang* (2010) 188 Cal.App.4th 794, 812 ("to the extent a local agency… 'has the authority' to charge for the mandated program or increased level of service, that charge cannot be recovered as a state mandated cost").

[63] Gov. Code §§ 17553, subd. (b)(1)(F) [test claim must identify funding sources, including general purpose funds available for this purpose, special funds and fee authority]; and Gov. Code § 17556, subd. (d).

[64] Test Claim, p. 5.9.

[65] Gov. Code, § 17556, subd. (c).

words, load allocations are required to be "established at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety which takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality."[66] TMDLs proposed by the Regional Water Board must be approved by U.S. EPA before they become effective.[67] Once U.S. EPA approves a TMDL for a waterbody, any NPDES permit, including an MS4 permit, must include effluent limits "consistent with the assumptions and requirements of any available wasteload allocations."[68]

TMDLs also include an Implementation Plan, a road map for how the Regional Water Board anticipates that the load allocations will be met. The Implementation Plan is, like the TMDL itself, submitted to EPA for approval, and included in the San Francisco Water Quality Control Plan (Basin Plan).[69]

The water quality of San Francisco Bay is impaired by both mercury and polychlorinated biphenyls (PCBs). Therefore, in 2008 the Regional Water Board developed, and EPA approved, TMDLs for mercury and PCBs designed to reduce the input, or loads, of mercury and PCBs, respectively, to San Francisco Bay. The TMDLs and their Implementation Plans are part of the Basin Plan.[70] Both TMDLs require municipal stormwater agencies to take aggressive action to reduce mercury and PCBs in stormwater discharges and envision that these load reductions will be implemented in successive municipal stormwater permits. Both TMDLS recognized that identification of control measures that will effectively implement the load allocations will be a process of trial and error, and will not be possible within one permit term.[71] U.S. EPA echoed this in its comments on the draft permit, stating, "EPA supports the Water Board's inclusion of specific numeric mercury and PCB milestones and deadlines within this permit cycle."[72] EPA noted that these numeric milestones were consistent with federal guidance and recognized that the "pollutant-specific values are interim milestones to achieve step-wise progress in this permit as well as to measure progress towards attaining the final TMDL wasteload allocations (mercury in 2028 and PCBs in 2030)…."[73] Accordingly, the TMDL provisions in the permit, described below, are (1) required pursuant to 303(d); (2) even if not a federal mandate, are not part of a new program and do not impose a higher level of service, and are not unique to local governments.[74]

[73] *Ibid.*

[74] In the LA MS4 case, the Commission determined that the permit requirement pertaining to trash receptacles was a reimbursable state mandate, but specifically noted that those local agencies subject to the requirements were not subject to a trash TMDL. (Statement of Decision re. Case Nos. 03-TC-04, 03-TC-19, 03-TC-20 and 03-TC-21 (July 31, 2009), p. 1.) Notably, the Supreme Court's *Department of Finance* decision has no impact on this analysis.

1. TMDL Provisions in the Permit

In accordance with federal law, the Regional Water Board implemented the TMDLs for mercury and PCBs through MRP 2.0 provisions in C.3, C.11, and C.12, as described below:

> [T]he Water Board has found that there is a reasonable potential that municipal stormwater discharges cause or may cause or contribute to an excursion above water quality standards for the following pollutants: mercury [and] PCBs…in San Francisco Bay segments…. In accordance with CWA section 303(d), the Water Board is required to establish Total Maximum Daily Loads (TMDLs) for these pollutants to these waters to gradually eliminate impairment and attain water quality standards. Therefore, pollutant control actions and further pollutant impact assessments by the Permittees are warranted and required pursuant to this Order.[75]

> The [Green Infrastructure] Plan is intended to serve as an implementation guide and reporting tool during this and subsequent Permit terms to provide reasonable assurance that urban runoff TMDL wasteload allocations (e.g., for the San Francisco Bay mercury and PCBs TMDLs) will be met, and to set goals for reducing, over the long term, the adverse water quality impacts of urbanization and urban runoff on receiving waters.[76]

> The [green infrastructure planning and tracking] methods shall also address tracking needed to provide reasonable assurance that wasteload allocations for TMDLs, including the San Francisco Bay PCBs and mercury TMDLs, and reductions for trash, are being met.[77]

> The [mercury control] provisions implement the urban runoff requirements of the San Francisco Bay and Guadalupe River Watershed mercury TMDLs and reduce mercury loads to make substantial progress toward achieving the urban runoff mercury load allocations established for the TMDLs. The aggregate, regionwide, urban runoff wasteload allocation from the San Francisco Bay mercury TMDL is 82 kg/yr. The TMDL implementation plan calls for attainment of the allocation by February 2028 and, as a way to measure progress, attainment of an interim loading milestone by February 2018 of 120 kg/yr, halfway between the 2003 estimated load, 160 kg/yr, and the aggregate allocation.[78]

> The Permittees shall implement sufficient green infrastructure projects so that mercury loads are collectively reduced by 48 g/yr by June 30, 2020, which shall be extended to December 31, 2020, if the Permittees provide documentation that

[75] Item 467, MRP 2.0, Finding 11, Bates No. 83561.
[76] *Id.*, Provision C.3.j, Bates No. 83601-83606.
[77] *Id.*, Provision C.3.j.iv, Bates No. 83606.
[78] *Id.*, Provision C.11, Bates No. 83665-83670.

> control measures that will attain the load reduction will be implemented by December 31, 2020.[79]
>
> The provisions implement the urban runoff requirements of the PCBs TMDL. Permittees shall reduce PCBs loads by a specified amount during the term of the Permit, thereby making substantial progress toward achieving the urban runoff PCBs wasteload allocation in the Basin Plan. The allocation, on an aggregate and regionwide basis, is 2 kg/yr (1.6 kg/yr allocated to Permittees) to be achieved by March 2030. This wasteload allocation represents a load reduction from all urban runoff sources to the Bay of approximately 18 kg/yr (14.4 kg/yr from Permittees) compared to loads estimated using data collected in 2003.[80]
>
> Permittees shall prepare a PCBs control measures implementation plan and corresponding reasonable assurance analysis that demonstrates quantitatively that the plan will result in PCBs load reductions sufficient to attain the PCBs TMDL wasteload allocations by 2030. The plan must:
>
> (i) Identify all technically and economically feasible PCBs control measures to be Implemented (including green infrastructure projects).[81]

Claimant acknowledges that the 2009 MRP required "Permittees to implement Green Infrastructure projects to comply with mercury and PCB load reduction requirements[82]." In the next breath, Claimant claims that the "green infrastructure requirements are new; the term was not used even once in the MRP1."[83] Claimant omits any discussion of the prior permit's requirements for low impact development, which is part of green infrastructure, as identified in the green infrastructure definition they cite.[84] The requirements for green infrastructure Planning were included at the permittees' request as a means of meeting the load reductions required by the TMDLs.[85] As described further in the table below, green infrastructure and low impact development provisions are common in federally-issued stormwater permits, and EPA "is a strong proponent for green infrastructure (GI) plans in MS4 permits."[86] The permit fact sheet

was modified to accept EPA's recommendation that the permit include EPA's menu of potential components of green infrastructure plans.[87]

2. The Regional Water Board Had No True Choice in Implementing the TMDL Requirements.

The Regional Water Board has little discretion in complying with title 40 of the Code of Federal Regulations, part 122.44(d)(1)(vii)(B), which governs implementation of TMDLs through permitting requirements. That section specifically directs the Board to include effluent limits which are consistent with the assumptions of any applicable wasteload allocations (WLAs). The Board had no "true choice" but to include the TMDL-related provisions in MRP 2.0 that will result in attainment of the WLA within the timeframe established in the TMDL (in the case of both the PCBs and Mercury TMDLs, 20 years.[88] The results of the pilot testing during the 2009 permit term demonstrate the lack of "true choice" for the Regional Water Board in imposing permit terms compliant with the TMDL. The Regional Water Board's Watershed Division Chief, Keith Lichten, described the PCBs TMDL load reduction requirements at the MRP 2.0 adoption hearing. He explained that the PCBs provisions were designed to achieve the stringent wasteload allocations set in the TMDL:

> The PCBs TMDL estimates that PCBs load from urban stormwater runoff is 20 kilograms per year, it assigns stormwater a waste load allocation of two kilograms per year, thus requiring a reduction of 18 kilograms per year after 20 years, and about 14 kilograms of that is assigned to the Permittees.
>
> MRP II would require a reduction of half a kilogram per year of PCBs by midway through the second year of the permit, and that would increase to three kilograms per year by the end of the permit term. That's about one-fifth of the PCBs TMDLs 14 kilograms per year load reduction requirements for the MRP Permittees, and it would be achieved half-way through that 20-year TMDL schedule[89]."
>
> ***
>
> We need the Permittees to make substantial progress in load reductions consistent with the TMDL during this permit term. As a result, MRP II requires the load reductions and reporting on where, what and when actions will be taken to achieve them[90]."

The Implementation Plans of both the Mercury and PCBs TMDLs provide for adaptive implementation of the load allocations for municipal stormwater. "Adaptive implementation

90 *Id*. at Bates No. 84027

simultaneously makes progress toward achieving water quality standards through implementing actions while relying on monitoring and experimentation to reduce uncertainty and refine future implementation actions."[91] The Implementation Plans anticipated that the first permit (in 2009) would require only pilot testing of mercury and PCBs controls, but that results of this testing would determine the requirements of the second permit (the provisions challenged here).

> The second five-year term permit requirements will be based on the knowledge gained during the first permit term and will call for strategic implementation of the BMPs and control measures identified as effective and that will not cause significant adverse environmental impacts based on the pilot studies conducted during the first permit term. The second term permit will also require development of a plan to fully implement control measures that will result in attainment of allocations, including an analysis of costs, efficiency of control measures and an identification of any significant environmental impacts[92].

Indeed, the provisions of MRP 2.0 reflect lessons learned during pilot testing: e.g., requiring PCBs reductions by "addressing building materials during demolition, from green infrastructure, particularly in older industrial areas, from referral of PCBs-contaminated sites for cleanup, from addressing PCBs in storm drain infrastructure, and street sweeping and other enhanced maintenance measures in contaminated areas[93]." U.S. EPA supported and recommended the retention of "the Water Board's approach to allow for flexibility in determining the various control measures to achieve PCBs milestones" in the final permit.[94] U.S. EPA also supported the accounting framework "based on permittees' success with several PCBs pilot projects during the current permit term, and likelihood of continued permittee efforts," and "endorse[d] the Water Board's evolving 'program' to minimize PCBs from entering urban runoff via age-specific building materials and concrete sealants."[95]

Accordingly, the Regional Water Board's discretion is curtailed by both the information on effectiveness submitted by permittees, which showed that green infrastructure would be effective and feasible for controlling PCBs and mercury discharges in stormwater when deployed on a large scale throughout the region, and the looming obligation to comply with aggressive load reductions to achieve water quality standards. Thus, the Regional Water Board had no "true choice" in imposing the challenged green infrastructure provisions of the new permit.

B. Clean Water Act Prohibitions

[91] Item 685, PCBs Staff Report, Bates No. 106607.

[92] Item 685, PCBs Staff Report, Bates No. 106611.

[93] Item 469, Nov. 18 Transcript, Bates No. 84024.

[94] Item 729, U.S. EPA Letter to SF Water Board, Bates No. 110609.

[95] *Ibid.*

As discussed above in the introductory remarks, the Clean Water Act requires that MS4 permittees effectively prohibit non-stormwater discharges to their MS4s.[96] Clean Water Act section 301 prohibits the discharge of any pollutant by any person without a permit. The Act "prohibits the discharge of any pollutant except in compliance with one of several statutory exceptions."[97] The first principle of the statute is that "it is unlawful to pollute at all. The Clean Water Act does not permit pollution whenever that activity might be deemed reasonable or necessary; rather, the statute provides that pollution is permitted only when discharged under the conditions or limitations of a [federal discharge] permit.[98]

Pursuant to Clean Water Act section 402, subdivision (p)(3)(B)(ii), permitting agencies "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers." U.S. EPA has defined "storm water" to mean "stormwater runoff, snow melt runoff and surface runoff and drainage."[99] In general, the requirement to "effectively prohibit" non-stormwater discharges requires either prohibiting the flows to or from the MS4's system or ensuring that operators of such non-stormwater systems obtain permits for those discharges.[100] MS4 operators meet this requirement by implementing "a program, including a schedule, to detect and remove … illicit discharges and improper disposal into the storm sewer."[101] Although U.S. EPA has exempted specified categories of non-stormwater discharges from this prohibition, the same regulation provides that the exemption no longer applies to a category that a municipality has identified as a pollutant source.[102]

Federal MS4 permit application requirements specify that an applicant must demonstrate adequate legal authority to "[p]rohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;" and "[c]ontrol through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water."[103] The regulations define the term "illicit discharges" as "any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to an NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer)…."[104] In other words, since illicit discharges are not authorized by the Clean Water Act, they must be prohibited.

---

[96] See State Water Board Order No. 2015-0175 (2012 LA MS4 Permit), pp. 62-63 (confirming that non-stormwater discharges to the MS4s under the Clean Water Act are not subject to the MEP standard applicable to stormwater discharges).

[97] See *WaterKeepers Northern California v. State Water Resources Control Bd.* (2002) 102 Cal.App.4th 1448, 1452.

[98] *Natural Resources Defense Council, Inc. v. U.S. E.P.A*. (D.C. Cir. 1987) 822 F.2d 104, 123; see 33 U.S.C. § 1311, subd. (a).

[99] 40 C.F.R. § 122.26.

[100] 55 Fed. Reg. 47990 at 47995.

[101] 40 C.F.R. § 122.26, subd. (d)(2)(iv)(B).

[102] *Ibid.*

[103] 40 C.F.R. § 122.26, subd. (d)(2)(i)(B) and (C).

[104] *Id.* at § 122.26, subd. (b)(2).

While "non-storm water" is not defined in the CWA or federal regulations, the federal regulations define "illicit discharge" as "any discharge to a municipal separate storm sewer that is not composed entirely of storm water and that is not covered by an NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer and discharges resulting from fire fighting activities)."[105] This definition is the most closely applicable definition of "non-storm water" contained in federal law. As stated in the Phase I Final Rule, U.S. EPA added the illicit discharge program requirement to begin implementation of the 'effective prohibition' requirement to detect and control certain non-storm water discharges to their municipal system. U.S. EPA stated: "Ultimately, such non-storm water discharges through a municipal separate storm sewer must either be removed from the system or become subject to an NPDES permit (other than the permit for the discharge from the [MS4])."[106] Thus, federal law mandates that permits issued to MS4s must require management practices that will result in reducing storm water pollutants to the maximum extent practicable (MEP) yet at the same time requires that non-storm water discharges be effectively prohibited from entering the MS4. The argument that non-storm water discharges, prohibited from entry into the MS4 in the first instance, should be held to comply with only the less stringent MEP standard developed for storm water discharges is contrary to and potentially renders the "effectively prohibit" requirement in section 402(p)(3)(B)(ii) meaningless.

C. Basin Plan Prohibitions

The water quality control plan applicable in the San Francisco Bay region is the “San Francisco Bay Basin Water Quality Control Plan (Basin Plan).[107] The beneficial uses, water quality objectives, and antidegradation policy constitute water quality standards for purposes of compliance with the Clean Water Act.[108] Pursuant to Clean Water Act section 303(c), the U.S. EPA must review and approve all water quality standards. Since 1975, the Basin Plan has prohibited the discharge of rubbish and litter, and toxic and deleterious substances.[109]

> It shall be prohibited to discharge:
>
> ***
>
> All conservative toxic and deleterious substances, above those levels which can be achieved by a program acceptable to the Regional Board, to waters of the Basin.
>
> ***

[105] 40 CFR § 122.26(b)(2).

[106] 55 Fed. Reg, 47990, 47995 (Nov. 16, 1990).

[107] The complete, current Basin Plan may be accessed at https://www.waterboards.ca.gov/sanfranciscobay/basin_planning.html#basinplan.

[108] Wat. Code, §§ 13142, 13240, 13241, 13242; 33 U.S.C § 1313(c); 40 C.F.R. § 131.3(i); 40 C.F.R. § 131.6 (2010).

[109] Item 684, Bates No. 106525 et seq.

> Rubbish, refuse, bark, sawdust, or other solid wastes into surface waters or at any place where they would contact or where they would be eventually transported to surface waters, including flood plain areas.[110]

Provisions C.10 (trash), C.11 and C.12 (mercury and PCBs) are designed to protect U.S. EPA's approved water quality standards established in the Basin Plan.

The Fact Sheet indicates that the Regional Water Board adopted the Prohibition in 1975.[111] Government Code section 17551, subdivision (c), requires Claimant to file test claims within 12 months of the effective date of a statute or executive order. The time for challenge to these prohibitions passed more than thirty years ago.

D. Federal Requirements for Monitoring

Claimant has incorporated the prior briefing concerning monitoring provisions in C.8, conceding that the contested provisions were already required by the 2009 MRP.[112] The contested monitoring provisions in C.8 constitute data and reports on permit implementation that provide the required information concerning the status of implementation controls.

The inclusion of monitoring requirements in the 2009 MRP is consistent with comments on a draft version of the permit, in which U.S. EPA staff noted that they supported the inclusion of detailed requirements in the permit.[113] U.S. EPA had complained prior to issuance of the 2009 MRP that "[o]ur municipal audits of recent years have identified lack of detailed requirements as a frequent shortcoming in previously issued-permits in our Region."[114] And Mr. Bromley's comments are consistent with the finding in *San Francisco Baykeeper v. Regional Water Quality Control Board, San Francisco Bay Region* (2003).[115] Although not precedential, this case ordered the Regional Water Board to include type, interval and frequency sufficient to yield data representative of the monitored activity, citing the Code of Federal Regulations.[116] For the Regional Water Board to decline to do so would have risked being in contempt of court.

[112] Test Claim, p. 5.10.

[113] Item 729, U.S. EPA Letter to Regional Board, Bates No. 110608. The trash monitoring provisions of C.10 were made more specific in response to EPA comments on the draft Permit. See Item 460, Response to Comments, Section C.10, Appendix C, Bates No. 82693.

[114] Item 689, Email from Eugene Bromley, EPA, "Comments on December 27 Draft MRP", Bates No. 106973.

[115] Item 690, *San Francisco Baykeeper v. Regional Water Quality Control Board, San Francisco Bay Region* (2003) San Francisco Superior Court No. 500527, Order Granting Petition for Writ of Mandate and Statement of Decision, Bates No. 106974-106979.

[116] *Id*. at Bates No. 106977 (citing 40 C.F.R. § 122.48, subd. (b)).

Subsequent permits therefore included these required elements, including Provision C.8 in MRP 2.0.

Claimant acknowledges that any claim concerning C.8 should have been raised and resolved with respect to the 2009 permit and not here.[117] Should the Commission re-evaluate those claims here, the Regional Water Board incorporates prior briefing on Provision C.8 as submitted in the May 17, 2011 submission[118] and augmented in the December 20, 2016 submission concerning the impact of the Supreme Court's decision in *Department of Finance*. The 2011 Response briefs the numerous federal requirements that validate the 2009 MRP's monitoring provisions.[119] The supplemental briefing describes how the Supreme Court's decision in *Department of Finance* did not impact any federal authorities requiring monitoring.

It bears noting that San Francisco Baykeeper has petitioned the State Water Board, claiming that the monitoring required by Provisions C.8 is not stringent enough to comply with the Clean Water Act.[120] While the Regional Water Board disagrees that the monitoring provisions are inadequate, Baykeeper's argument supports the conclusion that the provisions are no more stringent than what federal law requires.

E. U.S. EPA Has Required Similar Provisions In Permits It Has Issued.

In concluding that the trash receptacle requirement in the LA MS4 Permit was not a federal mandate, the Supreme Court found that "the fact the EPA itself had issued permits in other cities, but did not include the trash receptacle condition, undermines the argument that the requirement was federally mandated."[121] In contrast to the LA MS4 permit, U.S. EPA has issued permits requiring substantially similar provisions to the contested provisions of MRP 2.0. The following table lists provisions in permits the U.S. EPA has issued that are analogous to the challenged provisions in MRP 2.0, demonstrating that these provisions are federally mandated and that the Regional Water Board effectively administered federal requirements concerning permit requirements for monitoring, green infrastructure, and trash.

To the extent the provisions are more detailed or provide more specificity than past iterations of MRP 2.0, that is consistent with U.S. EPA's guidance that successive permits for the same MS4 must become more refined and detailed:

[117] Cal. Code Regs.,tit. 2, § 1183.1, subd. (c).

[118] Due to similar claims, this brief covers many of the same issues as the May 17, 2011 Response to Test Claims 10-TC-01, 10-TC-02, 10-TC-03 and 10-TC-05. To avoid undue length, this brief will refer as appropriate to that brief (2011 Response).

[119] 2011 Response, pp. 27-29 (MS4 permits must require monitoring conditions), 42-43 (monitoring provisions required by Clean Water Act and implementing regulations); 43-44 (collaborative and watershed monitoring required by federal law); 44-45 (characterization of MS4 discharges required by federal law); 46 (citizen monitoring required by federal law); 47 (electronic reporting required by federal law).

[120] Item 666, Baykeeper Petition, Bates No. 104302.

[121] *Department of Finance v. Comm'n on State Mandates, supra*, 1 Cal.5th at p. 772.

> The EPA also expects stormwater permits to follow an iterative process whereby each successive permit becomes more refined, detailed, and expanded as needed, based on experience under the previous permit. See, 55 Fed. Reg. 47990, 48052 ("EPA anticipates that storm water management programs will evolve and mature over time."); 64 Fed. Reg. 67722, 68754 (Dec. 8, 1999) ("EPA envisions application of the MEP standard as an iterative process.") Interim Permitting Approach for Water Quality-Based Effluent Limitations in Stormwater Permits (Sept. 1, 1996) ("The interim permitting approach uses BMPs in first-round storm water permits, and expanded or better-tailored BMPs in subsequent permits, where necessary, to provide for the attainment of water quality standards.")[122]

(Emphasis in original.) The need for, e.g., "expanded or better-tailored BMPs" is illustrated in the specificity of U.S. EPA's own permit provisions, as shown here:

MRP 2.0	U.S. EPA-Issued Permits
Provision C.3.j (Permittees shall complete and implement a Green Infrastructure Plan to include low impact development drainage design into storm drain infrastructure on public and private lands)	Item 654, Consent Decree, Bates No. 103435. The consent decree for the Boston Water and Sewer Commission (BWSC) requires submission of BMP proposal to EPA that "include[s] and emphasize[s] the use of all appropriate currently available Green-Infrastructure ("GI") and Low-Impact Development ("LID") techniques." Upon approval of this proposal by EPA, the Commission must submit a "Phase I BMP Implementation Plan that contains recommendations and schedules for the implementation of specific GI/LID BMPs [in specified areas around Boston]." Item 655, 2016 Annual Report, Bates No. 103537. BWSC 2016 Annual Report indicates that, in compliance with the Consent Decree, they have submitted a watershed-scale stormwater management plan that evaluates systematic implementation of BMPs, including structural BMPs/GI in Boston aimed at reducing pollutant loadings in stormwater discharges sufficient to meet applicable total maximum daily loads. One component of the BMP plan is to collaborate with the Boston Transportation Department to expand Boston's Complete Streets Initiative, which requires green infrastructure in street design, and to further define green design guidelines and emphasize implementation of priority BMPs with high pollutant removal efficiency. Another is to identify large

[122] Item 695, Letter from Alexis Strauss to Tam Doduc and Dorothy Rice, April 10, 2008, Bates No. 107261-107262 concerning Los Angeles County Co-permittees Test Claim Nos. 03-TC-04, 03-TC-19, 03-TC-20, and 03-TC-21. See also Item 729, U.S. EPA Letter to SF Regional Board, Bates No. 110608.

	impervious areas for retrofit such as parking lots with areas greater than 10,000 square feet that present BMP opportunities. *Id.* at Bates No. 103538-103539. BWSC's 2016 Annual Report shows that the City is implementing multiple green infrastructure projects around Boston, including projects at five public schools, a city-owned playing field, and near three tributaries to the Charles River. "The knowledge and experience gained pursuant to these projects will help guide Commission as it develops more detailed designs and schedules for installation of BMPs/GI citywide." Item 693, 2011 Washington, DC Permit, Bates No. 107100-107102. Requires Permittee to create green landscaping incentive program, develop performance standards for retrofits, inventory retrofit opportunities on federal land, and achieve targets for stormwater treatment, retention, tree planting, and green roofs. Item 671, MA MS4 General Permit. Requires report assessing zoning and design criteria and regulations affecting impervious cover in streets and parking lots (Bates No. 105739), including requirement to implement recommended changes to minimize impervious cover (Bates No. 105774); requires implementation of recommended, feasible changes to regulations to allow various green infrastructure techniques (Bates No. 105774-105775); requires inventory and identification of public properties to be retrofitted with stormwater controls (Bates No. 105775); requires development of new and redevelopment program, including LID planning and design, and stormwater controls in accordance with specified BMPs that specified amounts of certain pollutants (Bates No. 105772, 105773). Item. 670, Worcester, Draft 2008 EPA Permit, Bates No. 105700. EPA's draft permit for Worcester, Massachusetts, requires mapping of priority public and private facilities discharging pollutants throughout the MS4 (Bates No. 105703); coordination among public agencies for permitting of new development, and a program for construction and post-construction stormwater controls, including low-impact development technicques, (Bates No. 105703-105704) identification of regulatory barriers to implementing low-impact development and revisions to overcome them (Bates No. 105704); mapping of impervious area (Bates No. 105705) Requires infiltration or injection of storm water from new development or redevelopment sites, where feasible and appropriate, to approximate the annual recharge of

	groundwater occurring during pre-development conditions consistent with specified standards. (Bates No. 105700) Item 672, General Small MS4 for MA, NH, and tribal lands in CT. The permit requires permittees with stressed groundwater basins to "minimize the loss of annual recharge to ground water from new and redevelopment, including but not limited to drainage improvements done in conjunction with road improvements, street drain improvement projects and flood mitigation projects, Item 672, Bates No. 105800 Item 669, Draft NH Small MS4,Bates No. 105652. It also would require implementation of programs leading to disconnection of directly connected impervious area on municipal and/or private property, including green roofs, residential rain garden programs, removal of unnecessary impervious area, and downspout disconnection. *Id.*, Bates No. 105673. The Draft NH Small MS4 Permit requires site plan review for opportunities to use low impact design and green infrastructure. When the opportunity exists, the permittee shall encourage project proponents to incorporate these practices into the site design. The permittee shall track the number of site reviews, inspections, and enforcement actions. *Id.* Bates No. 105674. It would also require permittee to assess whether street design and parking lot guidelines can be modified to support low impact design options, coordinate with local planning and transportation boards, and recommend schedules for incorporating changes into relevant documents and procedures to minimize impervious cover in parking areas and street designs. *Id.* Bates No. 105674-105675. Permittee would assess the feasibility of making, at a minimum, specified green infrastructure practices allowable: green roofs, infiltration practices such as rain gardens, planter gardens, porous and pervious pavements, and other landscaping/soil based stormwater management techniques, water harvesting devices such as rain barrels and cisterns, and the use of stormwater for non-potable uses. Assessment would also identify any impediments to such practices, and include progress in annual reports. Requirement for an "inventory and priority ranking of permittee-owned property and existing infrastructure that could be retrofitted with BMPs designed to reduce the frequency, volume and pollutant loads of stormwater discharges to its MS4 through the mitigation of impervious area.

	Item 697, Albuquerque MS4 Watershed permit, Bates No. 107421-107426. Permittees required to implement a program that, inter alia: Describes master planning and project planning procedures to control the discharge of pollutants to and from the MS4. Minimizes the amount of impervious surfaces within each watershed, by controlling the unnecessary creation, extension and widening of impervious parking lots, roads and associated development. The permittee may evaluate the need to add impervious surface on a case-by-case basis and seek to identify alternatives that will meet the need without creating the impervious surface. Implements stormwater management practices that minimize water quality impacts to streams, including disconnecting direct discharges to surface waters from impervious surfaces such as parking lots. Implements stormwater management practices that protect and enhance groundwater recharge as allowed under the applicable water rights laws. Item 701, Boise/Garden City MS4 Permit, Bates No. 107753-107555. Requires Green Infrastructure/LID incentive strategy and pilot projects, development of one "green" outfall disconnection, and incorporation runoff reduction into street repairs.
Provision C.8.a (Permittees shall participate in monitoring program) **Provision C.8.b** (Permittees' monitoring data must meet minimum data quality requirements) **Provision C.8.c** (Permittees shall contribute to regional monitoring program) **Provision C.8.d** (Permittees shall monitor creeks for impacts of	Item 696, Washington, D.C. (2011) (Permit No. DC0000221), Revised Monitoring Program for D.C.'s NPDES Permit, Bates No. 107274: monitoring program "builds on" monitoring activities in prior permits. Item 693, Washington, DC NPDES Permit, Bates No. 107122-107127 Requires wet weather discharge monitoring; storm event data; sample type, collection, and analysis; dry weather monitoring; area and/or source identification program; flow measurements; minimum monitoring and analysis procedures. Item 700, Joint Base Lewis-McChord (2013) (Permit No. WAS-026638), Section IV.A.9, Bates No. 107705: Provides for participation in Puget Sound Regional Monitoring Program in lieu of certain monitoring requirements. Item 696, D.C. Revised Monitoring Program, Bates No. 107294-107296. Requires wet monitoring in three creeks and

stormwater) **Provision C.8.f** (Permittees shall implement pollutant of concern load monitoring and long-term monitoring using protocols identified in the Code of Federal Regulations) **Provision C.8.g** (Permittees shall monitor for pesticides and toxicity)	multiple special study sites. *Id.*, Bates No. 107292. Requires monitoring for pollutants of concern identified in historical data. Item 693, D.C. NPDES Permit, Bates No. 107123. Listing locations of monitoring stations. See generally Item 701, Boise/Garden City Area MS4 Permit, Section IV , Bates No. 107777-107785 (Monitoring and Reporting Requirements). See generally Item 697, Albuquerque MS4 Watershed Permit, Part III, Bates No. 107448-107455 Monitoring, Assessment, and Reporting Requirement (similar provisions).
Provision C.8.e (When Status Monitoring results trigger a follow-up action, Permittees shall conduct a site-specific evaluation)	Item 696, Washington, D.C. Revised Monitoring Program (2016), Bates No. 107283-107284: Monitoring is adaptive – the monitoring program incorporates the flexibility to be modified if needed. For instance, it can be modified if monitoring results identify the need to incorporate a follow-on study or if additional parameters or sites need to be monitored to gather the information required to understand sources or stressors and their impacts. See also *id.* Bates No. 107323, Follow Up Site Visits and Investigation, which requires: "This element addresses Section 5.4 of the MS4 permit, which requires DOEE to '… identify, investigate, and address areas and/or sources within its jurisdiction that may be contributing excessive levels of pollutants to the MS4 and receiving waters…'"
Provision C.8.h (Report data and monitoring; report data electronically)	Item 693, Washington, D.C. (2011) (Permit No. DC0000221), Bates No. 107126 (electronic reporting of monitoring results); Item 696, Washington, D.C., Revised Monitoring Program (2016), Bates No. 107348: "DOEE's monitoring data (quantitative and qualitative) will be input into separate Microsoft Access databases for each component of the Revised Monitoring Program…." *Id*. at Bates No. 107328: "Data are initially recorded on paper data sheets and then transferred into an electronic database." Item 697, Albuquerque MS4 Permit, Bates No. 107455:

	requiring electronic submission of discharge monitoring reports, annual reports, and all other reports required under the permit.
Provision C.10.a.i, ii, and iii (Permittees shall implement trash load reduction control actions to meet the goal of 100 % or no adverse impact to receiving waters from trash by July 1, 2022; Permittees shall demonstrate attainment; mandatory minimum trash capture) **Provision C.10.b** (Permittees shall demonstrate trash reduction)	Item 693, Washington, D.C. (2011) (Permit No. DC0000221), Bates No. 107114: The permittee shall continue to ensure the implementation of a program to further reduce the discharge of floatables (e.g. litter and other human-generated solid refuse). The floatables program shall include source controls and, where necessary, structural controls. *Id.*, Bates No. 107117-107118: At the end of the first year the permittee must submit the trash reduction calculation methodology with Annual Report to EPA for review and approval. The methodology should accurately account for trash prevention/removal methods beyond those already established when the TMDL was approved, which may mean crediting a percentage of certain approaches. The calculation methodology must be consistent with assumptions for weights and other characteristics of trash, as described in the 2010 Anacostia River Watershed Trash TMDL. Annual reports must include the trash prevention/removal approaches utilized, as well as the overall total weight (in pounds) of trash captured for each type of approach. *Id.* at Section 4.4.1, Bates No. 107110: Inventory of Critical Sources and Source Controls: *Ibid.,* 4.4.1.1: The permittee shall continue to maintain a watershed-based inventory or database of all facilities within its jurisdiction that are critical sources of stormwater pollution. *Id.*, 4.4.1.3, Bates No. 107111: The permittee shall update its inventory of critical sources at least annually. *Ibid.* 4.4.2: Inspection of Critical Sources. The permittee shall continue to inspect all commercial facilities identified in Part 4.4.1. herein and any others found to be critical sources twice during the five-year term of the permit. A minimum interval of

	six months between the first and the second mandatory compliance inspection is required, unless a follow-up inspection to ensure compliance must occur sooner. *Id.*, Section 4.7.1, Bates No. 107113: The permittee shall continue to implement an ongoing program to detect illicit discharges, pursuant to the SWMP, and Part 4 of this permit, and to prevent improper disposal into the storm sewer system, pursuant to 40 C.F.R. § 122.26(d)(2)(iv)(B)(1). Such program shall include, at a minimum the following: … d. Visual inspections of targeted areas. *Id.*, Section 4.10.1, Bates No. 107117-107118, Anacostia River Watershed Trash TMDL Implementation: The permittee shall attain removal of 103,188 pounds of trash annually, as determined in the Anacostia River Watershed Trash TMDL, as a specific single-year measure by the fifth year of this permit term. *Id.*, Section 4.10.3, Bates No. 107118: Consolidated TMDL Implementation Plan requiring, where applicable, "numeric benchmarks [which] will specify annual pollutant load reductions and the extent of control actions to achieve these numeric benchmarks" and interim milestones. The plan must also demonstrate, using modeling, how goals will be attained and include a narrative explanation for the schedules and controls proposed. Item 696, Revised Monitoring Program, Bates No. 107279. Trash monitoring. Trash monitoring occurs at stormwater outfalls where trash traps have been installed during wet weather events. It will be implemented at three sites in the Anacostia Watershed, two in the Potomac Watershed, and one in the Rock Creek Watershed. A number of categories of trash are quantified and the total weight of trash from each site will be recorded. Sample collection and analysis, quality control, reporting and adaptive management are described. The information collected through trash monitoring will inform the MS4 Program

	about trends in trash accumulation and the success of trash control efforts. See also *id.*, Bates No. 107324-107328, Trash Monitoring: Reductions must be made through a combination of the following approaches: 1. Direct removal from waterbodies, e.g., **stream clean-ups,** skimmers 2. Direct removal from the MS4, e.g., catch basin clean-out, trash racks Item 670, Worcester Draft Permit, Bates No. 105700, requires the control the discharge of spills and prohibits the dumping or disposal of materials, including but not limited to industrial and commercial wastes, trash, used motor vehicle fluids, food preparation waste, leaf litter, grass clippings, and animal wastes into its MS4. *Id.,* Bates No. 105707. requires direct removal prior to entry to the MS4, e.g., street sweeping: The Permittee shall continue a street sweeping program that removes sand, sediment and debris and includes year-round (weekly or more often) main line and arterial sweeping, spring city-wide residential sweeping, fall city-wide street sweeping and leaf pick-up program. As a goal, the Permittee shall compress its spring residential sweeping schedule to maximize the quantity of material collected at the end of the winter season. The Permittee shall document results of its sweeping program including, at a minimum: curb miles swept, dates of cleaning, cubic yards of material collected, and method(s) of reuse or disposal. *Id.*, Bates No. 105701-2: Prevention through additional disposal alternatives, e.g., public trash/recycling collection *Id.* Bates No. 105709: The Permittee shall continue to inspect, maintain, and monitor the Vortechnics Model 16000 storm water treatment device installed as a demonstration project during the first permit term on the Belmont Street Drain. *Ibid.*: The Permittee shall continue to inspect, maintain, and monitor the resource restoration project at Salisbury Pond, which included the installation of hydrodynamic separators at two outfalls into the pond, to reduce nutrients and sediment from entering the pond. The project shall include public

	education elements and the tracking of pollutant removal effectiveness of the separators. The Permittee shall continue to inspect, maintain, and monitor the resource restoration project at Indian Lake, which included the installation of three hydrodynamic separators to remove sediment and nutrients from entering the Lake. The project shall also include public education elements and ongoing operation and maintenance of the separators. Item 669, NH Draft Small MS4 Permit, Bates No. 105676. Permittee required to establish procedures for management of trash containers at parks (scheduled cleanings; sufficient number), and for placing signage in areas concerning the proper disposal of pet wastes. *Id.*, Bates No. 105672Provisions for construction program to include: Requirements to control wastes, including but not limited to, discarded building materials, concrete truck wash out, chemicals, litter, and sanitary wastes. These wastes may not be discharged to the MS4. Item 701, Boise/Garden City Area MS4 Permit, Bates No. 107762: Throughout the Permit term, the Permittee must implement effective methods to reduce litter within their jurisdiction. The Permittee must work cooperatively with others, as appropriate, to control litter on a regular basis, and after major public events, in order to reduce the discharge of pollutants to receiving waters. Item 697, Albuquerque MS4 Watershed Permit, Bates No. 107438-107439 Permittee required to: "[D]evelop, update and implement a program to address and control floatables in discharges into the MS4… include[ing] source controls and, where necessary, structural controls." Develop a schedule for implementation of the program to control floatables in discharges into the MS4. Certain permittees required to "update the schedule according to the findings of [scientific studies]" Estimate the annual volume of floatables and trash removed from each control facility and characterize the floatable type. Permittee required to detail methods of compliance and "assess the overall success of the program, and document the

	program effectiveness in the annual report." *Id.,* at Bates No. 107451. Floatables material monitoring required.

F. The Supreme Court Held that the Regional Water Board's Findings Regarding Implementation of Federal Law Are Entitled to Deference.

An essential underpinning of *Department of Finance* is the Supreme Court's determination that the LA Permit had as its roots both federal and State law. The Los Angeles Water Board made no finding that the permit requirements were necessary or the only means of implementing the MEP standard.[123] Instead, the Los Angeles Water Board found only that the permit was consistent with or within the federal standard. In *Department of Finance*, the Supreme Court held that, "Had the Regional Board found when imposing the disputed permit conditions, that those conditions were the only means by which the maximum extent practicable standard could be implemented, deference to the board's expertise in reaching that finding would be appropriate."[124]

In contrast to the LA MS4 permit, when issuing MRP 2.0, the San Francisco Regional Water Board implemented *only federal law*: "The authority exercised under this Permit is not reserved state authority under the CWA's savings clause … but instead, is part of a federal mandate to develop pollutant reduction requirements for MS4. To this extent, it is entirely federal authority that forms the legal basis to establish the permit provisions."[125] Findings No. 9, 10 and 11 of the Permit and Fact Sheet Section V.C set forth the Board's regulatory basis for issuing the permit. Collectively, these findings make it clear that the Board intended to and did rely solely on federal law in issuing the Permit.[126]

The Regional Water Board understands the Supreme Court to mean that, to be entitled to deference, regional water boards must make an express finding that the particular set of permit conditions finally embodied in a given permit is required to meet that federal standard, and must support that finding with evidence. Unlike the LA MS4 permit, MRP 2.0 made specific findings demonstrating that the permit provisions were necessary to implement the maximum extent practical standard:

> The requirements of the Permit are necessary to reduce the discharge of pollutants to the MEP. The Water Board finds that the requirements of the Permit are practicable, do not exceed federal law, and thus do not constitute an unfunded mandate. These findings are the expert conclusions of the principal state agency charged with implementing the NPDES program in California (CWC sections 13001, 13370). The provisions in this to effectively prohibit non-

[126] *Id.* at Bates No. 83560-83561.

> stormwater discharges are also mandated by the CWA (33 USC section 1342(p)(3)(B)(ii)).[127]
>
> [Th]e Water Board finds that the requirements in this Order are reasonably necessary to protect beneficial uses identified in the Basin Plan.[128]

As the Supreme Court held, "deference to the board's expertise in reaching that finding would be appropriate."[129]

G. The Supreme Court and Recent San Diego Mandates Decisions Have No Impact on This Permit.

Last month, the California Court of Appeal, Third Appellate District, issued its opinion in *Department of Finance v. Commission on State Mandates*, Case No. C070357 (filed December 19, 2017, 3rd Dist. Ct. App.) (2017 WL 6461994) (the "San Diego Opinion"). The San Diego Opinion conflicts with key provisions set forth in the Supreme Court's decision in *Department of Finance*. These provisions include the Court's recognition that deference is due to the Water Boards' factual findings that Permit provisions are necessary (i.e., the "only way") to meet the MEP standard, and the Court's reliance on evidence other than "federal law, regulation, or administrative case authority" to determine whether the permit provisions at issue were federal mandates.

Notably, neither the San Diego Mandates Decision nor the Supreme Court addressed critical questions here, including but not limited to (a) whether the requirement has general applicability; (b) whether the permit programs at issue are new; (c) whether the permit programs represent a higher level of service than required in previous permits; (d) whether TMDL-based provisions required by section 303(d) of the Clean Water Act are federally mandated; (e) whether requirements implementing the Clean Water Act's effective prohibition of non-stormwater discharges into the MS4 are federally mandated; and (f) whether permittees have the ability to impose fees or charges to fund the programs at issue. The Water Boards believe the San Diego Opinion was wrongly decided and are considering all options for seeking review.

IV. <u>There is No Unfunded Mandate Where the Requirement Has General Applicability.</u>

Claimant contends that the Permit requirements are unique to public entities because they arise from the operation of an MS4, which involves activities different from private non-governmental dischargers. These include "the development and amendment of government planning documents, the inspection of property, the development and construction of public work projects and other purely government functions."[130] In fact, many entities in the San Francisco Bay Region are on the Bay margin, involving potential stormwater discharges to San Francisco Bay; NPDES permits regulate those facilities.

[127] Item 467, MRP 2.0, Bates No. 83730.

[128] *Id.*, Bates No. 83722.

[129] *Department of Finance v. Comm'n on State Mandates, supra,* 1 Cal.5th at p. 768.

[130] Test Claim p. 5.10.

In order to obtain reimbursement, the Claimants must demonstrate either that (1) the program must carry out a governmental function of providing services to the public, or (2) the requirements, to implement a state policy, implement unique requirements on local governments and do not apply generally to all residents.[131] "[T]he intent underlying section 6 was to require reimbursement to local agencies for the costs involved in carrying out functions peculiar to government, not for expenses incurred by local agencies as an incidental impact of laws that apply generally to all state residents and entities."[132]

Reimbursement to local agencies is required only for the costs involved in carrying out functions peculiar to government, not for expenses incurred by local agencies as an incidental impact of laws that apply generally to all state residents and entities. Laws of general applicability are not entitled to subvention because they do not "force" programs on localities.[133] The fact that a requirement may single out local governments is not dispositive; where local agencies are required to perform the same functions as private industry, no subvention is required.[134]

EPA requires both municipal and non-municipal stormwater discharges to be controlled.[135] Moreover, numerous provision of the Permit are "laws of general applicability" and therefore fail to constitute an unfunded state mandate.[136] Compliance with NPDES regulations, and specifically with stormwater permits, is required of private industry as well as state and federal government agencies. Local government is not subject to "unique" requirements. Thus, while the MRP 2.0 provisions applied only to the municipalities and counties enrolled in the permit, the substantive actions required by the Permit's provisions were by no means unique to this class of permittee.

A. Provision C.8 (Monitoring)

With respect to the monitoring requirements in Provision C.8, federal law requires *all* NPDES permits to include monitoring "sufficient to yield data which are representative of the monitored activity including, when appropriate, continuous monitoring."[137] In keeping with this requirement, the monitoring obligations in Provision C.8 are common to non-municipal NPDES permittees in the Bay Area. For instance, Provision C.8.b, which provides for contribution to the Regional

137 40 C.F.R. § 122.48, subd. (b).

Monitoring Program or equivalent regional monitoring networks, is not limited to municipal dischargers.[138] The current San Francisco Bay Mercury Watershed Permit allows industrial and municipal wastewater dischargers to participate in the Regional Monitoring Program.[139] Pollutants of concern identification and monitoring akin to Provision C.8.e is not unique to municipalities but also required in individual NPDES permits.[140] Similarly, both general and individual NPDES permits also require electronic reporting, as required in Provision C.8.h.[141]

B. Provision C.10 (Trash)

The prohibition against discharging any solid waste and floating materials, including trash, is applied to many types of non-municipal NPDES permittees, as a refinement of the general prohibition on non-stormwater discharges.[142] In most circumstances outside of the municipal stormwater context, strict compliance is required, and dischargers are not permitted to achieve zero discharge over time. The Permit is thus generally applicable, but *less* stringent than individual permits.

C. Provisions C.11.f and C.12.f (TMDL Implementation)

Provisions C.11.f and C.12.f, which require Permittees to conduct pilot feasibility studies to divert mercury and PCBs, respectively, to public treatment works, implement the mercury and PCBs TMDLs in the San Francisco Bay. In addition to being mandated by federal law, these two provisions are also generally applicable to entities aside from local agencies.[143] The Mercury TMDL has wasteload allocations for stormwater runoff, wastewater from refineries and other industrial dischargers, and publicly-owned treatment works, while the PCBs TMDL has

[141] See, e.g., Item 707, 2009 Construction General Permit (CGP), Bates No. 107908, 107916, 107831-107933, 107960, 107965, 107969; Item 718, Schnitzer Steel, Order No. R2-2016-0045, Bates No. 109126.

[142] See, e.g., Item, 707, 2009 CGP, Bates No. 107961 (prohibition on discharge of debris, defined as “litter, rubble, discarded refuse, and remains of destroyed inorganic anthropogenic waste”); Item 710, Bay Ship & Yacht, Order No. 2005-0039, Bates No. 108320 (prohibitions on discharge of “solid materials and solid wastes” and “floating oil or other floating material”); Item 718, Schnitzer Steel, Order No. R2-2016-0045, Bates No. 109087 (prohibition on discharge of “untreated stormwater… or waste materials” including “rubbish, refuse, or debris”); Bates No. 109094 (requiring Water Pollution Prevention Plan to identify the activities that generate refuse and debris, “locations where these materials may accumulate, source types and characteristics”); Bates No. 109096 (requiring all debris and waste to be cleaned up and disposed of properly).

[143] See generally Items 685 (PCBs TMDL Staff Report_ and 687 (Mercury TMDL Staff Report)..

wasteload allocations for industrial wastewater discharges, municipal discharges, stormwater, and the Central Valley watershed.[144]

> The stormwater runoff allocations implicitly include all current and future permitted discharges, not otherwise addressed by another allocation, and unpermitted discharges within the geographic boundaries of urban runoff management agencies including, but not limited to, *California Department of Transportation (Caltrans) roadway and non-roadway facilities and rights-of-way*, atmospheric deposition, public facilities, *properties proximate to stream banks, industrial facilities, and construction sites*."[145]

Under both TMDLs, municipalities managing stormwater have comparable obligations to those of Caltrans[146] or industrial facilities managing wastewater and/or stormwater to identify and reduce their discharges of mercury and PCBs.[147] Caltrans' responsibility for reducing stormwater discharges demonstrates that the TMDL requirements were not targeted at local municipalities alone. To the contrary, responsibility for TMDL compliance lies with all the entities discharging the relevant pollutant, whether the entities are public or private, state or local.[148] In the case of the PCBs and Mercury TMDLs, local, state, and private entities were all required to reduce their discharges of PCBs and mercury.[149] With respect to reducing mercury in stormwater specifically, shuttered mines, whether privately or publicly owned, share responsibility for implementing control actions with municipal agencies.[150] Similarly, Caltrans, industry, developers, and municipal stormwater agencies bear responsibility for reducing PCBs in stormwater.[151]

Industrial and municipal wastewater dischargers, including one federal facility, meanwhile, are subject to a mercury and PCBs watershed NPDES permit.[152] Under this permit, similar to

---

[144] See Item 687, Mercury TMDL Staff Report, Bates No. 106882-106884; Item 685, PCBs TMDL Staff Report, Bates No. 106600-106601.

[145] See Item 685, PCBs TMDL Staff Report, Bates No. 106609 (emphases added).

[146] The Mercury TMDL contemplated that various provisions would be added to NPDES permits as a result of the TMDL, including investigations and reporting regarding mercury contamination; mercury source control program; monitoring; fate and transport studies; allocation-sharing with Caltrans; annual reporting; compliance with loadings via pollution prevention, source control, and treatment. (Item 687, Mercury TMDL staff report, Bates No. 106929.) Caltrans was subject to similar requirements as those imposed in MRP 2.0. (Item 708, Caltrans permit, Bates No. 108187.)

[147] See Item 687, Mercury TMDL Staff Report, Bates No. 106885-106886, 106890; Item 685, PCBs TMDL Staff Report, Bates No. 106608 (wasteload allocations for municipal and industrial dischargers would be implemented through BMPs); Bates No. 106610 (diversion of dry and/or wet weather flows to POTWs "should be investigated, pilot-tested, and implemented where feasible").

[148] Item 686, Basin Plan, Bates No. 106694 – 106703 (mercury sources); 106712 – 106716 (PCB sources); See also the Mercury and PCBs watershed permit, Item 722, Order No. R2-2012-0096, Bates No. 109834, which directs compliance for municipal and industrial wastewater facilities.

[149] Item 686, Basin Plan, Bates No. 106712 – 106713 (Sources of PCBs required to implement wasteload reductions); Bates No. 106694-106703 (listing sources of mercury and methylmercury).

[150] Item 686, Basin Plan, Bates No. 106702.

[151] *Id.* Bates No. 106713-106714; Item 722, Order No. R2-2012-0096, Bates No. 109835-109841 (listing permittees).

(footnote continued on next page)

stormwater agencies, wastewater dischargers are required to achieve stringent load reductions. To achieve these, they must not only achieve effluent limitations, but must implement source control programs to reduce the amount of PCBs and mercury entering their treatment systems.[153] NPDES permits in the Bay Area impose requirements of feasibility studies akin to the requirements in C.11.f and C.12.f.[154]

V. The Permit Is Consistent With Federal Law; It Does Not Require a New Program or Higher Level of Service.

Section 6 of article XIII B of the California Constitution states, "[w]henever the Legislature or any state agency mandates a new program or higher level of service on any local government, the State shall provide a subvention of funds to reimburse such local government for the costs of such program or increased level of service…." In this case, the contested provisions of the Permit are not new programs or higher levels of service, and in some cases were proposed by the permittees.[155]

A. MRP 2.0 Is a Continuation of the 2009 MRP, Not a New Program.

Claimant suggests that federal law did not compel the contested provisions, "because the State's NPDES program is undertaken on a voluntary basis" and "the State was not compelled to operate its own permitting system. . . Accordingly, the regional board's exercise of a 'true choice' constitutes a state mandate of costs associated with the contested permit provisions." [156] Contrary to Claimant's statements, federal law compels the adoption of MRP 2.0. "[T]he Clean Water Act requires an NPDES permit to be issued for *any* storm sewer discharge, whether there is any actual impairment in a particular region."[157]

The Clean Water Act requires municipalities to apply for an NPDES permit that must meet various federally mandated requirements. The state's "choice" to administer the program in lieu of the federal government does not alter the federal requirements on municipalities. If California had not decided to administer the NPDES program, Permittees would still receive a permit from U.S. EPA. As shown in the table above, a permit issued by U.S. EPA would contain the very

---

(footnote continued from previous page)

[153] Item 722, Order No. R2-2012-0096, Bates No. 109849-109858 (effluent limitations and discharge specifications).

[154] See Item 714, Order No. R2-2007-0032 (*C&H Sugar*), Bates No. 108700-108701 ; Item 715, R2-2007-0077 (*Mercury Watershed Permit*), Bates No. 108823-108824 (requiring both industrial and municipal dischargers to provide description of source control projects, including estimates of avoided mercury loading achieved by recycling water).

[155] The Regional Water Board has previously briefed this matter with respect to the 2009 MS4 permit, which had similar requirements. See 2011 Response, pp. 25-27 (prior permits include management plans, monitoring programs and annual reports that demonstrate permittees had already implemented numerous provisions); pp. 30-42 (Provision C.8 does not require new programs or higher levels of service); 49-53 (Provision C.10 does not require new programs or higher level of service); 55-56 (Provisions C.11 and C.12 do not require new programs or higher level of service); 59-63 (Provision C.2 does not require new programs or higher levels of service). See also December 20, 2016 Brief at pp. 4-6.

[156] Test Claim, p. 5.9.

[157] *City of Rancho Cucamonga v. Regional Water Quality Control Bd. – Santa Ana Region* (2006) 135 Cal.App.4th 1377, 1386.

same substantive requirements as MRP 2.0. In its role in issuing NPDES permits to dischargers, the Regional Water Board must implement the regulatory requirements U.S. EPA has established for state permitting agencies.[158]

A program is defined as "a program which carries out the 'governmental function of providing services to the public, or laws which, to implement a state policy, impose unique requirements on local governments and do not apply generally to all residents and entities in the state.'"[159] A program is "new" if the local government had not previously been required to institute it. (*Ibid*.) Here, even if each of the challenged provisions could be considered a "program," none meets this definition of "new." Permittees had been permitted under the NPDES program for more than two decades at the time the 2015 MRP was adopted.[160] Permittees' prior permits contained requirements for implementing mercury and PCBs TMDLs and implementing trash reduction activities which would result in a zero trash load by 2022.[161] EPA recognized and supported the evolution of permit terms based on permittees' successes in earlier permit terms and lessons learned by the agency.[162]

1. Provisions Implementing Mercury and PCBs TMDLs Predate MRP 2.0.

Description of phased implementation belies that this is a new program. The Mercury and PCBs TMDLs and their implementation plans were approved by EPA in 2008 and 2010, respectively, predating MRP 2.0 by a substantial amount of time. Both TMDLs envisaged that achievement of the required load reductions would take approximately 20 years, or four 5-year NPDES permit cycles. As one example, the PCBs TMDL anticipated that requirements would be refined and strengthened over two decades[163] as more information was gathered:

> These BMPs and control measures are expected to be implemented in phases as NPDES permits are issued and reissued. In the first five-year permit term, stormwater permittees will be required to implement control measures on a pilot scale to determine their effectiveness and technical feasibility…. The second five-year term permit requirements will be based on the knowledge gained during the first permit term and will call for strategic implementation of the BMPs and control measures identified as effective and that will not cause significant adverse environmental impacts based on the pilot studies conducted during the first permit term. The second term permit will also require development of a plan

159 *County of Los Angeles v. Comm'n on State Mandates* (2003) 110 Cal. App.4th 1176, 1189 (citing *County of Los Angeles v. State of California* (1987) 43 Cal. 3d 46, 56).

160 See Item 467, MRP 2.0, Bates No. 83559-83560; Item 721, 2009 MRP, Bates No. 109547-109548(listing prior permits for all municipalities) and Bates No. 109681-109684 (prior permits include management plans, monitoring programs and annual reports that demonstrate permittees had already implemented numerous provisions).

161 See 2011 Response, pp. 30-42 (C.8); 49-53 (C.10); and 55-56 (C.11 and C.12).

162 Item 729, U.S. EPA Letter to SF Water Board, Bates No. 110608.

163 Item 686, Basin Plan, Bates No. 106717 (PCB stormwater allocations to be implemented by urban runoff management agencies and Caltrans over a 20-year implementation period).

> to fully implement control measures that will result in attainment of allocations, including an analysis of costs, efficiency of control measures and an identification of any significant environmental impacts. Subsequent permits will include requirements and a schedule to implement technically feasible, effective and cost efficient control measures to attain allocations. If as a consequence, allocations cannot be attained, the Water Board will take action to review and revise the allocations and these implementation requirements as part of adaptive implementation.[164]

The implementation program for stormwater entities anticipated that the second permit (the challenged MRP 2.0) would include broadly applicable requirements that reflected the results of pilot testing and any other new information gathered during the permit term[165]. Anticipated implementation actions to reduce mercury in stormwater included: source and treatment controls and management methods, while anticipated implementation actions for PCBs included: technologies to filter or treat stormwater, increased use of routine maintenance BMPs, industrial inspections to identify and direct removal PCBs-containing equipment, and a program to control demolition waste[166]. These expected categories of implementation actions mirror the terms of the current permit.

The program under which the green infrastructure and other TMDL requirements were included in the permit was not new in 2015. Permittees had been aware of the required load reductions since adoption of the TMDLs in 2008. They had had the opportunity to participate, and did participate, in TMDL development. The Santa Clara Valley Urban Runoff Prevention Program's input directly informed the cost analysis by the Regional Water Board for the Mercury TMDL.[167] Permittees were also aware that achievement of load allocations would be challenging,[168] and that permit terms would become more stringent as the twenty-year implementation deadline approached. Furthermore, they had participated actively in pilot green infrastructure projects and discussions about how to "scale up" over the course of the entire term of the 2009 permit.[169] If Permittees were concerned that the TMDLs imposed unfunded state mandates then they should have challenged them on such grounds. Because they did not do so, their collateral attack on the TMDL allocations by way of the MRP 2.0 provisions, is not timely.[170]

Accordingly, the Permit provisions cannot be viewed in isolation, but instead in the context of the TMDL adoption and implementation as a whole. Viewed in this way, the green infrastructure

[170] Cal. Code Regs., tit. 2, § 1183.1, subd. (c).

provisions are not a new program at all, but the continuation of a program that had been ongoing for the better part of a decade by the time the Board adopted MRP 2.0.

2. The MRP 2.0 Trash Provisions Are a Continuation of the Prior Permit.

Similarly, the schedule for trash reduction activities is not new. As discussed above, Clean Water Act and Basin Plan have prohibited the discharge of trash into receiving waters for decades. Both the 2009 MRP and MRP 2.0 required reduction of trash to zero load by the year 2022.

> The Permittees shall demonstrate compliance with Discharge Prohibition A.2 and trash-related Receiving Water Limitations through the timely implementation of control measures and other actions to reduce trash loads from municipal separate storm sewer systems (MS4s) by 40% by 2014, 70% by 2017, and 100% by 2022 as further specified below.[171]
>
> Permittees shall implement trash load reduction control actions in accordance with the following schedule and trash generation area management requirements, including mandatory minimum full trash capture systems, to meet the goal of 100 percent trash load reduction or no adverse impact to receiving waters from trash by July 1, 2022.[172]

Claimant concedes that the 2009 MRP "stated that Permittees must achieve phased annual reductions in trash loading culminating in 100 percent by 2022."[173] MRP 2.0 does not change that expectation.

Claimant also suggests that the 2009 MRP had goals whereas MRP 2.0 has enforceable deadlines, claiming that this distinction "constituted a new program."[174] In fact, this is a distinction without a difference. As a general practice, NPDES permits will not contain requirements that go beyond the five-year term of the permit. The indented language above belies any claim that Claimant

B. MRP 2.0 Does Not Mandate a Higher Level of Service.

The changes to the requirements of prior permits (e.g. increased detail or specificity) are also not a higher level of service, both because equivalent changes are applicable to non-municipal permittees, as discussed above, and because they are merely refinements of existing requirements.[175] A higher level of service is not simply any increase in costs. "If the Legislature had intended to continue to equate 'increased level of service' with 'additional costs,' then the

[172] Item 467, MRP 2.0, Provision C.10.a, Bates No. 83655-83657.

[173] Test Claim, p. 5.12.

[174] *Ibid.*

[175] See *County. of Los Angeles v. Comm'n on State* Mandates (2003) 110 Cal.App.4th 1176, 1189-1190.

provision would be circular: 'costs mandated by the state' are defined as 'increased costs' due to an increased level of service, which, in turn would be defined as 'additional costs.'"[176] Additional costs do not equal "every increase in a locality's budget resulting from compliance with a new state directive."[177] Nor does every increase in specificity about where to direct costs amount to a higher level of service.[178]

Rather, the costs incurred must involve programs previously funded exclusively by the state.[179] The "state must be attempting to divest itself of its responsibility to provide fiscal support for a program, or forcing a new program on a locality for which it is ill equipped to allocate funding."[180]

In this case, any costs arising from the Permit's requirements do not result from a "new" program. Nor do they result from a "higher level of service," because the State has not shifted its own responsibilities to local agencies and the permittees are not "ill-equipped" to allocate funding to stormwater control. As described in the 2011 Response, the permittees' own documentation indicates that they have always been responsible for maintaining their trash collection services, storm drain system, etc.[181] Moreover, in rebutting the Regional Water Board's arguments that the challenged provisions impose a higher level of service, claimants do not contend that the state has shifted any costs to local government or that they have been saddled with entirely new obligations to control pollution in stormwater.[182] Without any burden shifting from the state to municipalities, mere direction from the Regional Water Board that the municipalities reallocate some of their resources in a particular way does not amount to a higher level of service.[183] "Loss of flexibility does not, in and of itself, require the [local agencies] to expend funds that previously had been expended by the State."[184]

[183] See *County of Los Angeles v. Comm'n on State Mandates, supra,* 110 Cal.App.4th at p. 1194.

[184] *Ibid.;* accord *Dept. of Finance v. Comm'n on State Mandates* (2003) 30 Cal.App.4th 727, 748 (requirement that school districts allocate some of their grant funds in a particular way did not transform those costs into a reimbursable state mandate).

As documented in the 2011 Response, many program components, and their associated costs, existed before the MRP 2.0 was issued and many of the Permit's terms were proposed by Permittees. In addition, reported program costs are not all attributable to compliance with the MRP 2.0. For example, the Alameda Stormwater Quality Management Plan (1996-2001 Plan) documents involvement in the regional monitoring program and numerous other monitoring efforts in place as of 1996/97.[185] The 2001-2008 Alameda Stormwater Management Plan reflects the "use of street sweeping to remove potential pollutants prior to their being flushed into local creeks and the bay. All of the municipalities report their street sweeping and storm drainage cleaning activities on a standardized monthly form."[186]

1. TMDL Compliance Requirements Do Not Impose a Higher Level of Service

The evolution of permit conditions to reflect better information and require more effective pollution control does not, *ipso facto*, mean that the new permit terms require a higher level of service. The level of service of the TMDL is the load allocation, which was set at the time of the adoption of the TMDLs in 2008 and 2010. The Mercury TMDL recognized that the 50% load reduction for municipal stormwater permittees from 160kg to 82 kg of mercury/year was not achievable immediately, particularly given scientific uncertainty about the best control methods.[187] Similarly, while identifying the types of actions municipal stormwater permittees would have to take to reduce PCB loadings, the staff report acknowledged that it would take time to evaluate and refine these mechanisms to determine which were successful.[188] The terms of successive permits are all designed to achieve the original load allocations – that is, the original level of service, not to achieve additional reductions beyond what the TMDL requires.[189]

2. Trash Provisions Do Not Require a Higher Level of Service.

Claimant protests the addition of an 80% milestone in the Trash Provision,[190] but that milestone does nothing to change the consistent schedule and expectation in both the 2009 MRP[191] and MRP 2.0[192] that Permittees reduce trash loading to zero or a no adverse impact by 2022. Achievement of this interim milestone is the type of specificity or additional detail –

[189] E.g., Item 686, Basin Plan, Bates No. 106716-106717; see also Item 729, U.S. EPA Letter to SF Water Board, Bates No. 110608.

[190] Test Claim, p. 5.14

[191] Item 721, 2009 MRP, Bates No. 109635.

[192] Item 467, MRP 2.0, Bates No. 83655.

inconsequential in the scheme of the overall timetable – that courts have declined to find constitutes a higher level of service.[193]

Claimant further argues that because specific provisions were not in the prior permit, they are new or higher levels of service, even though Claimant had already undertaken those services – e.g. had a plan in place for trash.[194] But the fact that Claimant was *already performing* those services, in accordance with City plans or policies, means there is nothing *new*; there is no new cost to Claimant beyond what it had previously incurred for the same services.[195] Under these circumstances, there is no new program or higher level of service for which the State shifted responsibility.

Claimant argues that Provision C.10.b "specifies detailed full trash capture system installation and maintenance instructions, which are more prescriptive, burdensome and costly than MRP1 to fulfill."[196] Such a claim is disingenuous given Claimant's simultaneous acknowledgement that MRP1 "required Permittees to install and maintain full trash capture devices."[197] Similarly, Petitioners' claim that they are required to implement full-trash capture devices is misleading.More accurately, they have concluded it is the most cost-effective of multiple options: "compliance by means of Other Trash Management Actions (meaning non-full trash capture systems) has become so burdensome and costly that Union City has determined installation of full trash capture systems is the least costly compliance option."

Finally, Claimant makes various arguments concerning the need to purchase a vactor truck, which it concedes it already had.[198] Maintaining full trash capture devices was a requirement of the 2009 MRP, however, and is not a new requirement in MRP 2.0.[199] Specifying timeframes for cleaning the trash capture devices is another example of the type of specificity, additional inconsequential detail, that the *County of Los Angeles* case found was not a higher level of service.[200] A less frequent cleaning schedule would not meet the requirement, dating from the 2009 MRP, to maintain trash capture devices.[201]

Finally, Claimant provides a laundry list of activities it has undertaken to comply with the trash reduction requirements.[202] MRP 2.0 does not specify any of these actions.[203] These are

[202] Test Claim, p. 5.14.

activities Claimant independently decided it would undertake to reduce trash loading; not requirements in the permit. Other options were available to Claimant, such as enforcing existing littering laws, to get to the next trash reduction goal. MRP 2.0 provided a flexible framework for Permittees to design their own programs to meet the trash reduction levels fundamentally required by the Clean Water Act.

VI. CONCLUSION

The evidence does not support any of the four factors that must *all* be proven for Claimant to prevail. Not only has the Legislature reaffirmed and reiterated that municipalities are able to raise fees for all costs associated with implementing the Permit, but the evidence is that Claimant and other Permittees have done just that. The NPDES permit program is an environmental protection program that applies to all dischargers – municipal and non-municipal alike – in the Bay Area. Non-municipal permittees throughout the Bay Area are subject to the same requirements as the contested provisions here. Finally, Claimant's own papers admit that numerous provisions were already required in past permits; the contested provisions are not a new program or higher level of service. Under these facts, the Commission should reject the Test Claim.

Respectfully submitted,

Tamarin E. Austin
Attorney IV
Office of Chief Counsel
State Water Resources Control Board

Re: City of Union City's Rebuttal to Department of Finance and Regional Water Board Comments on the Test Claim
California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049
10-TC-03

Dear Ms. Halsey:

This letter is submitted on behalf of the City of Union City, the Claimant in the above-captioned test claim, and transmits the City's rebuttal comments regarding the San Francisco Bay Regional Water Quality Control Board's (Regional Water Board) Comment Letter electronically served on February 9, 2018, and the Department of Finance's (Finance) comment letter dated October 10, 2017.

I. Introduction

The Regional Water Board's lengthy comments, as well as Finance's more succinct comments, are equally unpersuasive and confirm that the Commission on State Mandates (Commission) should approve Union City's Test Claim. Regional Water Board Order No. R2-2015-0049 (MRP2) imposes expensive new programs and higher levels of services on Union City to remove trash, PCBs and mercury from municipal storm water, and requires continued implementation of expensive monitoring programs at issue in Consolidated Test Claims 10-TC-01, 10-TC-02, 10-TC-03 and 10-TC-05. The Regional Water Board and Finance (collectively, Test Claim Opponents) do not dispute that they bear the burden of proving any exception to the constitutional general rule requiring subvention for state-mandated costs. They unsuccessfully try to carry this burden regarding the Fee Authority and Federal Mandates exceptions. Similarly, the Regional Water Board's argument that municipal storm water permittee costs are not subject to reimbursement because the NPDES is a "generally applicable" program also fails. Union City's storm water program provides municipal services to the public and implements

unique requirements not applicable to all residents. After consideration of the Test Claim Opponents' comments, it is apparent the Commission should approve Union City's Test Claim.

II. Test Claim Opponents Fail To Carry Their Burden of Demonstrating Union City's Alleged Fee Authority

A. Neither Test Claim Opponent Disputes That They Bear the Burden of Proving the Fee Authority Exception to Reimbursement

We note at the outset that while both the Regional Water Board and Finance contend that the Government Code section 17556, subdivision (d), fee authority exception applies to Union City's Test Claim, neither disputes that they bear the burden of proving applicability of the exception. Indeed, the Regional Water Board even quotes Union City's assertion in its Test Claim that "the Regional Water Board bears the burdens of proving the exception applies," (Regional Water Board Comments, p. 6), and does not take issue with the correctness of the City's statement of law. As the Supreme Court observed: "Typically, the party claiming the applicability of an exception bears the burden of demonstrating that it applies. [Citations.] Here, the State must explain why federal law mandated these requirements, rather than forcing the Operators to prove the opposite." (*Department of Finance v. Commission on State Mandates* ("*Dep't of Finance*") (2016) 1 Cal.5th 749, 769 citations omitted.) It is well established that when a party fails to carry its burden, "the party upon whom the burden rests to establish that fact should suffer, and not his adversary." (*Oldenburg v. Sears, Roebuck & Co.* (1957) 152 Cal.App.2d 733, 741, internal quotation and citation omitted.) Thus, since the Regional Water Board and Finance fail to carry their burden of showing the fee authority exception applies, it cannot be applied to the City's Test Claim.

B. Department of Finance's Contention that Possibility of Voter Approval Constitutes Fee Authority is Meritless

Finance's comments are meritless because they would eviscerate the subvention provisions of the Constitution, and no test claim could ever be approved if Finance's argument were accepted. Finance contends that "Local governments can choose not to submit a fee to the voters and voters can indeed reject a proposed fee, but not with the effect of turning permit costs into state reimbursable mandates," citing *Clovis Unified School District v. Chiang* (2010) 188 Cal.App.4th 794, 812. Finance attempts to extend the holding of *Clovis* to an absurd extent. In *Clovis*, the school district claimants were given specific statutory authority to charge the fees at issue. (*Id.* at 810 ["districts are statutorily authorized to charge students for health fees"]).) Finance argues "[t]he same reasoning applies to claimants here" because Union City could choose "to put a fee to the voters."

(Finance Comments, p. 2.) There is no legal basis, however, to analogize specific statutory fee authority to the power all public entities have to submit taxes to the voters.

Finance posits an impossible dilemma for test claimants: if claimants do not submit a fee to recover state mandated cost to the voters, or even if they do and the voters do not approve the fee, claimants have not utilized their alleged fee authority; if the voters do approve the fee, there would be local fee authority. Either way, according to Finance, it would not have to reimburse the state mandated costs. There is no way this position can be reconciled with the plain language of Proposition 4 and the intent of the electorate. The subvention mechanism enacted by the voters would be rendered completely illusory.

C. SB 231 Has No Effect on this Test Claim Since it Only Became Effective in 2018

The Regional Water Board's lead argument that Senate Bill 231, enacted in 2017, provides Union City with fee authority to pay for the state-mandated costs (Regional Water Board Comment, p. 6) fails for the simple reason that it became effective in 2018,[1] and this Test Claim must be approved based upon Fiscal Years 2015-16 and 2016-17. SB 231 has no effect on the availability of fee authority during the years that form the basis for the Commission's approval of the City's Test Claim. It is unnecessary for the Commission to weigh the effect of SB 231 on fee authority after its effective date to resolve this Test Claim, and it would be improvident to do so.

III. Test Claim Opponents Fail To Carry Their Burden To Show Costs are Imposed by Federal Mandates

As with the Fee Authority exception, Test Claim Opponents Regional Water Board and Finance bear the burden of demonstrating the alleged applicability of the Federal Mandate exception. This point was explicitly addressed in *Dep't of Finance*, and neither the Regional Water Board nor Finance disputes that they bear the burden of proving applicability of the Federal Mandates exception. (*Dep't of Finance, supra*, 1 Cal.5th at 769.) The Test Claim Opponents have failed to carry their burden, and so the "general rule requiring reimbursement of all state-mandated costs" must prevail. (*Ibid.*)

---

[1] "Under the California Constitution, a statute enacted at a regular session of the Legislature generally becomes effective on January 1 of the year following its enactment except where the statute is passed as an urgency measure and becomes effective sooner. (Cal.Const., art. IV, § 8, cl. (c)(1).)" (*People v. Henderson* (1980) 107 Cal.App.3d 475, 488.)

A. Controlling Authority Forecloses Test Claim Opponents Federal Mandates Position

The Commission now has the benefit of storm water-specific guidance from the California Supreme Court and the Third District Court of Appeal. The opinions in (*Dep't of Finance* and *Dep't of Finance v. Commission on State Mandates* (2017) 18 Cal.App.5th 661 ("San Diego Opinion") constitute controlling authority that forecloses most of the Regional Water Board's comments. Notwithstanding that "[t]he Water Boards believe the San Diego Opinion was wrongly decided," it remains binding precedent. (Regional Water Board Comment, p. 33.)

Union City respectfully submits that the Regional Water Board's arguments attempting to circumvent these appellate authorities should be viewed with great skepticism by the Commission. Taken together, the Regional Water Board's various arguments, including its contention that the NPDES program is generally applicable, amount to a suggestion that *Dep't of Finance* and the San Diego Opinion were a waste of time for California's High Court and all the other courts involved, not to mention the parties and amici, because the Regional Water Boards have thought of a new set of arguments. None of their arguments is well taken, and appellate authority cannot be ignored.

B. The Regional Water Board Mischaracterizes the Clean Water Act

In its zeal to prevail in the next round of storm water unfunded mandates cases, the Regional Water Board has unfortunately put forth a strained interpretation of the Clean Water Act that defies the actual language of the statute, EPA's implementing regulations and common sense. The Regional Water Board focuses on the Clean Water Act section 402(p)(3)(B)(ii) statement that municipal separate storm sewer system (MS4) permits "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers." According to the Regional Water Board, this means: "the Clean Water Act *prohibits all* non-storm water discharges into the storm sewers. No trash. No PCBs. No mercury." (Regional Water Board Comments, p. 2, italics in original.) The plain language of the statute demonstrates that Congress intended that the municipal MS4 permittee would use its governmental powers to effectively prohibit third parties from discharging non-storm water into the MS4. This reading is supported by EPA regulations, which show municipalities comply with this statutory provision by having "adequate legal authority" to, for example, "[p]rohibit *through ordinance, order or similar means*, illicit discharges to the municipal separate storm sewer." (40 C.F.R. § 122.26(d)(2)(i)(B), italics added.) Thus, third parties are prohibited from discharging into the MS4, but there is no corollary prohibition on non-storm water discharges from a permitted MS4. It is unreasonable to suggest, nor does the

law provide, that an MS4 permittee is in automatic violation of the Clean Water Act whenever a member of the public tosses litter into a storm drain.

The Regional Water Board is apparently trying to focus the next round of storm water unfunded mandate cases on the Clean Water Act requirement regarding non-storm water discharges because its arguments about the Maximum Extent Practicable provision have been rejected by the courts. The Commission should reject the Regional Water Board's ill-conceived attempt to re-litigate all the same issues based on an even less convincing interpretation of the Clean Water Act.

C. The Regional Water Board had a True Choice in Crafting the TMDLs and Shifted State Costs onto Municipalities

The Regional Water Board unpersuasively argues it "had no 'true choice' but to include the TMDL-related provisions in the MRP 2[] that will result in attainment of the [applicable wasteload allocations] within the timeframe established in the TMDL . . . [i.e.,] 20 years." (Regional Water Board Comment, p. 16.) This contention is demonstrably false, as most cogently demonstrated by the Regional Water Board's own TMDL documentation. For example, in adopting the PCB TMDL, the Regional Water Board considered longer timeframes to achieve the wasteload allocations, including 70 and 100 year timeframes, and chose the shortest timeframe with the most stringent limitations on discharges from MS4s. (Total Maximum Daily Load for PCBs in San Francisco Bay Final Staff Report for Proposed Basin Plan Amendment ("PCB TMDL Staff Report"), p. 60. This was absolutely a "true choice," and it imposed greater costs on Union City than the other alternatives available.

Moreover, in making its true choice in how to structure and implement the applicable TMDLs, the Regional Water Board exercised its discretion to shift PCB and mercury mitigation obligations away from the State and onto MS4 permittees like Union City. It is important to note that the State of California owns all of the land underneath San Francisco Bay. (State Lands Commission, Map of CSLC Lands and Statement of California State Lands Commission Jurisdiction ["The State of California acquired sovereign ownership of all tidelands and submerged lands and the beds of navigable lakes and waterways upon its admission to the United States in 1850. The California State Lands Commission (Commission) has jurisdiction and management authority over these sovereign lands.]) In developing the PCB TMDL, the Regional Water Board estimated that the PCB mass in the active sediment layer of the Bay, which is owned by the State, "is an order of magnitude greater" than other PCB sources. (PCB TMDL Staff Report, p. 49.) "[B]ottom sediments are the largest environmental reservoir of PCBs in the Bay." (*Id.* at p. 48) Notwithstanding these admissions, the Regional Water Board nevertheless adopted a TMDL implementation strategy that placed the entire

burden of reducing PCB loads on parties other than the State. "[I]nternal sources are not assigned load allocations." (*Id.* at p. 62.)

Thus, not only did the Regional Water Board exercise discretion and made a true choice in developing and implementing the TMDLs at issue, it also structured this program to shift responsibility away from the State and onto local governments. This offends the very the purpose of article XIIIB, section 6, of the Constitution, which "is to preclude the state from shifting financial responsibility for carrying out governmental functions to local agencies, which are 'ill equipped' to assume increased financial responsibilities because of the taxing and spending limitations that articles XIII A and XIII B impose." (*County of San Diego v. State of California* (1997) 15 Cal.4th 68, 81.)

D. Union City's Stormwater Programs Carry Out a Governmental Function of Providing Services to the Public and Implement Unique Requirements

By virtue of its ownership of public rights of way that receive runoff from all the property in the City, and because of the need to manage storm water to prevent the loss of the lives and property of its citizens, Union City operates its MS4 to carry out a governmental function of providing services to the public and implements unique requirements that are not applicable to all residents. The Regional Water Board's argument that the City is just like any other entity subject to the NPDES program is unpersuasive and cannot be sustained.

E. Evidence and Argument Pertaining to Other Jurisdictions is Not Relevant to Union City's Test Claim

The Regional Water Board offers extensive evidence related to storm water programs of jurisdictions other than Union City. This evidence is irrelevant to adjudication of the City's test claim, is unduly burdensome to Union City and the Commission, and should be disregarded.

IV. Conclusion

For the reasons set forth in these rebuttal comments, as well as in the initial Test Claim package, Union City respectfully submits that its Test Claim should be approved. The Test Claim Opponents have not raised any valid reason to deny the

claim, and they have failed to carry their burden of proving application of exceptions to the general rule requiring reimbursement of all state-mandated costs.

Sincerely,

Gregory J. Newmark
Attorney at Law

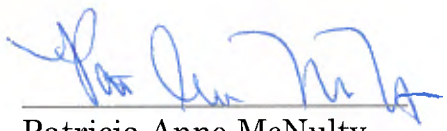
DECLARATION OF SERVICE BY EMAIL

I, the undersigned, declare as follows:



I am a resident of the County of Los Angeles and I am over the age of 18 years, and not a party to the within action. My place of employment is 707 Wilshire Boulevard, 24th Floor, Los Angeles, California 90017.

On May 29, 2018, I served the:

1. City of Union City's rebuttal letter

by electronically filing it on the Commission's website, which provides notice of how to locate it to the email addresses provided on the test claim mailing list.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct, and that this declaration was executed on May 29, 2018, at Los Angeles, California.

Patricia Anne McNulty

DECLARATION OF GREGORY J. NEWMARK

I, Gregory J. Newmark, declare as follows:

1. I am an attorney duly admitted to practice in California. I am a principal with the law firm Meyers, Nave, Riback, Silver & Wilson, attorneys of record for the City of Union City. I have personal knowledge of the facts set forth herein, except as to those stated on information and belief and, as to those, I am informed and believe them to be true. If called as a witness, I could and would competently testify to the matters stated herein.

2. On May 28, 2018, I downloaded Total Maximum Daily Load for PCBs in San Francisco Bay: Final Staff Report for proposed Basin Plan Amendment from the San Francisco Regional Water Quality Control Board's internet website at the following address: <https://www.waterboards.ca.gov/sanfranciscobay/water_issues/programs/TMDLs/sfbaypcbs/PCBs%20TMDL%20Final%20Staff%20Report%20April2017.pdf>. A true and correct copy of the report is attached hereto as Exhibit M.

3. On May 28, 2018, I downloaded maps of Statewide CSLC Lands, which includes a statement entitled "California State Lands Commission Jurisdiction," from the California State Lands Commission's internet website at the following address: <.http://www.slc.ca.gov/Info/EJ/EJ-JMap.pdf>. A true and correct copy of the maps and statement are attached hereto as Exhibit N.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Executed May 29, 2018, at Los Angeles, California.

Gregory J. Newmark

1. Introduction

This Staff Report presents the supporting documentation for a proposed Basin Plan amendment that will be considered by the California Regional Water Quality Control Board, San Francisco Bay Region (Water Board) that establishes a Total Maximum Daily Load (TMDL) and implementation plan for Polychlorinated Biphenyls (PCBs), including PCBs with dioxin-like properties, for all of San Francisco Bay. The TMDL is based on attainment of a fish tissue target PCBs concentration protective of human health, wildlife, and aquatic life. This report contains the results of analyses of PCBs impairment assessments, sources and loadings, linkage analyses, load reductions, and implementation actions.

The Clean Water Act requires California to adopt and enforce water quality standards to protect San Francisco Bay. The Water Quality Control Plan for the San Francisco Bay Region (Basin Plan) delineates these standards, which include beneficial uses of waters in the Region, numeric and narrative water quality objectives to protect those uses, and provisions to enhance and protect existing water quality (antidegradation). The California Toxics Rule (CTR) is the basis for the numeric water quality criteria for PCBs in San Francisco Bay. Section 303(d) of the Clean Water Act requires states to compile a list of “impaired” water bodies that do not meet water quality standards and to establish a TMDL for the pollutant that causes impairment. The proposed TMDL and implementation plan are designed to resolve PCBs impairment in all segments of San Francisco Bay.

For the purpose of the report, all segments of San Francisco Bay include the portion of the Sacramento and San Joaquin Delta in the San Francisco Bay Region, and all portions and contiguous tidal zones of Suisun Bay, Carquinez Strait, San Pablo Bay, Richardson Bay, Central Bay, Lower Bay and South Bay. Throughout this report, the terms San Francisco Bay and Bay are inclusive of all these segments.

This report provides the rationale and the technical basis for the required TMDL elements and associated implementation plan. This report meets the requirements of the California Environmental Quality Act (CEQA), including the preparation of a checklist (Appendix A) for adopting Basin Plan amendments and serves in its entirety as a substitute CEQA environmental document. It builds on earlier reports on sources and loadings (June, 2000), impairment assessment (June, 2001) and a Project Report (January 2004). It also builds on the Draft Staff Report (June 23, 2007 version) that was circulated for a 60-day public review period and testimony hearing that was held on September 12, 2007, and the Revised Draft Staff Report (December 3,, 2007 version) that was circulated for a 45-day public review. This report was developed with consideration of stakeholder input, including incorporation of comments received on the Project Report and comments received on the Draft Staff Report and Revised Draft Staff Report, and has been updated with new information.

The process for establishing a TMDL includes compiling and considering available data and information, conducting appropriate analyses relevant to defining the impairment problem, identifying sources, and allocating responsibility for actions to resolve the impairment. This report is organized into sections that reflect background information, the key elements of the TMDL process, and regulatory analyses required to adopt the amendment.

In addition, the scientific basis of the Basin Plan amendment was subjected to external scientific peer review. This step is required under §57004 of the Health and Safety Code, which specifies that an external review is required for work products that serve as the basis for a rule,

"…establishing a regulatory level, standard, or other requirements for the protection of public health or the environment." The scientific basis of the PCBs TMDL, as presented in the Staff Report, was evaluated by two peer reviewers, Prof. David O. Carpenter, M.D., and Prof. Kevin J. Farley, who concluded that the scientific basis of the proposed Basin Plan amendment is based on sound scientific knowledge, methods, and practices.

Section 2 presents the problem statement that the project is based on and defines the project, why it is necessary and its objectives. Section 3 presents information about the physical setting of San Francisco Bay, including climate, hydrology, geology and biology. Section 4 discusses the chemistry and historical use of PCBs. Section 5 provides a discussion of the water quality standards that are applicable to San Francisco Bay. Section 6 presents the results of the impairment assessment that identified adverse impacts to beneficial uses in the Bay.

Section 7 presents our understanding of the sources of loading of PCBs to the Bay. Sources and loading are identified as internal or external to the Bay. Internal sources reflect the current reservoir of PCBs found in sediments or the water column. External sources reflect loads coming into the Bay, for example, from urban runoff or wastewater treatment plants.

Section 8 presents the derivation of the numeric target. Section 9 presents the linkage analysis which describes the relationship between PCBs sources and the proposed target, and estimates the bay's capacity to assimilate PCBs while still meeting the numeric fish tissue targets. Section 10 presents the proposed TMDL and the allocations of the TMDL to external sources.

Section 11 presents the Implementation Plan which includes actions and requirements deemed necessary to implement the external source allocations and actions to manage internal sources of PCBs. It specifies monitoring activities to demonstrate attainment of allocations and the numeric target. It also presents an adaptive implementation strategy to review implementation progress and to evaluate any new information generated, which may lead to improved implementation actions, and refinement of the TMDL, the numeric target or the allocations in the future.

Section 12 presents the results of CEQA analyses including an environmental impact assessment and an evaluation of alternatives to the proposed Basin Plan amendment. Section 13, References, lists all the information sources cited and relied upon in preparation of this report.

2. Project Definition

This section presents the problem statement upon which the proposed Basin Plan amendment project is based. It also presents the project definition and objectives which form the basis of the assessment required by the CEQA.

2.1 Problem Statement

All San Francisco Bay segments were initially placed on the California 303(d) list in 1998 for total PCBs and dioxin-like PCBs due to an interim health advisory for fish consumption. The 1998 listing applies to the following Bay segments: Sacramento and San Joaquin Delta, Suisun Bay, Carquinez Strait, San Pablo Bay, Richardson Bay, Central Bay, Lower Bay and South Bay. The 303(d) list was revised in 2002 to include specific locations in the Lower Bay segment. These listing were sustained on the 2006 303(d) list version (Table 1; Figure 1). This TMDL applies to all Bay segments.

As further discussed in the Impairment Assessment in Section 6, water quality objectives that are not attained include the narrative water quality objective which states that controllable water quality factors shall not cause a detrimental increase in toxic substances found in bottom sediments or aquatic life and the numeric water quality criterion of 0.00017 ug/L total PCBs in water. The existing beneficial use that is not fully supported due to elevated PCBs levels in fish is commercial and sport fishing. However, this TMDL is designed to ensure protection of all beneficial uses of the Bay including but not limited to preservation of rare and endangered species, estuarine habitat, and wildlife habitat.

Table 1-San Francisco Bay Water Segments on 2006 303(d) List for PCBs

Water Body Names	Hydrologic Unit	Total Water Body Size (acres)
Sacramento/San Joaquin Delta	207.100	41,736
Suisun Bay	207.100	27,498
Carquinez Strait	207.100	5,657
San Pablo Bay	206.100	68,349
Richardson Bay	203.130	2,439
San Francisco Bay, Central	203.120	70,992
San Francisco Bay, Lower (including)	204.100	79,293
Central Basin, San Francisco	204.400	40
Mission Creek	204.400	8.5
Oakland Inner Harbor (Fruitvale site)	204.200	0.93
Oakland Inner Harbor (Pacific Dry-Dock Yard 1 site)	204.200	1.8
San Francisco Bay, South	205.100	21,669

(2006 CWA Section 303(d) list)

2.2 Project Definition

The project is the adoption of a proposed Basin Plan Amendment to establish a TMDL and a phased implementation plan to attain PCBs water quality standards in all segments of San Francisco Bay. The Water Board is obligated under Section 303(d) of the Clean Water Act to develop a TMDL for San Francisco Bay to address PCBs impairment. The following components form the basis of the proposed regulatory provisions and define the project:

1. Numeric target for PCBs concentrations in fish tissue of 10 ug/kg.
2. Total maximum average yearly PCBs load to San Francisco Bay of 10 kg/year.
3. Allocation of the total maximum average yearly PCBs load among the various external PCBs sources to San Francisco Bay.
4. Plan to implement the TMDL that includes actions to reduce PCBs loads to achieve external load allocations and actions to manage internal sources of PCBs in San Francisco Bay.
5. Monitoring program to evaluate progress in meeting the numeric target and load allocations.
6. Plan and schedule for studies to improve technical understanding relevant to the PCBs TMDL and implementation plan, and for reviewing progress toward meeting targets, implementing actions and evaluating continued appropriateness and effectiveness of actions.

Figure 1-San Francisco Bay Embayments

2.3 Project Objectives

The proposed Basin Plan Amendment is intended to reduce existing and future PCBs discharges to San Francisco Bay associated with controllable water quality factors. Controllable water quality factors are those resulting from human activities that can influence water quality and be reasonably controlled through prevention, mitigation, or restoration. Specific objectives of the project are as follows:

1. Attain numeric PCB water quality criteria and the narrative bioaccumulative water quality objective established for the Bay in as short a time frame as feasible.
2. Protect beneficial uses of San Francisco Bay including but not limited to sport fishing and wildlife habitat.
3. Set target(s) to attain relevant water quality standards in all parts of the Bay.
4. Reduce loading of PCBs to the Bay from external sources and reduce uptake from sediments.
5. Continue to make use of the experience and expertise of the Water Board and its stakeholder community regarding local watersheds and PCBs sources.
6. Initiate actions to reduce PCBs discharges, while continuing to accommodate new information on PCBs fate in the environment.
7. Establish a decision-making framework where management actions evolve to adapt to future knowledge or conditions.
8. Favor actions that have a multi-contaminant benefit and promote efficiencies in water quality regulation and resource management.
9. Avoid actions that will have unreasonable costs relative to their environmental benefits.
10. Comply with the antidegradation requirements of State Board Resolution No. 68-16 and federal antidegradation regulations (40 CRF 131.12).
11. Base decisions on readily available information on ambient conditions, PCBs loads, fish consumption patterns, and PCBs fate and effects.
12. Consider site-specific factors relating to PCBs sources, ambient conditions, watershed characteristics, and response to management actions.
13. Avoid arbitrary decisions and speculation when computing loads, setting targets, setting allocations, determining implementation actions, and defining a margin of safety.
14. When selecting from a range of options, select an environmentally protective option as a means of building an implicit margin of safety into the TMDL.
15. Consider natural, seasonal, and inter-annual variability in determining the manner of implementing the load allocations.
16. Avoid imposing regulatory requirements more stringent than necessary to meet the targets designed to attain water quality standards.
17. Provide details of an implementation plan that includes: a description of the nature of actions necessary to meet allocations and targets and thereby achieve water quality standards; a schedule for actions to be taken; and a description of monitoring to be undertaken to determine progress toward meeting allocations, targets and water quality objectives.

18. Provide interim risk management programs to protect recreational sport fishing anglers.
19. Comply with the Clean Water Act requirement to adopt a TMDL for a 303 (d) listed impaired water body.

3. Setting

San Francisco Bay is located on the Central Coast of California and marks a natural topographic separation between the northern and southern coastal mountain ranges. The Bay functions as the only drainage outlet for waters of the Central Valley.

Because of its highly dynamic and complex environmental conditions, the Bay system supports an extraordinarily diverse and productive ecosystem. The basin's deepwater channels, tidelands, and marshlands provide a wide variety of habitats that have become increasingly vital to the survival of several plant and animal species. The basin sustains communities of crabs, clams, fish, birds and other aquatic life and serves as an important wintering site for migrating waterfowl.

3.1 Physical Setting

San Francisco Bay is a large coastal embayment receiving fresh water from Central Valley rivers via the Delta and from local small tributaries (Figure 2). The Bay is relatively shallow with an average depth of around 6 meters and a median depth of about 2 meters at mean lower low water (Conomos, 1979). Narrow channels 10 to 20 meters deep incise broad expanses of the Bay floor. Deeper sections of channels such as the Golden Gate (110 meters) and Carquinez Strait (27 meters) are topographic constrictions where depths are maintained by scouring from tidal currents. Due to the extent of shallow areas, seasonal winds cause significant sediment resuspension and movement in the Bay.

The Bay is subdivided in segments: Sacramento and San Joaquin Delta, Suisun Bay, Carquinez Strait, San Pablo Bay, Richardson Bay, Central Bay, Lower Bay and South Bay. The northern reach of the San Francisco Bay (Suisun Bay, Carquinez Strait, and San Pablo Bay) is partially to well-mixed while the South Bay (Lower and South Bay) is a tidally oscillating lagoon. The Central Bay is most influenced by water exchange with the ocean.

3.2 Climate

The climate of San Francisco Bay plays an important role in determining the environmental conditions found in the Bay. The Bay has a Xeric (Mediterranean) moisture regime characterized by cool, dry summers and mild, wet winters. The amount and timing of precipitation, air temperature, and wind patterns influence the Bay's freshwater inflow, salinity, currents, and suspended sediment concentrations.

The sun affects the Bay by promoting photosynthesis and warming the shallow areas, which in turn influences carbon dynamics in the water column and sediments. Carbon dynamics and the formation of humic substances (natural organic matter) influence the partitioning of PCBs in aquatic environments between sediments, water, and biota.

The Bay is subjected to strong southwest summer winds. These strong winds exert stress on the water surface, which generates waves. Wind-generated waves resuspend sediments creating turbid conditions and dispersing sediments throughout the Bay, thereby affecting movement of PCBs in the Bay. Waves also tend to mix and aerate the water, which also influences carbon fluxes in the Bay.

PCBs mainly partition into the organic carbon phase such as the organic matter in sediments, or into the lipid fraction of biota. A better understanding of sediment movement and organic carbon fluxes is essential to understanding distribution and long-term fate of PCBs in the Bay. Our

ability to predict the fate of PCBs on a fine scale will require improved understanding of sediment movement and carbon flux throughout the Bay.

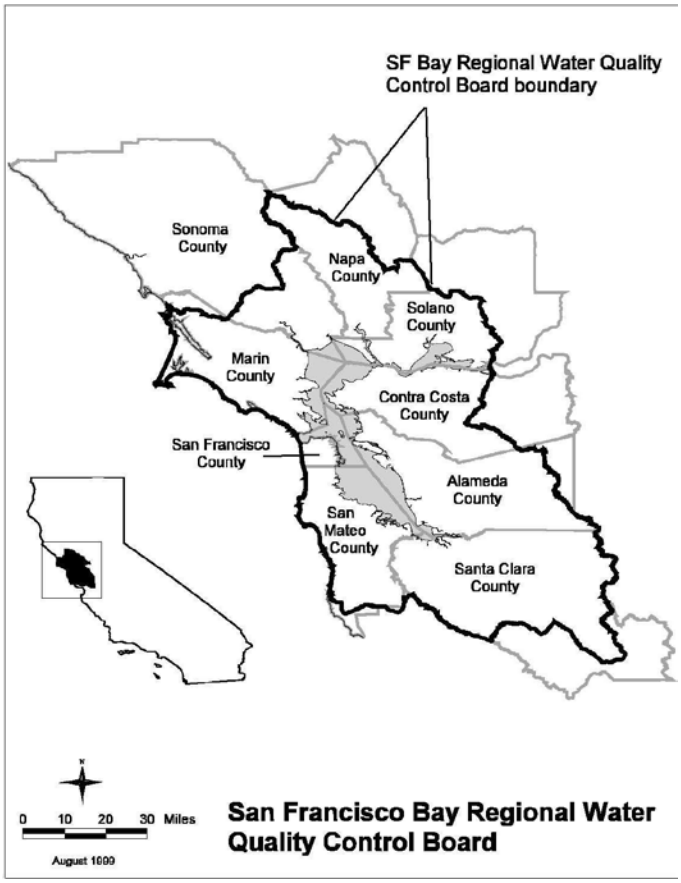

Figure 2-San Francisco Bay Region

3.3 Hydrology

Freshwater inflows, tidal mixing, and their interactions largely determine variations in the hydrology of the Bay. Hydrology has profound effects on biota that live in the Bay because it determines the salinity in different portions of the Bay.

The Bay receives 90 percent of its fresh water inflows from streams and rivers draining the Central Valley watershed and about 10 percent from local tributaries surrounding the Bay (SFEP, 1992a). The Sacramento and San Joaquin Rivers carry about 60 percent of the state runoff draining around 152,500 square kilometers (km^2) or 40 percent of California's surface area (Conomos et al., 1985). Of the fresh water flows entering the Bay from the Central Valley watershed, the Sacramento River typically accounts for 80 percent, the San Joaquin River 15 percent, and smaller rivers and streams the remainder.

The northern reach of the Bay (comprised of Suisun Bay, Carquinez Strait, and San Pablo Bay) is geographically and hydrologically distinct from the Central and South Bays. The northern reach is a partially to well-mixed waterbody (depending on the season) that is dominated by seasonally varying delta inflow. The South Bay is a tidally oscillating, lagoon-type Bay, where

variations are determined by water exchange with the northern reach and the ocean. Water residence times are much longer in the South Bay than in the North Bay.

Response time of the Bay to PCBs source control will depend on the sediment hydrodynamics of the Bay, such as its rate of flushing, sediment dynamics, and the variability in inflow. The effect of these parameters over a long time scale needs to be accounted for in determining the long-term fate of PCBs in the Bay.

3.4 Geology

San Francisco Bay is located within the Coast Ranges of California. The Coast Ranges are characterized by northwest trending longitudinal mountain ranges and valleys formed by faulting and folding (Howard, 1979).

In aquatic environments, PCBs are mainly associated with sediments. Therefore, understanding past, current, and future sedimentation and sediment movement is essential for predicting the fate and transport of PCBs in the Bay.

Delta inflow from the Central Valley watershed is the major source of new sediment input into the Bay. Most new sediment (approximately 80 percent) originates in the Sacramento-San Joaquin River drainage and enters primarily as suspended load during the high winter inflows. Much of the winter sediment load from the Sacramento and San Joaquin rivers initially settles out in San Pablo Bay. During the low flow summer months, wind-generated waves and tidal currents resuspend the previously deposited sediment and redistribute it over a wider area.

The Bay's sediment mass balance was greatly altered by the advent of hydraulic mining in the Sierras in the late 1800's. The resulting large increase in sediment loads to the Bay due to hydraulic gold mining affected both the mudflat and sub-tidal areas (SFEP, 1992a). Deposition of fine sediments originally raised mud elevations several meters in Suisun Bay, and the elevation of mud migrated as a "mud wave" to San Pablo Bay and the Central Bay over the past century. During the time of highest PCBs production and use, the continual deposition of sediment buried PCBs being released into the Bay from land and maritime-based activities. Therefore, a large reservoir of PCBs was created in the Bay sediments.

Recent studies indicate that, in portions of the Bay, sediments are eroding (Jaffe et al., 1998). Sediments deposited during the period of Bay Area industrialization are now being uncovered due to a decrease of sediments entering the Bay from the Sacramento and San Joaquin rivers. This erosion could uncover contaminated sediments, resulting in increased availability of PCBs to the food web. Even if all current PCBs sources to the Bay are eliminated, exposure of historically contaminated sediment may turn out to be a significant PCBs source to organisms.

Sediment dynamics influence the distribution, transport and fate of PCBs in the Bay. Bathymetry is a factor affecting sediment dynamics. Broad shallows incised by narrow channels characterize San Pablo Bay, Suisun Bay, and the South Bay. These shallower areas are more prone to wind-generated currents and sediment resuspension and deposition than deeper areas, such as the Central Bay. Near-shore shallow areas are likely repositories of larger reservoirs of PCBs, due to their proximity to historical land-based industrial activities.

Currents created by tides, freshwater inflows, and winds cause erosion and transport of sediments in the Bay. Tidal currents are usually the dominant observed currents in the Bay.

Generally, tides appear to have a significant influence on sediment resuspension during the more energetic spring tide when water column sediment concentrations naturally increase.

Strong seasonal winds create circulation and mixing patterns and add to tide- and river-induced current forces. It has been estimated that about 160 million cubic yards (mcy) of sediments are resuspended annually from shallow areas of the Bay by wind-generated waves (USACE, 1998), while 8 to 10 mcy enter the Bay from the Central Valley watershed and 4 to 8 mcy leave the Bay through the Golden Gate (Table 2). These estimates of sediment inputs have been updated (Schoellhamer et al., 2005), but these relative estimates are used to illustrate the substantial degree of sediment resuspension compared to gains and losses. These are the only estimates of sediment resuspension volumes. By comparison, between 2001 and 2005, an average of 1.8 mcy of dredged sediments was disposed in the Bay as a result of maintenance dredging activities between 2001 and 2005 (DMMO, 2006). The current estimate of the sediment budgets indicates a net loss of 2.4 mcy of sediments from the Bay (Schoellhamer et al., 2005).

Table 2-Sediment Movement in San Francisco Bay

Pathway	Sediment Volume (10^6 cu yd)
Inflow from Central Valley	6.9-8.1
Inflow from other tributaries	1.1-2.4
Outflow through the Golden Gate	4.2-8.1
Resuspension	160

(USACE, 1998)

Our understanding of sediment dynamics is based on general Bay-wide models. These models are based on Bay-wide averages and do not consider site-specific PCB-Contaminated sites in the near-shore environment.

3.5 Biology

Many species of birds, fish, and mammals regularly reside in the Bay, including a number of endangered, threatened, and rare wildlife species. The Bay supports a diversity of habitat types resulting in a diversity of wildlife species. High food productivity in different habitats types allow some species to achieve substantial numbers. Tidal salt marshes and open waters sustain aquatic plants and phytoplankton that feeds the Bay food web.

Open Waters

Open waters include various habitat types, such as subtidal waters and sloughs. Open waters support benthic and pelagic invertebrates, fish, waterbirds, and seals. Invertebrates serve as prey for large fish populations representing several different trophic levels, including Pacific herring, northern anchovy, Pacific sardine, staghorn sculpin, several species of perch, English sole, and California halibut. Many of these fish species in turn serve as prey to piscivorous birds such as the Forster's tern, California least tern, American white pelican, brown pelican, and double-crested cormorant. Waterfowl such as greater scaup, lesser scaup, canvasbacks, and surf scoters dive for bivalves, crustaceans, and other invertebrates in shallower open waters. Bird diversity in the open Bay waters is fairly low, as the species of birds that can exploit the subtidal areas are limited to those that can forage from the air (*e.g.*, terns) or under water (*e.g.,* scoters) and those that can swim.

Sloughs and channels provide important habitat for large numbers of benthic and pelagic invertebrates and fish. These organic-rich channels serve as important nurseries and feeding areas for estuarine fish. Diving ducks generally avoid the smaller tidal channels but are found in abundance, particularly during their non-breeding season, near the mouths of the larger sloughs, and in open waters. Terns often forage in the larger channels, and several species of herons and egrets forage in the shallower channels for fish. Many shorebirds feed along the exposed flats along tidal channels at low tide, as do rails and other tidal marsh birds.

The Bay's open water provides shallow and deep-water habitat throughout San Francisco Bay. Sediments in these areas range from clays to sand. The dominant plants are phytoplankton, green algae and blue green algae (SFEP, 1992b). Extensive phytoplankton growth in the water column occurs in Suisun, San Pablo and South Bays. Open waters also provide habitat for benthic (bottom dwelling) organisms, fish, and birds. Other important habitats include mudflats, tidal and brackish marsh, and wetlands. Large numbers of benthic organisms, such as clams, worms, mussels, shrimps, and crabs, reside in these habitats. Bay-dwelling fish, such as shiner surfperch, white croaker, and jacksmelt, are known to feed on these benthic organisms (Goals Project, 2000).

The makeup of benthic communities varies highly both spatially and over time (SFEP, 1992b; Thompson et al., 2000). A better understanding of the factors controlling benthic community composition and dynamics would further our understanding of the food web in general, and the uptake and transfer of PCBs in the food web. Benthic organisms are a large part of the diet for the Bay fish species with the highest PCBs concentration (Roberts et al., 2002). Modeling of PCBs in the food web of in the Bay has been performed providing a linkage between PCBs concentrations in sediment, water and biota (Gobas and Wilcockson, 2003; Gobas and Arnot, 2005).

Mudflats

Intertidal mudflats are expanses of minimally vegetated to unvegetated mud in the lower marsh zone. Most of this habitat occurs just beyond the edge of fully vegetated wetlands, and between channels and edges of wetlands within sloughs. Shallow waters generally cover mudflats during high tide, but they are uncovered at low tide. Narrow mudflats occur along the edges of the tidal sloughs and channels, while larger mudflats occur at the mouths of sloughs and along the edge of the Bay.

Mudflats support a large community of diatoms, worms, shellfish, and algae. Organic debris from tidal marshes, phytoplankton, algae, and diatoms are responsible for the large numbers of benthic invertebrates on mudflats. Crustaceans, polychaete worms, gastropod and bivalve mollusks, and other invertebrates live on or just below the surface of the mud. During high tides, mudflats provide foraging habitat for many species of fishes and wading birds. During low tides, large numbers of shorebirds feed in the mudflats. These mudflats are a key reason for the importance of the San Francisco Bay Area to West Coast shorebird populations.

Smaller channels in brackish and salt marshes are the favored feeding areas for the state and federally endangered California clapper rail. Shorebirds, gulls, terns, American white pelicans, and ducks often use exposed mudflats as roosting or loafing areas when available, as do Pacific harbor seals. When the tides rise, most of these birds return to roosting areas in salt ponds or other alternate habitats; the seals move to open waters.

The state and federally endangered salt marsh harvest mouse, the salt marsh wandering shrew, and the California vole reside where pickleweed is present. California clapper rails nest in cordgrass, denser stands of pickleweed, and marsh gumplant, in both salt and brackish tidal marshes.

Tidal marshes are important to the aquatic components of the Bay' overall ecosystem, not just to the species that reside and/or feed there. Organic debris from tidal marshes forms much of the foundation of the Bay food web.

Brackish Marsh
Brackish marshes occur in the low-to-mid intertidal reaches of sloughs and creeks draining into the Bay. Their vegetation is subject to tidal inundation diluted by freshwater flows.

The vegetation in brackish marsh habitat is dominated by plant species adapted to intermediate (brackish) salinities, including short bulrushes such as alkali bulrush and saltmarsh bulrush. Other plants found in brackish marshes include alkali heath, cattails, spearscale, and pickleweed. Large patches of the invasive pepperweed also occur within the terraced areas in these middle reaches.

Brackish marshes support many of the wildlife species that use salt marsh and freshwater marsh habitats. Brackish marshes are particularly important for anadromous fish (migrating from saline to fresh water to spawn) and catadromous fish (migrating from fresh to saline water to spawn) and invertebrates such as shrimp.

Most terrestrial and wetland wildlife species are tolerant of a range of salinities, and are affected more by habitat structure and food availability than by salinity. Brackish marshes support most of the bird species occurring in both salt and freshwater marshes. California clapper rails occur in brackish marshes, and likely breed in these marshes. The often taller, denser vegetation in brackish marshes supports large densities of breeding song sparrows, saltmarsh common yellowthroats, and marsh wrens, and large numbers of Virginia rails and soras during migration and winter.

4. Polychlorinated Biphenyls

PCBs are a class of organic compounds produced as complex mixtures for a variety of uses, including dielectric fluids in capacitors and transformers. PCBs were manufactured commercially by the Swann Chemical Company beginning in 1929. Monsanto acquired the process in 1935 and continued PCBs production until 1977 (Erickson, 1997).

In the United States, discovery of PCBs as ubiquitous environmental contaminants led to their initial regulation under the Toxic Substances Control Act (TSCA) in 1976. In 1978, Congress banned the manufacture, processing, and distribution in commerce of PCBs. Use of PCBs was restricted to totally enclosed applications, and non-totally enclosed applications were only allowed with the United States Environmental Protection Agency (USEPA) exemptions. In 1979, USEPA passed regulations that defined totally enclosed applications as intact, non-leaking electrical equipment. USEPA banned the manufacture and distribution in commerce of materials containing any detectable PCBs in 1984 (Erickson, 1997).

Although PCBs uses have been phased out since the ban, large quantities have remained in use, and some PCBs are still in use today (Table 3). Therefore, the potential for continued PCBs release to the environment remains. It is not known how much unreported PCBs are still being used today nor how much were used in the past in a manner such that they could be currently released to the environment.

Table 3-Self Reporting of PCBs Uses in the Bay Area (1999)

4.1 Chemical Structure

PCBs are a family of chlorinated organic compounds formed by two benzene rings linked by a single carbon-carbon bond (Figure 3). Various degrees of substitution of chlorine atoms for hydrogen are possible on the remaining 10 benzene carbons. There are 209 possible arrangements of chlorine atoms on the biphenyl group. Each individual arrangement or compound is called a congener. Groups of congeners with the same number of chlorine atoms are called homologs. Thirteen of the 209 congeners are known to show toxic responses similar to those caused by 2,3,7,8 tetrachlorodibenzo-p-dioxin (TCDD), the most toxic dioxin compound (Van den Berg et al, 1998).

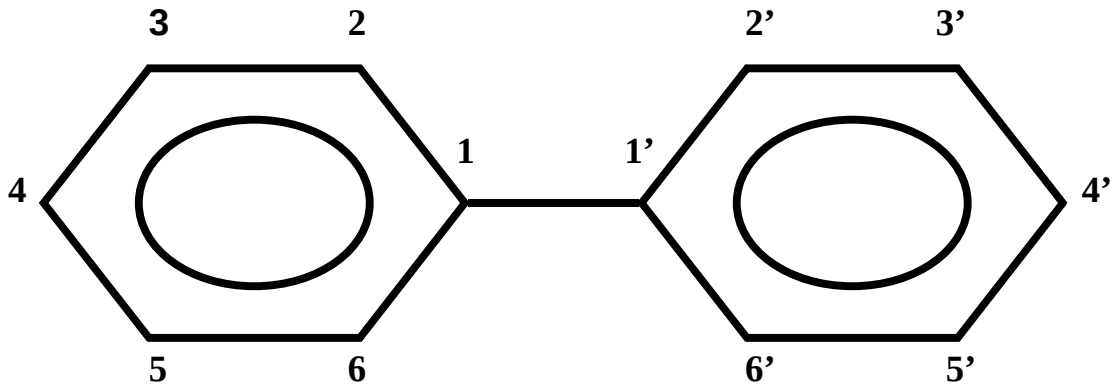

Figure 3-Structure of PCB Molecule

PCBs were mainly marketed as Aroclors in the United States. Aroclors are mixtures of congeners with varying numbers of chlorine atoms (Table 4). Aroclors were the most abundant PCBs mixtures manufactured and used in the United States. The numbering scheme for Aroclors is based on their structure and mixture: the first two digits represent the number of carbon atoms (12) while the second two numbers denote the percent chlorine by weight. Aroclor 1016 is an exception and has a chlorine weight content of 40 to 42 percent (ATSDR, 2000).

Table 4-Percentage of PCB Homolog in Aroclors

Homolog	Aroclor						
	1016	**1221**	**1232**	**1242**	**1248**	**1254**	**1260**

Deca-CBs	--	--	--	--	--	--	--

(ATSDR, 2000)

Although the congener compositions of manufactured Aroclors are known, the fate of the various congeners in the environment is not as well understood. Fate and stability of congeners vary with the degree and location of chlorination, making source identification of environmental PCBs difficult.

4.2 Chemical and Physical Properties

PCB congeners vary markedly in their chemical and physical properties depending on the degree and position of chlorination. Important properties such as non-flammability, low electrical conductivity, high thermal stability, and high boiling point, make PCBs highly stable and persistent in the environment. PCBs are also soluble in non-polar organic solvents and biological lipids, hence their tendency to bioaccumulate in living organisms.

PCBs are generally resistant to degradation, and are strongly resistant to acids and alkalis. PCBs have a low solubility, low volatility (small Henry's Law constant), and increasing affinity for organic matter (increasing log K_{ow}) with increasing chlorination (Table 5). Note that organic compounds with a log K_{ow} greater than 3.5 are considered to have a large potential to bioaccumulate (USEPA, 1985). Biodegradation rates of PCBs also vary greatly depending on the degree and location of chlorination, and redox conditions (ATSDR, 2000).

PCB congeners exhibit of range of properties, which affect their fate and residence time in the environment. Solubility of PCBs in water generally decreases with increased chlorination (Table 5). PCBs adsorption to sediment, denoted by increasing K_{ow}, generally increases with increasing degree of chlorination (Table 6) or increasing sediment organic carbon concentration (ATDSR, 2000). PCBs in aquatic systems are therefore usually found in much greater mass in the sediments than in the water column. Increasing log K_{ow} is accompanied by an increase in the tendency to bioaccumulate in aquatic organisms. Bioconcentration factor (BCF) increases a thousand-fold when going from monochlorobiphenyl to decachlorobiphenyl. Evaporation rates decrease with increasing degree of chlorination (Table 6). In general, the lower chlorinated PCB congeners are removed faster from the aquatic environment than the more chlorinated PCBs as

the lower chlorinated congeners are not sorbed as strongly to sediments and are more readily volatilized.

Table 5-Selected Properties of PCBs as Aroclors

Aroclor	Density (g/cm^3)	Solubility (mg/L)	Log K_{ow}	Henry's Law Constant ($atm\text{-}m^3/mole$)
1016	1.37	0.42	5.6	2.9×10^{-4}
1221	1.18	0.59	4.7	3.5×10^{-3}
1232	1.26	0.45	5.1	No Data

DecaCB	306	1.4×10^{-6}	7.6×10^{-4}	8.3	1.0×10^7	8.5×10^{-7}

(Erickson, 1997)

The biggest reservoir of PCBs in aquatic systems is sediments rather than the water column. As the tendency of PCBs to adsorb to sediments increases with increasing log K_{ow}, their persistence in surface waters increases. This property enhances the importance of bottom-dwelling organisms in the food-web transfer of PCBs. This is also the case for decreasing water solubility and decreasing volatility (decreasing vapor pressure). Many physical and chemical factors affect this persistence and transfer, ultimately limiting our ability to predict the fate and transport of PCBs in aquatic environments.

4.3 Production and Uses

PCBs were produced in very large quantities both within and outside the United States. Although their uses in capacitors and transformers are well known, PCBs were used in a wide variety of applications including some involving direct contact with the environment.

Production

In the United States, commercial PCBs production started in 1929 and continued until 1977 (ATSDR, 2000). The estimated total commercial production of PCBs in the United States ranged from 610 million to 635 million kilograms (kg). Most of domestic uses of PCBs were Aroclors produced in the U.S. with only 1.4 million kg of PCBs imported. U.S. production peaked in 1970 at 39 million kg.

PCBs mixtures were manufactured in other countries under many different trade names; these include Clophen (Germany), Fenclor (Italy), Kaneclor (Japan), Sovol (former USSR) and Phenoclor (France). Fenchlor DK is a product of interest as it is comprised solely of decachlorinated biphenyl (Congener #209) and was used in investment casting (Erickson, 1997).

The Monsanto Chemical Company produced approximately 99 percent of PCBs used by U.S. industry. Prior to ceasing production, up to 200,000 kgs of PCBs products per year were imported into the U.S. (ATSDR, 2000). Importation of PCBs continued after U.S. production was banned until January 1, 1979. However, USEPA permitted 16 companies that filed exemption petitions to continue to import and use PCBs after the ban on importation.

Between 1957 and 1977, 52 percent of the Aroclors produced consisted of Aroclor 1242 and 13 percent were its replacement, Aroclor 1016 (Table 7). Aroclor 1016 production was started in 1970, as it was believed to be less harmful to the environment than Aroclor 1242 (Erickson, 1997). Although frequently reported in environmental samples, the more chlorinated Aroclors 1248, 1254 and 1260 comprised only 7, 16 and 11 percent of the PCBs mixtures produced. This high frequency of detection of more chlorinated PCBs may be due to the preferential loss of lower chlorinated PCB congeners from the environment.

Table 7-Relative Production of Aroclors in the United States (1957-1977)

PCBs Mixture	Percent of Production
Aroclor 1016	13
Aroclor 1221	1
Aroclor 1232	<1
Aroclor 1242	52
Aroclor 1248	7
Aroclor 1254	16
Aroclor 1260	11
Aroclor 1262	1
Aroclor 1268	<1

(USEPA, 1996)

Use

PCBs mixtures were most commonly used as dielectric fluid in electrical equipment such as transformers and capacitors (EIP, 1997). PCBs uses can be divided into three different categories: completely closed systems (electrical equipment such as capacitors and transformers), nominally closed systems (e.g., vacuum pumps and hydraulic transfer systems), and open-ended applications (e.g., paints, adhesives, pesticide extenders, inks, and plasticizers). In addition, PCBs had a vast number of other uses, through their inclusion as components in products such as building materials (paints, caulks and sealants), greases, oils, carbonless copy paper, and as ballast in fluorescent lights (Table 8). For example, PCB-containing paints and building sealants were used extensively at Department of Defense (DOD) and Department of Energy (DOE) facilities (U.S. Navy, 2006a; Poland et al., 2001). PCBs have also been detected in up to half the paints and sealants of buildings constructed between 1950 and 1980 in Switzerland (Kohler et al., 2005), Sweden (Astebro et al., 2000), and Australia (CFEMU no date). Based on the results of these studies, PCBs removal programs from building materials have been implemented in these countries. PCBs have been used and are still in use in non-liquid forms in building materials (USEPA, 1999a), including as aquatic paints in fish hatcheries (WDEC, 2006; Cornwall, 2005). However, the extent of PCB-containing materials use in Bay area buildings, as well as the potential of these materials to be released and transported to the Bay, has not been determined.

Prior to 1974, PCBs were used in both closed and open-ended applications. After 1974, open-ended uses of PCBs mixtures were discontinued. One exception was the use of PCBs 209 (decachlorobiphenyl) as filler for investment casting waxes. About 200 tons of PCBs were imported from France and Italy for this use in 1974. The production of PCBs-containing capacitors and transformers ended in January 1979. The life expectancy of transformers and capacitors is decades. In-place capacitors and transformers may still remain significant potential sources of PCBs to the environment. USEPA maintains a database of current volumes of PCBs used in the United States. The database only contains uses that have been reported voluntarily. A query of this USEPA database showed significant ongoing use, almost 200,000 kg, in the San Francisco Bay Area (Table 3).

PCBs industrial use and manufacture has created on-land and in-Bay contaminated area in the San Francisco region. Remediation and control of PCBs releases from these sites may be necessary to restore the Bay's beneficial uses. In addition, the role of widespread open-ended PCBs uses needs to be addressed to ensure that the implementation actions are successful.

Table 8-Selected List of PCBs Uses

Category	Use
Electrical Uses	Transformers and Capacitors Voltage Regulator (power lines) Starting Aid (single phase motors) Power Factor Correction (rectifier, AC induction motor, furnaces) Consumer Electrical Items (refrigerators, televisions, washing machines) Water Well Pumps Lamp Ballast (fluorescent, high intensity discharge) Switch Gear Manufacturing Machinery (capacitors, transformers, associated

Category	Use
	switchgear)
	PCB Contaminated Mineral Oils (transformer changeout)
Non-Electrical Uses	Printing Inks and Pastes
	Carbonless Copy Paper
	Pumps
	Hydraulic Fluids
	Heat Transfer Fluids
	Flame Retardant
	Air Compressor Lubricants
	Plasticizer in paints, resins, synthetic rubber, surface coatings, wax, sealants, waterproofing compound, glues and adhesives
	Pesticides (as extenders)
	Cutting Oil (microscope slide oil)
PCB Contaminated Solids	Wiping Rags
	Safety Equipment
	Machinery
	Soil, Gravel, Asphalt, Sediment

(EIP, 1997)

Disposal

USEPA first promulgated rules in 1978 specifying that liquids containing >0.05 percent (500 mg/kg) PCBs could only be disposed of by incineration in specially permitted facilities, and all non-liquid PCBs mixtures >0.05 percent could only be disposed in specially permitted landfills. In 1979, the regulated PCBs content was lowered to 0.005 percent, or 50 mg/kg. Regulations did not apply to disposal of PCBs dielectric fluid in small capacitors (<3 lbs.) commonly found in fluorescent light ballasts due to the impracticality of regulating the one billion ballasts installed in fluorescent light fixtures throughout the U.S. Disposal and management of PCBs is further regulated under the Resource Conservation and Recovery Act (RCRA). The Clean Water Act (CWA) regulates the discharge of PCBs-laden wastewater into U.S. waters.

4.4 Quantitation

Historically, PCBs have been quantified as Aroclor mixtures by comparing environmental samples to pure unweathered Aroclor standards. This method's ability to correctly quantify PCBs has been questioned (USEPA, 1996), due to the changes (weathering) Aroclor mixtures undergo in the environment. Analytical methods are now being used to quantify individual PCB congeners (Erickson, 1997). These new methods for quantifying PCB congeners in soils and tissue matrices are performed on a relatively routine basis. Low-level analysis of PCB congeners in water at detection limits that allow comparison to USEPA criterion are still non-routine, can have poor precision, and are relatively expensive.

USEPA established the PCBs water quality criterion for the protection of aquatic life based on the sum of Aroclors, and for the protection of human health based on total PCBs, e.g., the sum of all congeners, or isomers or homologs or Aroclor analyses (USEPA, 2000b). In order to utilize all readily available data, in this report we define total PCBs as any of the following:

- Sum of Aroclors;
- Sum of the individual congeners routinely quantified by the Regional Monitoring Program (RMP) or a similar congener sum; or

- Sum of the National Oceanic and Atmospheric Administration (NOAA) 18 congeners converted to total Aroclors (NOAA, 1993). A comparison of the sum of 18 NOAA congeners converted to Aroclor with quantified sums of Aroclors shows relatively good correlation (Figure 4) in one study.

This is a broad designation of total PCBs that can introduce data comparability issues. However, for the purpose of estimating PCBs loads, sources and reservoirs, the introduced error will likely be small compared to the range of PCBs concentrations found in the Bay. PCBs concentrations in Bay sediments commonly vary by three to four orders of magnitude: Bay ambient sediments have about 4.6 micrograms per kilogram (µg/kg) PCBs, while areas considered contaminated can have PCBs concentrations ranging from 1,000-10,000 µg/kg and up. In addition, PCBs concentrations in sources, reservoirs and biota vary by several orders of magnitude in the Bay. Therefore, the use of data, obtained by different methodologies, is justifiable for the purpose of this report. Where possible, water PCBs concentrations were quantified using similar analytical methods, permitting better data comparability.

All data collected for the development of this TMDL are congener based. We recommend that ongoing PCBs data collection activities in the Bay analyze for a suite of congeners. Specifically, Regional Board staff promotes the analysis of a congener list comparable to that quantified by the RMP to facilitate data comparability for long-term trend analysis. Typically, PCBs are measured as Aroclors using USEPA method 8082 or USEPA method 608 for wastewater. These are routine, relatively inexpensive, methods employed by most laboratories. However, the reporting limits for sediments (about 20 µg/kg) and water (about 0.5 µg/L) with these methods are significantly greater than current ambient concentrations in the Bay and discharged wastewater. In the last few years, more laboratories have started using USEPA method 1668 for the analysis of PCBs in sediment and water. Using this method, reporting limits achieved for sediment (50 ng/kg) and water (100 pg/L) have environmentally significance. Therefore we use method 1668 for the monitoring of ambient conditions in San Francisco Bay.

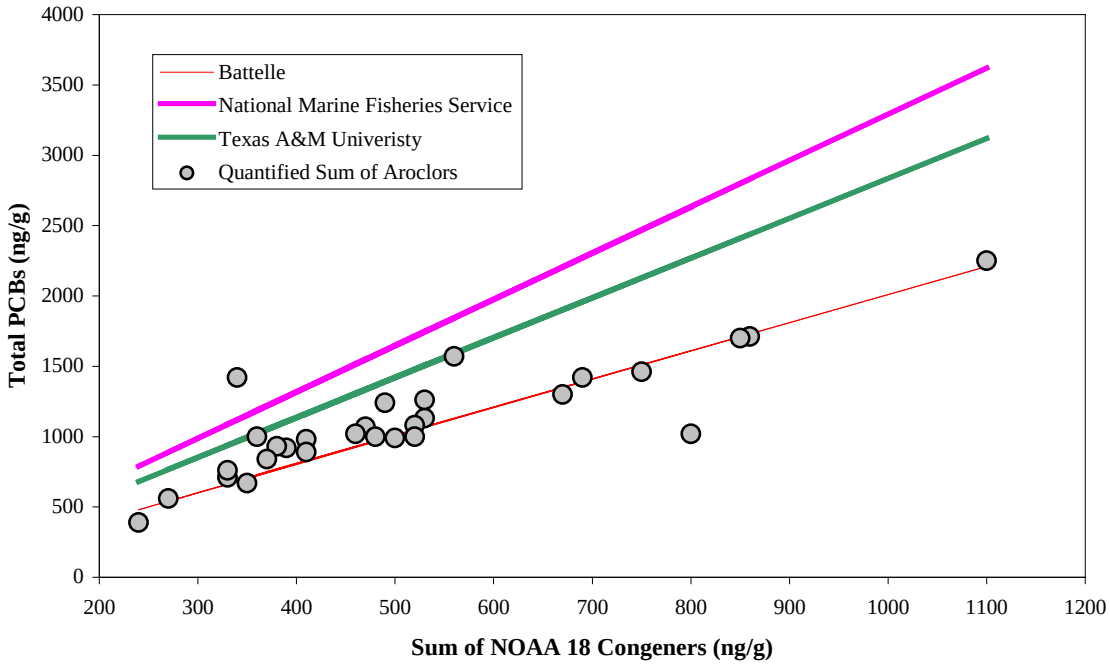

Figure 4-Correlation of PCBs Quantified as Aroclors and Aroclors Calculated from Congener Data (data from SFPUC, 2002).
Regression Line Represents each Organizations Respective Methodology for Quantifying Total Aroclors from Congener Data.

5. Applicable Water Quality Standards

Section 303(d) of the Clean Water Act requires the State of California to identify waters not meeting water quality standards. Water quality standards consist of three parts: beneficial uses, water quality objectives, and antidegradation.

> **Designated or Beneficial Use** - A specific desired use appropriate to the waterbody, termed a *designated use* (beneficial use in California). A beneficial use describes the goal of the water quality standard. It is stated in a written, qualitative form, but the description is as specific as possible.
>
> **Water Quality Criterion or Objective** - A *criterion* that can be measured to establish whether the designated use is being achieved (objective in California). A water quality criterion or objective represents the condition of the waterbody that supports a designated use. The designated or beneficial use is a description of a desired endpoint for the waterbody, and the criterion or objective is a measurable or narrative indicator that is a surrogate for determining attainment of the beneficial use.
>
> **Antidegradation Policy** - An antidegradation policy (under both Federal and California regulations) ensuring that water quality will be maintained at a level protecting beneficial uses.

The beneficial use impaired by PCBs in the Bay is described as follows:

> **Ocean, commercial, and sport fishing (COMM)**
> *Uses of water for commercial or recreational collection of fish, shellfish, or other organisms in oceans, bays, and estuaries, including, but not limited to, uses involving organisms intended for human consumption or bait purposes.*

The applicable water quality objectives include the narrative objective for bioaccumulative substances in San Francisco Bay. This narrative objective states: “Many pollutants can accumulate on particles, in sediment, or bioaccumulate in fish and other aquatic organisms. Controllable water quality factors shall not cause a detrimental increase in toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered.” This narrative water quality objective is applicable to both total PCBs and dioxin-like PCBs.

Two applicable numeric water quality standards for total PCBs are promulgated at 40 Code of Federal Regulation Section 131.38, also known as the California Toxics Rule (CTR). These standards include the saltwater criterion continuous concentration (CCC) of 30 nanograms per liter (ng/L) for the protection of aquatic life and its uses from chronic toxicity, and the human health criterion of 170 picograms per liter (pg/L) for the protection from consumption of aquatic organisms. These criteria apply to total PCBs, defined as the sum of all Aroclors, or all congeners or homologs or isomers, and were derived to protect against adverse effects due to PCBs in water. PCBs concentration in the Bay waters are generally below the CCC water quality standard, indicating that current conditions are protective of aquatic life from chronic toxicity. We therefore propose to use the more protective human health criterion as the applicable water quality standard for the PCBs TMDL. This criterion was derived to protect the general population from an increased risk of no more than one in a million. This criterion was

developed using a bioconcentration factor (BCF) approach with an upper bound potency factor reflective of high risk and persistence. However, in the development of this criterion it is explicitly recognized that it is not as protective of sub-populations that consume greater quantities of fish than the general population, and that subsistence fish consumers may only be protected from an increased risk of one in ten thousand. The CTR does not promulgate a separate numeric water quality criterion for dioxin-like PCBs.

Both the narrative and numeric water quality objectives are intended to protect beneficial uses related to human health (COMM). The narrative water quality objective is also intended to protect wildlife beneficial uses of the Bay, including:

Estuarine habitat (EST)
Uses of water that support estuarine ecosystems, including, but not limited to, preservation or enhancement of estuarine habitats, vegetation, fish, shellfish, or wildlife (e.g., estuarine mammals, waterfowl, shorebirds), and the propagation, sustenance, and migration of estuarine organisms.

Preservation of rare and endangered species (RARE)
Uses of waters that support habitats necessary for the survival and successful maintenance of plant and animal species established under state and federal law as rare, threatened or endangered.

Wildlife habitat (WILD)
Uses of water that support wildlife habitats, including, but not limited to, the preservation and enhancement of vegetation and prey species used by wildlife, such as waterfowl.

6. Impairment Assessment

All segments of San Francisco Bay were placed on the 303(d) list for PCBs due to an interim health advisory for fish consumption. The advisory was based on elevated PCBs concentrations in fish tissue collected in 1994 that may cause a detrimental human health effect for people consuming fish caught in the Bay. Follow-up studies in 1997 and 2000 confirmed the presence of PCBs in Bay fish tissue at concentrations that may be harmful to fish consumers. As such, the narrative water quality objective for bioaccumulative substances that is protective of these beneficial uses is not attained. This is also deemed impairment of COMM beneficial uses with regards to commercial and sport fishing in the Bay, and of EST, RARE and WILD with regards to bioaccumulation.

Consumption of PCBs-contaminated fish is considered a primary source of human exposure in locations where fish consumption (i.e. sports and subsistence fishing) and PCBs contamination are significant. A related probable exposed population is breast-fed children whose mothers consume PCBs-contaminated fish. The evaluation of the health effects of PCBs mixtures is complicated by their complex congener composition (ATSDR, 2000). There is evidence that PCB-health risks increase with increased chlorination because more highly chlorinated PCBs are retained more efficiently in fatty tissues (USEPA, 1997a). Observed effects in humans have ranged from mild reactions to serious health consequences. However, individual PCB congeners have widely varying potencies for producing a variety of adverse biological effects including hepatotoxicity, developmental toxicity, immunotoxicity, neurotoxicity, and carcinogenicity.

PCBs mixtures have been classified as probable human carcinogens (USEPA, 1997a). This is based on studies that have found liver tumors in rats exposed to Aroclors 1260, 1254, 1242, and 1016. Evaluation of the animal data indicates that PCBs with 54 percent chlorine content induces a higher yield of liver tumors in rats than other PCBs mixtures (ATSDR, 2000).

The CTR numerical criterion was derived for the protection of human health from the consumption of aquatic organisms, and as such exceedances of this criterion result in the impairment of the COMM beneficial uses. However, evidence that wildlife may be affected by PCBs exists as bird egg PCBs concentrations that have been measured at levels near the effects threshold (Schwarzbach et al., 2001)

The following sections present the data used to evaluate PCBs impairment of beneficial uses of the Bay. A review of readily available PCBs concentration data for benthic organisms and fish tissue is included, as well as water column PCBs concentrations.

6.1 Benthic Organisms

Several agencies use bivalves to measure the presence of bioaccumulative substances in the water column (NOAA, 1993; Stephenson et al., 1995). Because bivalves integrate water column concentrations of bioaccumulative substances over time, they are useful in identifying geographical areas needing further investigation.

The California Department of Fish and Game (CDFG) initiated the California Mussel Watch Program to measure bioaccumulation in bivalves placed at specific locations throughout the Bay. The long-term bivalve data shows a significant decrease of PCBs concentration in mussels deployed off Point Pinole and Treasure Island between 1977 and 1992 (Stephenson et al., 1995). The bivalve deployment program was continued and expanded by the RMP. RMP data

indicate a continued decrease in PCBs concentration in bivalves placed near Yerba Buena Island from 1980 to 1996 (Gunther et al., 1999).

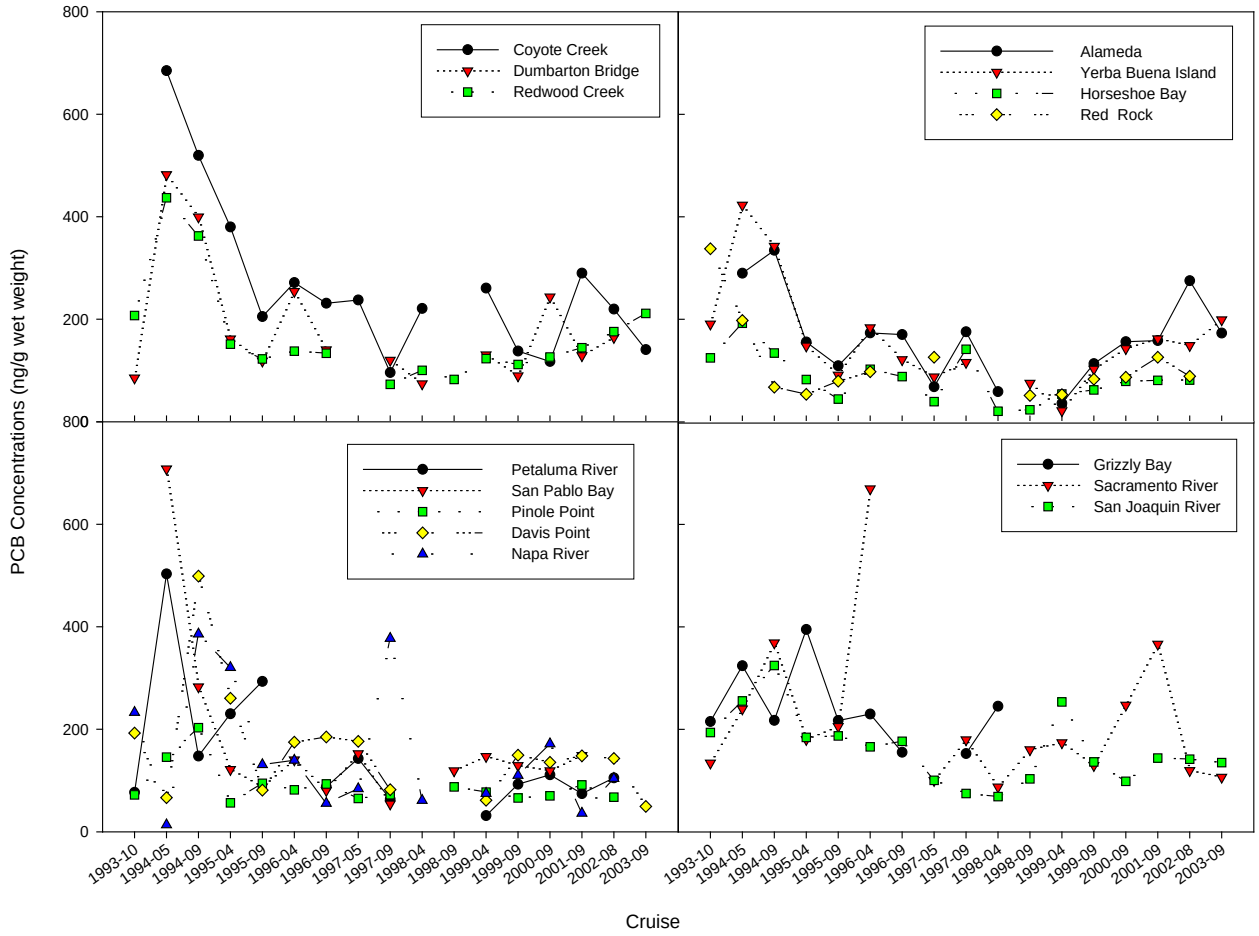

Figure 5-PCBs in Bivalves Deployed in San Francisco Bay (1993-2003)

(http://www.swrcb.ca.gov/programs/smw/index.html and http://www.sfei.org)

Over time, the frequency of deployed bivalves with tissue PCBs concentration less than the screening level of 70 nanograms per gram (ng/g) dry-weight (SFEI, 2000a) has increased (Figure 5), indicating potential improvement of the Bay relative to PCBs. Interpretation of bivalve data is limited, however, due to changing analytical procedures over time.

PCBs tissue concentrations of intertidal benthic organisms have been measured at concentrations up to 700 ng/g wet weight (PRC, 1996) near Hunter's Point Shipyard. Unfortunately, this study combined all species collected within an area and did not measure PCBs concentrations in collocated sediments. Note, however, that the maximum tissue concentration is much greater than the currently used level of concerns for fish tissue and for deployed bivalves. In a subsequent investigation at Hunter's Point Shipyard, PCBs concentrations up to 13,000 ng/g dry weight were measured in polychaete worm tissue collected in the South Basin (U.S. Navy, 2005). The biota were collected at a known PCBs-

contaminated sites in the Bay where sediment PCBs concentrations are several orders of magnitude greater than those in ambient sediments.

PCBs concentrations seem to be declining over time in deployed bivalves, but are still measured at concentrations causing concern. Other benthic organisms, collected at contaminated sites, are often orders of magnitude greater than the screening level, and could be significant sources of PCBs to fish in the Bay.

6.2 Fish Tissue Studies

In 1994, fish were collected throughout the Bay and analyzed for a suite of contaminants including PCBs (SFBRWQCB, 1995). All fish species collected in the 1994 study had tissue PCBs concentrations exceeding the calculated screening level of 3 ng/g wet weight (SFBRWQCB, 1995). Based on these PCBs concentrations, as well as elevated concentrations of other contaminants, measured in this fish study, the Office of Environmental Health Hazard Assessment (OEHHA) issued an interim fish consumption advisory for all of San Francisco Bay (OEHHA, 1994). The OEHHA advisory is listed as interim because more information is needed about PCBs (and other contaminants) concentrations in fish in San Francisco Bay and fish PCBs concentrations that are protective of human health. Note that nationwide, there are 873 advisory listings for PCBs in surface water (USEPA, 2005). OEHHA is currently reviewing this interim health advisory (OEHHA, 1999). This review includes consideration of newly collected Bay fish PCBs concentration data (SFEI, 1999a; Greenfield et al., 2003; Davis et al., 2006). OEHHA will also be considering survey results of San Francisco Bay sport fish consumers and their level of fish consumption (SFEI, 2000a).

In 1997 and 2000, the RMP collected and analyzed Bay fish for contaminant concentrations (Greenfield et al., 2003; SFEI, 1999b; Davis et al., 2006). As part of these studies, the screening level for fish tissue PCBs concentration was recalculated based on an updated cancer slope factor of 2 (USEPA, 1997a); the resulting screening level was 23 ng/g wet-weight (SFBRWQCB, 1995). We recalculated this screening level using local fish consumption habits (SFEI, 2000a). We used a 95th percentile upper bound estimate of the local consumption rate for fish-consuming anglers of 32 grams fish per day rather than a consumption rate for the general population of the Bay area which would be smaller. This conservative estimate constitutes, in effect, a margin of safety for the TMDL, implicitly recognizing the long-term goal of increasing the viability of fish consumption and commercial harvest from the Bay. The screening level is calculated as follows:

$$SVc = \left[\left(RL / CSF\right) * BW\right] / CR \qquad \textit{(Equation 1)}$$

where,

SVc = Screening value for a carcinogen in mg/kg
RL = Maximum acceptable risk level, 10^{-5} or one in 100,000
CSF = Oral cancer slope factor, upper bound estimate is 2 $(mg/kg\text{-}day)^{-1}$
BW = Mean body weight of the population (70 kg)
CR = Fish consumption rate by all consumers based on a four-week recall, 32 g/day

The calculated screening level is 10 ng/g wet-weight. This screening level applies directly to the attainment of the COMM beneficial uses. As will be discussed in Section 9.1, this screening level is equivalent to a sediment PCBs concentration of 1 ng/g. The screening level is therefore

also be protective of the EST, RARE, and WILD beneficial uses as USEPA (1997b) calculated a screening level for the protection of wildlife of 160 ng/g PCBs in sediment. Using the same method and assumptions, a dioxin toxic equivalent (TEQ) screening level of 0.14 pg/g dioxin is calculated for PCBs with dioxin-like properties.

Fish tissue PCBs concentrations in all white croaker and shiner perch exceeded the screening level by an order of magnitude in the four years for which data were collected (Figure 6). Three other fish species had a high frequency of screening level exceedances: sturgeon, jacksmelt and striped bass. Two other species' contaminant concentrations had a low frequency of screening level exceedances: halibut and leopard shark. In shiner surfperch and white croaker, PCBs tissue concentrations are noticeably more elevated than in the other fish species, in large part due to the higher lipid content of these fish (SFEI, 1999b).

Regional differences in fish tissue PCBs concentrations are noticeable, especially in the 1997 data. In the 1997 data, elevated fish tissue PCBs concentrations are noticeable in the Oakland inner harbor for the three fish species shown in
Figure 7: jacksmelt, surfperch and white croaker. This is not unexpected as several contaminated sites are located in the Oakland inner harbor (Batelle, 1988; BPTCP, 1998). In 2000, elevated PCBs concentrations are also noticeable for surfperch in the Oakland inner harbor as well as in San Leandro Bay, another area known to have elevated sediment PCBs concentrations (Daum et al., 2000). Elevated fish tissue concentrations in certain locations may reflect a localized diet of benthic organisms residing in contaminated sediments.

PCBs concentrations in white croaker tissue collected in the Oakland Inner Harbor showed a seasonal trend (Figure 8) with higher concentrations in summer and fall and lower concentrations in winter and spring (Greenfield et al., 2003). The trend was correlated with lipid content of the white croaker, and a relation of PCBs concentrations with reproductive activity has been hypothesized (Greenfield et al., 2003). Based on these results, we consider that relying on white croaker PCBs data collected in summer is adequate for long-term trend monitoring as it reflects the season with the higher PCBs concentrations in fish. This seasonal trend will need to be verified for other fish species of concern.

Long-term trends indicate that PCBs tissue concentrations have decreased in shiner surfperch since 1965 (Risebrough, 1995). Unfortunately, data limitations make it difficult to resolve more recent trends of fish tissue PCBs concentrations. For white sturgeon, there does not appear to be a decrease in PCBs concentrations over the last 20 years (Greenfield et al., 2003).

A possible approach for estimating the risk from environmental exposure to PCBs is to use the toxic equivalency factor (TEF) method (ATSDR, 2000). This approach looks at the potency of PCBs mixtures by comparing the toxicity of a individual dioxin-like PCB congener relative to that of 2,3,7,8-tetrachlorodibenzop-dioxin (2,3,7,8-TCDD), the most toxic and studied of the dioxins. Toxicity is calculated as the ratio of the individual PCB congener to that of 2,3,7,8 TCDD that is given a toxicity of 1 (Ahlborg et al., 1994). The contribution of each congener to dioxin-like toxicity (Table 9) is calculated by multiplying their environmental concentrations by its toxic equivalent factor (TEF) and summing to get a dioxin toxic equivalent (TEQ).

A fish tissue screening value for TEQ of 0.14 pg/g was calculated using the same methodology as that for total PCBs. That is, we used the same equation with the same values for risk level, body weight and fish consumption rates. However, we used a cancer slope factor of 156,000, specific to dioxin-like PCBs (USEPA, 2000d). In some cases, the TEQ was calculated using

only three PCB congeners. PCBs 77, 126 and 169. However the TEQ from these three congeners usually comprises more than 80 percent of the TEQ from all PCB congeners with dioxin like toxicity. The screening value is exceeded in shiner surfperch, striped bass and white croaker (*Figure 9*).

6.3 Aqueous PCBs concentrations

As previously discussed, USEPA has promulgated a water quality criterion for total PCBs of 170 pg/L (USEPA, 2000b). Over a nine-year period of monitoring at San Francisco Bay monitoring stations (Figure 10), the PCBs water quality criterion was almost always exceeded (Figure 11; Figure 12). In the South Bay and the mouth of the Petaluma River, the water quality criterion was exceeded in 100 percent of the samples. Samples from all other in-Bay RMP sampling locations exceeded the criterion nearly 100 percent of the time. There are no apparent increasing or decreasing trends in water column PCBs concentrations over this time period, so the Bay can be considered at steady state with respect to PCBs concentrations.

The San Joaquin and Sacramento River monitoring stations did not exceed the criterion as often than those in-Bay locations. The criterion was exceeded fewer than 50 percent of the time at only one monitoring station: the Golden Gate located outside the Bay. Elevated in-Bay water column PCBs concentrations can therefore be attributed to Bay Area sources, whether from ongoing discharge of PCBs to the Bay or remobilization of PCBs already in Bay sediments.

There is a high frequency of water column exceedances of the PCBs water quality criterion. Yet, as was discussed in sections 6.1 and 6.2, benthic organisms and fish have elevated PCBs in areas where sediments also have elevated PCBs concentrations. In order to lower the fish tissue PCBs concentrations to the screening level, the TMDL focuses on PCBs in sediments.

7. Reservoirs, Sources and Loads, and Movement of PCBs

Since the onset of production in 1929, PCBs have been introduced to the environment through land disposal (legal and illegal), accidental spills and leaks, incineration of PCBs or other organic materials in the presence of chlorine, pesticide applications, surface coatings such as paints and caulks, and wastewater discharge. Diffusion of PCBs from localized areas with high PCBs concentrations has resulted in widespread low-level background concentrations across the globe (Erickson, 1997).

In the following sections, we present our understanding of PCBs distribution in the Bay, along with estimates of sources and loads. We have assessed current PCBs mass in the water column and sediments, as well as the loads from direct atmospheric deposition, Central Valley watershed inputs, municipal and industrial wastewaters, and stormwater runoff to the Bay. We also present our understanding of in-Bay PCB-contaminated sites, but can not estimate their role as sources to the water column and biota.

7.1 Environmental Reservoirs

Due to potentially large historical releases of PCBs to the Bay, an estimate of PCBs reservoirs is needed to put current PCBs loads in perspective. Two environmental reservoirs of PCBs exist in the Bay: the water column and the sediments. As discussed below, the mass of PCBs in sediments is much greater than in the water column. However, it is important to note that a numeric criterion exists for water but not for sediments. This is important since the potential for sediments to be resuspended and supply PCBs to the water column is significant, as well as the ability for sediment to supply PCBs directly to biota.

Water Column

SFEI (2007) calculated a Bay-wide PCBs concentration of 430 pg/L from RMP data collected between 2002 and 2006. Based on this water column concentration and a water volume of 5,500 million m^3 for the Bay, they estimate a PCBs mass of 2.4 kg in the water column (SFEI, 2007).

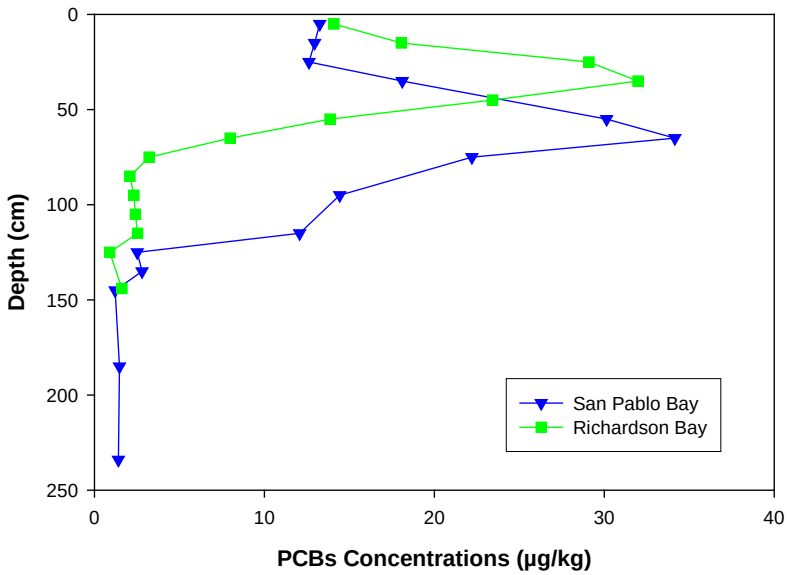

Figure 13-PCBs Concentrations with Depth in Sediments from Two North Bay Locations (USGS, 1999)

Sediments

For the purposes of this report, we separated Bay sediments into two categories: ambient and contaminated. Sediments considered ambient are from locations distant from known sources of contamination and have PCBs concentrations that cannot be statistically differentiated from other sediments collected in similar environments. Sediments considered representative of contamination are usually located near-shore, close to potential sources of contamination and have concentrations often several orders of magnitude greater than ambient sediments.

In 1992, the United States Geological Survey (USGS) collected ambient sediment cores in Richardson Bay and San Pablo Bay (Fuller et al., 1999). Radioisotopes were used to determine deposition chronologies of the sediments, which were compared to the chemical concentrations as a function of depth. PCBs concentrations were relatively constant to a depth of 25 to 50 centimeters (cm), corresponding to deposition since the early 1980s. A sharp increase in PCBs concentrations was observed below those depths, with maximum concentrations corresponding to deposition in the 1970s (Figure 13).

Total masses of PCBs per unit area for the entire depth of the cores were calculated to be 1,400 nanogram per square centimeter (ng/cm^2) and 4,100 ng/cm^2 for Richardson Bay and San Pablo Bay respectively (Venkatesan et al, 1999). Extrapolating the core results to the entire Bay, we estimate based on an estimated surface area of 1,285 km^2 that the total PCBs mass in ambient sediments ranges from 18,000 to 52,000 kg (Table 10). This range is based on the results from sediment cores collected far from known on-land PCBs use areas, and may under-represent total PCBs in the Bay. Yet, sediments represent a PCBs reservoir four to five orders of magnitude larger than the 2.4 kg in the water column.

Table 10-Estimated Total PCBs Mass in Bay Sediments Based on USGS Core Data

Location	Depth (m)	Total PCBs (ng/cm2)	Total PCBs in Estuary (kg)
Richardson Bay	0.75	1,391	18,000
San Pablo Bay	1.25	4,069	52,000

Alternatively, the total mass of PCBs in ambient sediments can be estimated using the mean concentration of PCBs in sediments of 4.6 μg/kg (SFEI, 2007). Again using an area of 1,285 km^2 for the Bay and a depth of 1 meter to cover the depth to which PCBs are usually found. Assuming that Bay sediments are 55 percent solid by weight (range from 40 to 80%), we can estimate total PCBs in sediments. Sediment volumes are converted to sediment dry mass as follows:

$$M_s = \frac{(x\rho_w)}{\left[1 + x\left(\rho_w / \rho_s - 1\right)\right]} V_t$$

Error! Bookmark not defined. *(Equation 2)*

where,

M_s = the dry mass of sediments in kg,
x = the percent solid per unit mass sediment,
ρ_w = the density of water (1kg/L),
ρ_s = the particle density of sediments (2.65 kg/L for aluminosilicates),
and V_t = the volume of sediments.

The dry mass of sediment is then converted to PCBs mass for a range of sediment PCBs concentrations. This gives an estimate of 4,300, kg of total PCBs in ambient sediments of the Bay (Table 11), which is lower than the results based on the USGS cores (Table 10).

There are specific in-Bay locations where sediment PCBs concentrations are much higher than in the rest of the Bay (BPTCP, 1998) that we refer to as PCBs-contaminated sites. Data were collected at these sites (Table 12, Figure 14) to satisfy different regulatory requirements, and are therefore not readily comparable. For example, sampling densities and methods often vary between regulatory programs. Several of the sites (e.g. Cerrito Creek) were identified under the Bay Protection and Toxic Clean-up Program (BPTCP) and the sampling consists of one or a few surface grab samples. The Vallejo Ferry terminal site was identified during sampling and analysis for a dredging project and corresponds to one composite sample collected from several deep cores. Hunters Point Shipyard and Seaplane Lagoon at the Alameda Naval Air Station are Superfund sites regulated under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). They have a much higher sampling density than most other sediment sites in the Bay. Other sites were investigated as part of scientific studies, such as in San Leandro Bay, or remedial investigations of on-land contaminated sites, such as the Emeryville crescent. At the Oyster Point site, remedial actions have already been undertaken. Regardless of the differences in methodology used for collecting these data, the listed sites have sediment PCBs concentrations several orders of magnitude greater than those considered

ambient. These highly elevated PCBs concentrations could be contributing significant PCBs mass to the Bay's biota. PCBs concentrations in sediment dwelling biota can be correlated to PCBs concentrations in sediments (Figure 15). Potential contribution of PCBs to biota from these contaminated sediments needs to be further evaluated, and likely needs to be reduced to lower the fish tissue PCBs concentrations.

Table 11-Estimated Total PCBs Mass in Bay Sediments Based on Ambient PCBs Concentrations

Sediment PCB Concentrations (µg/kg)	SurfaceArea (km^2)	Depth (m)	Total PCBs (kg)
4.6	1,285	1	4,300
11	1,285	1	12,000
22	1,285	1	24,000
35	1,285	1	38,000

7.2 External Sources

As previously discussed, sediments are the largest PCBs reservoir in the Bay and may contribute significant PCBs mass to biota. However, these sediments correspond to only one pathway of PCBs loadings to the Bay. As part of developing this TMDL, all known and potential sources and loads of PCBs to the Bay must be considered. In this section, we present our current understanding of sources and estimates of the loads from the following sources:

- Direct atmospheric deposition
- Central Valley watershed (Sacramento and San Joaquin Rivers)
- Municipal and industrial wastewater discharges
- Runoff and local tributaries

Direct Atmospheric Deposition

PCBs have been detected in remote regions of the world, far from known areas of PCBs use, indicating that atmospheric movement and deposition of PCBs can be significant sources of PCBs to surface waters (Erickson, 1997). Conversely, PCBs can also be lost from surface waters to the atmosphere by volatilization. In some instances, loss of PCBs to the atmosphere can account for the largest removal of PCBs from surface water (Jeremiason et al., 1994).

Deposition of PCBs from the atmosphere occurs either directly to surface waters, or indirectly in the watershed. PCBs deposited in the watershed may then be transported to the Bay via stormwater runoff discharges. The San Francisco Estuary Institute (SFEI) has completed a study of the direct deposition of PCBs to the Bay from the atmosphere (SFEI, 2005; Tsai et al., 2002). Indirect contributions of PCBs to the Bay from the atmosphere were not quantified, but are included in the loadings estimates for urban and non-urban stormwater runoff. Direct PCBs loads to the Bay are estimated to be 0.5 kg/yr (SFEI, 2007), but loss to the atmosphere is estimated at 7.4 kg/yr resulting in a net loss. (Table 13) However, PCBs loss from the Bay to the atmosphere is accounted for in the mass budget model and is quantified in the prediction of attainment of the target.

Table 13-Estimated PCBs Mass Associated with Dredge Material Disposal (2001-2005)

Disposal Site	Total Volume 2001-2005 (cu yd)	Average Volume (cu yd/yr)	Average Annual Estimated PCB Mass (kg/yr)
In-Bay Disposal	8,900,000	1,800,000	4.6
Ocean (SF-DODS) Disposal	3,800,000	760,000	-2.0
Upland/Wetland Reuse	8,100,000	1,600,000	-4.1
Net Loss			-6.1

These load estimates are small compared to load estimates for water bodies elsewhere in the United States and may need to be revised. However, it is very likely that loads to the Bay currently are and have always been, much lower than loads to eastern United States water bodies due to regional wind patterns that typically come from the ocean pushing locally generated airborne PCBs inland and the fact that there have been historically lower uses of PCBs in the Bay area. Finally, it is recognized that water-atmosphere transfers have greatly declined over the last three decades.

Central Valley Watershed

PCBs concentrations in the Sacramento and San Joaquin Rivers have been monitored by the RMP for over ten years. Based on the concentrations measured by the RMP, we had previously estimated that about 40 kg of PCBs entered the Bay each year from the Central Valley. More recently, PCBs loads entering the Bay from the Central Valley have been estimated for the years 2002 and 2003 (Leatherbarrow et al., 2005). Annual loads of PCBs were estimated at 6.0 ± 2.0 and 23 ± 18 kg for years 2002 and 2003, respectively. The load estimates are based on measured flow-weighted mean PCBs concentrations ranging from 200 to 6,700 pg/L with a median concentration of 600 pg/L. SFEI calculated annual PCBs mass loadings using Central Valley water discharge data at Mallard Island from the Department of Water Resources (Interagency Ecological Program) using a mass balance approach and the DAYFLOW model (SFEI, 2007). These annual load estimates may be at the lower end of the range of annual loads as these years were drier years with lower sediment inflow from the Central Valley (Leatherbarrow et al., 2005). For the TMDL, we are using the SFEI derived average load of 11 kg/yr, derived from five years of data, as the loading to the Bay from the Central Valley (SFEI, 2007).

Municipal and Industrial Wastewater Dischargers

There are a number of municipal and industrial wastewater discharges into San Francisco Bay (Figure 16 and Figure 17). Municipal wastewater discharges are located throughout the Bay (Figure 16), while the major industrial wastewater discharges take place in the north Bay segments (Figure 17) where ambient PCBs water concentrations are some of lowest in the Bay.

Municipal and industrial wastewater discharges to surface waters are controlled through waste discharge requirements issued as federal National Pollutant Discharge Elimination System (NPDES) permits. Selected municipal wastewater dischargers (Publicly Owned Treatment Works or POTWs) and petroleum refineries have quantified PCBs in their wastewaters using USEPA method 1668 to achieve lower detection limits (SFEI, 2001b; 2002a; 2002b). Wastewaters from the POTWs with secondary treatment have an average PCBs concentration of 3,600 pg/L (Table 14), while wastewaters from POTWs with advanced treatment have an average PCBs concentration of 210 pg/L (Table 15). Wastewaters from petroleum refineries in the North Bay had an average PCBs concentration of 270 pg/L (Table 16), similar to that in the POTWs with advanced treatment, while other industrial wastewater dischargers had an average concentration of 1900 pg/L.

Using average daily flows from the POTWs and industries, including refineries, and the average PCBs concentrations in wastewaters from each category, we estimate that municipal and industrial wastewater discharges annually contribute 2.3 kg and 0.035 kg of PCBs to the Bay respectively.

Urban and non-Urban Stormwater Runoff

Municipal urban stormwater runoff management agencies measured sediment PCBs concentrations within their urban and non-urban stormwater runoff conveyance systems in the summers of 2000 and 2001 (ACCWP, 2001; ACCWP 2002a, ACCWP 2002b; KLI, 2001; KLI, 2002). The purpose of these studies was to determine whether PCBs are evenly distributed and discharged from stormwater conveyance systems or whether PCBs-contaminated sites exist within watersheds. These studies also attempted to evaluate whether runoff conveyances are sources of PCBs in themselves. The studies also examined whether specific locations within watersheds are contributing to ongoing PCBs discharge to the Bay via stormwater conveyance systems due to historical or current activities at those locations. Finally, loads of PCBs from

runoff to the Bay were estimated based on the sediment PCBs concentrations and estimated loadings of sediments to the Bay.

(SFEI, 2002b)

The urban and non-urban stormwater runoff study found sediment PCBs concentrations ranging from the low µg/kg level to the tens of thousands of µg/kg level. Sediment sampling locations were selected to reflect a variety of land use categories (Figure 18 and Figure 19). Sediment PCBs concentrations were statistically greater in areas of industrial, commercial and residential land use than in open space, clearly showing that PCBs were not evenly distributed across watersheds. Eleven of 209 locations had PCBs concentrations greater than 1,000 µg/kg (Figure 20), while 125 locations had PCBs concentrations greater than in-Bay ambient sediments which have PCBs concentrations of 4.6 µg/kg. Pilot studies of these urban stormwater runoff conveyance systems contaminated sites indicate that only in some cases can the PCBs be traced back to current or historical on-land activities (ACCWP, 2002a, ACCWP, 2002b; CCCWP, 2002; San Jose and EOA, 2002; SMCSTPPP, 2002). Elevated PCBs concentrations in the urban and industrial landscapes were expected due to the widespread use of PCBs both in closed and open applications (Table 8), such as transformers or capacitors that may have leaked, hydraulic fluids, lubricants, and plasticizers, as well as its uses in building materials. PCBs in open space land use area were also expected due to the known role of atmospheric transport and deposition of PCBs around the world, as well as the direct application of PCBs to the environment in various processes (Section 4.3), such as pesticide extenders.

At several locations with elevated sediment PCBs concentrations, follow-up case studies were conducted to attempt to locate the source of PCBs to the stormwater conveyance system (CCCWP, 2002; San Jose and EOA, 2002; SMCSPPP, 2003; SMCSPPP, 2004). These case studies were successful on only some occasions to identify a potential source of PCBs to the stormwater conveyance system. In another study (Kleinfelder, 2006), targeted sampling for

PCBs in soils and sediments the public right-of-way was performed within an industrial watershed with elevated PCBs in storm drain sediments. Sampling locations were based on an analysis of current and past business, followed by inspections for compliance with the industrial general NPDES permit under which the business operate. This investigation was able to detect a number of potential sources of PCBs within the watershed at a larger frequency than in a randomly determined sampling scheme performed alongside. This study showed a need to target PCBs source and treatment controls to current and historical industrial watersheds.

PCBs loads for the Guadalupe River have been estimated to be from 0.7 to 1.2 kg/yr between 2003 and 2005 (McKee et al., 2005). SFEI extrapolated these loads to small urban tributaries and estimated a total load of 20 kg/yr (SFEI, 2007). We use this newer load estimate for combined urban and non-urban stormwater runoff. The contribution to the total load from non-urban runoff is much smaller than that from urban runoff since the mean sediment concentration in open spaces is about 2 µg/kg whereas it is about 500 µg/kg in urban spaces (KLI, 2002).

7.3 Internal Sources

As discussed in Section 7.1, bottom sediments are the largest environmental reservoir of PCBs in the Bay. In general, the water column PCBs mass is mostly associated with suspended sediments. Deposition of suspended sediments and re-suspension of bottom sediments are therefore important processes controlling the mass of PCBs in Bay water. Continual mixing of bottom sediments from wave action or other disturbances, such as mixing by organisms (bioturbation) or erosion of bedded sediments, can provide an ongoing supply of PCBs to the water column and biota. The large mass of PCBs in sediment denotes the importance of sediment dynamics in predicting the fate and distribution of PCBs throughout the Bay. In this section, we look at two processes affecting the bioavailability of sediment-bound PCBs. First, PCBs in the “active” sediment layer are considered because of their potential to be resuspended along with sediment and their potential for uptake by bottom dwelling aquatic organisms (bioavailability). Second, dredging activities are also considered because they can potentially cause previously buried PCBs to become bioavailable.

Active Sediment Layer

A sediment active layer can be defined many different ways based on the biophysical mechanism and reference timeframe of interest. In this report, the active layer is defined as the Bay sediments that are in contact with biota or that can be resuspended into the water column.

In one study, radioisotope dating indicated a mixing depth of about 10 cm on a timeframe of several months in Richardson Bay (Fuller et al., 1999). Biological and physical mixing within the sediment column was further substantiated by burrow worms found to a depth of 12 to 15 cm. In San Pablo Bay, the depth of the active layer was difficult to measure, as sediments at this site are believed to have undergone episodes of rapid deposition and scouring. Worms have also been observed to a depth of one to two feet in the area offshore of Hunter's Point Shipyard (U.S. Navy, 2005).

In this report, we define the active layer as the top 15 cm of sediments in the Bay to be consistent with modeling performed on the long-term fate of PCBs in the Bay. Although there is uncertainty as to the exact depth of the active layer (Davis, 2003), using 15 cm is appropriate to get an order of magnitude estimate of PCBs mass in the active layer because we are interested in the relative masses of PCBs in the various reservoirs and load categories. Using this depth and a mean sediment PCBs concentration of 4.6 µg/kg, we estimate that a PCBs mass of 650 kg resides in the active sediment layer of the Bay, with potentially a maximum between 3,100 and 4,900 kg. This mass is an orders of magnitude greater than PCBs sources and loads discussed in Section 7. The large mass of PCBs in the active layer, as compared to the annual loads, is likely to affect recovery of the Bay even after load reductions have been implemented.

Navigational Dredging

Maintenance dredging of Bay sediments is an ongoing activity where sediment is removed from navigation channels and is disposed of at either designated in-Bay locations (Figure 21) or out of the Bay. Between 2001 and 2005, an annual average of 1.8 million cubic yards per year of dredged sediments were disposed of at in-Bay disposal sites (DMMO, 2006) while an average of about 2.4 million cubic yards of dredged sediments were removed annually from the Bay. Using five year annual averages, we can estimate the mass of PCBs disposed of in and out of the Bay. We converted sediment volumes to dry mass using the equation given in Section 7.1. Using mean ambient PCBs concentrations commonly found in the Bay (4.6 µg/kg), we estimate that, each year, about 4.6 kg/yr of PCBs are being disposed of in the Bay at dredged sediment disposal sites. During the same period, placement of dredged sediment at either upland sites or the deep ocean disposal site removes about 6.1 kg of PCBs per year from the Bay, resulting in a net loss of about 6.1 kg of PCBs each year. However, the large volume of sediment placed upland originates from the 50-feet deepening project by the Port of Oakland. This is a one-time deepening project that does not qualify as maintenance dredging. It is unlikely that this high volume will be maintained after completion of this dredging project. Future upland beneficial reuse and deep ocean disposal will need to obtain sediments from maintenance dredging projects represented mainly by in-Bay disposal volumes. This will result in much smaller volumes taken out of Bay. These are small PCBs masses compared to that in the surface layer (650 kg), but are on the same scale as the loads discussed in Section 7. Furthermore, note that natural processes are believed to annually re-suspend much larger volumes of sediments (Table 2) and could potentially be mobilizing a significantly larger mass of PCBs.

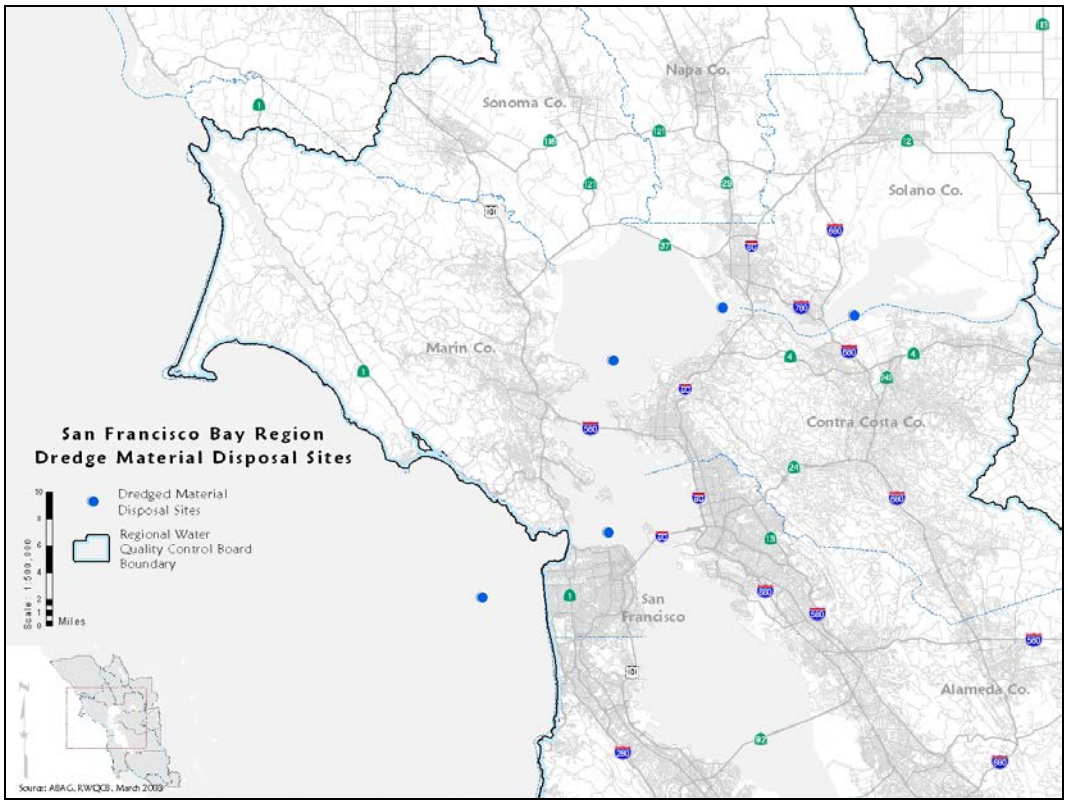

Figure 21-Dredged Sediment Disposal Sites for San Francisco Bay Region

7.4 Summary of PCBs Sources and Loads

Comparing the various load categories, excluding in-Bay sediments, the two major sources of PCBs mass to the Bay come from the Delta and urban stormwater runoff (Figure 22; Table 17) As discussed in Section 7.2, sediments from the Central Valley watershed carry a large mass of PCBs but are lower in concentrations than in-Bay sediments, potentially helping to reduce the current impact of PCBs on the Bay by burying more contaminated sediments. Therefore, implementation of the TMDL should focus primarily on reducing sediment PCBs concentrations by controlling sources in urban stormwater runoff as well as controlling the release of PCBs from contaminated sediments in the Bay.

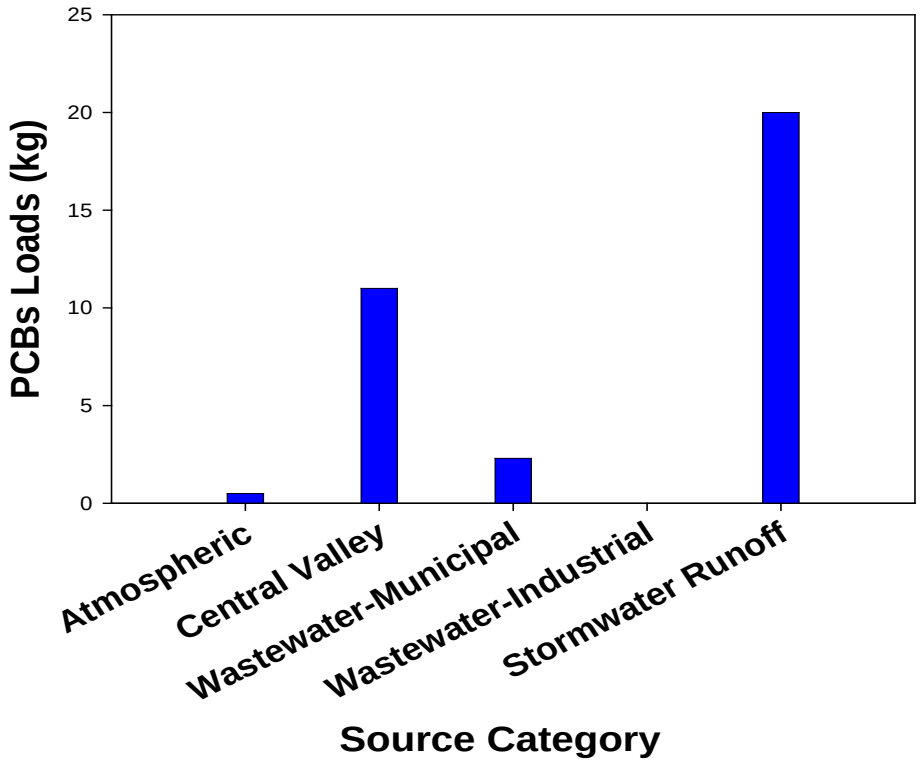

Figure 22-Sources and Loads of PCBs to San Francisco Bay

In summary, PCBs are found mostly in the central and southern portion of the Bay (Figure 23) generally in or near areas associated with historical industrial activities. Therefore, we should focus implementation to these on land areas and the remediation of the nearby in-Bay areas most impacted by PCBs discharges.

Table 17-Synopsis of PCBs Loads to San Francisco Bay

Source Category	Current PCBs Loads (kg/yr)
Atmospheric	Net Loss
Central Valley Watershed	11
Municipal Wastewater Dischargers	2.3
Industrial Wastewater Dischargers	0.035
Urban and Non-Urban Stormwater Runoff	20

8. Numeric Target

A numeric target is a measurable condition that demonstrates attainment of water quality standards. A numeric target can be a numeric water quality objective, a numeric interpretation of a narrative objective, or a numeric measure of some other factor necessary to meet water quality standards. In this report, we propose a fish tissue PCBs numeric target.

The fish tissue numeric target provides for the attainment of the desired conditions that support the beneficial uses currently impaired. Fish tissue PCBs concentrations are the direct cause of impairment of beneficial uses. The CTR water quality criterion for PCBs is a surrogate measure of impairment as it is derived for the protection of human health based on the risk from eating fish caught in the Bay. This PCBs TMDL focuses on fish tissue PCBs concentrations, as this is the direct measurement of impairment of commercial (COMM) beneficial uses. We expect lower bioaccumulation will also protect estuarine (EST) and wildlife (RARE, WILD) beneficial uses. Fish tissue PCBs concentrations are currently being monitored as part of the RMP, and therefore progress towards attaining the fish tissue numeric target is directly monitored.

8.1 Fish Tissue Target

As noted above, fish tissue PCBs concentrations are the direct cause of impairment of beneficial uses. Therefore, the proposed numeric target for the PCBs TMDL is a fish tissue PCBs concentration. The proposed fish tissue numeric target for PCBs is based on a calculated screening level developed using standard protocol (USEPA, 2000c). The screening level is defined as concentrations of PCBs in fish above which there are potential health concerns. The screening level for PCBs is calculated using Equation 1 (Section 7.1).

We calculated the screening level for a risk of one extra cancer case for an exposed population of 100,000 over a 70-year lifetime, using a mean body weight of 70 kg, a slope factor of 2 $(mg/kg\text{-}day)^{-1}$, and a mean daily consumption rate of 0.032 kg/day. The consumption rate is the 95th percentile upper bound estimate of fish intake reported by all Bay fish-consuming anglers (SFEI, 2000a). The fish tissue screening level calculated based on these numbers is 10 ng/g. This represents about a ten-fold reduction in fish tissue PCBs concentrations from current levels. This numeric fish tissue target is applicable to fish collected in summer and fall seasons, when fish tissue concentrations are most elevated (Figure 8), in consideration of seasonality.

The screening value protective of Bay sport fish consumer is calculated using the upper 95th percentile consumption rate of all consumers, 32 g/day. All consumers reflect a subpopulation of Bay area residents that catch and consume sport fish which is a subset of the fisher category. The general population includes all Bay area residents, including those that do not catch or consume sport fish. As was discussed earlier about the derivation of the CTR criterion for PCBs, the water column criterion was not derived to protect subpopulations at the same risk level as the general population. We have therefore used a 10^{-5} risk level to derive the fish tissue numeric target of 0.010 mg/kg. This numeric target is also more protective than the 10^{-5} risk level since an upper bound consumption rate, rather than the mean, was used for this subpopulation. The numeric target is protective of those consuming ten times more fish, 320 g/day, at a 10^{-4} risk. This is a greater consumption rate than the maximum reported in the fish consumption study, based on a four-week recall. Finally, it is reasonable to assume that this numeric target is protective, at a 10^{-5} risk level, of the general population as only a small fraction of the overall population catch and consume fish in the Bay. Therefore, this fish tissue numeric target is protective of the general population and the most exposed population of the Bay area and is consistent with the CTR criterion. Attainment of the fish tissue target is consistent with the

narrative bioaccumulation water quality objective in the Basin Plan in that it results in removal of the detrimental effects of elevated PCBs in fish.

Attainment of the fish tissue numeric target is also consistent with the CTR criterion. Bioaccumulation factors (BAFs) are the ratios of a substance's concentration in tissue of an aquatic organism to its concentration in the ambient water ($BAF_{water}=C_{tissue}/C_{water}$), where both the organism and its food are exposed and the ratio does not change substantially over time, which seems applicable to the Bay. Once developed, BAFs can be used to either predict future fish tissue concentrations based on water concentrations or inversely water column concentrations using fish tissue concentrations. We have calculated BAFs for PCBs in the entire Bay as well as individual segments of the Bay using RMP fish tissue data collected in 1994, 1997 and 2000, and RMP water column data collected from 1993 through 2001 (Table 18-Bioaccumulation Factors and Estimated Water Column PCBs Concentrations upon Attainment of the Fish Tissue Target for White Croaker

). Using these BAF values, we calculated an expected concentration of PCBs in the water column when the fish tissue numeric target is met. The model calculations predict that the CTR water quality standard will be attained upon attainment of the fish tissue numeric target for PCBs.

The CTR numeric criterion is only a surrogate measure of conditions affecting fish tissue concentration. Site-specific conditions, such as water depth and magnitude of PCBs contamination of sediments, may affect fish tissue PCBs concentrations to a larger extent than water column PCBs concentrations. Measures to attain the PCBs fish tissue numeric target will focus on reductions of pollutant mass loads and contaminated site cleanups, rather than on avoidance of exceedances of concentration-based water quality standards. A decreased input of PCBs into the Bay will result in the reduction of PCBs concentrations in sediments and a decrease in PCBs available for uptake by biota.

Attainment of the fish tissue target for PCBs in San Francisco Bay will be evaluated using white croaker (size class, 20 to 30 centimeters in length) and shiner surfperch (size class, 10 to 15 centimeters in length). These two fish species are selected as the measure of attainment of the target for three reasons. First, these two fish species have the highest PCBs concentrations of all fish monitored in the Bay (Figure 6), which is expected as they are both benthic feeders. Second, they live near shore for at least part of the year and are caught from piers and jetties where recreational fishing is most likely to happen. Finally, the food model predicts that attainment of the fish tissue target for white croaker and shiner surfperch will result in attainment of the target for all other fish species currently monitored in the Bay. Comparison of the numeric target to these fish species constitutes an implicit margin of safety as sport fishers do not limit their fish consumption to these species (SFEI, 2000a). Rather, sport fishers consume a variety of fish species including many with lower PCB concentrations. Attainment of the fish tissue target in these two species ensures attainment of the fish tissue target for all Bay species sport fishers consume, and provides a implicit margin of safety as these other species consumed will have lower PCBs concentration than the fish tissue target.

The Water Board will continue to evaluate attainment of the fish tissue target and require the collection of additional information concerning Bay sport fish patterns of consumption and evaluate if fish species other than white croaker and shiner surfperch should be considered to evaluate attainment of the target. The average PCBs concentrations in the edible portion of these species will be used to determine attainment of the PCBs target following the methods

currently in use by the RMP to ensure consistency and data comparability. The number of fish samples collected to determine compliance with the target will be based on guidance described in USEPA's Guidance for Assessing Chemical Contaminant Data for Use in Fish Advisories (EPA 823-B-00-007) and will be based on the desired statistical power needed to demonstrate differences over time.

Attainment of the PCBs fish tissue numeric target is also expected to result in removal of impairment of the Bay by dioxin-like PCBs. In *Figure 24*, we show the regression of calculated TEQ from dioxin-like PCBs to that of total PCBs in fish tissue caught in the Bay. The regression shows that a decrease of fish tissue PCBs concentrations to the fish tissue numeric target of 10 ng/g will result in a decrease of TEQ to the TEQ screening level of 0.14 pg/g.

Table 18-Bioaccumulation Factors and Estimated Water Column PCBs Concentrations upon Attainment of the Fish Tissue Target for White Croaker

Waterbody	**White Croaker**		**Shiner Surfperch**	
	BAF[a]	**Water PCBs Concentration (pg/L)**	**BAF[a]**	**Water PCBs Concentration (pg/L)**
Entire Bay	0.224	49	0.160	69
Central Bay	0.572	19	0.424	26
North Bay	0.259	43	0.089	123
South Bay	0.498	22	0.090	122

a)BAFs were calculated from pg/L in water and ng/g wet weight in fish

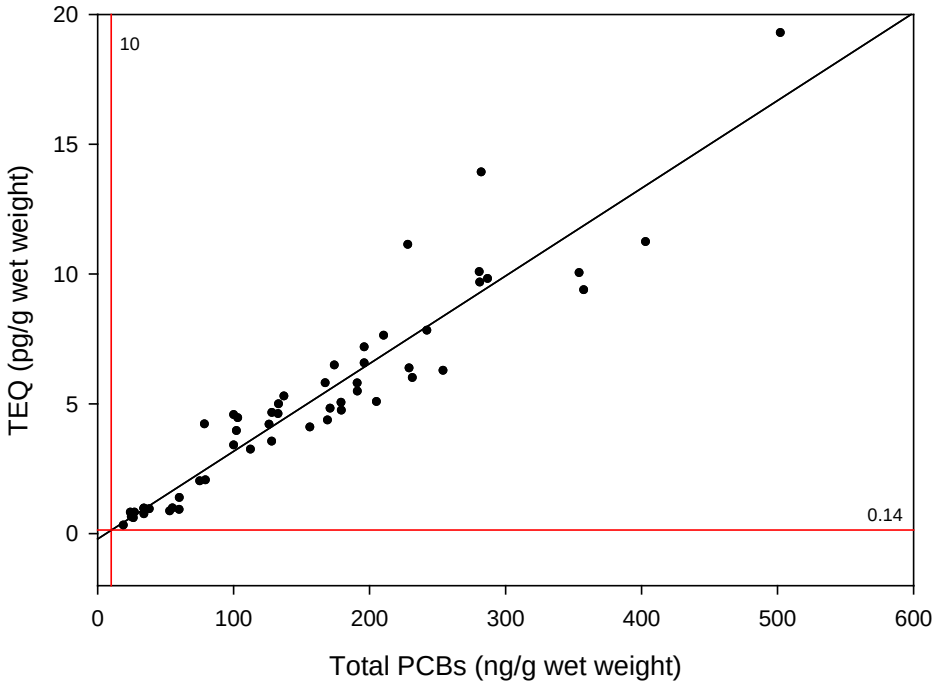

Figure 24-Regression of Dioxin-Like PCBs Total Equivalent Toxicity by Total PCBs Concentrations in Fish

8.2 Antidegradation

A numeric target must be consistent with antidegradation policies as described in 40 CFR 131.12 and SWRCB Resolution 68-16. Antidegradation policies are intended to protect beneficial uses by ensuring that water quality will be maintained at the highest levels.

The fish tissue numeric target is designed to implement the narrative water quality objective for bioaccumulation. This numeric target is intended to achieve beneficial uses of the Bay, specifically relating to the consumption of sport fish by humans. As such, it is consistent with the established numeric water quality criterion for total PCBs. Since PCBs concentrations in sediment and fish tissue currently exceed the narrative bioaccumulation objective, attaining the numeric target will improve current water quality conditions. Therefore, the numeric target is consistent with the antidegradation policies.

9. Linkage Analysis

The TMDL linkage analysis is used to connect PCBs loads to the numeric target protective of beneficial uses in the Bay. This linkage analysis can be accomplished in a variety of ways. One common approach has been to use numerical models. Water quality models for TMDL development are typically classified as either watershed (pollutant load) models or as waterbody (pollutant response) models (NRC, 2001). A watershed model relates pollutant loads to a waterbody as a function of land use and helps allocate the TMDL among sources. A waterbody model is used to predict pollutant concentrations and other responses in the waterbody as a function of the pollutant load. Other models are used to set numerical targets such as food-web models that link sources to biological receptors.

PCBs uptake by biota from sediment is well documented in the scientific literature. In a shallow bay with a large sediment PCBs reservoir, such as San Francisco Bay, this is the most important pathway for PCBs bioaccumulation in fish. Therefore, reducing PCBs concentrations in Bay sediments is the most effective means of reducing fish tissue PCBs concentrations. In this TMDL, we use a food web model to translate the fish tissue numeric target to a corresponding sediment concentration. We then use a waterbody (mass budget) model to predict the long-term fate of PCBs in the Bay and determine the external load of PCBs that will attain the sediment concentration goal resulting in attainment of the fish tissue numeric target.

The mass budget model and food web model represent the linkage between load reductions and attainment of the fish tissue numeric target, as well as between the cause of impairment and the sources of PCBs. Based on the insights provided by these two models, we first present a conceptual model of our understanding of PCBs fate and movement between environmental reservoirs (Figure 25). Figure 25 depicts the conceptual linkage between sources, reservoirs (compartments) and receptors. In this figure, we have used larger arrows and bold text to highlight the sources and processes that we consider important. The left side of Figure 25 represents the mass budget model providing the linkage between the sources, reservoirs and processes. The right side of the conceptual model highlights the food-web model providing the linkage between PCBs reservoirs and aquatic receptors. We consider urban stormwater runoff and releases from current or historical activities as the most significant sources of PCBs to the Bay. PCBs in Bay sediments are likely to function as the major source of PCBs to biota. We consider the major mechanism of PCBs uptake by fish to result from foraging on bottom dwelling organisms (benthic organisms) living in sediment.

9.1 Food Web Bioaccumulation Modeling

PCBs impairment of the Bay is related to PCBs fish tissue concentrations. In order to implement the most effective load reductions, it is critical to understand the important factors and sources causing PCBs bioaccumulation in fish. There are two general approaches for developing a linkage between PCBs concentrations in water, sediment and biota (USEPA, 2000c; USEPA, 2000d). First, there is an empirical approach where one generates data to calculate bioaccumulation factors (BAFs) and biota-sediment accumulation factors (BSAFs). BAFs are the ratios of a substance's concentration in aquatic organisms to ambient water concentrations, taking the organism's trophic level into consideration. BSAFs are the ratios of concentrations in aquatic organisms compared to sediment concentrations. The second approach is to develop an equilibrium or kinetic biological food web model that considers mechanistic aspects of bioaccumulation and describes the chemical reactions and physicochemical processes taking place. These two modeling approaches are complimentary as the empirical data can be used to verify, or calibrate, the food web model results.

SFEI has developed a food web model based on Gobas (1993) and Morrison et al. (1997). Bay-specific data have shown that the fish species of concern have a diet consisting mainly of benthic organisms (Roberts et al., 2002), suggesting the importance of sediment PCBs as a source of PCBs to fish. This model predicts that the most sensitive endpoint is the protection of human health from the consumption of white croaker, and that attainment of conditions that result the fish tissue numeric target will be protective of wildlife. The model mathematically links the concentrations of PCBs in aquatic organisms and their prey to water and sediment PCBs concentrations via the food web as depicted in Figure 26 (Gobas and Arnot, 2005). Using this model, we can associate a specific PCBs concentration in fish to that in sediment, the main compartment of PCBs in aquatic environments, and water. Starting with the numeric fish tissue target of 10 ng/g, the model yields a corresponding concentration of 1 µg/kg PCBs in sediment. This sediment PCBs concentration goal is lower than the sediment concentration deemed protective of wildlife of 160 µg/kg total PCBs (USEPA, 1997b), and is therefore considered to result in attainment of all beneficial uses currently impaired by PCBs. Model results validate the sediment PCBs concentration goal as protective of wildlife in San Francisco Bay. The food web model specifically predicts that this sediment goal will also be protective of risks to wildlife such as harbor seals, and birds such as cormorants and terns.

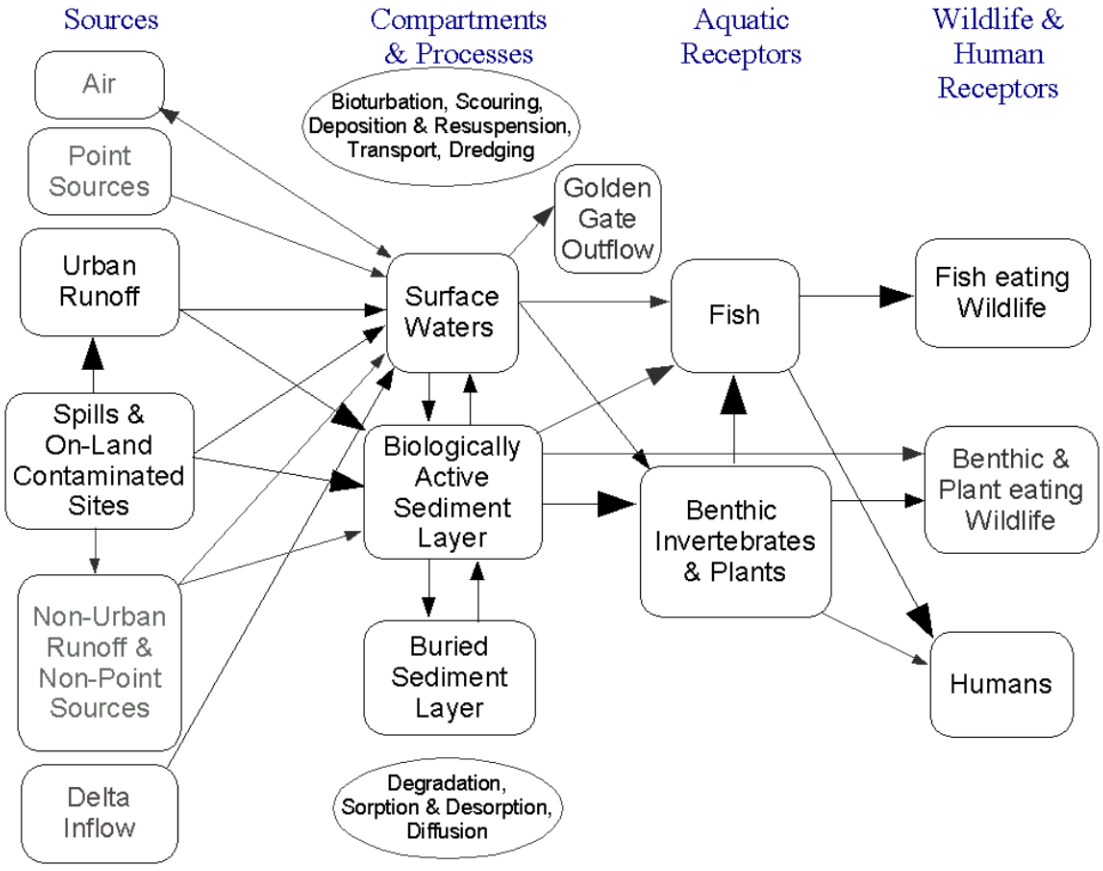

Figure 25-Conceptual Model of PCBs Movement and Fate in San Francisco Bay

This sediment goal is equivalent to reducing the total mass of PCBs in the active layer (of 0.15 m) of the entire Bay to about 160 kg. This represents a ten-fold decrease of PCBs concentrations in ambient sediments and fish tissue. The need to reduce ambient sediment PCBs concentrations by an order of magnitude to attain the 1 µg/kg sediment concentration goal is not unexpected. Empirical models such as biota-sediment accumulation factor (BSAF) are based on a one to one relationship between sediment and fish tissue PCBs concentrations. As discussed in Section 6.2, fish tissue concentrations are also an order of magnitude greater than the fish tissue numeric target for certain species. Hence the need for a ten-fold reduction in sediment to attain the fish tissue numeric target is not surprising. However, this sediment goal should not be interpreted as a clean-up goal, rather it is the long-term sediment PCBs concentration that will be attained after reduction of external loads, some targeted action on internal reservoirs of PCBs, and degradation or burial of PCBs in Bay sediments.

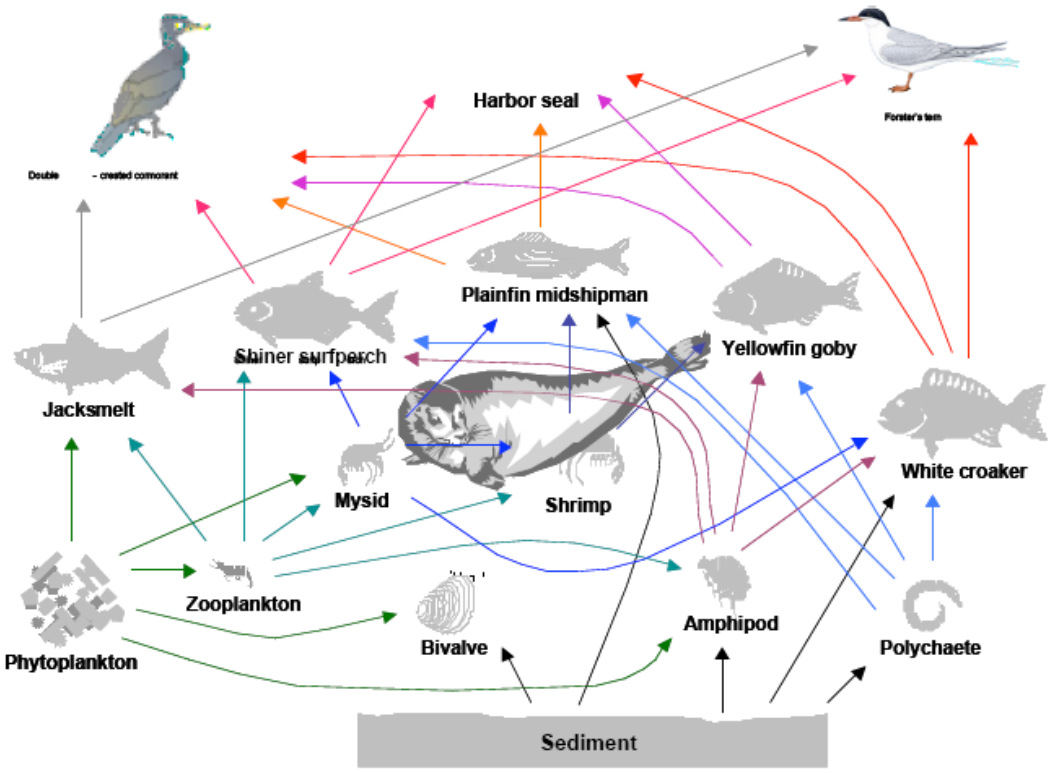

Figure 26-Food Web Model for San Francisco Bay (Gobas and Arnot, 2005)

9.2 Mass Budget Model

A mass budget model allows the exploration of different PCBs load reduction scenarios on the long-term fate of PCBs. SFEI developed a simple mass budget model for PCBs (Davis, 2003) that treats the Bay as a single box with two environmental reservoirs: water and sediment (Figure 27). This model includes eight processes of PCBs input and loss: burial in deep sediment, degradation, external loadings, outflow to the ocean, tidal mixing, exchange with the atmosphere, natural attenuation, and transfer between sediments and water.

Reduction of the external load to 10 kg/year is needed to attain a PCBs mass in the Bay of 160 kg that is equivalent to the PCBs sediment goal of 1 µg/kg. The mass budget model predicts that current external PCBs loads to the Bay of about 34 kg/year will delay the attainment of the 160 kg goal for 100 years (Figure 28). Reduction of current external loads to 20 kg/yr, results in a more rapid reduction of PCBs in the active layer, attaining the goal in about 70 years. An external load of 10 kg/yr attains the 160 kg mass in about 30 years. The mass budget model predictions highlight the importance of reducing current external loads of PCBs to the Bay. Achieving these load reductions, along with cleanup of in-Bay sediment PCB-contaminated sites, will form the core of the TMDL implementation strategy.

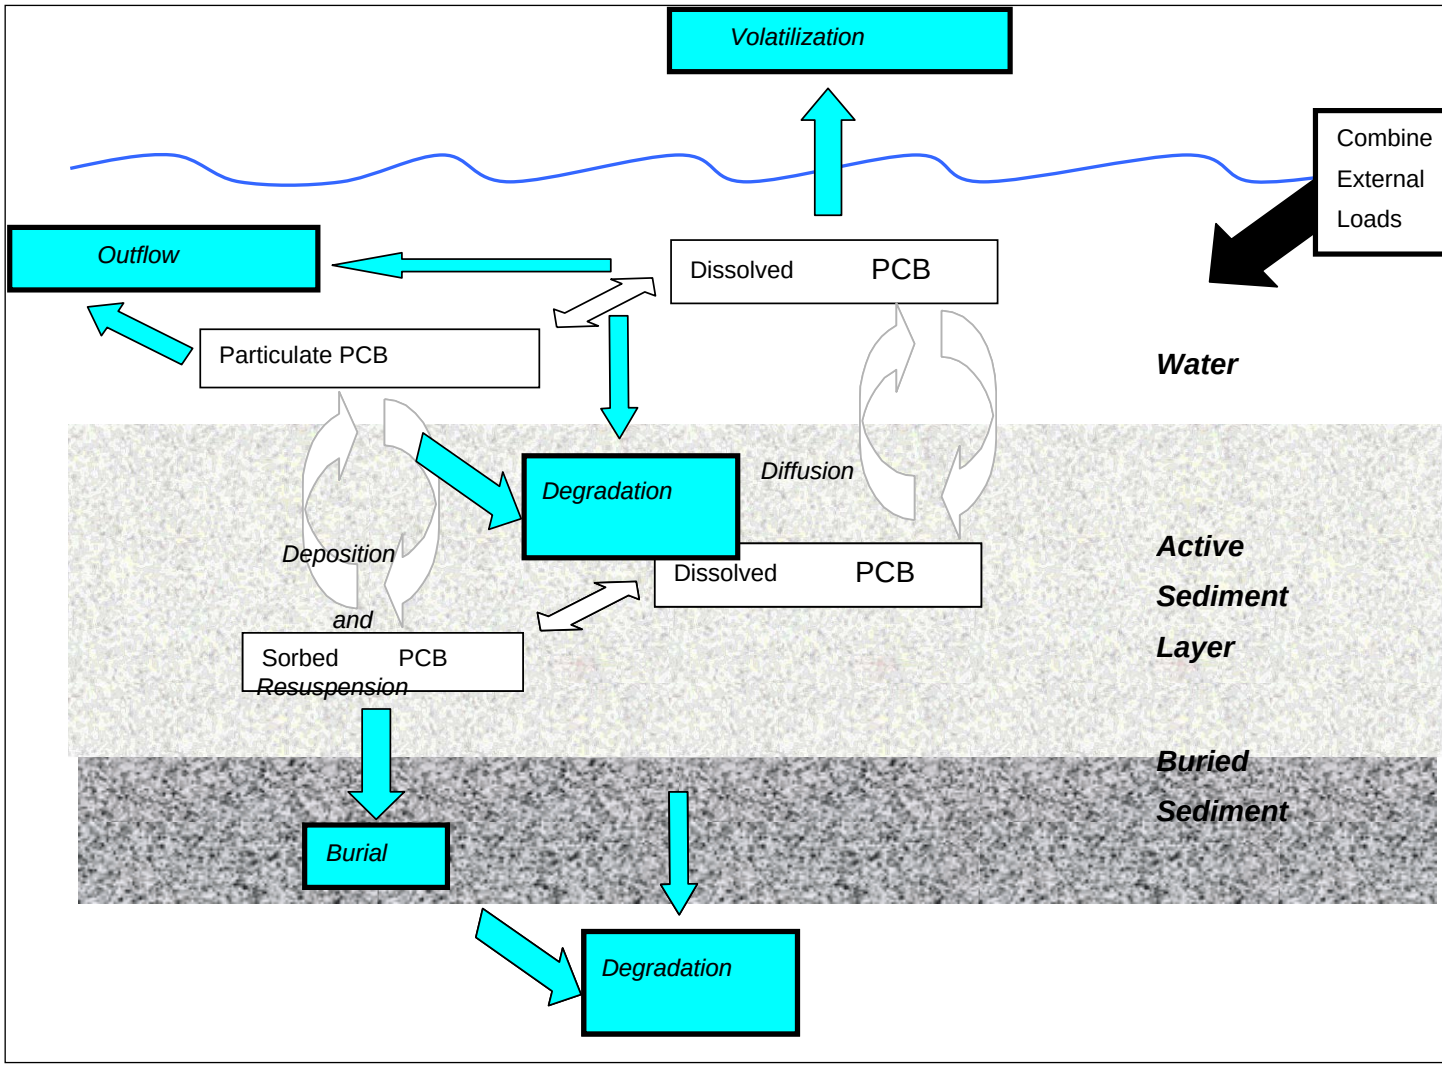

Figure 27-Mass Balance Model for PCBs in San Francisco Bay (Davis, 2003)

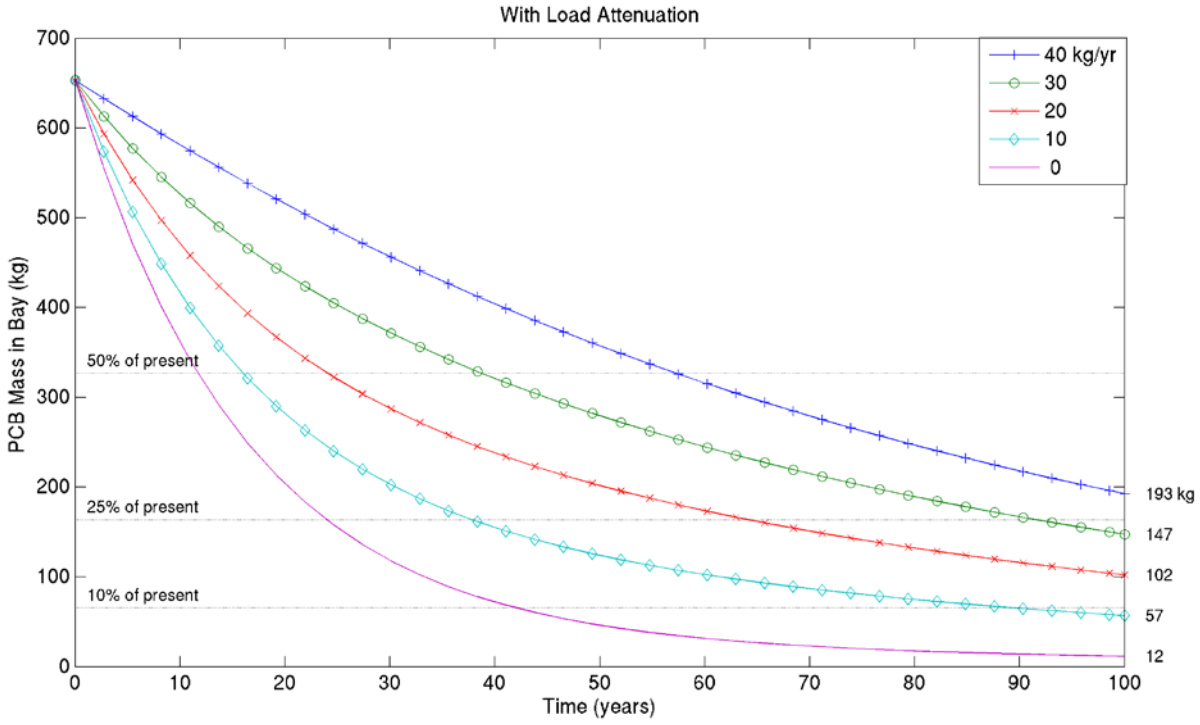

Figure 28-Predicted Long-Term Mass of PCBs in Active Sediment Layer under Different Loading Conditions (SFEI, 2007)

10. Total Maximum Daily Load and Allocations

The total maximum daily load (TMDL) is the maximum quantity of a pollutant that can enter a waterbody and attain water quality standards. The TMDL is allocated amongst the various sources of the pollutant.

10.1 Total Maximum Daily Load

The PCBs TMDL is 10 kg/yr and represents the assimilative capacity of the Bay. This TMDL necessitates achieving a load reduction of about 24 kg/yr to reduce total PCBs in the Bay active layer to 160 kg in about 30 years (Figure 28). This is equivalent to achieving the sediment PCBs concentration goal of 1 µg/kg, which will result in attainment of the fish tissue target of 10 µg/kg.

The TMDL is expressed as an average annual rather than as a daily load for several related reasons. First, the TMDL is derived from a mass budget model that depicts the long term (decadal) fate of PCBs. This model uses daily time steps derived by averaging annual load estimates, as the loadings data are not refined enough to provide discrete daily loads and therefore do not reflect variability in the data. Future data collection to verify attainment of the TMDL will also be collected on an annual timeframe, due to the large cost associated with these types of data. Therefore a TMDL is needed based on annual loads for comparison purposes. Also, the response of fish tissue PCBs concentrations to PCBs load reductions is not instantaneous. Even with immediate or rapid attainment of the sediment goal, there would be delay in attainment of the numeric fish tissue target, due to the time required for depuration (shedding from body) of PCBs by biota to occur. Finally, the TMDL is expressed as an average annual load because the natural variability in quantifying PCBs loads is much greater than the expected rate of load reductions. Long-term averaging of the loads is necessary to dampen out the variability in the data.

10.2 Categorical Load and Wasteload Allocations

We propose to allocate the TMDL (Figure 29, Table 19) among the existing external sources: direct atmospheric deposition, Central Valley watershed, wastewater dischargers, and urban and non-urban stormwater runoff. A portion of the TMDL is also allocated to potential future stormwater treatment by municipal wastewater dischargers. The linkage analysis shows that the fish tissue target can be achieved with reduction of external loads to the TMDL of 10 kg/yr. As such, internal sources are not assigned load allocations. However, reduction of internal loads will lead to an increased rate of recovery of beneficial uses. Sediment dredging and disposal, which results in an on-going net loss of PCBs from the Bay is expected to continue to decrease in-Bay disposal volumes and increase out-of-Bay disposal based on goals established in the "Long Term Management Strategy for the Placement of Dredged Material in The San Francisco Bay Region" (USACE, 1998). Therefore, sediment dredging is expected to continue to remove PCBs from the Bay. In addition, remediation of in-Bay contaminated sediment is expected to decrease potential loadings from this other internal source.

The following sections present the basis of the allocation for each source category.

10.3 Wasteload Allocations

Wasteload allocations apply to all NPDES permitted discharges to the Bay, including municipal and industrial wastewater dischargers, and municipal stormwater (urban and non-urban stormwater runoff) discharges.

Table 19-PCBs Load and Wasteload Allocations to San Francisco Bay

Source Category	Allocations
	Kilograms per year

Central Valley Watershed	5
Municipal Wastewater Dischargers	2
Industrial Wastewater Dischargers	0.035
Stormwater Runoff	2
Reserved for stormwater treatment by municipal wastewater dischargers	1
Total	***10[b]***

[a] Zero allocation reflects overall net loss to the atmosphere
[b.] Total differs from column sum due to rounding.

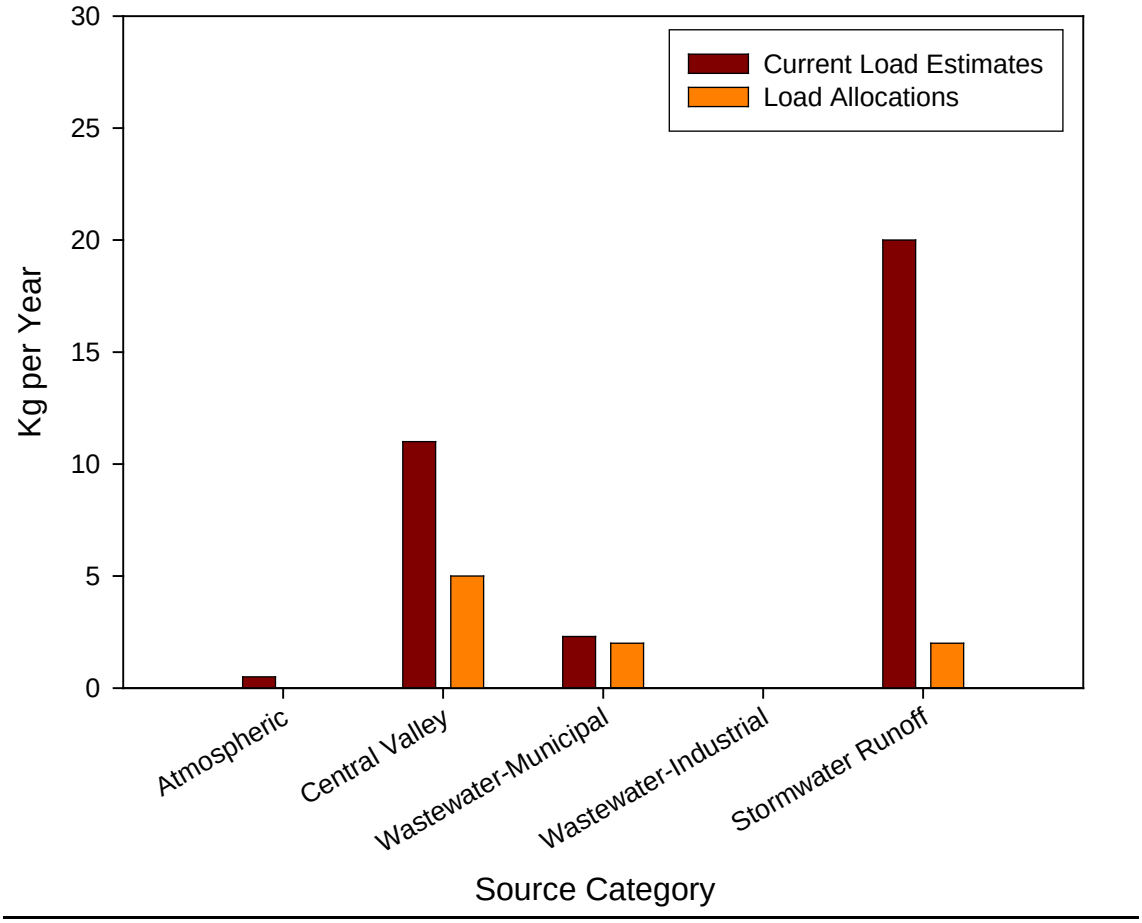

Figure 29-Loads and Allocations of PCBs to San Francisco Bay

Municipal and Industrial Wastewater Dischargers
Municipal and industrial wastewater NPDES permitted facilities discharge a small fraction of the total PCBs load to the Bay. In general, municipal and industrial wastewater dischargers operate at a high level of performance and remove PCBs via solids reduction treatment processes. The wasteload allocations for municipal wastewater dischargers total 2 kg/yr, which reflects the current estimated aggregate load to the nearest kg/yr. Although this is lower than our actual estimate of 2.3 kg/yr, it reflects the anticipated decreases in current loadings expected from implementation actions and degradation of PCBs in sources to wastewater systems. The wasteload allocations for industrial facilities total 0.035 kg/yr, which reflects estimated current loads.

Individual wasteload allocations are specified for each municipal and industrial wastewater dischargers in Table and Table 21, respectively. We have insufficient or no data to calculate wasteload allocations for individual facilities based on individual facility performance at this time. Therefore, individual load allocations are based on each facility's fraction of the total yearly wastewater discharged from this source category using average annual flow data from 1999 through 2002. The resulting individual wasteload allocations do not represent individual facility actual discharge performance and do not account for variability in discharge performance. As part of the adaptive implementation plan of this TMDL, we will use data generated through implementation of the TMDL to review and revise individual allocations for Water Board consideration that account for actual performance.

Stormwater Runoff
Existing PCBs loads from stormwater runoff are estimated at 20 kg/yr. The proposed total wasteload allocation for stormwater runoff is 2 kg/yr. It reflects the resulting PCBs load when all sediment in stormwater runoff has a concentration of 1 µg/kg, the sediment PCBs concentration goal, assuming the sediment loads used to calculate the current PCBs load do not change. Sediment load estimates vary from 870,000 tons (SFEI, 2007), 930,000 tons (Krone, 1979), to 1,500,000 tons (Schoellhamer et al., 2005). Due to the uncertainty in these estimates and until they are refined, we will use 2,000,000 tons as an upper bound estimate of maximum sediment yields from local tributaries to calculate the stormwater wasteload allocations, resulting in 2 kg/yr.

Individual county-based watershed wasteload allocations for stormwater runoff are presented in Table 22. This total wasteload allocation is based on the aggregate allocation of 2 kg/yr and the fraction of the Bay-side year 2000 population residing in each permitted entity (USCB, 2000). Wasteload allocations for stormwater runoff apply to all NPDES permitted municipal stormwater discharges (Table 22). These allocations apply to unincorporated areas and all municipalities in the county that drain to the Bay and are part of the San Francisco Bay Region. They implicitly include all current and future permitted discharges within the geographic boundaries of municipalities and unincorporated areas within each county. Examples of discharges include but are not limited to California Department of Transportation (Caltrans) roadways and non-roadway facilities and rights-of-way, atmospheric deposition, public facilities, properties proximate to stream banks, industrial facilities, and construction sites. The San Francisco allocation does not account for treatment provided by San Francisco's combined sewer system. The wet weather treatment provided by the City and County of San Francisco's Southeast Plant (NPDES permit CA0037664) and the Northpoint Wet Weather Facility will be credited toward meeting the allocation.

Urban Stormwater Runoff Treatment by Municipal Wastewater Dischargers

A potential means to reduce urban stormwater runoff PCBs loads will be to strategically intercept and route runoff to municipal wastewater treatment systems. We propose a separate wasteload allocation for discharges associated with urban stormwater runoff treatment via municipal wastewater treatment systems, since such actions will result in increased PCBs loads from municipal wastewater dischargers, and the proposed individual wasteload allocations for municipal wastewater dischargers reflect current performance levels. We propose a wasteload allocation of 0.9 kg/yr, which is the difference between the TMDL of 10 kg/yr and the sum of the other proposed wasteload and load allocations.

a) Wasteload allocations for industrial wastewater dischargers do not include mass from once-through cooling waters. The Water Board will apply intake credits for once through cooling as allowed by law.
b) Total differs from column sum due to rounding.

10.4 Load Allocations

In this section, we present the load allocations for nonpoint source discharges of PCBs including direct atmospheric deposition and the Central Valley watershed Allocations focus on controllable loads of PCBs. Assessment of PCBs load reductions from sources considered uncontrollable will continue as part of the implementation of the TMDL.

Direct Atmospheric Deposition

PCBs freely exchange between the Bay and the atmosphere through both deposition and volatilization. Currently, PCBs escape to the atmosphere from the Bay at a greater rate than they are deposited from the atmosphere, resulting in a net loss of PCBs. As such, the proposed allocation to direct atmospheric deposition is zero. This load allocation is limited to PCBs that deposit directly into the Bay. Atmospheric PCBs deposited in the watershed, and indirectly washed into the Bay with runoff are not included in this source category. However, the PCBs concentrations in non-urban stormwater conveyances from open space areas are low and include indirect loads from atmospheric deposition onto the landscape (KLI, 2002). Therefore, the indirect load from atmospheric deposition in commercial and industrial areas is also estimated to be small, contributing minimally to stormwater runoff discharges.

Table 22 - County-Based Watershed Wasteload Allocations for Stormwater Runoff

County	Population	Allocations (kilograms / year)
Alameda	1,440,000	0.5
Contra Costa	790,000	0.3
Marin	240,000	0.1
Napa	120,000	0.05
San Francisco	630,000	0.2
San Mateo	600,000	0.2
Santa Clara	1,600,000	0.5
Solano	290,000	0.1
Sonoma	110,000	0.05
Total		***2***

Central Valley Watershed

PCBs loads from the Sacramento and San Joaquin Rivers are significant. However, this load results from the large volume of sediments carried into the Bay at low sediment PCBs concentrations, although the sediment PCBs concentrations are generally greater than the sediment PCBs goal. Current estimates of sediment loads to the Bay are around 1.2 millions tons (Leatherbarrow et al, 2005; Schoellhammer et al., 2005). If all of this sediment from the Central Valley had a concentration equal to the sediment goal, the resulting PCBs loads from the Central Valley would be 1.2 kg/y. However, based on natural attenuation with a half life of 56 years (Davis, 2003), loads will not be reduced to this level in the next 100 years (Figure 30). However, natural attenuation will lower the Central Valley load to 5 kg/yr in about 40 years. As this load reduction will result in attainment of the TMDL, we propose using 5 kg/yr as the load allocation to the Central Valley watershed.

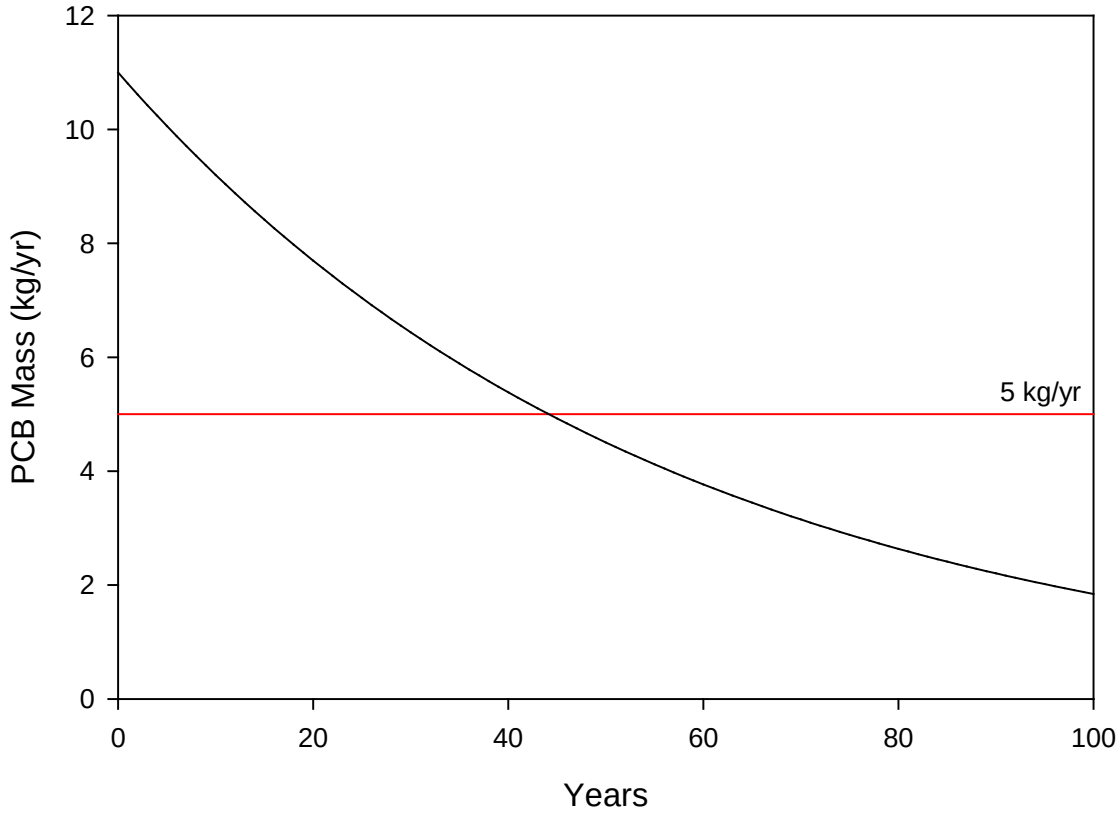

Figure 30-Natural Attenuation of Central Valley PCB Loads

10.5 Margin of Safety and Seasonality

A margin of safety needs to be incorporated into the TMDL to account for uncertainty in understanding the relationship between pollutant discharges and water quality impacts (USEPA, 1991). The margin of safety can be incorporated in the TMDL either explicitly or implicitly (USEPA, 2000a). Making and documenting conservative assumptions used in the TMDL analysis provides an implicit margin of safety. The purpose of the margin of safety is to ensure, given the uncertainties in developing the TMDL, that the beneficial uses currently impaired are restored.

For the PCBs TMDL, we are incorporating an implicit margin of safety. We have used a conservative approach to derive the fish tissue numeric target. We used a high-end value, the 95th percentile consumption rate, rather than the average consumption rate allowed by USEPA (2000c). Therefore, the fish tissue numeric target proposed in this TMDL is as protective as possible following USEPA methodology and should provide additional protection to human health from fish consumption. In addition, the wasteload allocation reserved for urban stormwater runoff treatment via municipal wastewater treatment systems is not expected to be fully utilized for several years. In the meantime, we intend to regularly review the effectiveness of implementation actions in meeting the numeric target and revise, as necessary, the proposed load and wasteload allocations. We also propose to monitor attainment of the numeric target

and to reevaluate the appropriateness of the currently proposed fish tissue numeric target and associated total PCBs sediment concentration goal.

Seasonal variation also needs to be considered when developing a TMDL. As was discussed in Section 6.2, PCBs concentrations in white croaker tissue collected in the Oakland Inner Harbor showed a seasonal trend with higher concentrations in summer and fall, and lower concentrations in winter and spring. This trend does not correlate with the expected higher total loading of PCBs to the Bay during the winter associated with stormwater and Central Valley runoff. We account for this seasonal trend by applying the fish tissue target to fish collected in the summer. In this manner, attainment of the fish tissue numeric target in the season when fish are most impacted will also be protective at other times of the year.

11. Implementation

Success of the PCBs TMDL requires an adaptive management approach to implementation actions. Adaptive implementation is a cyclical process in which TMDL plans and actions are regularly assessed for their achievement of water quality standards (NRC, 2001). Adaptive implementation simultaneously makes progress toward achieving water quality standards through implementing actions while relying on monitoring and experimentation to reduce uncertainty and refine future implementation actions.

The adaptive implementation process consists of the development of a plan that includes early implementation actions based on existing knowledge that have a reasonable probability of success and an overview of options for future actions. For PCBs in the Bay, the immediate or early implementation actions are not expected to completely eliminate the Bay impairment. Therefore, future actions must be evaluated based on continued monitoring and response to the early implementation actions, as well as based on well-designed studies used for model refinement.

This implementation plan includes three general implementation categories: control of external loadings of PCBs to the Bay, control of internal sources of PCBs within the Bay, and actions to manage risks to Bay fish consumers. In addition, the monitoring section describes monitoring required to measure attainment of the numeric target, water quality objectives and to measure implementation progress towards attainment of the load and wasteload allocations. The adaptive implementation section describes the method and schedule for evaluating and adapting the TMDL and implementation plan as needed to assure water quality standards are attained based on new information, studies to fill information gaps, and tracking and evaluation of actions.

11.1. External Sources

The following sections outline the proposed approach to adaptive implementation for mass reductions of PCBs loads from external sources.

Direct Atmospheric Deposition

There is a net removal of PCBs from the Bay through the atmosphere and consequent air-borne transport. No foreseeable actions can be taken to accelerate this loss of PCBs from the Bay. In the long-term, this loss will diminish as PCBs mass in the Bay is reduced and the numeric target is attained. A reevaluation of PCBs input and loss from the atmosphere may be needed in the future as part of reevaluation of the long term fate and transport of PCBs in the Bay, or if current implementation actions do not cause a rapid enough trend towards attainment of the target.

Central Valley Watershed

Sediments entering the Bay from the Central Valley have lower PCBs concentrations than in-Bay sediment, and major PCBs mass loading events that occur during episodic high flow events mostly flow directly out of the Bay through the Golden Gate. There are very limited locations with PCBs impairment of waters within the Central Valley watershed. The allocation will be attained through anticipated natural attenuation of PCBs in the Central Valley watershed. Verification of ongoing loads and load reductions will be a regular component of the Regional Monitoring Program.

Municipal and Industrial Wastewater Dischargers

Wasteload allocations for municipal and industrial wastewater discharges reflect current PCBs loads. Loads are expected to diminish as sources of PCBs to wastewater treatment systems diminish over time. Wasteload allocations will be implemented through NPDES permits that require implementation of best management practices (BMPs) to maintain optimum treatment performance for solids removal and to identify and manage controllable sources. Developing effluent limits for PCBs that accurately reflect treatment system performance require a substantial data set that accounts for system variability of a difficult to measure pollutant that is present at very low levels (See Section 5.2). The primary PCBs treatment mechanism is solids removal, and as such, ongoing attainment of suspended solids effluent limits provides a surrogate indicator of PCBs control. In addition to maintaining optimum solids removal performance, wastewater dischargers should evaluate whether there are any controllable sources of PCBs to their systems (e.g., industrial uses of equipment that contain PCBs).

Effluent limits in NPDES permits will be based on current performance; however, it's not feasible to calculate such limits as this time. The wasteload allocations were derived from a limited data set used to estimate the total PCBs annual load to San Francisco Bay from all wastewater discharges. The data set was limited due to the technical difficulty and associated costs of measuring very low concentrations of PCBs in wastewater. Furthermore, the individual allocations, which were based on each facility's fraction of the total yearly wastewater discharged to the Bay, do not represent actual performance of individual dischargers. Consequently, implementation of the individual wasteload allocations as effluent limits is not feasible at this time. NPDES permits will require individual facility's to collect data in order to calculate daily or monthly average effluent limits that are consistent with the annual load allocations, and possibly recalculation of individual wasteload allocations based on these data. However, calculation of these limits is not feasible at this time. Implementation of the wasteload allocations is further complicated by the lack of a low-detection level analytical method that can be used for compliance determinations. The level of quantification achievable with the regulatory analytical methods promulgated under 40 CFR 136 (US EPA Method 608) is 0.5 µg/L. Accordingly, compliance with effluent limits in NPDES permits will be determined using this approved method.

NPDES permits will require quantification of PCBs loads using a lower detection level method such as Method 1668A. This method was used to derive the loading estimates that are the basis of the allocations. However, as noted above, there are technical difficulties and high analytical costs ($1,000 to $1,200 per sample) associated with measuring very low concentrations of PCBs in wastewater. Another complication is that the daily, monthly, and even annual variability of PCBs in wastewater is unknown. Consequently, calculation of limits that account for variability may require several years of data. Also, if individual performance data result in effluent limits that are not consistent with individual wasteload allocations established with this TMDL, then the Water Board will take action to revise the individual allocations as part of the adaptive implementation plan.

We also propose a separate wasteload allocation for discharges associated with urban stormwater runoff treatment via municipal wastewater treatment systems. This allocation will be implemented through a permit that will allow municipal wastewater dischargers to apply for a portion of this reserved allocation. Although we recognize that the capacity and opportunity for existing systems to receive stormwater runoff may be limited, we expect that there will be strategic opportunities to do so.

In addition to controlling PCBs sources and discharges, municipal and industrial wastewater dischargers will be required to support actions to manage the health risks associated with the consumption of PCBs-contaminated Bay fish by people that recreationally fish, and to conduct or cause to be conducted monitoring, and studies to fill critical data needs identified in the Adaptive Implementation section.

Stormwater Runoff

The stormwater runoff wasteload allocations shown in Table 22 will be implemented through NPDES stormwater permits issued to urban runoff management agencies. The stormwater runoff allocations implicitly include all current and future permitted discharges, not otherwise addressed by another allocation, and unpermitted discharges within the geographic boundaries of urban runoff management agencies including, but not limited to, California Department of Transportation (Caltrans) roadway and non-roadway facilities and rights-of-way, atmospheric deposition, public facilities, properties proximate to stream banks, industrial facilities, and construction sites.

Substantial load reductions are required to attain wasteload allocations. In addition to reductions due to natural attenuation, urban runoff management agencies can reduce PCBs loads by preventing PCBs sources from contaminating sediment or by reducing the amount of contaminated sediment discharged to the bay. Urban runoff management agencies can prevent contamination through various source control and pollution prevention activities, including remediation of on-land PCBs contaminated soils and control of releases of PCBs from electrical or other equipment, building materials and waste during demolition/remodeling, or other sources. In addition, urban stormwater PCBs loads can be reduced through capture, detention, and removal of highly contaminated sediment, and possibly by urban storm water treatment, including routing of PCBs contaminated runoff to wastewater treatment systems. Substantial infrastructure improvements are expected to result from implementation of construction and new development runoff permit requirements. These requirements, which promote controls such as planting vegetative buffers around impervious surfaces, may effectively control urban sediment discharges. Many of these actions also have the potential benefit of reducing other particle-associated pollutant loads in addition to PCBs.

Remediation of on-land PCBs-contaminated soils and effective PCBs prevention or removal infrastructure improvements will take several years to pilot test, evaluate, and then plan, design and implement on a scale sufficient to substantially reduce PCBs loads. As such, we propose a 20-year schedule for attaining the wasteload allocations. Requirements in each NPDES permit issued or reissued and applicable for the five-year term of the permit will be based on an updated assessment of best management practices, and control measures intended to reduce PCBs in urban runoff to the maximum extent practicable. This is consistent with the Water Board's phased approach towards attainment of water quality objectives in waters that receive stormwater discharges from urban areas described in Section 4.8 of the Basin Plan.

There are already efforts underway to gain insights regarding opportunities for load reductions. NPDES permit requirements will call for progressive implementation of PCBs control measures. Specific best management practices (BMPs) and control measures to be considered include:

- Abatement of PCBs in runoff from areas with elevated PCBs in soils/sediments
    - Investigate on-land PCBs contaminated soils and/or sediments – PCBs are a known historical contaminant in soils and sediments throughout the region, both in private and public properties, and public rights-of-ways. Although many contaminated sites have undergone remediation, it is likely that PCBs contaminated sites remain and continue to

contribute PCBs to stormwater. Stormwater runoff management agencies are expected to conduct, or cause to be conducted by other agencies or responsible parties, identification of on-land sites with PCBs contamination, such as private properties, public rights-of-ways, and stormwater conveyances. Stormwater runoff management agencies would be expected to report investigation results, including identifying potentially contaminated properties and/or responsible parties to the Waterboard and/or DTSC, and/or in some instances to local agencies with authority to conduct oversight of hazardous materials. The Waterboard, DTSC, or local agency would be expected to follow up on further investigation and oversee any necessary abatement.

- Improve system design, operation, and maintenance to increase fine sediment– PCBs are mainly transported within the stormwater conveyances attached to sediments. Many routine maintenance BMPs exist and are currently in use to control the discharge of sediments to the Bay from urban stormwater runoff, such as storm drain inlets, detention basins and street sweeping. Urban runoff management agencies are expected to implement increased routine sediment control measures within the stormwater conveyances in locations that will result in increased reduction of PCBs loads.
- Strategic runoff treatment retrofits – There are many sediment control BMPs, such as sand (or other media) filtration devices or multi-chamber treatment trains, that have not been evaluated or implemented for their ability to reduce PCBs loads in urban environments. As such, urban runoff management agencies are expected to investigate and implement as necessary new sediment treatment control measures within stormwater conveyances.
- Urban stormwater runoff treatment via municipal wastewater treatment systems – Opportunities to route dry weather and/or wet weather flows from storm drain systems to wastewater systems should be investigated, pilot tested, and implemented where feasible. This includes consideration of dry weather flows, including possible street washing flows, and wet weather flows, particularly first flush flows.

- Abatement of PCBs in runoff from all areas
  - Control/oversee removal and disposal of PCBs-containing equipment – PCBs-containing equipment remains in use with varying degrees of regulatory oversight depending on equipment type and PCBs concentration. Containment of the PCBs varies depending on equipment uses and regulatory oversight. These materials may therefore be released to the environment and enter stormwater conveyances. As such, urban runoff management agencies are expected to conduct industrial inspections to identify and cause replacement of PCBs-containing equipment remaining in the urban environment.
  - Control/manage removal and disposal of PCBs from building materials and waste during demolition/remodeling – PCBs-containing building materials remain in use with little regulatory oversight. With aging, or construction or demolition activities, these materials may be released to the environment and enter stormwater conveyances. As such, urban runoff management agencies are expected to conduct or cause to be conducted a program to manage PCBs in building materials through their inspection programs.

These BMPs and control measures are expected to be implemented in phases as NPDES permits are issued and reissued. In the first five-year permit term, stormwater permittees will be required to implement control measures on a pilot scale to determine their effectiveness and technical feasibility. Permit requirements will include the following:

- Ensure that industrial inspectors can identify PCBs or PCB-containing equipment during inspections.
- Conduct pilot studies to evaluate the presence of PCBs in building materials (e.g. caulks and adhesives) and develop BMPs to prevent PCBs from being released into the environment during building demolition and renovation.
- Conduct pilot studies to develop and implement best management practices (BMPs) and control measures where areas where elevated PCBs are detected in storm drain sediments, e.g., street cleaning, on-site treatment, investigate on land PCBs-contaminated soils and/or sediments and diversion of stormwater for treatment by wastewater treatment facilities.
- Evaluate the effectiveness of the BMPs and control measures and any environmental impacts associated with their implementation as part of the pilot studies.

The second five-year term permit requirements will be based on the knowledge gained during the first permit term and will call for strategic implementation of the BMPs and control measures identified as effective and that will not cause significant adverse environmental impacts based on the pilot studies conducted during the first permit term. The second term permit will also require development of a plan to fully implement control measures that will result in attainment of allocations, including an analysis of costs, efficiency of control measures and an identification of any significant environmental impacts.

Subsequent permits will include requirements and a schedule to implement technically feasible, effective and cost efficient control measures to attain allocations. If as a consequence, allocations cannot be attained, the Water Board will take action to review and revise the allocations and these implementation requirements as part of adaptive implementation.

In addition to controlling PCBs sources and discharges, urban stormwater management agencies will be required to develop and implement a monitoring system to quantify PCBs loads and the loads reduced through treatment, source control and other actions. The current limited monitoring of PCBs loads from local tributaries by the RMP is not sufficient to quantify PCBs loads from urban stormwater runoff and the loads reduced from urban stormwater runoff control actions. The Water Board will encourage and accept a region-wide design via augmentation of the current RMP as a means of developing and implementing the required PCBs loads monitoring.

Urban stormwater management agencies will also be required to support actions to manage the health risks of consuming PCBs-contaminated Bay fish; and conduct or cause to be conducted monitoring, and studies to fill critical data needs identified in the Adaptive Implementation section.

Urban runoff management agencies have a responsibility to oversee various discharges within the agencies' geographic boundaries. However, if it is determined that a source is substantially contributing to PCBs loads to the Bay or is outside the jurisdiction or authority of an agency the Water Board will consider a request from an urban runoff management agency which may include an allocation, load reduction, and/or other regulatory requirements for the source in question.

Urban Stormwater Runoff Treatment by Municipal Wastewater Dischargers
Routing of urban stormwater runoff through municipal wastewater treatment facilities is a means of reducing PCBs, and other particle-associated pollutant loads to the Bay. The wasteload allocation for stormwater runoff treatment via municipal wastewater treatment systems provides an incentive to implement this control measure. As described previously, proposed

implementation requirements for municipal wastewater and urban stormwater runoff discharges include investigating the feasibility and PCB-removal efficiency of intercepting and routing and treating urban stormwater runoff via wastewater treatment systems, and implementing this control measure where feasible.

A wastewater discharger that accepts urban stormwater runoff will be provided an augmentation of its individual wasteload allocation that accounts for the resulting load increase. The Water Board will consider either amending individual NPDES permits or adopting a separate NPDES permit as an implementing mechanism for this wasteload allocation that would allow wastewater dischargers opportunity to apply for a portion of this wasteload allocation to account for an increase in load associated with treating urban stormwater runoff.

11.2. Internal Sources

Internal sources of PCBs have not been allocated a load. However, we expect reductions in the mass of PCBs from these source categories based on sediment removal activities or other treatment controls. Reduction of the in-Bay PCBs mass will help accelerate the recovery of the Bay from its current impairment, by driving the overall sediment PCBs concentration towards the sediment concentration goal of 1 µg/kg.

The following sections outline the proposed adaptive implementation approach to control internal sources of PCBs.

In-Bay PCB-Contaminated Sites

A number of former and current on-shore industrial and military facilities, and associated PCBs-contaminated in-Bay sediments, exist throughout the Bay. Data are not available for every site to determine whether it is currently discharging to the Bay or contributing significantly to the impairment of the Bay. The State Board adopted a statewide Consolidated Cleanup Plan (Water Code Section 13394) in 2004. Some of the sites listed in Table 12 of this report are identified in the Statewide Consolidated Cleanup Plan. While past and/or current loads of PCBs from these sites to the Bay are difficult to quantify, potentially bioavailable PCBs in off-shore sediments pose a threat to human health and the environment. As such, cleanup of these sites is a Water Board priority and many cleanups are underway. The Water Board will maintain an inventory of contaminated sites (see Table 12) and continue to set priorities for investigating and remediating the sites. Prioritization of contaminated sites may result in identifying sites where additional information is needed to determine future actions, as well as sites where sufficient information is available to determine the need for no further actions. Our initial screening focused on identification of in-Bay sites where sediment PCBs concentrations exceeded 180 ug/kg (Table 23). The Water Board will coordinate clean-up actions with U.S. EPA and the Department of Toxic Substances Control, and issue clean-up orders as necessary. Table 23 provides the status of cleanup at these sites.

The proposed approach to cleanup PCBs contaminated sites is consistent with existing efforts. This TMDL will not result in new requirements for selecting site clean-up levels and remedial options. Rather, setting of clean-up levels at contaminated sites will continue to follow current guidance (e.g. DTSC, 1996; USEPA, 1997c; USEPA, 1998) and continue to be derived on a site- specific basis. The sediment goal derived in this TMDL is not a de facto clean-up level for contaminated sites not should it be interpreted as an applicable or relevant and appropriate requirement (ARAR), or a to be determined (tbd) ARAR, rather it represents the desired conditions that when achieved throughout the Bay will result in attainment of beneficial uses of the Bay.

Table 23- In-Bay PCBs Contaminated Sites

In-Bay contaminated site remediation	Lead Agency	Status
Work Completed		
Emeryville Crescent	Water Board	Completed
Oyster Point/Shearwater (20,100 cyds removed)	Water Board	Completed
Peyton Slough	Water Board	Completed
Redwood City Harbor	USACE	Completed
Former Hamilton Army Airbase – Coastal Salt Marsh	Water Board	Completed
Work In Progress		
Yosemite Slough Channel	Water Board	Site Investigation
Alameda Naval Air Station Seaplane Lagoon	U.S. EPA	Record of Decision
Hunter's Point Shipyard	U.S. EPA	Feasibility Study in preparation
Moffett Field/NASA Ames-Site 25	U.S. EPA	Feasibility Study in review
Oakland Army Base	DTSC	
Richmond Harbor/Potrero Point	DTSC	
Stege Marsh	DTSC	PCBs Interim Removal Action completed under Water Board lead
Work Not Started		
Cerrito Creek		
Cordonices Creek		
Guadalupe Slough		
Mission Creek		
Oakland Harbor		
Richardson Bay		
San Francisco Airport		
San Leandro Bay		
Vallejo Ferry Terminal		

Contaminated site investigations and evaluation of remedial activities will occur due to existing regulations whether or not called for in this TMDL. Parties responsible for PCBs contaminated sediment sites will continue to be required to gather the following information:

1. Estimate the pre-cleanup and post-cleanup vertical and lateral extent of PCBs in Bay sediments;
2. Estimate the pre-cleanup and post-cleanup mass of PCBs in Bay sediments;
3. Quantify rate(s) of sediment accretion, erosion or natural attenuation;
4. Implement on-land source control measures, if necessary, to ensure that on-land sources of PCBs do not further contaminate in-Bay sediments;
5. Evaluate, post-cleanup, the residual risks to humans and wildlife;
6. Support actions to reduce the health risks of people who consume PCBs-contaminated San Francisco Bay fish;
7. Conduct or cause to be conducted studies to fill critical data needs identified in the Adaptive Implementation section.

If not already completed, these requirements will be incorporated into individual site cleanup plans within five years of the effective date of this TMDL, with full implementation of the actions within ten years of the effective date of this TMDL or as agreed to in the individual site cleanup plan.

Navigational Dredging

Maintenance dredging involves the removal of sediments from navigation channels and the disposal of this sediment at different permitted sites. Dredged sediment from the Bay can be disposed of at upland sites, at in-Bay disposal sites, or at a deep-ocean disposal site (USEPA/USACE, 1999a; USEPA/USACE, 1999b). The Long Term Management Strategy for the Disposal of Dredged Material in the San Francisco Bay Region (LTMS) seeks to reduce the total volume of in-Bay disposal from about 2,000,000 cubic yards per year (yd^3/yr) to approximately 1,000,000 yd^3/yr within about 10 years (USACE, 2001). The lower in-Bay dredge material disposal will result in a net removal of PCBs from the Bay.

In order to ensure that buried PCBs are not being spread out through the Bay via dredge material disposal at dispersive sites, sediments disposed of in Bay should have total PCBs concentrations no greater than that in ambient surface sediments in the Bay. To provide this assurance, we propose that the PCBs concentration in dredged material disposed of in the Bay not exceed the 99th percentile total PCBs concentration of the previous 10 years of Bay surface sediment samples collected through the RMP (excluding stations outside the Bay like the Sacramento River, San Joaquin River, Guadalupe River and Standish Dam stations). Prior to disposal, the material should be sampled and analyzed according to the procedures outlined in the 2001 U.S. Army Corps of Engineers document “Guidelines for Implementing the Inland Testing Manual in the San Francisco Bay Region.” All in-Bay disposal of dredged material shall comply with the Dredging and Disposal of Dredged Sediment program described in Section 4.20 of the Basin Plan and the Long Term Management Strategy for the Disposal of Dredge Material in San Francisco Bay.

In addition to controlling PCBs sources and discharges, dredged material dischargers will be required to support actions to reduce the health risks of people consuming PCBs-contaminated Bay fish, and to conduct or cause to be conducted studies to fill critical data needs identified in the Adaptive Implementation section.

11.3. Risk Management

Load reductions and consequent attainment of the numeric target to support fishing in the Bay as a beneficial use will take time to achieve. However, there are actions that should be undertaken immediately to help manage the risk to consumers of PCBs-contaminated fish. The Water Board will work with the California Office of Environmental Health Hazard Assessment, the California Department of Toxic Substances Control, the California Department of Health Services, and dischargers to pursue risk management strategies. The risk management activities will include the following:

- Investigate and implement actions to address public health impacts of PCBs in San Francisco Bay/Delta fish, including activities that reduce actual and potential exposure of and mitigate health impacts to those people and communities most likely to be affected by PCBs in San Francisco Bay caught fish, such as sport and subsistence fishers and their families;

- Provide multilingual fish-consumption advice to the public to help reduce PCBs exposure through community outreach, broadcast and print media, and signs posted at popular fishing locations;
- Regularly inform the public about monitoring data and findings regarding hazards of eating PCBs-contaminated fish; and
- Perform special studies needed to support health risk assessment and risk communication.

11.4. Critical Data Needs

Data and other information are needed to assess both the progress toward attainment of the numeric fish tissue target and to inform the adaptive implementation of the TMDL. Dischargers will therefore be required to support the following studies to fill critical data needs.

- PCBs mass budget modeling and food web model improvements – Model refinements are needed to improve our ability to predict recovery rates of the Bay from impairment by PCBs, and to help focus implementation actions on those with the most potential for success. Better models could lead to a recalculation of the TMDL, and revised load and wasteload allocations. The TMDL will be revised if improved models predict that the current TMDL will not result in attainment of the fish tissue target. Improved models will also help evaluate whether implemented actions are effective and sufficient, and could direct the need for different or expanded implementation action. Models are also needed to improve our understanding of the role in-Bay PCBs-contaminated sites play in the Bay's recovery.

- Rate of natural attenuation of PCBs in the Bay environments – Natural attenuation is a component of the implementation of the TMDL. Attenuation rates greatly affect model prediction of recovery of the Bay from PCBs impairment. A better understanding of local rates of natural attenuation is needed in order to predict with more certainty the recovery time of the Bay, and to inform whether more, less or different implementation actions are needed. A refined understanding of the PCBs natural attenuation rate in water and sediment could lead to revised load and wasteload allocations. Specifically, load allocations to the Central Valley and navigational dredging currently rely on natural reduction of PCBs and new findings could result in load reduction actions implementation.

11.5. Monitoring

Monitoring is needed to demonstrate progress toward attainment of allocations and the numeric target. The discharger-funded RMP currently monitors PCBs in San Francisco Bay fish, sediments, and water. The Water Board will call on dischargers to support the RMP to monitor PCBs in fish (as specified in the numeric target), in sediments and water, at a spatial scale and frequency to track trends in the decline of PCBs and to demonstrate attainment of the numeric fish tissue target and sediment concentration goal. Monitoring will provide information on the progress in attaining the TMDL target, and therefore the success of actions implemented. Long term data are needed to verify the recovery rate of the Bay, and compare this with a model predicted recovery rate. These efforts will also inform whether the actions implemented are effective in reducing PCBs to the TMDL target or whether further actions are required. A refined understanding of long term PCBs concentration trend data in water, sediment and biota could lead to a recalculation of the TMDL, and revised load and wasteload allocations.

Monitoring of load allocations to demonstrate progress towards attainment shall be conducted by municipal and industrial wastewater dischargers and by urban runoff stormwater agencies. The RMP also conducts regular monitoring of PCBs loads from the Central Valley and some limited monitoring of PCBs loads from local tributaries. The current limited monitoring of PCBs loads from local tributaries by the RMP is not sufficient to quantify PCBs loads from stormwater runoff or the loads reduced from urban stormwater management control actions. As described in the discussion of implementation of Central Valley allocations, the Water Board will also call on dischargers, via the RMP, to verify ongoing loads and load reductions to allow evaluation of trends in the loads of PCBs from the Central Valley watershed and to confirm that loads are being reduced due to natural attenuation.

11.6. Adaptive Implementation

Adaptive implementation entails taking immediate actions commensurate with available information, reviewing new information as it becomes available, and modifying actions as necessary based on the new information. Taking immediate action allows progress to occur while more and better information is collected, and the effectiveness of current actions is evaluated (NRC, 2001). In this manner, this TMDL will be implemented in phases starting with actions described in each source category, risk management, monitoring, and critical data needs section above with subsequent modifications and phases based on improved knowledge of PCBs sources, control measures, and fate in the environment. In particular, there are four principal ongoing activities that may necessitate TMDL adaptation.

First, the ongoing monitoring being conducted through the Regional Monitoring Program will allow us to improve our understanding of the rate of natural attenuation and recovery and our understanding of patterns of PCB concentrations in tissue and sediment. Interpretation of these data may result in improved ways of expressing TMDL targets or of evaluating them using monitoring data.

Second, there are ongoing efforts to improve understanding of the fate and transport of PCBs in the Bay and to model the relevant biological, physical and chemical processes. Improved modeling capabilities combined with bathymetric and sediment core data allow us to better predict how the Bay will respond to management actions and changing conditions. This will, in turn, inform the need to adapt implementation schedules.

Third, we will continue to pursue clean-up of in-Bay contaminated sites. By evaluating the degree to which in-Bay contaminated sites can be remediated and evaluating the resultant impact on PCB levels in the Bay and its biota, we will gain valuable insights relevant to determining the pace at which the beneficial uses of the Bay will be restored.

Last, the success of the TMDL depends in large part on concerted efforts to locate and evaluate opportunities to control on-land PCB sources and the PCB load conveyed to the Bay via urban stormwater runoff. The progressive approach for addressing this challenge is described in the stormwater runoff implementation section above in more detail.

We will be assessing progress in each of these four areas on a continuing basis to determine if the quantity and quality of emerging information are sufficient to warrant adaptation of the TMDL.

The Water Board will adapt the TMDL and implementation plan to incorporate new and relevant scientific information such that effective and efficient measures can be taken to achieve the

TMDL allocations and numeric fish tissue target. The Water Board, via an annual report by Water Board staff on TMDL implementation progress, will evaluate new and relevant information from implementation actions, monitoring, special studies, and scientific literature. Within ten years of the effective date of the TMDL, any necessary modifications to the targets, allocations, or implementation plan will be incorporated into the Basin Plan. The Water Board will make new information available to the public and will allow opportunities for public participation regarding the results of the periodic review of the TMDL, attainment of load allocations, attenuation of PCBs, or revised TMDL derivations.

The Water Board will adapt the TMDL and implementation plan to incorporate new and relevant scientific information such that effective and efficient measures can be taken to achieve the allocations and numeric fish tissue target. The Water Board staff will present an annual progress report to the Water Board on implementation of the TMDL that includes evaluation of new and relevant information that becomes available through implementation actions, monitoring, special studies, and scientific literature, and within ten years of the effective date of the TMDL, the Water Board will consider amending the PCBs TMDL and implementation plan as necessary to ensure attainment of water quality standards in a timely manner while considering the financial and environmental consequences of new control measures.

In particular, achievement of the allocations for stormwater runoff, which is projected to take 20 years, will be challenging. Consequently, the Water Board will consider modifying the schedule for achievement of the load allocations for stormwater runoff provided that dischargers have complied with all applicable permit requirements and all of the following have been accomplished relative to that source category or discharger:

- A diligent effort has been made to quantify PCBs loads and the sources of PCBs in the discharge;
- Documentation has been prepared that demonstrates that all technically and economically feasible and cost effective control measures recognized by the Water Board as applicable for that source category or discharger have been fully implemented, and evaluates and quantifies the comprehensive water quality benefit of such measures;
- A demonstration has been made that achievement of the allocation will require more than the remaining ten years originally envisioned; and
- A plan has been prepared that includes a schedule for evaluating the effectiveness and feasibility of additional control measures and implementing additional controls as appropriate.

12. Regulatory Analyses

This section provides the regulatory analyses required to adopt the Basin Plan amendment to establish the PCBs TMDL. It includes a discussion of the results of an environmental impact analysis and a discussion of economic considerations. The environmental impact analysis is required under the California Environmental Quality Act (CEQA) when the Water Board adopts a Basin Plan amendment under the Water Board's certified regulatory program (California Public Resources Code § 15251 [g]). The environmental analysis also satisfies Public Resources Code § 21159 which applies when adopting rules or regulations requiring installation of pollution control equipment, compliance with a performance standard, or treatment requirement. It evaluates the reasonably foreseeable environmental impacts of the methods of compliance with the implementation plan in Section 11, and describes the reasonably foreseeable and feasible mitigation measures that could be used to reduce significant environmental impacts. The discussion of economic considerations is provided in accordance with Public Resources Code § 21159 [a] [3] [c] which requires an analysis of economic factors related to costs of implementation of the new rules or regulations. This Staff Report, including the CEQA checklist and these analyses, constitute a substitute environmental document.

The results of the assessment of environmental impacts and economic considerations show that the Basin Plan amendment is not likely to result in long-term, significant impacts and will not cause immediate, large scale expenditures by the entities required to implement the PCBs TMDL. Many of the actions identified in the Basin Plan amendment to implement the PCBs TMDL are built on existing efforts to improve management of urban runoff, treatment of wastewater, and to remediate upland and in-Bay PCBs-contaminated sites. Many of the actions will be implemented in a phased manner after pilot studies are conducted to evaluate those specific BMPs or control measures that are effective both from a load reduction perspective and from a cost perspective. This section analyzes environmental impacts for many of the potential individual projects that may be developed to implement the PCBs TMDL to the extent such impacts can be identified at this time. At such time as individual projects are proposed, the impacts of those individual projects will be evaluated as to location, specific technologies, size, quantity, feasibility and any mitigation necessary to address the identified environmental impacts. These project specific impacts are too speculative to evaluate at this time. We anticipate that these projects would be required to mitigate any potential environmental impacts. Mitigation measures that are both feasible and already in common use as standard industry practice, are discussed in this analysis of environmental impacts and are expected to reduce all potentially significant impacts to less than significant levels.

12.1. Environmental Impact Analysis: CEQA Compliance

The Water Board is the lead agency responsible for evaluating the potential environmental impacts of the proposed Basin Plan amendment to establish the PCBs TMDL and implementation plan for San Francisco Bay. To accomplish this evaluation, a standard CEQA checklist was prepared (Appendix A) along with an explanation of the results of the analysis. It includes a discussion of the potential environmental impacts as well as mitigation measures that would be used to eliminate or reduce the impacts. Because the Water Board cannot mandate adoption of any specific compliance method, the analysis provided here should be viewed as comparable to a Tier 1 environmental impact review. It does not and cannot present detailed analysis of project-specific

impacts at specific locations in the San Francisco Bay watershed, since such projects have yet to be defined, and thus, any analysis would be speculative at this time. Our assessment evaluates likely impacts of reasonably foreseeable means of compliance and the reasonably foreseeable mitigation measures that would reduce any potentially significant impacts.

12.2. Project Description

Sections 2.2 and 3. of this Staff Report present the project definition, objectives and environmental setting that provide the basis for the CEQA evaluation. The project is composed of a Basin Plan Amendment that includes a TMDL of 10 kg/yr for San Francisco Bay based on a numeric target for fish tissue (10 ug/kg) protective of human health and wildlife beneficial uses and allocates the TMDL among the various external sources. This target is based on evaluating the lifetime incremental cancer risk of one in a 100,000 for an adult recreational sport fisher. It is derived from assuming a 70 kilogram person, consuming on average 32 grams of fish caught in San Francisco Bay per day, over a lifetime of 70 years. The fish consumption rate of 32 g/day is based on a San Francisco Bay survey (SFEI 2000a). This consumption rate represents the 95th percentile upper bound estimate of consumption for local sport fish consumers based on their four-week recall of eating Bay caught fish.

The Basin Plan amendment includes a plan to implement the TMDL using a phased approach, a monitoring program to evaluate progress towards achievement of the target, and a plan and schedule for additional studies to improve the technical understanding relevant to the PCBs TMDL and implementation plan. It also requires reviewing progress toward meeting targets, implementing actions, and evaluating continued appropriateness and effectiveness of actions. The phasing of the implementation plan involves conducting pilot studies and/or feasibility studies for some actions, prior to requiring those actions to be undertaken. The proposed implementation schedule also provides a realistic timeframe in which to complete the tasks required by the TMDL and a timeframe to evaluate the need for modifications to the TMDL and the implementation plan.

12.3. Project Objectives

The primary objective of the project is to achieve the PCBs fish tissue target specified by the TMDL in order to restore the currently impaired beneficial use of commercial and sport fishing in the Bay.

The objectives of the project with respect to PCBs, which are most relevant to the analyses of environmental impacts and alternatives, are listed below (the entire list is found in Section 2.2):

- Attain numeric PCBs water quality criteria and the bioaccumulative narrative water quality objective established for the Bay in as short a time frame as feasible.
- Protect beneficial uses of the Bay related to sport fishing and wildlife.
- Provide interim risk management programs to protect recreational sport fishing anglers.
- Set target(s) to attain relevant water quality objectives in all parts of the Bay.
- Avoid imposing regulatory requirements more stringent than necessary to meet the targets designed to attain water quality standards.

- Reduce loading of PCBs to the Bay from external sources.
- Comply with the Clean Water Act requirement to adopt a TMDL for a 303 (d) listed impaired water body.
- Initiate actions to reduce PCBs discharges, while continuing to accommodate new information on PCBs fate in the environment.

12.4. Reasonably Foreseeable Methods of Compliance

Implementation Plan requirements not evaluated in this CEQA analysis
Some of the TMDL implementation plan requirements of the Basin Plan amendment are not evaluated in this Section of the Report because they are requirements that do not cause a direct physical change in the environment or a reasonably foreseeable indirect physical change in the environment. Those requirements include evaluations of potential actions, monitoring, participation in additional research to fill critical data needs, and development of public outreach and human health risk management programs.

Implementation Plan requirements evaluated in this CEQA analysis
Implementation measures that are reasonably foreseeable methods of compliance that result in a physical change in the environment are reviewed in this analysis. An explanation of what is evaluated in this analysis is provided below and organized by source category.

External Sources

Wastewater and Stormwater Implementation
The implementation plan for the TMDL is considered a phased plan because many of the actions necessary to achieve the TMDL allocations will require an evaluation as part of a pilot study or feasibility study prior to implementation. Many of the actions that are required to achieve reductions in PCBs loading to the Bay will be required as part of an NPDES permit for municipal and industrial wastewater dischargers or stormwater runoff management agencies.

The NPDES permit requirements for urban stormwater runoff would be implemented in a phased approach. The first five years of TMDL implementation are anticipated to include pilot studies that will test a variety of control measures in order to implement measures that will achieve load allocations in the most effective and cost-efficient manner. The second five-year permitting period will feature strategic implementation of those measures found to be effective through pilot testing conducted in the first permit term. In 10 years, it is expected that the permit would require a schedule for full implementation of the technically practicable, effective and cost efficient BMPs and control measures to the maximum extent practicable. It is speculative at this time to identify specific individual projects that will be implemented based on the results of the pilot studies. Instead we have has compiled a general list of reasonably foreseeable compliance measures that may be considered as part of a pilot study or may eventually be implemented to attain the load allocations identified in the Basin Plan amendment for the external sources of municipal and industrial wastewater, and urban stormwater runoff.

The general list of reasonably foreseeable means of compliance evaluated in this environmental impact analysis for these source categories include the following:

- Removal and disposal of PCBs-containing equipment
- Removal and disposal of PCBs from building materials
- Removal and disposal of PCBs residuals in sewer lines
- Survey and remediation of contaminated soil or sediment in public rights-of-way, wastewater conveyances, and private properties
- Increased street cleaning (includes sweeping or washing)
- Storm drain and inlet maintenance (above and beyond normal practices)
- Construction, operation, and maintainance of facilities/units to intercept, divert and treat storm water (e.g., on-site system retrofits including detention basins, infiltration basins, sand filters, bioretention drainage areas etc.)
- Strategically routing/diverting stormwater to POTWs (i.e., municipal wastewater treatment plants) for treatment

These measures are evaluated in this environmental analysis without much detail as to location, size or number, or location-specific feasibility, since they will be evaluated in the future as part of the pilot projects undertaken by the dischargers. BMPs and control measures to be evaluated as part of a pilot study include both potentially new activities as well as augmentation of existing actions. For example, the number and extent of projects to remove and dispose of PCBs-containing equipment and building materials containing PCBs is currently unknown. Storm drain maintenance and street cleaning are all conducted as part of normal municipal stormwater programs. They are included in this analysis because adoption of the PCBs TMDL may increase their frequency.

Pilot studies will be required under a future NPDES stormwater permit to evaluate the feasibility of the construction, operation, and maintenance of new facilities to intercept, divert, and treat stormwater. Therefore, the number and locations of these projects are uncertain. No specific type of project is required, rather this is an implementation measure that could be selected if strategically feasible in some locations. The pilot studies are intended to analyze the environmental impacts of implementing these types of measures.

No specific project to route stormwater to a wastewaster treatment plant is currently required. Studies are underway by the San Francisco Estuary Institute under funding from the State Water Resources Control Board to investigate opportunities, i.e., locations of PCB-contaminated stormwater runoff occurring in the vicinity of pump stations. Based on the results of these studies, pilot projects could be pursued by the stormwater management agencies or municipal wastewater treatment facilities.

Central Valley

No actions for the Central Valley watershed load allocations are required other than monitoring, and thus, there are no reasonably foreseeable compliance measures to evaluate here.

Internal Sources

In-Bay Contaminated Hot Spots

There are no load allocations to internal sources, therefore no new actions are explicitly required of any regulated party by this TMDL for in-Bay PCB-contaminated hot spots.

Projects to remediate in-Bay PCB-contaminated sediments have been completed in some locations, are in-progress at others, and may occur in the future for sites identified in Table 23 of this Report.

The environmental impacts of cleanup activities at some of the sites that were identified as part of the Bay Protection Toxic Cleanup Program were analyzed in a programmatic level environmental evaluation by the State Water Resources Control Board during development of the Consolidated Toxic Hot Spots Clean Up Plan (SWRCB, 2003) The environmental evaluation concluded that the action of adoption of the Consolidated Cleanup Plan by the SWRCB will not result in significant adverse impacts. Any adverse environmental effects that may occur due to remediation under the proposed Plan would be substantially the same as environmental effects of remediation if the Plan is not adopted. This is because the regulatory framework requiring remediation and the regulatory framework protecting the environment against adverse affects of remediation, are unchanged by the adoption of the proposed Plan. In other words, the Plan will neither affect the requirements for remediation nor the way in which the environment is protected against adverse effects through permitting, CEQA, Waste Discharge Requirements, Cleanup Orders, etc. This is also true in the case of this PCBs TMDL.

Remediation of PCBs-contaminated hot spots may support attainment of the fish tissue target and TMDL, based on decreases in the mass of PCBs in localized in-Bay surface sediments. Despite the fact that these actions are not required by this Basin Plan amendment, there may be a fair argument that such actions may occur due to the project or may receive greater attention and resources from state, federal or local agencies and thus the number of projects in an active stage at any given time may be accelerated, thus the environmental impacts of selected potential remedial alternatives that involve a potential physical change in the environment are evaluated in this section. This analysis is a general evaluation of environmental impacts that could occur due to remediation of PCBs contaminated sediment. A feasibility study is anticipated to be required prior to implementing any remedial alternative. Some potential remedial alternatives, such as monitored natural recovery, are not evaluated here because they do not involve a physical change in the environment. The fact that they are not evaluated in this report has no bearing on their potential effectiveness as a remedial alternative.

Detailed clean-up plans would also require an assessment of environmental impacts that would be conducted by the lead agency at time of review and approval. These projects could be carried out under the authority of the Water Board, DTSC, US EPA, or in some cases local agencies. In each case, the lead agency is responsible for ensuring environmental impacts are avoided, minimized, and mitigated.

The reasonably foreseeable means of compliance evaluated in this environmental impact analysis for this source category include the following:

- Remediation of contaminated sediment with dredging and appropriate disposal

- Remediation of contaminated sediment with dredging, appropriate disposal, and capping of residual contamination in-situ

Navigational Dredging

There is no load allocated to navigational dredging, instead the TMDL implementation plan establishes a methodology to determine whether sediments dredged to support navigation could be disposed of in-Bay. Application of the methodology to navigational dredging project could result in less material being allowed to be disposed of in-Bay over time if the ambient concentration of PCBs in sediments decreases. A Basin Plan amendment adopted by the Water Board, and approved by State Board on November 6, 2007, sets a long-term overall goal for in-Bay disposal of dredged material at designated in-Bay disposal sites at one mcy (or less) per year to be attained step-wise over a 12-year period. This goal requires a reduction of in-Bay disposal. The environmental impacts of reductions in-Bay disposal were evaluated in the Long Term Management Strategy for Dredged Material Environmental Impact Statement/Programmatic Environmental Impact Report (US EPA 1996) and was identified as being more environmentally beneficial than allowing in-Bay disposal. Navigation dredged material not disposed of in-Bay is likely to be taken to the deep ocean disposal site. The environmental impacts of the implementation plan actions for navigational dredging are therefore not further evaluated in this analysis.

12.5. Regulatory Framework

Agencies with permit review or approval authority over the implementation of reasonably foreseeable means of compliance include the following:

San Francisco Bay Water Board

Issues Clean Water Act Section 401 Water Quality Certifications required to conduct dredging or filling of waters of the U.S., including San Francisco Bay; NPDES permits, WDRs and Cleanup and Abatement Orders for discharges that pollute or threaten to pollute surface or groundwater, and other orders as necessary to enforce the Porter Cologne Water Quality Control Act of 1969.

Bay Conservation and Development Commission

Permits actions subject to the San Francisco Bay Plan; issues consistency determinations with the Coastal Zone Act Reauthorization Amendments of 1990.

The Department of Toxic Substances Control

Issues orders in accordance with Chapter 6.8 of Division 20 of the California Health and Safety Code.

U.S. Army Corps of Engineers

Issues Clean Water Act section 404 permits for dredging and fill projects in navigable waters.

U.S. Fish and Wildlife Service

Conduct section 7 consultation for effects to listed federal species.

National Oceanic Atmospheric Administration/National Marine Fisheries Service (NOAA/NMFS)

Conduct section 7 consultation for effects to migratory and endangered fish species

California Department of Fish and Game

Provide section 2081 consultation for effects to listed species.

Municipalities/Counties

Issue building and/or grading permits; enforce of noise ordinances

12.6. Environmental Checklist

A significant impact is defined by CEQA as, "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by a project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historical or aesthetic significance," (14 CCR Title 14, Chapter 3, Article 20, Section 15382). Our analysis, prepared using the CEQA checklist (Appendix A), identified some potentially significant environmental impacts in the areas of air quality, biological resources, hydrology and water quality, noise and utilities and service systems.

Mitigation Measures

Although some potentially significant impacts have been identified, recommended mitigation measures, many of which are mandatory conditions of local, state, and federal regulations and permits (see Section 12.5, e.g., mitigation requirements of the Water Board's 401 Water Quality permits) will eliminate entirely or reduce these impacts to a "Less than Significant with Mitigation Incorporated" level. As used in this analysis and as defined by CEQA (Article 20, Section 15370), mitigation can be divided into four types:

1. Avoiding the impact altogether by not taking a certain action or part of an action.
2. Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
3. Rectifying or eliminating the impact over time by preservation and maintenance operations during the life of the action.
4. Compensating for the impact by replacing or providing substitute resources or environments.

It is likely that all of these mitigation strategies will be used alone or in a variety of combinations to address specific impacts associated with individual projects developed as means of compliance with the Basin Plan amendment.

It should be noted that the Water Board will not require any actions or projects to implement the PCBs TMDL that would lead to significant, permanent, negative impacts on the environment. Furthermore, we anticipate that all potentially significant environmental impacts will be mitigated to less-than-significant levels either through the Water Board's regulatory and permitting authorities or under those of other agencies

with jurisdiction in relevant areas, such as U.S. Environmental Protection Agency (U.S. EPA), U.S. Fish and Wildlife Service (USFWS), NOAA/NMFS, Occupational Health and Safety Administration (OSHA), U.S. Army Corps of Engineers (USACE), California Department of Fish and Game (CDFG), California Department of Toxic Substances Control (DTSC), and San Francisco Bay Conservation and Development Commission (BCDC).

Results of the Environmental Analysis

The CEQA checklist (Appendix A) summarizes the results of the analysis of potential environmental impacts associated with the reasonably foreseeable means of compliance with the PCBs TMDL as proposed in the Basin Plan amendment. The standard CEQA rating system, which was used here, includes four designations of the level of significance. They are: Potentially Significant (PS), Less than Significant (LTS), Less than Significant with Mitigation Incorporated (LTSM), and No Impact (NI). Table 24 presents those environmental impacts determined to be potentially significant before mitigation and the associated mitigation measures. A discussion of the environmental impact categories on the checklist, level of significance, and recommended mitigation measures follows the summary table.

Table 24-Summary of Potentially Significant Environmental Impacts and Mitigation Measures

Reasonably Foreseeable Compliance Measures Evaluated	**Environmental Impacts**	**Level of Significance Before Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
3. AIR QUALITY 3-B Contribute to Air Quality Violation				
On-Land • Construct, operate, and maintain facilities/units to intercept, divert, and treat stormwater • Remediation of PCBs-contaminated soil or sediment from public rights-of-way, storm water conveyances, and private property • Increased Street Cleaning (washing and/or sweeping) • Storm drain and inlet maintenance • Strategically route stormwater to POTWs for treatment	Impacts: • Short-term increase in particulates (PM-10) from vehicle exhaust • Short-term increase in photo-chemical smog constituents from vehicle exhaust • Construction-related dust • Diesel exhaust (nuisance odors)	PS	On-Land Implementation of established BMPs and site-control measures to control and minimize dust include, but not limited to: • Spray down construction sites with water or soil stabilizers • Cover all hauling trucks • Maintain adequate freeboard on haul trucks • Limit vehicle speed in unpaved work areas • Suspend work during periods of high wind or air quality restrictions • Install temporary windbreaks • Use of low sulfur or emulsified diesel fuel to reduce constituents of photo-chemical smog • Use of soot traps on diesel equipment to reduce particulates Additional BMPs for removal of PCBs-containing equipment/building materials: • Use covered dust chutes for removal of material • Create a Soil Management Plan • Test and monitor on-site air quality	LTSM

Reasonably Foreseeable Compliance Measures Evaluated	Environmental Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance With Mitigation
In-Bay • Dredge contaminated sediment with offsite disposal (all methods)	Impacts: • Short-term increase in airborne particulates (PM-10) from barge and equipment exhaust • Short-term increase in photo-chemical smog constituents from barge and equipment exhaust	PS	In-Bay • Use of electric-powered excavating equipment and barges in place of diesel-fueled equipment and barges • Use of low sulfur or emulsified diesel fuel to reduce constituents of photo-chemical smog • Use of soot traps on diesel equipment to reduce particulates	LTSM
4. BIOLOGICAL RESOURCES 4-A, C and D Substantial adverse effect on special status species, federally protected wetlands and substantially interfere with migratory fish				
In Bay • Dredge contaminated sediment (all methods)	Impacts: • Disturbance of near-shore tidal wetlands • Short-term habitat disturbances such as vegetation removal, noise, presence of humans	PS	In-Bay Mitigation measures include: • Use of electric dredging equipment (noise reduction) • Use of clamshell buckets and silt screens to minimize re-suspension of sediment • Vibration dampening material on equipment • Adherence to established state and federal policies for "No Net Loss" of wetlands • Adherence to policy to avoid, minimize, mitigate for projects involving wetlands • Adherence to Water Board permit requirements, USFWS, NOAA/NMFS, CDFG consultation requirements • BMPs to minimize project footprint • Pre-construction survey for endangered or sensitive species • Presence of trained on-site biological monitors • Training for construction personnel to	LTSM

Reasonably Foreseeable Compliance Measures Evaluated	**Environmental Impacts**	**Level of Significance Before Mitigation**	**Mitigation Measures**	**Level of Significance With Mitigation**
			recognize and avoid sensitive species	
8. HYDROLOGY AND WATER QUALITY 8-A Violate any water quality standards or waste discharge requirements				
In-Bay • Dredge PCBs-contaminated sediment with off-site disposal • Dredge (partial) and cap remainder in situ	Impacts: • Short term violations of water quality objectives due to sediment resuspension or creation of decant water	PS	In-Bay • Mitigation measures include: • Comply with requirements of water quality certification or waste discharge requirements • Installation of temporary sheet pile enclosure or silt curtains • Treatment or proper disposal of decant water	LTSM
11. NOISE 11-A and B Expose people to noise or groundborne vibration in excess of local ordinances or other standards				
On Land • Removal and disposal of PCBs-containing equipment • Removal and disposal of PCBs-containing building materials • Removal and disposal of PCBs residuals in sewer lines • Remediation of contaminated soil or sediment from public rights-of-way, storm water conveyances, and private property • Construct, operate, and maintain facilities/units	Impacts: • Short-term noise related to construction activities and use of heavy equipment for all projects involving construction and removal and hauling of equipment/material from buildings	PS	On Land Mitigation measures include: • Compliance with local noise ordinances (typical standards include blackouts prohibiting use of heavy equipment on Sundays, early morning hours and evenings all week, and on holidays) • Use of noise dampening material or barriers around equipment • Engine and pneumatic exhaust controls • Locating equipment as far as practical from noise-sensitive areas • Selecting haul routes that affect the lowest number of people	LTSM

Reasonably Foreseeable Compliance Measures Evaluated	Environmental Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance With Mitigation
to intercept, divert, and treat storm water • Strategically Route Stormwater to POTWs In-Bay • Dredge PCBs-contaminated sediment with off-site disposal • Dredge (partial) and cap remainder in situ	Impacts: • Use of heavy equipment during dredging and hauling activities could cause short-term, localized noise	PS	In-Bay Mitigation measures include: • Compliance with local noise ordinances (typical standards include blackouts prohibiting use of heavy equipment on Sundays, early morning hours and evenings all week, and on holidays) • Use of noise dampening material or barriers around equipment • Engine and pneumatic exhaust controls • Locating equipment as far as practical from noise-sensitive areas • Selecting haul routes that affect the lowest number of people	LTSM
11. NOISE 11-D Substantial temporary or periodic increase in ambient noise in vicinity of project				
On Land • Removal and disposal of PCBs-containing equipment • Removal and disposal of PCBs-containing building materials • Removal and disposal of PCBs residuals in sewer lines	Impacts: • Short-term, intermittent noise from use of heavy equipment during construction or remediation activities	PS	On Land Mitigation measures include: • Compliance with local noise ordinances (typical standards include blackouts prohibiting use of heavy equipment on Sundays, early morning hours and evenings all week, and on holidays) • Use of noise dampening material or barriers around equipment • Engine and pneumatic exhaust controls	LTSM

Reasonably Foreseeable Compliance Measures Evaluated	Environmental Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance With Mitigation
• Remediation of contaminated soil or sediment from public rights-of-way, storm water conveyances, and private property • Construct, operate, and maintain facilities/units to intercept, divert, and treat storm water • Strategically Route Stormwater to POTWs In-Bay • Dredge contaminated sediment (all methods)			• Locating equipment as far as practical from noise-sensitive areas • Selecting haul routes that affect the lowest number of people • Compliance with work window restrictions In-Bay Mitigation measures include: • Compliance with local noise ordinances (typical standards include blackouts prohibiting use of heavy equipment on Sundays, early morning hours and evenings all week, and on holidays) • Use of noise dampening material or barriers around equipment • Engine and pneumatic exhaust controls • Locating equipment as far as practical from noise-sensitive areas	
16. UTILITIES AND SERVICE SYSTEMS 16-B Require or result in construction of new water or wastewater treatment facilities or expansion of facilities, construction of which could cause significant environmental effects				
On-Land • Removal and disposal of PCBs residuals in sewer lines	Impacts: • Projects to remove PCBs residuals from sewer lines	PS	On Land Mitigation measures include: • Compliance with existing, applicable zoning, land-use, permitting requirements of all	LTSM

Reasonably Foreseeable Compliance Measures Evaluated	Environmental Impacts	Level of Significance Before Mitigation	Mitigation Measures	Level of Significance With Mitigation
• Construct facilities/units to intercept, divert, and treat storm water • Strategically Route Stormwater to POTWs	may, in a limited number of cases, include replacement of some sections of the line • Some dischargers may strategically select sites where feasible to intercept and divert storm water to POTWs. Construction is likely to be limited to interception devices and pipelines		agencies (local, state, and federal) • Use of standard construction BMPs to avoid and minimize environmental impacts	
16. Utilities and Service Systems 16-C Require or result in construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects				
On Land • Construction of facilities to intercept and divert urban stormwater runoff • Strategically Route Stormwater to POTWs	Impacts: • Impacts related to construction activities as described above	PS	On Land Mitigation measures include: • Compliance with existing, applicable zoning, land-use, permitting requirements of all agencies (local, state, and federal) • Use of standard construction BMPs to avoid and minimize environmental impacts	LTSM

Discussion of Environmental Impacts and Mitigation by Checklist Category
In this section, we present the rationale for the ratings of environmental impacts listed in the CEQA checklist (Appendix A) and Table 24-Summary of Potentially Significant Environmental Impacts and Mitigation Measures.
The following sections are numbered to match the checklist.

1. Aesthetics

There are no known or reasonably foreseeable impacts to aesthetic values as a result of compliance with the proposed Basin Plan amendment. Significant impacts to aesthetics would involve introduction of new elements that are substantially out of character with existing land uses or would obscure or alter scenic vistas or occur within a designated scenic area. There are no impacts of this type associated with the reasonably foreseeable means of compliance with the Basin Plan amendment as projects will be implemented in urban industrial areas. Some projects may occur adjacent to the San Francisco Bay. Construction impacts associated with activities along the shoreline may include sheet pile installation, removal of vegetation, sediment stabilization or pipeline installation; these impacts are all short-term activities with no long-term impacts to aesthetic resources.

2. Agricultural Resources

There are no known or reasonably foreseeable impacts to agricultural resources as a result of compliance with the proposed Basin Plan amendment. Significant impacts would occur if a project substantially affected agricultural lands or production processes. The reasonably foreseeable methods of compliance with Basin Plan amendment will be implemented in urban, industrial areas where there are essentially no agricultural land uses.

3. Air Quality

The impacts of a project to air quality in the Bay Area are assessed in relation to guidelines set by the Bay Area Air Quality Management District (BAAQMD 1999) as well as in relation to federal standards established by the Clean Air Act. The air pollutants of greatest concern in the Bay area include ozone and inhalable particulate matter less than 10 microns in diameter (PM_{10}). The San Francisco Bay Area Air Basin is currently classified as a nonattainment area for both the state and federal ozone standards, and for state PM_{10} standards.

In the case of implementation activities related to the PCBs TMDL, emissions of air pollutants are primarily associated with construction activities. Given the temporal aspect of such projects, all reasonably foreseeable impacts would be short-term. Construction activities emissions are included in the emission inventory that is the basis for regional air quality plans and are not expected to impede attainment or maintenance of ozone or carbon monoxide standards in the Bay Area (BAAQMD 1999). Even if emissions are greater than anticipated they would be mitigated as discussed below.

The other pollutant of greatest concern related to construction and possible remediation work is fine particulate matter ($<PM_{10}$), which is related to activities such as excavation, grading, vehicle travel on paved and unpaved surfaces, and vehicle and equipment emissions. Construction-related emissions of PM_{10} vary depending on a variety of factors including the level of activity, specific operations taking placing, equipment being used, and local soil and weather conditions. Although particulate matter is closely associated with diesel exhaust, it is also formed from tire wear and road dust. However, despite the variability of these influences, the BAAQMD has identified numerous BMPs that are feasible control measures to significantly reduce emissions

of PM_{10} from construction projects. In addition, as of mid-2006, California law requires that all highway diesel fuel sold in the state be Ultra Low Sulfur Diesel (ULSD), which is compatible with existing, in-use vehicles. This formulation also contributes to significant reductions in particulate matter emissions. We anticipate use of this fuel and implementation of BMPs would be required as necessary for projects associated with implementation of the PCBs TMDL. Specific areas of impact and mitigation are described below.

Implementation measures for the PCBs TMDL could lead to projects or other activities with impacts to air quality in the following area as listed on the CEQA checklist:

Would the project:

Impact 3- B Violate any air quality standard or contribute substantially to an existing or projected air quality violation.

These impacts are rated as potentially significant, but less than significant with mitigation incorporated.

On Land

Impacts: Implementation measures for the PCBs TMDL may include removal of PCB-containing equipment from buildings or other industrial facilities and disposal at appropriate offsite locations. Remediation projects may also be implemented to remove contaminated soils or sediments from public rights-of-way, private property, and sewer lines. Such projects would involve the use of heavy equipment during remediation or hauling and disposal of materials.

Some dischargers responsible for urban runoff/stormwater may decide to conduct additional street cleaning, including street sweeping and washing, or installation of new filtration systems for storm drains. Activities of this type could require more frequent operation of street cleaning machinery than under current maintenance schedules. This increase in maintenance could impact air quality on a short-term, periodic basis. Impacts from construction of other possible control measures, e.g., facilities/units to intercept, divert and treat stormwater may also occur but are expected to be short term in nature and the number and locations of such projects would be speculative, as the feasibility and specific nature of these projects will be evaluated by dischargers through pilot studies.

In addition, in a limited number of instances, dischargers may opt to construct facilities to divert stormwater to municipal wastewater treatment facilities. This is only likely to be undertaken where strategically feasible, such as in locations where municipal wastewater treatment facilities are proximate to areas with significant amounts of PCBs in urban runoff. These efforts would involve construction of pipelines connecting the storm collection system to municipal wastewater treatment facilities.

The implementation measures for the PCBs TMDL described above could contribute to two main types of air quality impacts: increased input of PM_{10} (as described above) from dust (in construction areas) and diesel exhaust emissions as well as an increase in vehicle exhaust emissions that contain air pollutants known to contribute to photo-chemical smog, i.e., ozone, cause annoyance odors, and potentially irritate respiratory systems (particularly in sensitive individuals). The impacts would result from use of heavy equipment during construction and construction activities and from increases in street cleaning, as well. Construction-related

impacts would be short-term; impacts associated with increases in street cleaning would also be short-term and minimal, but would occur on a regular basis.

Mitigation: Use of standard BMPs should reduce these impacts to less than significant levels. For particulate matter, the BMPs include, but are not limited to: spraying of construction and staging areas to control dust; covering all hauling trucks and maintaining adequate freeboard; using electric equipment when possible; ceasing construction activities during periods of high wind or episodes of poor air quality as identified by BAAQMD; using covered dust chutes for removal of building materials or equipment; developing and implementing soil management plans at all construction sites, and ongoing testing and monitoring to detect and eliminate airborne release of PCBs during remediation activities. Measures to mitigate vehicle exhaust emissions include use of construction and maintenance equipment with lower emission engines, use of soot traps or diesel particulate filters, and use of emulsified or low sulfur diesel fuel. Over time, vacuum-assisted street sweepers could be incorporated into municipal maintenance vehicle fleets, which generate less dust during operation than conventional street sweeping equipment.

In-Bay

Impacts: Remediation of PCBs-contaminated hot spots located along the margins of the Bay may result in short term impacts to air quality. These activities may involve the use of diesel-powered dredging equipment and barges to transport the dredged material. On a localized, short-term basis, this equipment could contribute particulate matter as well as some of the ozone precursors. In addition, disposal of material from remediation of in-Bay contaminated hot spots would most likely be disposed of at upland facilities. Upland disposal could also result in increased use of diesel-fueled trucks, which would increase the release of exhaust emissions with particulates (including PM_{10}) and the constituents of photo-chemical smog.

Mitigation: It is anticipated that standard BMPs would reduce these impacts to less than significant levels. Measures to mitigate vehicle exhaust and equipment emissions include use of construction and maintenance equipment with lower emission engines, use of soot traps or diesel particulate filters, and use of emulsified or low sulfur diesel fuel. For large-scale dredging project near-shore, use of electric-powered excavating equipment and barges would significantly reduce equipment and vehicle emissions of both particulates and pollutants without a consequent loss of performance.

4. Biological Resources

Impacts to biological resources would be considered significant if the project caused substantial adverse effects directly or indirectly on a special status species (e.g., listed threatened or endangered) or candidate species. Similarly, substantial adverse impacts to sensitive natural communities, including wetlands, are considered significant impacts due to the potential presence of endangered species. Conflicts with various resource policies and plans, such as Natural Community Conservation Plans, Habitat Conservation Plans, or local tree protection ordinances, if substantial, could also be considered significant impacts.

Implementation of the TMDL for PCBs could lead to projects or activities with impacts to biological resources in three areas as listed on the CEQA checklist:

Would the project:

Impact 4-A Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local, regional plans, policies, regulations or by California Department of Fish and Game or U.S. Fish and Wildlife Service.

Impact 4-B Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or the U.S. Fish and Wildlife Service.

Impact 4-C Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including. but not limited to, marsh, vernal pool, coastal, etc) through direct removal, filling, hydrological interruption, or other means.

These impacts are rated potentially significant for in-Bay projects as explained below. There are no known reasonably foreseeable impacts to biological resources from on-land projects; this rating is also explained below.

On Land

There are no reasonably foreseeable impacts to biological resources from implementation of the PCBs TMDL at on-land sites. Although removal of soil and sediment could occur as part of land-based implementation activities, PCBs are normally found in highly urbanized, industrial areas where the presence of sensitive native species and habitats such as wetlands is improbable. As a result, removal of soil and sediment, PCBs-contaminated equipment and building materials, or other remediation activities at on-land sites are unlikely to disturb any rare or sensitive species or habitats. Implementation measures developed to intercept, and treat stormwater or to divert, urban stormwater runoff to municipal wastewater treatment systems are only likely to occur at strategic locations in highly urbanized areas where urban runoff is identified as a source of PCBs or wastewater treatment facilities are in close proximity, which is most likely to be in urban industrial areas. Given these factors, on-land projects have no reasonably foreseeable impacts to biological resources.

In-Bay

Impacts: Implementation of the PCBs TMDL at in-Bay locations could include remediation of sites with PCBs-contaminated sediments. One approach to site remediation dredging is to remove contaminated sediment with offsite disposal or partial dredging combined with capping the remainder in-situ. In-Bay projects to remove PCBs-contaminated sediment would occur in near-shore areas, in sub-tidal or intertidal habitats or in some cases may include sensitive tidal marsh habitat. The size of these projects vary but are generally limited to less than 10 acres. Benthic macroinvertebrate community impacts in sub-tidal or intertidal habitats are generally short-lived. These communities are not considered to be a sensitive natural community. In marine environments, recolonization of stable benthic communities occurs in 3-5 years. In the San Francisco Bay, benthic communities are subject to perturbations due to the effects of salinity changes, wind-wave action and other Bay phenomenon. Changes in community structure occur naturally and therefore remedial dredging small areas of the Bay is not considered a significant environmental impact on biological resources. In addition, one of the reasons some of these sites are on the list of contaminated hot spots, other than because of PCBs, is because toxicity was identified as a concern for the benthic community.

Dredging for remediation of in-Bay contaminated sediment could cause potential impacts to sensitive anadromous fish species such as sturgeon and coho salmon. Impacts are also possible from removal of tidal marsh vegetation and disrupting waterfowl and other wildlife, including endangered species that inhabit such ecosystems through short-term noise and disturbance caused by the presence of humans.

Mitigation: Use of BMPs, and compliance with resource agency requirements, including USFWS, NOAA/NMFS and CDFG as part of formal or informal consultations required prior to issuance of Clean Water Act 401 water quality certifications by the Water Board and 404 dredging and filling permits should mitigate potentially significant impacts related to dredging of sediment contaminated by PCBs to less than significant levels. Specific mitigation measures include adherence to established work windows to time of dredging activities to avoid key seasonal activity of anadromous fish and bird species that inhabit near shore areas either seasonally or year round; use of electric dredge equipment; use of environmental (closed) clamshell buckets on dredges; and noise dampening material on equipment. Electric-powered dredging equipment has been used for San Francisco Bay dredging projects, such as in the Oakland Harbor. However, this technology is only feasible if the amount of material to be removed is very large and the site is close to shore. Projects that disrupt tidal marshes would be required to mitigate for the temporal and any long-term potential losses.

Any or all of these mitigation measures could be imposed on projects through the regulatory authority of the Water Board, under the Clean Water Act 401 water quality certification requirements. Therefore impacts to biological resources from in-Bay dredging projects would be mitigated to less than significant levels with mitigation incorporated.

5. Cultural Resources

Cultural resources encompass archeological, traditional, and built environment resources including, buildings, other structures, objects, districts, and sites. Significant impacts to cultural resources would occur if a project caused substantial adverse changes or destroyed cultural, historical, or archeological resources or disturbed human remains.

Implementation of the PCBs TMDL could lead to projects or activities with impacts to cultural resources in two areas as listed on the CEQA checklist:

Would the project:

Impact 5-B Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5.

Impact 5-D Disturb any human remains, including those interred outside of formal cemeteries.

These impacts are rated as less than significant as explained below.

<u>On Land</u>

Impacts: Implementation measures for the PCBs TMDL could include construction of facilities/units to intercept, divert and treat urban stormwater runoff; strategic routing of stormwater to POTWs, and removal of soil and sediment from PCBs-contaminated sites. Grading and excavation would affect near-surface soils in previously disturbed soils or artificial fill. Activities would not affect native soil or areas of high archeological sensitivity. Therefore these impacts are rated as less-than-significant.

In Bay

Impacts: Implementation of the PCBs TMDL could include dredging with offsite disposal and dredging combined with capping the remainder in-situ at sites identified as contaminated by PCBs. Such activities are most likely to be located in Bay-margin or near-shore areas adjacent to former industrial areas. It is possible, though unlikely, that dredging activities to remove PCBs-contaminated sediment in near-shore locations could uncover previously unmapped cultural resources, such as archeological sites.

6. Geology and Soils

Significant impacts to geology and soils would occur if a project exposed people or structures to potential, substantial adverse effects related to rupture of a known earthquake fault, other seismic events, or landslides. Significant impacts would also occur is a project caused substantial erosion or was located in areas with unsuitable soils or landslide-prone conditions. There are no known or reasonably foreseeable impacts to geology and soils as a result of reasonably feasible compliance measures to implement the PCBs TMDL. It is unlikely that agencies or other entities responsible for implementing this TMDL would select projects or project locations that would place people or structures at risk from seismic hazards or landslides or would develop projects requiring construction at sites with unsuitable soils.

7. Hazards and Hazardous Materials

This category refers to chemicals that have been discharged to the environment that may adversely impact the environment or human health and safety. Soil and groundwater impacted by such chemicals are also included classification. Significant impacts would occur if a project led to increased hazards to the public or environment from transport, handling, or emissions of such materials or if projects are located near airports and listed hazardous materials sites.

Implementation of the TMDL for PCBs could lead to projects or activities with impacts related to hazards and hazardous materials in the following three areas as listed on the CEQA checklist:

Would the project:

Impact 7-B Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.

Impact 7-C Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Impact 7-D Be located on a site with is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.

These impacts are rated as less than significant as explained below.

On Land

Impacts: Actions to implement the PCBs TMDL would include handling and transport of equipment, building materials, soil and sediment containing PCBs or other potentially hazardous material. To protect people and the environment from potential impacts from PCBs-containing material they would be handled, transported, and stored in accordance with applicable laws and regulations.

Project workers and supervisors are required to comply with applicable Occupational of Health and Safety Administration (OSHA) training requirements for site clean-up personnel. In addition, site-specific health and safety plans would be prepared in accordance with Title 8, California Code of Regulations, §5L92 and Title 29, § 1910.120 of the Federal Code of Regulations, which govern site clean-up.

In-Bay

Impacts: There are also potential remediation projects at numerous sites within the Bay that have been identified as 'hot-spots' containing PCBs-contaminated sediment. These are also under the regulatory oversight of the Water Board, ACOE, U.S. EPA, DTSC, and BCDC. These sites were listed as toxic hot spots; the sediments are contaminated, but the available data indicate they are not at hazardous levels. Most of the available data for PCBs contaminant levels in bay sediments indicate levels below the hazardous waste designation level of >50 ppm. Many of these sites have other contaminants identified as co-occurring in the sediment; these other contaminants are also generally at levels that are not considered hazardous. Additional site investigation activities are necessary to better understand some of these sites, and feasibility studies would also be required, thus analyzing for the potential that some hazardous materials may be associated with these sites is speculative at this time.

To protect people and the environment from potential impacts from PCBs-contaminated sediment, the sediment would be handled, transported, and stored in accordance with applicable laws and regulations.

Project workers and supervisors are required to comply with applicable Occupational of Health and Safety Administration (OSHA) training requirements for site clean-up personnel. In addition, site-specific health and safety plans would be prepared in accordance with Title 8, California Code of Regulations, §5L92 and Title 29, § 1910.120 of the Federal Code of Regulations, which govern site clean-up.

8. Hydrology and Water Quality

Significant impacts to hydrology and water quality would occur if a project substantially alters existing drainage patterns, alters the course of a river or steam, violates water quality standards, or creates or contributes to runoff that would exceed local stormwater drainage systems. Significant impacts would also occur if a project placed housing or other structures within the 100-year flood plain, or exposed people or structures to significant risks from flooding, seiches, or tsunamis. There are no known, reasonably foreseeable impacts to hydrology and water quality from the PCBs TMDL as explained below.

Would the project:

Impact 8 – B Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would

drop to a level which would not support existing land uses or planned uses for which permits have been granted?

On Land

Implementation of the PCBs TMDL may include remediation projects involving removal of PCBs-contaminated soil and sediment. These projects could include activities such as excavation and backfill. They would not result in permanent changes to drainage patterns. In addition, because PCBs-contamination is most closely associated with their use in equipment such as transformers and building materials in older, highly urbanized, industrial areas, they are unlikely to occur in areas where hydrological changes or proximity to streams is of concern. Furthermore, the purpose of the PCBs TMDL and implementation plan is to attain water quality standards.

In-Bay

Remediation projects to remove PCBs-contaminated sediment through dredging are on-going in a number of locations along the Bay margin; sites are the subject of feasibility studies and others are at different stages of remediation. These projects are being undertaken under regulatory programs other than the PCBs TMDL and are not required by this TMDL. To the extent that the existing pace of cleanup is affected by this TMDL, it is anticipated that any new remediation activities for sites not currently being worked on could result in potentially significant impacts to water quality due to resuspension of contaminated sediments in the water column.

Mitigation: projects to remediate PCBs-contaminated sediment in hot spot sites through dredging or partial dredging and capping, would require a water quality certification under Section 401 of the Clean Water Act or waste discharge requirements issued by the Water Board and permit conditions to ensure that there are no violations of water quality. Examples of mitigation measures include the use of temporary sheet pile enclosures to prevent tidal action or deployment of silt curtains to protect water quality. In addition decant water resulting from hydraulic dredging activities would need to be treated prior to discharge into the environment or properly disposed of. Potentially localized short term impacts would be mitigated by these actions. In addition, these types of remediation activities are expected to result in improved water quality in the long-term. Therefore, impacts to hydrology and water quality from in-Bay dredging projects would be mitigated to less than significant levels with mitigation incorporated.

9. Land Use and Planning

Significant impacts to land use and planning would occur if a project physically divided a community, conflicted with a land use plan, policy or regulation, or caused conflict with a habitat conservation plan. There are no projects related to the PCBs TMDL that would be of a type or scale to cause any impacts in this category. Projects anticipated by the PCBs TMDL implementation plan would occur in urban or industrial areas or on the Bay margin and are not expected to result in substantial changes to established communities or land use patterns. Impacts to land use and planning are expected to be less than significant. Pilot studies to evaluate stormwater control measures, such as use of detention basins, will be conducted by land use agencies, i.e., municipalities and counties, and compatibility with land use will be evaluated as part of those pilot/feasibility studies. It is not reasonably foreseeable that large scale implementation of stormwater detention basins will occur as a result of this TMDL as it not feasible in a densely populated urban areas. The locations of such control measures are not specifically required by this project, and therefore, analyzing the impacts would be speculative at this time.

10. Mineral Resources

Significant impacts to mineral resources would occur if a project resulted in the loss of a mineral resource of value locally, regionally, or statewide. There are no projects related to the PCBs TMDL that would be of a type or scale to cause any impacts in this category. None of the PCBs-contaminated sites are known to occur on land identified as a mineral resource of local, regional, or statewide significance. There are no known or reasonably foreseeable impacts to mineral resources as a result of compliance with the PCBs TMDL.

11. Noise

Significant impacts from noise would occur if a project exposed people to noise or groundborne vibration in excess of excess of established standards in a local general plan or noise ordinance or resulted in substantial permanent increase to ambient noise levels. Significant impacts can also occur if a project causes substantial temporary or periodic increases in noise or if a project is located in the vicinity of an airport and would expose people residing or working in the project area to excessive noise levels.

Reasonably foreseeable means of compliance with the PCBs TMDL at on land locations include projects for removal and disposal of PCBs-containing equipment and building materials; remediation of PCBs-contaminated soil or sediment in public rights-of-way; storm water conveyances; and private property; increased street cleaning (sweeping and washing); storm drain and inlet maintenance above what is currently done. Other possible means of compliance include projects to construct, operate, and maintain facilities/units to intercept, divert, and treat stormwater (e.g., pipelines, detention basins, underground sand filters). For in-Bay control of sources of PCBs, potential means of compliance include projects to dredge PCBs-contaminated sediment. These projects could employ a variety of methods including dredging combined with capping. A small percentage of material removed by these projects may require disposal at approve facilities at upland sites. Noise impacts related to the TMDL are primarily short-term and related to construction activities.

According to the Federal Transit Administration's guidelines for evaluation of noise and groundborne vibration associated with construction activities, assessments of noise and vibration during construction are dependent upon a number of factors. These include proximity to sensitive receptors (schools, museums, some types of parks), characteristics of the soil and rock substrate to transmit vibration, sound-proofing characteristics of buildings, and the degree of noise already present in an area. It is difficult to determine the extent of noise impacts since site-specific factors are not currently known. In addition, impacts also vary based on the type of equipment used and the number of pieces of equipment operated simultaneously. The discussion below is, therefore, general in nature. However, with implementation of industry standard mitigation, we anticipate that all noise impacts could be mitigated to less than significant levels.

Implementation of the PCBs TMDL could lead to projects or activities with impacts related to noise in three areas as listed on the CEQA checklist:

Would the project result in:

Impact 11-A Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Impact 11-B Exposure of persons to or generation of excessive groundborne vibration or groundborne noise?

Impact 11-D A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Impacts 11-A and 11-D are rated as potentially significant, but less than significant with mitigation incorporated as explained below. Impact 11-B is less than significant and is also explained below.

On Land:

Impacts: Projects involving remediation of PCBs-contaminated sites, including removal of equipment or building materials; construction of facilities to treat or intercept and divert stormwater; and clean PCBs-contaminated sewer lines could cause short-term, localized noise impacts.

Mitigation: Individual projects with noise impacts would be subject to applicable local permitting requirements and noise ordinances. Local agencies require implementation of standard construction BMPs to reduce noise impacts, and include, but are not limited to practices such as restrictions on operating hours and use buffer materials around/on machinery. In some cases, use of hydraulic or electric equipment could be substituted for noisier diesel equipment. Newer equipment, which emits less noise, could also be used. For particularly loud or lengthy activities, temporary noise buffers could be installed.

In-Bay:

Impacts: Dredging activities to remove PCBs-contaminated sediment from near shore or Bay margin locations could produce potentially significant noise-related impacts because they may involve the use of sheet pile to dewater work areas. Installation of sheet pile may produce short-term, potentially significant noise impacts.

Mitigation: Individual projects with noise impacts would be subject to applicable local permitting requirements and noise ordinances. Local agencies require implementation of standard construction BMPs to reduce noise impacts, such as restrictions on operating hours, for example, typical standards include blackouts prohibiting use of heavy equipment on Sundays, early mornings and evenings all week, and on holidays). Buffer materials around/on machinery and engine and pneumatic exhaust controls could be used to control noise. In some cases, use of electric powered dredging equipment may be possible as a substitute for noisier diesel machinery.

12. Population and Housing

Significant impacts to population and housing would occur if a project substantially encouraged population growth, displaced substantial numbers of people from existing housing necessitating construction of replacement housing elsewhere. There are no projects related to the PCBs TMDL that would involve construction or removal of housing or bring large numbers of people to the Bay Area. There are no known or reasonably foreseeable impacts to population and housing as a result of compliance with the PCBs TMDL.

13. Public Services

Significant impacts to public services would occur if a project resulted in substantial physical impacts as a result of requirements for increased public services such as police, fire protection, schools, or other public facilities. There are no projects related to the PCBs TMDL of a type that would increase the need for police or fire services. There are no known impacts to public services as a result of the PCBs TMDL.

14. Recreation

Significant impacts to recreation would occur if a project increased the use of existing park facilities such that physical impacts occurred of if a project included construction or expansion of park facilities leading to physical impacts. Actions to implement the PCBs TMDL would not affect use of parks or other recreational facilities or lead to physical impacts to them. There are no known impacts to recreation as a result of the PCBs TMDL.

15. Transportation and Traffic

Significant impacts to transportation and traffic would occur if a project caused a substantial increase in traffic in relation to existing traffic load/capacity of the existing street system, exceeded established level of service standards, resulted in change in air traffic patterns, lead to increases in road-related hazards, resulted in inadequate emergency access or parking.

Assessment of transportation and traffic impacts normally requires extensive study of the project area, existing traffic patterns, loads, and level of service standards. In this programmatic review, such detailed analyses are not possible, since specific projects have not yet been developed. However, Water Board staff anticipates that some reasonably foreseeable means of compliance with the PCBs TMDL could result in impacts to as identified below.

Implementation of the PCBs TMDL could lead to projects or activities with impacts to transportation and traffic in two areas as listed on the CEQA checklist:

Impact 15-A Cause an increase in traffic substantial in relation to the existing traffic load and capacity of the street system.

Impact 15-B Exceed either individually or cumulatively a level of service standard established by county congestion management agency for designated roads and highways.

These impacts are rated as less than significant as explained below.

<u>On Land</u>

Impacts: Projects to implement the TMDL could include construction of facilities to treat stormwater or to strategically divert, stormwater to municipal wastewater treatment facilities for treatment. It could also result in projects for remediation or removal of PCBs-containing equipment and building materials. Remediation projects could be developed to remove soils and sediments from public rights of way, wastewater conveyances (in some limited locations), and private property. Finally, some dischargers may increase the frequency of maintenance of storm drain inlets and filtration systems as well as street cleaning (sweeping and washing).

Movement of personnel to and from work sites and hauling of equipment and materials to or from such construction or remediation sites as well as hauling of contaminated in-Bay sediments to upland disposal facilities, could potentially result in short-term impacts to traffic.

Increases in the frequency of street cleaning and maintenance activities at storm drain inlets or filters could result in a minor increase in traffic.

The location, routes, and scale of such projects and activities are currently unknown and thus the impacts of any individual project would be speculative. However, standard industry practices require a traffic management plan, which includes measures such as strategic route selection and carefully planned timing for haul-truck traffic, traffic impacts would be minimized. Other traffic, such as from street cleaning, would add only very small volumes of traffic that would not affect levels of service, roadway networks, or parking capacity. We anticipate that impacts to traffic and transportation would be less than significant levels.

In-Bay

As described above, site remediation at in-Bay locations may produce some material that does not meet new standards for in-Bay disposal. In that case, this material is most likely to be transported to appropriate on-land sites, possibly increasing traffic. However, given the small percentage of material likely to be involved and the ability to control timing and route to minimize effects, this is impacts is considered less than significant.

16. Utilities and Service Systems

Significant impacts to utilities and service systems would occur if a project exceeded wastewater treatment standards, required construction of new water or wastewater treatment facilities, new or expanded storm water drainage facilities, or a project's water needs exceeded existing resources or entitlements. Significant impacts would also occur if a project was not served by a landfill with sufficient capacity or the project failed to comply with federal, state, or local regulations for solid waste.

Implementation of the PCBs TMDL could lead to projects or activities with impacts to utilities and service systems in three areas as listed on the CEQA checklist:

Would the project:

Impact 16-B Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

Impact 16-C Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects.

These impacts are rated as potentially significant, but less than significant with mitigation incorporated as explained below.

On Land

Impacts: Projects to implement the PCBs TMDL could include construction of new facilities to intercept or treat stormwater or to divert stormwater runoff to municipal wastewater facilities for treatment. While it is not anticipated that retrofits to stormwater drainage systems, construction of new stormwater treatment control measures, or diversion to POTWs, would be significant, construction of any of these facilities could be viewed as potentially significant. The number and location of projects of this type is currently unknown. Pilot studies to evaluate stormwater control

measures will be conducted by stormwater management agencies. In addition, the implementation plan calls for pilot studies to evaluate the feasibility of routing stormwater to POTWs, and this would be conducted by individual stormwater agencies or municipal wastewater districts.

Mitigation: Mitigation for these projects is linked to careful site selection. The implementation plan notes that interception and diversion of stormwater is an option that could be employed where strategically feasible, such as areas where stormwater systems and municipal treatment facilities or conveyances are close together. The benefits of this are lowered cost and lowered potential environmental impacts.

The specific mitigation measures could include, but are not limited to, pre-construction BMPS, such as appropriate site selection and environmentally-friendly design; during construction, the use of standard construction BMPs appropriate to the conditions at a site; and for the project as a whole, measures appropriate to offset impacts, such as habitat restoration or enhancement, contributions to mitigation banks, etc.

In-Bay

This category is not applicable to in-Bay projects.

12.7. Mandatory Findings of Significance

The results of this analysis demonstrate that the means of compliance with TMDL for PCBs in San Francisco Bay and its Implementation Plan will not have any reasonably foreseeable potentially significant impacts on the environment that cannot be mitigated to less-than-significant levels.

With implementation of mitigation measures identified in the environmental checklist and required by federal, state, and local laws and regulations, impacts having a potential to degrade the environment would be reduced to less than significant levels.

Pursuant to Section 13360 of the Water Code, the Water Board cannot mandate which compliance measures responsible agencies may choose to adopt or which mitigation measures they would employ for projects to implement the PCBs TMDL that do have potentially significant impacts. However, the Water Board anticipates that appropriate mitigation measures, which are already widely in use and considered consistent with industry standards, be applied as necessary, in order to avoid and reduce as well as mitigate potential environmental impacts. These measures should ensure that impacts are reduced to less than significant levels. Since the decision to perform these measures is strictly within the responsibility and jurisdiction of the individual implementing agencies, such measures can and should be adopted by these agencies (Title 14, California Code of Regulations, Section 15091 (a) (2)).

12.8. Cumulative Impacts and Other Analyses

Cumulative Impact Analysis

This section provides an analysis of the significant cumulative impacts of the proposed Basin Plan amendment (CEQA Guidelines Section 15130). Cumulative impacts refers to “two or more

individual effects which, when considered together, are considerable or which compound or increase other environmental impacts."

The cumulative impact that results from several closely related projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present and reasonably foreseeable probable future projects. In this case, these are the impacts from non-TMDL required municipal and private projects to reduce PCBs that would occur in the watershed during the period of implementation of the TMDL.

Approach to Cumulative Impact Analysis

The areas of cumulative impacts analyzed in this section include: 1) the program level cumulative impacts and 2) the project level cumulative impacts. On the program level, the PCBs TMDL is one of several TMDLs planned or already adopted to address impairment in the San Francisco Bay. Other adopted or planned future TMDLs for San Francisco are considered in this program cumulative analysis. On the project level, the full environmental analysis of individual projects is the purview of the implementing counties/municipalities, POTWs or other agencies with approval authority. The cumulative impact analysis included here entails consideration of other stormwater control measures implemented in the past and present, planned future upgrades of wastewater treatment plants, and past, present and future cleanup actions for in-Bay contaminated hot spots.

Adoption of the Basin Plan amendment is intended to facilitate implementation of the TMDL. However the requirements identified in the TMDL implementation plan are generally implemented through NPDES permits, waste discharge requirements or other regulatory tools. Agencies other than the Water Board will likely use regulatory and non-regulatory tools in implementing the PCBs TMDL. The Basin Plan amendment would be cumulatively beneficial to the environment in terms of some resource areas. Conceptually, the impacts associated with improving water quality through the TMDL, if occurring with other construction projects, could contribute to temporary cumulative effects to air quality, noise or traffic impacts that would not occur with only one project.

Overall the cumulative effect is to provide an environmental benefit to the San Francisco Bay and achieve compliance with existing adopted water quality standards established by the U.S. EPA and this Water Board.

Program Cumulative Impacts

The Water Board has adopted one TMDL for San Francisco Bay. The Mercury TMDL for San Francisco Bay (adopted by the Water Board on August 9, 2006 and by the State Board on July 17, 2007) was developed due to impairments from mercury. Many of the reasonably foreseeable methods of compliance for one TMDL are the same as or similar to those that will be used to address other pollutants through the implementation of other TMDLs. In terms of stormwater, best management practices and control measures that are applicable to PCBs are likely to be similar measures to those being implemented for mercury in the urban watershed. On-land control measures for mercury also target mine sites in the watershed and would therefore be conducted in addition to on-land control measures for PCBs. The potential implementation strategies discussed in this document for the PCBs TMDL are likely relevant to the implementation of other TMDLs for the San Francisco Bay.

In addition, TMDLs for selenium, legacy pesticides, and dioxins other than dioxin-like PCBs, are in development for the San Francisco Bay and a TMDL for pathogens is in development for Richardson Bay.

Project Cumulative Impacts

Specific TMDL projects must be environmentally evaluated and cumulative impacts considered as the implementing municipality or agency designs and sites the project. However, as examples, TMDL projects and other construction activities may result in cumulative effects.

With regards to cleanup of PCB-contaminated hot spots, the TMDL requires only the collection of information about in-Bay contaminated hot spots; it does not require other actions at these sites and does not set cleanup standards to be achieved at these sites. Investigation and cleanup of contaminated in-Bay hot spots are already underway at many sites in the Bay without the adoption of the TMDL. The one part per billion sediment goal is not a cleanup goal or regulatory standard. Thus, the one part per billion sediment goal will not require a large-scale, bay-wide mass removal of contaminated sediments from in-Bay hot spots. Table 23 lists the sites where cleanup of contaminated in-Bay sediments sites have occurred in the past, those that are in the process of being addressed, and sites where some studies may have been completed but no plans currently exist for any actions to be taken. Since the TMDL does not call for specific actions to be taken, and it is unclear whether actions will be taken in the future at sites where work has yet to be started, an evaluation of the cumulative environmental impacts are speculative. However, to the degree enough information may be available to provide a general response, they are provide below by subject category.

Air Quality

Implementation of the PCB TMDL Program may cause additional emissions of ozone precursors, $PM_{10,}$ and slightly elevated levels of carbon monoxide during construction activities. Emissions of PM_{10} resulting from implementation of TMDL compliance measures may exceed the thresholds established by the Bay Area Air Quality Management District (BAAQMD), and therefore the TMDL, in conjunction with all other construction activity, may contribute to the region's nonattainment status. However, the BAAQMD CEQA guidelines (BAAQMD 1999) state that cumulative impacts should be determined based on an individual project’s consistency with applicable local General Plans and whether it would affect conformance of the General Plan with the regional air quality plan. The majority of the implementation measures under consideration as reasonably foreseeable means of compliance with the TMDL do not result in operational activities that would increase emissions in the areas due to an increase in population or vehicular traffic that would be sustained over time.

The control measure that might increase vehicular traffic is street sweeping/cleaning and storm drain maintenance. Past and current stormwater control measures focus on street sweeping and litter/debris removal, which results in vehicular traffic. This TMDL would increase the amount of vehicular traffic in an incidental fashion as the areas that would be subject to increased street sweeping are geographically small and limited to industrial, former industrial or small adjacent residential areas of municipalities and the cumulative impacts due to the individual impacts from this project when considered with the impacts from existing street sweeping activities are not anticipated to be significant.

The cumulative impacts to emissions of criteria pollutants and greenhouse gases are not anticipated to be significant. Cleanup actions taken at in-Bay contaminated hot spots in the past,

present, or planned for the future involve dredging for PCB contaminated sediments in sites smaller than 10 acres and the list of contaminated hot spots has only 21 sites listed (Table 23). Removal actions conducted or planned at contaminated hot spots in the bay to-date range from a few thousand cubic yards to less than 100,000 cubic yards (Battelle 2005, U.S. Navy 2006b, U.S. Navy, 2007 and URS, 2002a). Construction activities at these sites may create short-term impacts. However, these activities do not occur simultaneously and are located in different parts of San Francisco Bay. It takes a number of years to evaluate and select a remedial alternative and thus it is unlikely that multiple projects will be occurring simultaneously. Therefore, the cumulative impact of these projects are not anticipated to be significant. In addition, these types of construction activities are accounted for in the BAAQMD's emissions inventory in the regional air quality plan.

Biological Resources

Many of the compliance measures required under the TMDL are located in urban, industrial areas, do not impact sensitive habitats or biological resources. Where in-Bay contaminated hot spot cleanups conducted in the past have had the potential to impact biological resources, they have been required to mitigate by waste discharge requirements or 401 water quality certifications for the temporary impacts to sensitive wetlands and to monitor to ensure site vegetation and habitat restoration. In addition, mitigation measures for the protection of listed or endangered species are required where applicable. For example, construction is required to operate outside of nesting seasons and during migratory fish passage windows. These mitigation measures are required by any agency with approval authority for the cleanup actions.

The cumulative impacts to biological resources, i.e., destruction or damage to healthy benthic communities due to the excavation of PCBs-contaminated sediment from in-Bay PCB contaminated hot spots are not anticipated to be significant. Cleanup actions taken at in-Bay contaminated hot spots in the past have involved dredging for PCB contaminated sediments in sites smaller than 10 acres and the list of contaminated hot spots has only 21 sites listed (Table 23). Benthic macroinvertebrate community impacts in sub-tidal or intertidal habitats are generally short-lived; these communities have the ability to recolonize in a few years and are not considered to be a sensitive natural community. In San Francisco Bay, changes in benthic community structure occur naturally and therefore remedial dredging of small areas of the Bay is not considered a significant environmental impact on biological resources.

Cultural Resources

Implementation of the PCBs TMDL is not expected to contribute to a cumulative loss of cultural resources in the San Francisco Bay area. The activities related to past, present or future contol of external loading of PCBs to San Francisco Bay or remediation of In-Bay PCB-contaminated hot spots are not known, or likely, to contain cultural resources that would be lost or contribute to a cumulative loss or to impact historic districts in the Bay area.

Hazards and Hazardous Materials

Projects to cleanup on-land contamination and in-Bay contamination from PCBs in soils and sediment have been on-going in the San Francisco Bay area since the ban was enacted on PCBs. The greatest concern is in the safe transport and treatment, storage and disposal of hazardous materials. The implementation of the PCBs TMDL and all other cumulative projects must comply with the applicable laws and regulation pertaining to public safety in the transport, treatment, storage and disposal of hazardous materials. Thus, cumulative impacts would be less than significant. In addition, addressing sources of these contaminants in the environment has a cumulatively positive impact on the environment.

Hydrology and Water Quality
Implementation of the PCBs TMDL is expected to result in long-term improvement in water quality by reducing the potential for introduction of PCBs into San Francisco Bay. Other TMDLs are addressing other pollutants responsible for impairing water quality in San Francisco Bay, and thus, the cumulative impact of other program, as well as specific, projects constructed to meet Clean Water Act requirements, have resulted in long-term improvements in water quality and are expected to continue this improvement.

Land Use and Planning
The cumulative impacts to land use and planning and landfill capacity are not anticipated to be significant. Cleanup actions taken at in-Bay contaminated hot spots in the past have involved dredging for PCBs-contaminated sediments in sites smaller than 10 acres, and the list of contaminated hot spots has only 21 sites listed (Table 23). Cleanups conducted in the past or planned for the future for remediation of contaminated hot spots have occurred in the vicinity of industrial sites, brownfields, redevelopment sites and former military bases. There has been sufficient land available to process hydraulically dredged sediments prior to off-site disposal at landfills. There has also been adequate landfill capacity in the past, and in some cases, the dried sediment was clean enough to be used as alternate daily cover at landfills. In some cases, material was allowed to be managed upland at industrial sites or remain in-Bay, if properly managed, i.e., capped and isolated in place.

The TMDL does not envision the use of multiple, large detention basins capable of treating all Bay area stormwater. Much of the available land in the Bay Area has been developed for housing, industrial or commercial purposed. Stormwater management agencies are required to conduct pilot studies to evaluate the effectiveness of such control measures prior to strategically implementing them. Therefore, there is no basis to conclude that the proposed project would result in cumulative impacts to land use.

Noise
Construction activities associated with the implementation of the PCBs TMDL in combination with other noise-generating sources may exacerbate noise conditions in some locations, however, these impacts are short term in nature. Most noise is associated with traffic. Noise levels from construction activities, once completed, would return to current levels. Other activities, such as street sweeping, are expected to occur intermittently, over small geographical areas and be of short term duration. Overall, with mitigation, the activities resulting from the PCBs TMDL would not be expected to contribute considerably to a cumulative noise impact.

Transportation and Circulation
Implementation of control measures will create additional short terms increases during construction and maintenance. Implementation, after successful completion of the initial pilot studies, will likely be staggered over time and will occur in a few locations throughout the watershed. This decreases the likelihood that these projects cumulatively will cause significant impacts. The PCBs TMDL would require implementation of control measures and best management practices in locations within the watershed where existing land use indicates a historical use of PCBs. Most of the implementation measures, for example, additional street sweeping, are unlikely to create significant cumulative impacts.

Existing stormwater runoff permits currently require the installation of control measures at new developments or redevelopment projects. Some cities in the Bay area are actively requiring

construction of stormwater control measures as part of new development projects. These control measures are generally smaller elements of much larger construction projects, residential subdivisions, commercial high rises, and these larger projects require a consideration of the permanent impacts to traffic and transportation. The stormwater control measures are thus inconsequential to these projects.

Overall, it is anticipated that implementation of the TMDL is unlikely to create cumulatively permanent, significant additions to traffic or transportation.

Utilities and Service Systems
Implementation of the PCBs TMDL would not increase water use. There is the possibility that strategically routing of stormwater to wastewater treatment plants would increase the amount of wastewater processed by these plants. However, the requirement of the TMDL is to evaluate the feasibility of this type of approach with an emphasis on using currently available existing capacity at municipal treatment plants. Therefore no significant additions to wastewater treatment plants are expected. The addition to the plant facilities would be limited to construction of pipelines or pumping capacity to route the stormwater. A few wastewater treatment plants in the Bay Area are planning upgrades to their facilities, improving their capacity or collection system rehabilitation. Some of these facilities have analyzed the environmental impacts of these activities and others are still in the planning stages. All these projects are anticipated to conform with their General Plans. It is not anticipated that construction to support routing of stormwater will create a significant impact on available services.

Growth Inducement
Approval and implementation of the proposed Basin Plan amendment would have no direct effect on growth inducement. Implementation of the PCBs TMDL would not directly or indirectly foster economic or population growth or the construction of additional housing. The project does not require the construction of additional capacity at wastewater treatment plants that might be considered to indirectly foster growth.

Significant Irreversible Changes in the Environment
Approval and implementation of the proposed Basin Plan amendment would result in the irretrievable commitment of petroleum products to fuel vehicles and equipment and the creation of some greenhouse gases that might be viewed as contributing to significant irreversible environmental changes already occurring globally.

12.9. Alternatives Analysis

The discussion that follows evaluates four alternatives to the proposed Basin Plan amendment establishing the PCBs TMDL. It presents a brief evaluation of each alternative. None of the alternatives evaluated significantly lessen the environmental impacts of the proposed project. The proposed project is not expected to result in significant impacts that cannot be mitigated and thus it is not reasonable to look to other alternatives to lessen significant impacts. Some of the alternatives do meet some of project's objectives. However, they generally result in attainment of water quality objectives in a longer period of time and thus do not meet one of the primary objectives which is attainment of water quality objectives in the shortest time frame possible. In addition, there would be a longer period of time during which the environmental

impact of exposure to Bay fish contaminated with PCBs would continue. The proposed project is thus the preferred alternative.

No Project Alternative

The "No-Project" alternative means that the Water Board would not adopt the Basin Plan amendment that establishes the numeric fish tissue target and associated PCBs TMDL, allocations, implementation plan, monitoring requirements, or special studies. A "No-Project" alternative would not set targets, nor would monitoring be required to demonstrate achievement of those targets or protection of beneficial uses. The Regional Monitoring Program (RMP) may continue to collect and evaluate data on the status and trends of PCBs in San Francisco Bay.

The "No Project" alternative is anticipated to achieve some of the objectives of the proposed project, including protection of the beneficial uses for sport fishing and wildlife habitat. As seen in Figure 28, the Bay is projected to recover without the project due to natural attenuation of PCBs in the environment. However, it would take nearly 100 years to attain the desired condition, about 60 years more than if the proposed project alternative is implemented. The "No-Project" alternative would delay recovery of the Bay and attainment of beneficial uses by about 60 years, and unduly prolong the associated impacts to Bay sports fish consumers. This alternative would unnecessarily maintain human health risk to Bay sport fish consumers for a longer time than under the proposed project. Thus, it would not meet the objective of attaining water quality objectives in as short a time frame as feasible.

Finally, the "No-Project" alternative would not lessen the environmental impacts over the proposed project because 1) other regulatory programs already require many of the actions and the associated environmental impacts of the proposed project, and 2) the environmental impacts of exposure to PCBs contaminated Bay fish would continue for a longer period of time than with the proposed project and there would be no measures to address risk management of the potential health impacts of consuming PCB-contaminated Bay fish.

Alternative TMDL of 20 kg/yr

We considered doubling the TMDL to 20 kg/yr, using the same long-term mass balance model used to set the proposed TMDL. A higher TMDL of 20 kg/yr would result in higher load and wasteload allocations for each source category. This alternative will result in attainment of the TMDL target in about 70 years. This alternative would delay recovery of the Bay and attainment of beneficial uses by about 30 years, and unduly prolong the associated impacts to Bay sports fish consumers. This alternative would unnecessarily maintain human health risk to Bay sport fish consumers for a longer time than under the proposed project. Under this alternative, we could assign a higher load allocation to the Central Valley, resulting in earlier attainment of the allocations. However, wasteload allocations for industrial and municipal wastewater would remain the same, as they are set at current performance. Therefore, the proposed implementation actions for industrial and municipal wastewater dischargers would remain the same and the associated environmental impacts would remain the same. The stormwater wasteload allocations would likely increase under this alternative. However, there would still be a need for load reductions from stormwater discharges, maintaining the requirements for stormwater agencies to evaluate and implement PCBs source and treatment control BMPs through pilot studies as in the proposed project. Requirements for in-bay contaminated sites, special studies, monitoring, dredgers, and risk management would remain the same as in the proposed project under this alternative. This alternative would not significantly change

environmental impacts compared to the proposed project. As the implementation actions would remain the same under this alternative, i.e., implementation requirements for wastewater, stormwater, Central Valley, in-bay contaminated sites, special studies, monitoring, navigational dredging, and risk management in the first phase of implementation would remain the same.

Alternative Based on Equal Percentage Load Reductions

Under this alternative, we could propose load and wasteload allocations based on an equal percentage reduction from each source category to achieve the TMDL of 10kg/yr. This alternative would result in a higher wasteload allocation to stormwater, and lower allocations to all other source categories. Figure 31 below presents the proposed equal percentage load reductions.

This alternative is not acceptable for several reasons. First, this alternative allows stormwater, the highest controllable source of PCBs in the watershed, to continue to discharge PCBs in sediment at concentrations above the sediment goal. This is anticipated to delay recovery of the Bay from impairment and attainment of beneficial uses. The environmental impacts of exposure to PCBs contaminated Bay fish would continue for a longer period of time than with the proposed project. Increased stormwater load allocations would not relieve the need for implementation of source and treatment control BMPs for PCBs to the maximum extent practicable. As such, it would be speculative to contend that there would be either increased or reduced environmental impacts associated with increased stormwater load allocations. Third, this alternative would place a large financial burden on industrial and municipal wastewater treatment plants. Most treatment plants would need to upgrade to advanced treatment technology to lower PCBs loads to meet the wasteload allocations under this alternative. This would require a large capital investment for wastewater treatment plants upgrades to achieve small load reductions and potential increased environmental impacts to air quality and noise due to the facility upgrades. Requirements for in-bay contaminated sites, special studies, status and trend monitoring, navigational dredging, and risk management would remain the same as in the proposed project under this alternative and thus any relevant environmental impacts would be the same.

This alternative would not significantly change environmental impacts compared to the proposed project. Increased stormwater wasteload allocations would still require load reductions from stormwater discharges, maintaining the requirements for stormwater agencies to evaluate and implement PCBs source and treatment control BMPs through pilot studies as in the proposed project. It would be speculative to contend that there would be either increased or reduced environmental impacts associated with increased stormwater load allocations.

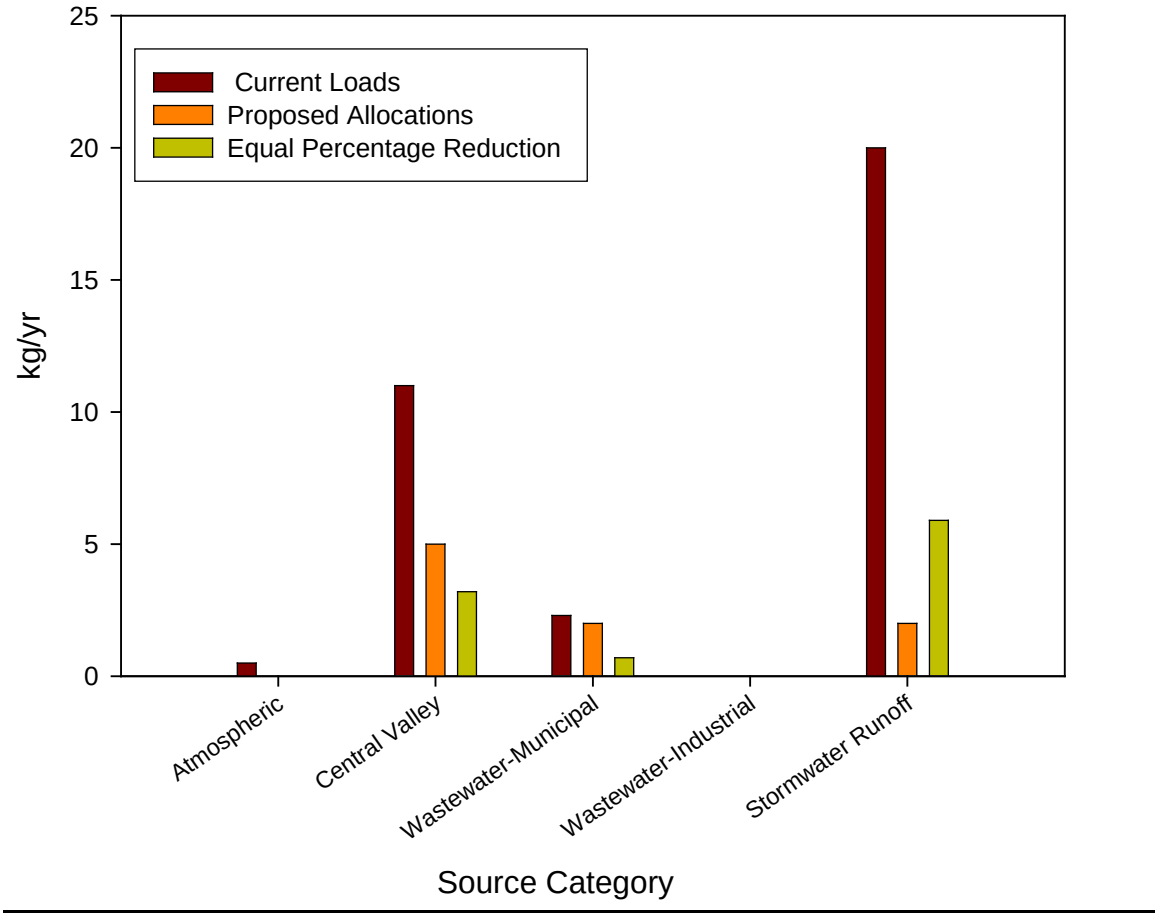

Figure 31-Current Loads, Proposed Allocations and Equal Percentage Reduction Alternative Allocation

Lowest Possible Cost Alternative

Under this alternative, we would propose a TMDL that would attain the project objectives at the lowest possible costs. This alternative would establish a TMDL and set a fish tissue target but would limit implementation to existing on-going implementation actions and monitoring requirements. No new implementation actions, special studies, or pilot studies to evaluate stormwater control measures would be required under this alternative.

As with the “No Project” alternative, the lowest possible cost alternative would achieve some of the objectives of the proposed project, including protection of the beneficial uses for sport fishing and wildlife habitat. As seen in Figure 28, the Bay is projected to recover without the project due to natural attenuation of PCBs in the environment. However, it would take nearly 100 years to attain the desired condition, about 60 years more than if the proposed project alternative is implemented. The “No-Project” alternative would delay recovery of the Bay and attainment of beneficial uses by about 60 years, and unduly prolong the associated impacts to Bay sports fish consumers. This alternative would unnecessarily maintain human health risk to

Bay sport fish consumers for a longer time than under the proposed project. Thus, it would not meet the objective of attaining water quality objectives in as short a time frame as possible.

Finally, the lowest possible cost alternative would not lessen the environmental impacts over the proposed project because: 1) other regulatory programs already require many of the actions and the associated environmental impacts of the proposed project, and 2) the environmental impacts of exposure to PCBs contaminated Bay fish would continue for a longer period of time than with the proposed project and there would be no measures to address risk management of the potential health impacts of consuming PCB-contaminated Bay fish.

12.10. Economic Considerations Related to Potential Implementation Plan Actions

The California Environmental Quality act requires that whenever a Water Board adopts a rule that requires the installation of pollution control equipment or establishes a performance standard or treatment requirement, it must conduct an environmental analysis of reasonably foreseeable means of compliance. This analysis must take into account a reasonable range of factors, including economics. This proposed Basin Plan Amendment for the PCBs TMDL includes performance standards (e.g., targets and allocations). This part of the Staff Report discusses the reasonably anticipated costs associated with implementation methods and monitoring that might result from the proposed Basin Plan amendment.

Discussion of Costs

The costs of implementation actions are difficult to estimate because the PCBs TMDL implementation plan applies to the entire nine-county, Bay-wide region and applies to numerous public agencies as well as individual dischargers all of which have a variety of ways to comply with the plan and will be guided in selecting those implementation measures by their technical needs and budgetary constraints. Thus it is difficult to anticipate which implementation measures are most likely to be adopted. Furthermore, phased pilot or feasibility studies will be used to identify and evaluate the feasibility (which includes relative costs and effectiveness) of most compliance measures. These assessments need to be completed before the dischargers select which action or combination of actions will be most effective and appropriate to their allocations. Also, as mentioned previously, many of the implementation measures are part of ongoing programs, and will only result in incremental increases to costs of existing programs.

These factors result in the likelihood that short-term costs will be modest. In the longer term, achieving the proposed allocations set by the TMDL may be more substantial for some dischargers. However, the implementation plan and schedule provide an opportunity to analyze alternative means of compliance and time to identify and secure adequate funding. Furthermore, because PCBs adhere to soil as do numerous other pollutants such as PBDEs, PAHs, chlorinated legacy pesticides, and heavy metals, efforts to reduce PCBs loads to the Bay will produce multi-pollutant reduction benefits. Thus, some of the costs to comply with this TMDL will also result in compliance with other TMDLs and regulatory requirements for those other pollutants.

This discussion provides an overview of the relative costs for each of the source categories that are required to implement new actions, or increased actions to attain allocations or implementation requirements. Cost information is based on similar work performed elsewhere and the best professional judgment of Water Board staff. All costs discussed below are rough estimates and only provide an order-of-magnitude characterization of costs. The main focus of the implementation plan is on control of PCBs in stormwater. Thus, the largest implementation

costs are anticipated to result from implementation of the stormwater runoff allocation portion of the TMDL.

The following provides an overview:

Municipal and Industrial Wastewater Dischargers

Wastewater dischargers are required to maintain optimum treatment performance for solids removal and identify and manage controllable sources, i.e., maintain their existing performance. Existing overall annual wastewater management costs exceed $500 million to control all pollutants in wastewater, including PCBs.

The costs of implementing the TMDL is considered to be incidental increases associated with identifying and managing controllable sources. For municipalities, we expect this effort would be part of existing pollution prevention and source control programs and new costs would be minimal. Industrial facilities are already required to manage their use of PCBs. Use of PCBs is allowed in enclosed containers such as in transformers and capacitors. However, as this equipment ages, it must be removed and replaced with PCBs-free products. There will be some new costs associated with conducting or causing to conduct monitoring and special studies to fill critical data gaps and to participate in risk management activities (see discussion below).

Stormwater Runoff Dischargers

The costs of attaining load reductions above and beyond natural attenuation may be substantial. Five California municipalities and one metropolitan area with stormwater programs that were demonstrating meaningful progress toward maximum extent practicable compliance were surveyed for their stormwater compliance costs in the 2002/2003 time frame (SWRCB, 2005). Annual cost per household for the six stormwater programs surveyed ranged from $18 to $46. The City of Fremont, included in this cost survey, has costs estimated at $46 per household. The majority of these program costs were for street sweeping and litter/debris removal. We estimate Bay Area municipalities currently spend approximately $100 million per year to manage urban stormwater runoff (assuming 2.5 million households and average fees of $40 per year per household). An upper bound estimate of the cost of complying with stormwater control requirements for all pollutants, including PCBs, can be thought of in terms of the costs of treating wastewater in the Bay area. The load allocations in the TMDL for stormwater and wastewater are equal. The current cost of treating wastewater, $500 million annually, results in wastewater loads which are equal to what the Basin Plan amendment allocates for stormwater. We consider $500 million to be the reasonable cost estimate to the stormwater runoff management agencies annually. The $500 million would translate into average fees of $200 per year per household.

The TMDL implementation plan calls for dischargers to conduct pilot studies of best management practices and control measures. Based on these studies the effective, cost-efficient control measures will be implemented through NPDES permits. It is anticipated that the overall costs are likely to be less than $500 million per year.

These include:

- Removal and disposal of PCBs from building materials
- Remediation of contaminated soil or sediment in public rights-of-way, wastewater conveyances, and private property

- Street cleaning (includes sweeping or washing)
- Storm drain and inlet maintenance (above and beyond normal practices)
- Construction, operation, and maintenance of facilities/units to intercept, divert, and treat urban stormwater runoff (e.g., detention basins, wetlands, underground sand filters, swales)
- Diversion of urban storm water runoff to wastewater treatment

To provide further perspective on costs, we expect that facilities which treat urban stormwater runoff will have the highest costs of these options. As discussed in the Implementation Plan section of this report, we anticipate discharger's pilot studies will include consideration of strategic runoff treatment in areas with elevated PCBs in soils/sediments, such as older industrial urban areas. Underground sand filters, such as the Austin sand filter, are likely retrofit treatment unit candidates in these areas. Typically the Austin sand filter system is designed to handle runoff from drainage areas up to 50 acres (USEPA, 1999b), and Caltrans has considered these filters for treatment of highway runoff and has estimated the cost of installing the Austin sand filter unit at around $240,000 (Caltrans, 2004). The Ettie Street pump station drainage area in Oakland, CA, which encompasses 100 acres, is one of the industrial urban areas that drain to the Bay that have high levels of PCBs in storm drain sediments. In the case of Ettie Street watershed, installing Austin sand filters to treat the entire drain area would cost less than $5 million, based on the above figures. Assuming there are about 20 Ettie Street-like watersheds that have high levels of PCBs in storm drain sediments that drain to the Bay, the cost of installing these sand filters would be around $100 million. Annual costs for maintaining sand filter systems average about 5 percent of the initial construction (USEPA, 1999b). These are rough estimates, but they likely represent the order of magnitude of costs of retrofit treatment units.

The proposed implementation plan and schedule provides opportunity to analyze alternative means of compliance and allows time for urban stormwater runoff agencies to secure reasonable funding. There will be some new costs associated with conducting or causing to conduct monitoring and special studies to fill critical data gaps and to participate in risk management activities (see discussion below.)

Navigational Dredging and Disposal

The proposed sediment dredging and disposal implementation actions are based on the Long Term Management Strategy for the Placement of Dredged Material in the San Francisco Bay Region (USACE, 1998) which is already being implemented. We estimate the current annual costs of dredging and dredged sediment disposal exceeds $50 million per year. Although the LTMS is expected to result in substantial costs over time as less dredged material is disposed of in the bay and more is disposed of in the ocean or at upland sites, little or no new costs should be incurred as a result of this PCBs TMDL and implementation plan, because the overall goal of the LTMS is to limit in-Bay disposal and to the degree the TMDL requires less in-Bay disposal it is furthering the LTMS program's overall goals. There will be some new costs associated with conducting or causing to conduct monitoring and special studies to fill critical data gaps and to participate in risk management activities (see discussion below).

In-Bay Contaminated Sediment

A number of sites within the Bay have already been cleaned-up or are currently undergoing remediation or feasibility studies to determine the type and level of clean-up required. The costs per site vary significantly; a few past and planned projects are discussed below.

In 2001, remedial actions, including dredging three feet of PCB and metal contaminated sediment and placement of an underwater isolation cap were completed for the offshore portion of the former U.S. Steel property in South San Francisco (URS, 2002b). A total of 20,100 cubic yards of sediment were removed from San Francisco Bay at this site. 14,100 cubic yards were dredged from the subtidal area and 6,000 cubic yards were removed using land-based equipment from the intertidal area. The majority of the sediments were taken to a landfill for disposal. The cost of this cleanup was estimated to be about $12 million for three acres.

A Draft Final Feasibility Study for Parcel F (offshore PCB-contaminated sediments) completed for Hunters Point Shipyard (U.S. Navy, 2007) evaluated a range of alternatives from no action, to complete removal and off-site disposal and included a number of alternatives and a mix of remedial actions, including focused removal, off-site disposal and monitored natural recovery. Other than no action, the costs of conducting some level of active remediation were from $13,060,000 to $42,630,000. The costs included base costs, including costs for remedial design and construction, as well as future costs for 30 years of operation and maintenance. The costs of monitored natural recovery, an element of multiple remedial alternatives, were considered to include the costs of deed restrictions, (documentation, posting and enforcement) baseline monitoring, (bathymetric survey and sediment core sampling using a vibracore sampler (30 samples)) and annual monitoring over a 30 year period.

A Final Feasibility Study for Seaplane Lagoon at Alameda Point (Battelle 2005) to address PCBs and cadmium and other contaminants in subtidal sediments evaluated a range of remedial alternatives, including but not limited to, no action, monitored natural recovery with institutional controls, isolation capping, dredging/dewatering and off-site disposal and focused dredging/upland confinement. Other than no action, the costs of conducting some level of active remediation were from $2,280,106 to $40,947,000. The costs included base costs, including costs for remedial design and construction, as well as future costs for 30 years of operation and maintenance. The Water Board and other regulatory agencies signed a Record of Decision in 2005 (U.S. Navy, 2006b) with the U.S. Navy, agreeing to the selected remedial alternative of dredging, dewatering, and off-site disposal at a 30-year net present value of $24,600,000. The remedy calls for dredging 63,000 cubic yards of contaminated sediment over approximately a 6-acre area. Even though there are and will be substantial costs associated with completing existing and new clean-ups, these sites will be subject to clean-up with or without this TMDL and therefore little or no new costs are anticipated as a result of this TMDL as the costs of cleanup would be driven by other regulatory programs.

Monitoring and Special Studies

The Regional Monitoring Program (RMP) conducted by the San Francisco Estuary Institute collects much of the data that are required as part of the ongoing assessment of the health of the Bay. The RMP is jointly funded by municipal and industrial wastewater dischargers. The current budget for the program is $3.4 million, which includes monitoring of PCBs and other pollutants in water, sediment, and fish throughout the Bay. Maintaining this effort should be sufficient to track attainment of the TMDL target and recovery of the Bay. In addition, the RMP also conducts regular monitoring of PCBs loads from the Central Valley and limited monitoring of PCBs loads from local tributaries. Additional monitoring will be necessary to sufficiently quantify loads from urban stormwater runoff and the loads reduced from urban stormwater runoff control actions. As with the control measures, this loads monitoring would also address

other pollutants of concern such as heavy metals, pesticides, and petroleum hydrocarbons. This additional monitoring could cost $500 thousand to $1 million per year.

There are critical data needs to improve our understanding of PCBs fate and transport, particularly PCBs in Bay sediments. Also, a better understanding of the rate of natural attenuation of PCBs in Bay environments is needed to predict with more certainty the recovery time of the Bay, and to inform on the need for more, less or different implementation actions. We estimate these costs, which would be shared by all source category dischargers, urban stormwater dischargers, and dredgers, would total approximately $1 to 3 million, some of which would be accounted for within the existing RMP. These costs include the costs of collecting information regarding pollutants other than PCBs that are the subject of study by the RMP.

Risk Management

The risk management activities range from conducting studies to support health risk assessment and risk communication associated with eating Bay fish, providing outreach and advice to the general public and regular consumers of Bay fish, and investigating and implementing direct actions that reduce the actual and potential exposure of, and mitigate health impacts to, people and communities most likely to be consuming PCBs-contaminated fish from San Francisco Bay. Responsibility and costs associated with these activities will be shared among the California Office of Environmental Health Hazard Assessment, the California Department of Toxic Substances Control, the California Department of Health Services, dischargers, community-based organizations, and the Water Board. Although the direct risk reduction, studies, outreach efforts and mitigation actions have yet to be determined, they will likely cost in the range of $100 thousand to $1 million dollars per year. Some of these costs are likely to be incurred without this TMDL as the San Francisco Bay mercury TMDL and mercury watershed NPDES permit require similar risk management activities.

EXHIBIT N

STATEWIDE CSLC LANDS

Prepared December 2017 by:

California State Lands Commission

This map was created to generally illustrate the lands that are under the jurisdiction of the California State Lands Commission, including active leases issued by the Commission as of April 2017, State-owned school lands, and certain State-owned sovereign land that has been legislatively granted in trust to local entities. This map does not depict any mineral interests reserved to the State. Not all grants are shown. This map, and the data on which it is based, are subject to change, does not include all lands within the Commission's jurisdiction, and does not purport to show precise boundaries. Therefore, while it may be helpful to obtain a general understanding of the Commission's jurisdiction, the boundaries of the lands must not be used for title, boundary or ownership determination purposes or for obtaining permits or other entitlements from any federal, State, or local agencies. The user assumes all risk of use. The California State Lands Commission makes no warranty as to the accuracy of the map or the underlying data nor assumes any liability for its use.

California State Lands Commission Jurisdiction

The State of California acquired sovereign ownership of all tidelands and submerged lands and the beds of navigable lakes and waterways upon its admission to the United States in 1850. The California State Lands Commission (Commission) has jurisdiction and management authority over these sovereign lands. These lands include the beds of more than 120 navigable rivers and sloughs, nearly 40 navigable lakes, and the 3-mile-wide band of tide and submerged lands adjacent to California's 1,100 mile coast and offshore islands, totaling nearly 4 million acres. The Commission also has certain residual and review authority for tidelands and submerged lands legislatively granted in trust to local jurisdictions. The protections of the common law Public Trust Doctrine apply to all these lands.

The State holds these lands in trust for the benefit of all people of the State for statewide Public Trust purposes including waterborne commerce, navigation, fisheries, water-related recreation, habitat preservation, and open space, among others. On tidal waterways, the State's sovereign fee ownership extends landward to the mean high-tide line, except for areas of fill or artificial accretion or where the boundary has been fixed by agreement or a court decision. On navigable non-tidal waterways, including lakes, the State holds fee ownership of the bed of the waterway landward to the ordinary low-water mark and a Public Trust easement landward to the ordinary high-water mark, except where the boundary has been fixed by agreement or a court decision. These boundaries may not be readily apparent from present day site inspections.

The Commission also manages State-owned school lands granted to the State in 1853 by the federal government to support public schools. Today, the Commission manages approximately 459,000 acres of school lands held in fee ownership by the State and reserved mineral interests on approximately 790,000 acres of school lands where the surface estate was sold.

Proposed Legislation

West's Annotated California Codes
Constitution of the State of California 1879 (Refs & Annos)
Article IV. Legislative (Refs & Annos)

West's Ann.Cal.Const. Art. 4, § 8

§ 8. Bills; procedure; effective date of statutes; urgency measures

Effective: November 9, 2016

Currentness

SEC. 8. (a) At regular sessions no bill other than the budget bill may be heard or acted on by committee or either house until the 31st day after the bill is introduced unless the house dispenses with this requirement by rollcall vote entered in the journal, three fourths of the membership concurring.

(b)(1) The Legislature may make no law except by statute and may enact no statute except by bill. No bill may be passed unless it is read by title on 3 days in each house except that the house may dispense with this requirement by rollcall vote entered in the journal, two thirds of the membership concurring.

(2) No bill may be passed or ultimately become a statute unless the bill with any amendments has been printed, distributed to the members, and published on the Internet, in its final form, for at least 72 hours before the vote, except that this notice period may be waived if the Governor has submitted to the Legislature a written statement that dispensing with this notice period for that bill is necessary to address a state of emergency, as defined in paragraph (2) of subdivision (c) of Section 3 of Article XIII B, that has been declared by the Governor, and the house considering the bill thereafter dispenses with the notice period for that bill by a separate rollcall vote entered in the journal, two thirds of the membership concurring, prior to the vote on the bill.

(3) No bill may be passed unless, by rollcall vote entered in the journal, a majority of the membership of each house concurs.

(c)(1) Except as provided in paragraphs (2) and (3) of this subdivision, a statute enacted at a regular session shall go into effect on January 1 next following a 90-day period from the date of enactment of the statute and a statute enacted at a special session shall go into effect on the 91st day after adjournment of the special session at which the bill was passed.

(2) A statute, other than a statute establishing or changing boundaries of any legislative, congressional, or other election district, enacted by a bill passed by the Legislature on or before the date the Legislature adjourns for a joint recess to

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

reconvene in the second calendar year of the biennium of the legislative session, and in the possession of the Governor after that date, shall go into effect on January 1 next following the enactment date of the statute unless, before January 1, a copy of a referendum petition affecting the statute is submitted to the Attorney General pursuant to subdivision (d) of Section 10 of Article II, in which event the statute shall go into effect on the 91st day after the enactment date unless the petition has been presented to the Secretary of State pursuant to subdivision (b) of Section 9 of Article II.

(3) Statutes calling elections, statutes providing for tax levies or appropriations for the usual current expenses of the State, and urgency statutes shall go into effect immediately upon their enactment.

(d) Urgency statutes are those necessary for immediate preservation of the public peace, health, or safety. A statement of facts constituting the necessity shall be set forth in one section of the bill. In each house the section and the bill shall be passed separately, each by rollcall vote entered in the journal, two thirds of the membership concurring. An urgency statute may not create or abolish any office or change the salary, term, or duties of any office, or grant any franchise or special privilege, or create any vested right or interest.

188 Cal.App.4th 794
Court of Appeal, Third District, California.

CLOVIS UNIFIED SCHOOL DISTRICT et al.,
Plaintiffs and Appellants,
v.
John CHIANG, as State Controller, etc., Defendant and Appellant.

No. C061696.
|
Sept. 21, 2010.
|
As Modified on Denial of Rehearing Oct. 14, 2010.

Synopsis
Background: School districts and community college districts brought action against State Controller's Office for declaratory and writ relief challenging auditing rules used in reducing state-mandated reimbursement claims for employee salary and benefit costs. The Superior Court, Sacramento County, No. 06CS00748 and 07CS00263, Lloyd G. Connelly, J., invalidated the Contemporaneous Source Document Rule (CSDR) as applied to Intradistrict Attendance Program and Collective Bargaining Program, granted no relief as to CSDR as applied to the School District of Choice Program (SDC) and the Emergency Procedures, Earthquake Procedures and Disasters Program (EPEPD), and upheld the Health Fee Rule. Plaintiffs appealed.

Holdings: The Court of Appeal, Butz, J., held that:

[1] CSDR implemented, interpreted, or made specific the regulatory Parameters and Guidelines (P&Gs) applied to state-mandated reimbursement claims;

[2] declaratory and traditional mandate relief was appropriate form of relief for use of CSDR as underground regulation; and

[3] amount of optional student fee was deducted from amount reimbursed to community college districts for state-mandated costs.

Reversed in part with directions and affirmed in part.

States
State expenses and charges and statutory liabilities

School districts' and community college districts' action against State Controller's Office, for declaratory and writ relief challenging audits that reduced state-mandated reimbursement claims for employee salary and benefit costs based on an auditing rule which was an invalid underground regulation in violation of the state Administrative Procedure Act (APA), was subject to the three-year statute of limitations for lawsuits based on statutory liability, since state-mandated reimbursement was a statutory liability. West's Ann.Cal.C.C.P. § 338(a); West's Ann.Cal.Gov.Code §§ 11340 et seq., 17500 et seq.

[9] **Declaratory Judgment**
State officers and boards
Declaratory Judgment
Education
Mandamus
Establishment, maintenance, and management of schools

Declaratory and accompanying traditional mandate relief was an appropriate form of relief, for school districts' challenge to State Controller's Office's policy of using an underground regulation to conduct audits in violation of the Administrative Procedure Act (APA), even though the underground regulation was later incorporated into valid regulations, where the dispute related to audit determinations under the invalid regulation which did not become final prior to the applicable statute of limitations, and there was no adequate administrative remedy because the Commission on State Mandates consistently refused to rule on underground regulation claims. West's Ann.Cal.Gov.Code § 11350.

Opinion

BUTZ, J.

***797** This declaratory relief and writ of mandate action concerns the validity of two auditing rules used by defendant State Controller's Office (Controller). The Controller used these rules in reducing state-mandated reimbursement claims for employee salary and benefit costs submitted from plaintiff school districts and community college districts (hereafter plaintiffs).

Contemporaneous Source Document Rule (CSDR)
The first auditing rule is referred to by plaintiffs as the Contemporaneous Source Document Rule (CSDR). The Controller used this rule to reduce reimbursement claims for the following four state-mandated school district programs during the challenged period straddling fiscal years 1998 to 2003: (1) the School District of Choice Program (SDC); (2) the Emergency Procedures, Earthquake Procedures and Disasters Program (EPEPD); (3) the ***798** Intradistrict Attendance Program; and (4) the Collective Bargaining Program. We conclude this rule was an invalid underground regulation under the state Administrative Procedure Act (APA) during this period. (Gov.Code, § 11340 et seq.)[1] Consequently, we overturn

the Controller's audits for these four programs during this period to the extent they were based on this rule.

[1] Undesignated statutory references are to the Government Code.

Health Fee Elimination Program: Health Fee Rule

The second auditing rule is the Health Fee Rule, which the Controller used to reduce reimbursement claims for state- ****37** mandated health services provided by the plaintiff community college districts pursuant to the Health Fee Elimination Program. We uphold the validity of this rule.

The trial court: (1) invalidated the CSDR as applied to the Intradistrict Attendance and Collective Bargaining Programs (from which the Controller appeals); (2) hinted at the CSDR's invalidity as applied to the SDC and EPEPD Programs but did not grant relief thereon, apparently deeming the administrative remedy sufficient (from which the school districts appeal); and (3) upheld the validity of the Health Fee Rule (from which the community college districts appeal). We shall affirm the judgment regarding the Intradistrict Attendance Program, the Collective Bargaining Program, and the Health Fee Rule, but reverse the judgment, with directions, regarding the SDC and EPEPD Programs.

Because the issues raised in this appeal are almost entirely legal ones subject to our independent review (see *Grier v. Kizer* (1990) 219 Cal.App.3d 422, 434, 268 Cal.Rptr. 244, disapproved on a different ground in *Tidewater Marine Western, Inc. v. Bradshaw* (1996) 14 Cal.4th 557, 577, 59 Cal.Rptr.2d 186, 927 P.2d 296 (*Tidewater*) [whether an auditing rule is an APA regulation is a question of law]), it is unnecessary to set forth a factual background at this stage. Instead, we will proceed straight to our discussion. First, we will briefly summarize the process of state-mandated reimbursement and the concept of underground regulation. Then we will turn our attention to the programs and remedies at issue, weaving in the pertinent facts as we go.

DISCUSSION

I. State-mandated Reimbursement Process

In 1979, California's voters adopted article XIII B, section 6 of the state Constitution, which specifies that if the state imposes any "new program ***799** or higher level of service" on any local government (including a school district), the state must reimburse the locality for the costs of the program or increased level of service.

In 1984, the Legislature enacted statutes to govern the state mandate process. (§ 17500 et seq.) Under these statutes, the Commission on State Mandates (the Commission) determines, pursuant to a "test claim" process, whether a state program constitutes a reimbursable state mandate. (§§ 17551, subd. (c), 17553.)

Once the Commission determines that a state mandate exists, it adopts regulatory "[P]arameters and [G]uidelines" (P & G's) to govern the state-mandated reimbursement. (§ 17557.) The Controller, in turn, then issues nonregulatory "[C]laiming [I]nstructions" for each Commission-determined mandate; these instructions must derive from the Commission's test claim decision and its adopted P & G's. (§ 17558.) Claiming Instructions may be specific to a particular mandated program, or general to all such programs.

The Controller may audit a reimbursement claim filed by a local agency or school district within three years of the claim's filing or last amendment. (§ 17558.5, subd. (a).)

If the Controller reduces a specific reimbursement claim via an audit, the claimant may file an "[I]ncorrect [R]eduction [C]laim" with the Commission. (§ 17558.7, subd. (a).)

II. The Concept of Invalid Underground Regulation

[1] In their petitions for writ of mandate and complaints for declaratory relief, the school districts (comprising Clovis, ****38** Fremont, Newport–Mesa, Norwalk–La Mirada, Riverside, Sweetwater, and San Juan; hereafter collectively, School Districts) allege that the CSDR constitutes an invalid, unenforceable underground regulation under the APA as applied by the Controller in auditing salary and benefit costs in reimbursement claims for the SDC, EPEPD, Intradistrict Attendance, and Collective Bargaining Programs during the applicable periods roughly encompassing the fiscal years 1998 to 2003.[2]

[2] Because of the large number of school districts and program audits involved, as well as the slightly varying

fiscal years at issue corresponding to these districts and program audits, we will use the general phrasing "applicable periods roughly encompassing the fiscal years 1998 to 2003" to describe the audits at issue. The parties are well aware of the particular audits being challenged for this period. Regardless, the School Districts must meet the applicable three-year statute of limitations that governs lawsuits based on statutory liability (like state-mandated reimbursement) for any audits of the four programs that have been determined on the basis of the invalidated CSDR. (Code Civ. Proc., § 338; *Union of American Physicians & Dentists v. Kizer* (1990) 223 Cal.App.3d 490, 504, fn. 5, 272 Cal.Rptr. 886.) San Juan School District filed its petition and complaint on March 2, 2007. The rest of the School Districts, together, filed their petition and complaint on May 23, 2006. The trial court consolidated these two petitions and complaints on March 27, 2007.

The School Districts made challenges to other programs as well, but these challenges are not at issue on appeal.

***800** In their petition for writ of mandate and complaint for declaratory relief (actually appended to the School Districts' petition and complaint), the community college districts (comprising San Mateo, Santa Monica, State Center, and El Camino; hereafter collectively, College Districts) allege that the Health Fee Rule constitutes an invalid, unenforceable underground regulation under the APA as applied by the Controller in auditing reimbursement claims for the Health Fee Elimination Program or, alternatively, that the Controller's auditing actions in this respect were beyond its lawful authority.

The basic legal principles that apply to these allegations are as follows:

" 'If a rule constitutes a "regulation" within the meaning of the APA (other than an "emergency regulation" ...) it may not be adopted, amended, or repealed except in conformity with "basic minimum procedural requirements" ' " which include public notice, opportunity for comment, agency response to comment, and review by the state Office of Administrative Law. (*Morning Star Co. v. State Bd. of Equalization* (2006) 38 Cal.4th 324, 333, 42 Cal.Rptr.3d 47, 132 P.3d 249 (*Morning Star*).) "These requirements promote the APA's goals of bureaucratic responsiveness and public engagement in agency rulemaking." (*Ibid.*)

Any regulation " 'that substantially fails to comply with these requirements may be judicially declared invalid' " and is deemed unenforceable. (*Morning Star, supra,* 38 Cal.4th at p. 333, 42 Cal.Rptr.3d 47, 132 P.3d 249; § 11350, subd. (a).)

[2] A "regulation" under the APA "means every rule, regulation, order, or standard of general application or the amendment, supplement, or revision of any rule, regulation, order, or standard adopted by any state agency to implement, interpret, or make specific the law enforced or administered by it, or to govern its procedure." (§ 11342.600.) As we will later explain more fully, an APA regulation has two principal characteristics: It must apply generally; and it must implement, interpret, or make specific the law enforced or administered by the agency, or govern the agency's procedure. (*Morning Star, supra,* 38 Cal.4th at pp. 333–334, 42 Cal.Rptr.3d 47, 132 P.3d 249; *Tidewater, supra,* 14 Cal.4th at p. 571, 59 Cal.Rptr.2d 186, 927 P.2d 296.)

*801 III. The CSDR as Applied to the SDC, EPEPD, Intradistrict Attendance, and Collective Bargaining Programs

We will start with the SDC Program. We do so because, of these four programs, the Commission's APA-valid, pre-May 27, 2004 P & G's for the SDC Program most closely resemble the Controller's CSDR.[3] If we conclude, nevertheless, that the CSDR is an underground regulation that violates the APA in this context, we will have to conclude similarly for these three other programs. It is undisputed that the Controller's CSDR was not enacted in compliance with APA procedure.

[3] On May 27, 2004, the Commission validly amended its SDC Program P & G's to adopt this CSDR language.

As we shall explain, we conclude that the CSDR, as applied to the (pre-May 27, 2004) SDC Program, is an underground, unenforceable regulation under the APA. Accordingly, the CSDR is invalid as applied to the School Districts' SDC Programs for the applicable periods roughly encompassing the fiscal years 1998 to 2003 (see fn. 2, *ante*), and invalid in parallel fashion to the three other programs as well.

The Commission determined, in the mid–1990's, that the SDC Program imposed a reimbursable state-mandated program on school districts by establishing the right of parents/guardians of students, who were prohibited from transferring to another school district, to appeal to the county board of education. (See former Ed.Code, § 48209.9, inoperative July 1, 2003.)

From August 24, 1995, until May 27, 2004, the Commission's P & G's for the SDC Program set forth the following two requirements for school districts seeking SDC state-mandated reimbursement for employee salary and benefit costs: (1) "Identify the employee(s) and their job classification, describe the mandated functions performed and specify the actual number of hours devoted to each function, the productive hourly rate and the related benefits. The average number of hours devoted to each function may be claimed if supported by a documented time study"; and (2) "For auditing purposes, all costs claimed must be traceable to source documents (e.g., employee time records, invoices, receipts, purchase orders, contracts, etc.) and/or worksheets that show evidence of and the validity of such claimed costs."

The Commission's SDC Program P & G's divide the subject of reimbursable costs into three categories: employee salaries and benefits; materials and supplies; and contracted services. The examples set forth in these P & G's for ***802** "source documents" align with these three categories: "employee time records" for employee salaries and benefits; "invoices," "receipts" and "purchase orders" for materials and supplies; and "contracts" for contracted services. At issue in this appeal for the SDC, EPEPD, Intradistrict Attendance, and Collective Bargaining Programs are just the cost category of employee salaries and benefits.

From the initial issuance of the Commission's SDC Program P & G's in 1995 until May 27, 2004, the Controller's SDC-specific Claiming Instructions substantively aligned with the SDC Program P & G's.

However, in September 2003, the Controller revised its general Claiming Instructions (that apply to state-mandated reimbursement claims in general) to set ****40** forth, for the first time, what has become known as the CSDR. The CSDR states:

"To be eligible for mandated cost reimbursement for any fiscal year, only actual costs may be claimed. Actual costs are those costs actually incurred to implement the mandated activities. Actual costs must be traceable and supported by source documents that show the validity of such costs, when they were incurred, and their relationship to the reimbursable activities. A source document is a document created at or near the same time the actual cost was incurred for the event or activity in question. Source documents may include, but are not limited to, employee time records or time logs, sign-in sheets, invoices, and receipts.

"Evidence corroborating the source documents may include, but is not limited to, worksheets, cost allocation reports (system generated), purchase orders, contracts, agendas, training packets, and declarations. Declarations must include a certification or declaration stating, 'I certify under penalty of perjury under the laws of the State of California that the foregoing is true and correct based upon personal knowledge.' Evidence corroborating the source documents may include data relevant to the reimbursable activities otherwise in compliance with local, state, and federal government requirements. However, corroborating documents cannot be substituted for source documents."

Substantial evidence showed that prior to the use of the CSDR in Controller audits, school districts obtained SDC state-mandated reimbursement for employee salary and benefit costs based on (1) declarations and certifications from the employees that set forth, after the fact, the time they had spent on SDC-mandated tasks; or (2) an annual accounting of time determined by the number of mandated activities and the average time for each activity. After the Controller began using the CSDR in its auditing of SDC reimbursement claims, the Controller deemed these declarations, certifications, and accounting methods insufficient, and reduced the ***803** reimbursement claims accordingly. (Substantial evidence also showed that the Controller, in 2000, began applying a CSDR requirement in field audits of SDC reimbursement claims, before the CSDR was expressed in the Controller's general Claiming Instructions in September 2003 or adopted in the Commission's SDC Program P & G's on May 27, 2004.)

The question is whether the Controller's CSDR constituted an underground, unenforceable regulation that the Controller used in auditing the School Districts' SDC Program for the fiscal years 1998 to 2003, because the CSDR constituted a state agency regulation that was not adopted in conformance with the APA prior to its valid adoption in the Commission's SDC Program P & G's on May 27, 2004. We answer this question "yes."

[3] " '*A regulation subject to the APA* ... has *two principal identifying characteristics.* [Citation.] *First,* the agency must intend its rule to apply generally, rather than in a specific case. The rule need not, however, apply universally; a rule applies generally so long as it declares how a certain class of cases will be decided. [Citation.] *Second,* the rule must "implement, interpret, or make specific the law enforced or administered by [the agency], or ... govern [the agency's] procedure." ' " (*Morning Star, supra,* 38 Cal.4th at pp. 333–334, 42 Cal.Rptr.3d 47, 132 P.3d 249, quoting *Tidewater, supra,* 14 Cal.4th at p. 571, 59 Cal.Rptr.2d 186, 927 P.2d 296, italics added.)

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

[4] As to the first criterion—whether the rule is intended to apply generally—substantial evidence supports the trial ****41** court's finding that the CSDR was "applie[d] generally to the auditing of reimbursement claims ...; the Controller's auditors ha[d] no discretion to judge on a case[-]by[-]case basis whether to apply the rule." (The trial court made this finding in the context of ruling on the Intradistrict Attendance and Collective Bargaining Programs, but this finding is a general one that applies equally to the SDC Program. The trial court did not apply this general finding to the SDC Program only because the court reasoned that the CSDR was not an APA-violative underground regulation in the SDC context, as the Commission later adopted the CSDR into its SDC Program P & G's (see fn. 3, *ante*). As we shall explain later, we reject this reasoning involving subsequent adoption.)

[5] The CSDR also meets the second criterion of being a regulation: It implements, interprets, or makes specific the law enforced or administered by the Controller. The Controller argues, to the contrary, that the CSDR "merely restates" the source document requirement found in the pre-May 27, 2004 Commission P & G's for the SDC Program, and that "source documents" are, by their sourceful nature, contemporaneous. As we explain, we reject this argument.

Admittedly, the pre-May 27, 2004 SDC Program P & G's stated that, "[f]or auditing purposes, all costs claimed must be traceable to source documents ***804** (e.g., employee time records, invoices, receipts, purchase orders, contracts, etc.) and/or worksheets that show evidence of and the validity of such claimed costs." However, the Controller's CSDR, in contrast to these P & G's, did not equate "source documents" with "worksheets," but relegated "worksheets" to the second-class status of "corroborating documents" that can only serve as evidence that corroborates "source documents." This is no small matter either. This is because, prior to the Controller using the CSDR to audit reimbursement claims, the School Districts, in making these claims, had used employee declarations and certifications and average time accountings to document the employee time spent on SDC-mandated activities; and such methods can be deemed akin to worksheets.

More significantly, the CSDR expressly states that employee declarations and certifications are only corroborating documents, *not* source documents; the pre-May 27, 2004 SDC Program P & G's had nothing to say on this subject. In effect, then, the CSDR bars the use of employee time declarations and certifications as source documents or source document-equivalent worksheets, in contrast to the pre-May 27, 2004 P & G's.

Along similar lines, the pre-May 27, 2004 SDC Program P & G's also stated that the "average number of [employee] hours devoted to each [mandated] function may be claimed if supported by a documented time study"; the record showed that such a time study is a documented estimate. The CSDR, which recognizes only actual costs traceable and supported by contemporaneous source documents, does not countenance such estimation.

Nor may the Controller point to the examples of the source documents listed in the pre-May 27, 2004 SDC Program P & G's and argue they show the contemporaneous nature of source documents: "employee time records, invoices, receipts, purchase orders, contracts, etc." First, this argument ignores the source document-equivalent of "worksheets" set forth in these P & G's, as discussed above. And, second, while the CSDR lists "employee time records," "invoices," and "receipts" as source documents, it specifies that "purchase orders," "contracts" (and "worksheets") ****42** are only corroborating documents, not source documents.

Finally, the School Districts that had used employee declarations and certifications and average time accountings to document time for reimbursement claims also note that it is *now* physically impossible to comply with the CSDR's requirement of contemporaneousness that "[a] source document is a ***805** document *created at or near the same time the actual cost was incurred* for the event or activity in question."[4] (Italics added.)

[4] As a related aside, it is interesting to note that the Controller's SDC-specific Claiming Instructions that were in place during the pre–2004 P & G's stated that, "[f]or audit purposes, all supporting documents must be retained [by claimant] [only] for a period of two years after the end of the calendar year in which the reimbursement claim was filed or last amended, whichever is later"; but the Controller had three years in which to conduct a reimbursement audit "after the date that the actual reimbursement claim is filed or last amended, whichever is later." (§ 17558.5, subd. (a).)

Given these substantive differences between the Commission's pre-May 27, 2004 SDC Program P & G's and the Controller's CSDR, we conclude that the CSDR implemented, interpreted or made specific the following laws enforced or administered by the Controller: the Commission's pre-May 27, 2004 P & G's for the SDC Program (§ 17558) [the Commission submits regulatory P & G's to the Controller, who in turn issues nonregulatory

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

Claiming Instructions based thereon]; and the Controller's statutory authority to audit state-mandated reimbursement claims (§ 17561, subd. (d)(2)).

Consequently, the CSDR meets the two criteria for being an APA regulation. And because the CSDR, as applied to the SDC Program, was not adopted as a regulation in compliance with the APA rule-making procedures until its May 27, 2004 incorporation into the SDC Program P & G's, this CSDR is an underground and unenforceable regulation as applied to the audits of the School Districts' SDC Programs for the applicable periods roughly encompassing the fiscal years 1998 to 2003. (See fn. 2, *ante*.) These audits are invalidated to the extent they used this CSDR.

[6] [7] [8] As we noted at the outset of this part of the opinion, if we were to conclude (as we now have done) that the CSDR is an underground regulation that violates the APA in the SDC Program context presented here, we would have to conclude similarly for the EPEPD, Intradistrict Attendance, and Collective Bargaining Programs too. This is because the Commission's P & G's for these latter three programs less resembled the Controller's CSDR than did the Commission's pre-May 27, 2004 P & G's for the SDC Program. We now turn to the EPEPD, Intradistrict Attendance, and Collective Bargaining Programs, which we will describe briefly in order.

The EPEPD Program was found to be a reimbursable state-mandated program in 1987. This program requires school districts to establish earthquake procedures for each of its school buildings, and to allow use of its buildings, grounds and equipment for mass care and welfare shelters during public disasters or emergencies. (Former Ed.Code, §§ 35925–35927, 40041.5, 40042.)

***806** From 1991 until June 2, 2003, the Commission's P & G's for the EPEPD Program required school districts seeking state-mandated reimbursement for employee salary and benefit costs: (1) to "provide a listing of each employee ... and the number of hours devoted to their [mandated] function"; and (2) "[f]or auditing purposes, all costs claimed may be ****43** traceable to source documents and/or worksheets that show evidence of the validity of such costs." The Controller's EPEPD-specific Claiming Instructions, since 1996, have stated that "Source documents required to be maintained by the [reimbursement] claimant may include, but are not limited to, employee time cards and/or cost allocation reports." (The Commission, in like fashion to what it did with the SDC Program, incorporated the CSDR into its P & G's for the EPEPD Program, effective June 2, 2003.)

These pre-June 2, 2003 P & G's for the EPEPD Program parallel the pre-May 27, 2004 P & G's for the SDC Program, but even less resemble the Controller's CSDR than did those SDC Program P & G's. For the reasons set forth above involving the SDC Program, then, we conclude that the Controller's CSDR is an underground, unenforceable regulation as applied to the audits of the School Districts' EPEPD Programs for the applicable periods roughly encompassing the fiscal years 1998 to 2003. (See fn. 2, *ante*.) These audits are invalidated to the extent they used this CSDR.

The Intradistrict Attendance Program, in 1995, was found to be a reimbursable state-mandated program. This program establishes a policy of open enrollment within a school district for district residents. (Former Ed.Code, § 35160.5.)

Since 1995, the Commission's P & G's for the Intradistrict Attendance Program have required school districts seeking state-mandated reimbursement for employee salary and benefit costs (1) to "[i]dentify the employee(s) and their job classification ... and specify the actual number of hours devoted to each [mandated] function.... The average number of hours devoted to each function may be claimed if supported by a documented time study"; and (2) "[f]or auditing purposes, all costs claimed must be traceable to source documents and/or worksheets that show evidence of the validity of such costs." For the 1998 to 2003 period of fiscal years at issue, the Controller's Intradistrict Attendance Program-specific Claiming Instructions substantively mirrored P & G's for (1) above (except for the "average number of hours" provision), and stated as to source documents: "Source documents required to be maintained by the claimant may include, but are not limited to, employee time records that show the employee's actual time spent on this mandate." (In early 2010, the Commission incorporated the Controller's CSDR into the Intradistrict Attendance Program P & G's; see fn. 5, *post*.)

***807** Applying the same reasoning we have applied above with respect to the SDC and the EPEPD Programs, we conclude that the Controller's CSDR is an underground, unenforceable regulation as applied to the audits of the School Districts' Intradistrict Attendance Programs for the applicable periods roughly encompassing the fiscal years 1998 to 2003. (See fn. 2, *ante*.) These audits are invalidated to the extent they used this CSDR.

That leaves the Collective Bargaining Program, which was found to be a reimbursable state-mandated program in 1978 (by the Commission's predecessor, the State

Board of Control). This program requires school district employers to collectively bargain with represented employees, and to publicly disclose the major provisions of their agreements prior to final adoption. (§ 3540 et seq.)

If the Commission's pre-May 27, 2004 P & G's for the SDC Program most closely resemble the Controller's CSDR, the P & G's for the Collective Bargaining Program bear the least resemblance. As pertinent, the Collective Bargaining Program P & G's require school districts seeking reimbursement ****44** for employee salary and benefit costs to simply "[s]upply workload data requested ... to support the level of costs claimed" and "[s]how the classification of the employees involved, amount of time spent, and their hourly rate"; nothing is said about "source documents." The Controller's Collective Bargaining Program-specific Claiming Instructions substantively mirror those of the Intradistrict Attendance Program, stating that source documents include employee time records that show the employee's actual time spent on the mandated function. (And as with the Intradistrict Attendance Program, the Commission, in early 2010, incorporated the Controller's CSDR into the Collective Bargaining Program P & G's; see fn. 5, *post.*)

Consequently, employing the same reasoning we have employed above, we conclude that the Controller's CSDR is an underground, unenforceable regulation as applied to the audits of the School Districts' Collective Bargaining Programs for the applicable periods roughly encompassing the fiscal years 1998 to 2003. (See fn. 2, *ante.*) These audits are invalidated to the extent they used this CSDR.

IV. Declaratory and Related Writ of Mandate Relief

The trial court declared that the Controller's CSDR, as applied to the audits of the Intradistrict Attendance and Collective Bargaining Programs for the 1998 to 2003 period of fiscal years, was an invalid and void underground regulation under the APA. Correspondingly, the trial court issued a peremptory writ of mandate (traditional mandamus) invalidating these CSDR-based audits to the extent they were not final audit determinations for more than ***808** three years before the School Districts filed their respective lawsuits on May 23, 2006 (Clovis et al.) and March 2, 2007 (San Juan). This three-year period is the applicable three-year statute of limitations under Code of Civil Procedure section 338, subdivision (a), for enforcing a statutory liability like state-mandated reimbursement. We are affirming this part of the trial court's judgment.

However, the trial court refused to provide, in parallel fashion, declaratory and writ of mandate relief for the CSDR-based audits involving the SDC and EPEPD Programs. The School Districts contend the trial court erred in this respect. We agree.

In refusing to provide this relief, the trial court reasoned that, since the Commission had incorporated the Controller's CSDR into the Commission's regulatory P & G's for the SDC and EPEPD Programs, there was no longer an actual and ongoing controversy upon which to grant declaratory and related mandate relief concerning the CSDR's invalidity as an underground regulation in this context; and the Commission could administratively determine, pursuant to the Incorrect Reduction Claim process, the past audits that had used the CSDR before its incorporation into the SDC and EPEPD Programs' P & G's. This is where we part company with the trial court.

Our departure is based on section 11350 of the APA and the legal principles set forth in *Californians for Native Salmon etc. Assn. v. Department of Forestry* (1990) 221 Cal.App.3d 1419, 271 Cal.Rptr. 270 (*Native Salmon*) and its progeny.

Section 11350 of the APA specifies that "[a]ny interested person may obtain a judicial declaration as to the validity of any regulation ... by bringing an action for declaratory relief...." (§ 11350, subd. (a).)

In *Native Salmon,* the plaintiffs sought declaratory relief against the state forestry department, alleging that it was department policy, with respect to timber harvest plans: (1) to delay responses to public comments, and (2) to not evaluate the cumulative ****45** impact of logging activities in the plans. The *Native Salmon* court concluded that declaratory relief was appropriate in this context, stating: "[Plaintiffs] ... challenge not a specific [administrative] order or decision [which is generally subject to review only pursuant to a writ of *administrative* mandate, rather than traditional mandate], or even a series thereof, but an overarching, quasi-legislative policy set by an administrative agency. Such a policy is subject to review in an action for declaratory relief.... [¶] ... [R]eview of specific, discretionary administrative decisions [must not be confused] with review of a generalized agency policy. Declaratory relief directed to *policies* of administrative agencies is not an unwarranted control of discretionary, specific agency decisions." (*Native Salmon,* ***809** *supra,* 221 Cal.App.3d at p. 1429, 271 Cal.Rptr. 270, citations omitted; accord, *Venice Town Council, Inc. v. City of Los Angeles* (1996) 47 Cal.App.4th 1547, 1566, 55

Cal.Rptr.2d 465; see also *Simi Valley Adventist Hospital v. Bontá* (2000) 81 Cal.App.4th 346, 354–355, 96 Cal.Rptr.2d 633.)

[9] [10] [11] Similarly, here, the School Districts have challenged "an overarching, quasi-legislative policy set by an administrative agency" (*Native Salmon, supra*, 221 Cal.App.3d at p. 1429, 271 Cal.Rptr. 270) rather than a specific, discretionary administrative decision: i.e., the Controller's policy of using the (underground) CSDR to conduct audits in the SDC and EPEPD Programs for the period straddling the fiscal years 1998 to 2003. Declaratory and accompanying traditional mandate relief is appropriate in this context; this is an ongoing controversy limited by the three-year statute of limitations noted above.[5]

[5] The Controller had requested that, at a minimum, we stay this appeal in light of the Commission's pending decision to incorporate the Controller's CSDR into the Commission's P & G's for the Intradistrict Attendance and Collective Bargaining Programs, as the Commission has done for the SDC and EPEPD Programs. In a subsequent request for judicial notice, the Controller has now noted that the Commission, on January 29, 2010, amended its P & G's for the Intradistrict Attendance and Collective Bargaining Programs to adopt the CSDR for each program. We deny this request for judicial notice. This is because the central issue in the present appeal concerns the Controller's policy of using the CSDR *during the 1998 to 2003 fiscal years*, when the CSDR was an underground regulation. This issue is not resolved by the Commission's *subsequent* incorporation of the CSDR into its Intradistrict Attendance and Collective Bargaining Programs' P & G's.

Also, we deny the School Districts' request for judicial notice of the Commission's Incorrect Reduction Claim caseload summary and the Controller's list of final audit reports for California school districts and community college districts.

And there is no adequate administrative remedy. The trial court made a finding—supported by substantial evidence—that the Commission "consistently refuses to rule on underground regulation claims on the basis of an opinion that it lacks jurisdiction to decide such claims." (The trial court made this finding in discussing the Intradistrict Attendance and Collective Bargaining Programs, but the finding applies equally to the SDC and EPEPD Programs.)

We conclude that declaratory and accompanying traditional mandate relief applies not only to the Intradistrict Attendance and Collective Bargaining Programs, but also to the SDC and EPEPD Programs for the fiscal years at issue.[6]

[6] In light of our resolution, we need not consider the School Districts' alternative claim that the Controller's CSDR constitutes an unlawful retroactive rule, or the School Districts' additional claim that regardless whether an actual controversy exists for purposes of declaratory relief, the requested writ relief is not moot.

*810 V. Health Fee Elimination Program

[12] In 1986, and again in 1989 (after statutory amendment), the Commission determined ****46** that the Health Fee Elimination Program imposed a reimbursable state-mandated cost on those community college districts that provide health services, by requiring those districts to maintain in the future the level of service they had provided in the 1986–1987 fiscal year (termed, the "maintenance of effort" requirement); this "maintenance of effort" had to take place even if the districts, as they were and are permitted to do under the relevant statute, eliminated their nominal statutory student health fee ($7.50 per semester maximum (former Ed.Code, § 72246, Stats.1984, 2d Ex.Sess., ch. 1, p. 6642)); $10 per semester maximum (current Ed.Code, § 76355, subd. (a)(1)).[7]

[7] As Education Code section 76355, subdivision (a)(1) states: "The governing board of a district maintaining a community college may require community college students to pay a fee in the total amount of not more than ten dollars ($10) for each semester, seven dollars ($7) for summer school, seven dollars ($7) for each intersession of at least four weeks, or seven dollars ($7) for each quarter for health supervision and services, including direct or indirect medical and hospitalization services, or the operation of a student health center or centers, or both." (An inflationary adjustment is provided for in subdivision (a)(2) of § 76355.)

The College Districts contend that the Controller's Claiming Instruction for the Health Fee Elimination Program is an underground regulation under the APA and beyond the Controller's authority. Specifically, the College Districts argue that the Controller's Health Fee Rule misapplies the Commission's Health Fee Elimination Program P & G's by automatically reducing reimbursement claims by the amount that districts are statutorily authorized to charge students for health fees, even when a district chooses not to charge its students

those fees.

Since 1989, the Commission's Health Fee Elimination Program P & G's have stated in pertinent part:

"Any offsetting savings the claimant experiences as a direct result of this statute [i.e., the health fee statutes—formerly Ed.Code, § 72246; now Ed.Code, § 76355] must be deducted from the [reimbursement] costs claimed. In addition, reimbursement for this mandate received from any source, e.g., federal, state, etc., shall be identified and deducted from this claim. This shall include the amount of $7.50 per full-time student per semester, $5.00 per full-time student for summer school, or $5.00 per full-time student per quarter, as authorized by Education Code section 72246[, subdivision] (a). This shall also include payments (fees) received from individuals other than students who are not covered by Education Code Section 72246 for health services."

***811** The Controller's Health Fee Rule (i.e., its Health Fee Elimination Program-specific Claiming Instruction) states in pertinent part:

"Eligible claimants will be reimbursed for health service costs at the level of service provided in the 1986/87 fiscal year. The reimbursement will be reduced by the amount of student health fees authorized per the Education Code [section] 76355."

The College Districts maintain that the Controller's Health Fee Rule constitutes an invalid, underground regulation—i.e., one not adopted pursuant to the APA—because it meets the two-part test of a "regulation": (1) the Controller generally applies it; and (2) the rule implements, interprets or makes specific the Commission's Health Fee Elimination Program P & G's. ****47** (*Morning Star, supra,* 38 Cal.4th at pp. 333–334, 42 Cal.Rptr.3d 47, 132 P.3d 249.)

There is no quibble with part (1)—general application. The real issue is with part (2) of the test—defining a "regulation" as implementing, interpreting, or making specific the Health Fee Elimination Program P & G's. The College Districts argue that those P & G's require that the mandate claimant have actually "experience[d]" or "received" an amount of health service money for that amount to be deducted from the reimbursement claim. That is, if a college district does not charge its students a health service fee, as the district is statutorily permitted to do, then the district has not "experienced" or "received" that fee, and that amount cannot be deducted. The College Districts note that the Health Fee Rule, by contrast, states flatly that "reimbursement will be reduced by the amount of student health fees authorized per the Education Code [section] 76355."

The College Districts' argument carries some weight, especially when viewed solely within the prism of comparing the Health Fee Elimination Program P & G's to the Health Fee Rule semantically. But the argument falters when exposed to the broader context of the nature of state-mandated costs and common sense.

As for the nature of state-mandated costs, section 17514 defines "costs mandated by the state" to mean "any *increased costs* which a local agency or school district is *required to incur* after July 1, 1980, as a result of any statute enacted on or after January 1, 1975, or any executive order implementing any statute enacted on or after January 1, 1975, which mandates a new program or higher level of service of an existing program within the meaning of Section 6 of Article XIIIB of the California Constitution." (Italics added.) And section 17556 reflects this definition by stating that costs are not deemed mandated by the state to the extent the "local agency or school district *has the authority* to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service." (§ 17556, subd. (d), italics added.)

[13] ***812** The College Districts point out, though, in a series of overlapping arguments, that sections 17514 and 17556 govern the *Commission's* determination of whether a program is a state-mandated program, not the *Controller's* determination as to audit reductions; and the Commission has already found the Health Fee Elimination Program to be a state-mandated program. This observation, however, does not diminish the basic principle underlying the state mandate process that sections 17514 and 17566, subdivision (d) embody: To the extent a local agency or school district "has the authority" to charge for the mandated program or increased level of service, that charge cannot be recovered as a state-mandated cost.[8] (See *Connell v. Superior Court* (1997) 59 Cal.App.4th 382, 401, 69 Cal.Rptr.2d 231 ["the plain language of [section 17556, subdivision (d)] precludes reimbursement where the local agency has the authority, i.e., the right or the power, to levy fees sufficient to cover the costs of the state-mandated program"]; see *Connell,* at pp. 397–398, 69 Cal.Rptr.2d 231.)

8 In light of sections 17514 and 17556, subdivision (d), the Commission found the Health Fee Elimination Program to be a reimbursable state-mandated program to the extent the cost to community college districts of maintaining their level of health services at the

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

> 1986–1987 level, as required by the Health Fee Elimination Program mandate, is not covered by the nominal health fee authorized by section 76355, subdivision (a)(1) ($10 maximum per semester per student).

And this basic principle flows from common sense as well. As the Controller succinctly ****48** puts it, "Claimants can choose not to require these fees, but not at the state's expense."

[14] The College Districts also argue that the Controller lacks the authority to rely on these Government Code sections to uphold its Health Fee Rule. The argument is that, since the Health Fee Rule is a claiming instruction, its validity must be determined *solely* through the Commission's P & G's. To accept this argument, though, we would have to ignore, and so would the Controller, the fundamental legal principles underlying state-mandated costs. We conclude the Health Fee Rule is valid.

DISPOSITION

We direct the trial court to issue a peremptory writ of mandate that invalidates the Controller's audits of the School Districts' SDC and EPEPD Program reimbursement claims for the applicable periods identified in footnote 2, *ante*, encompassing the fiscal years 1998 to 2003, to the extent those audits were based on the CSDR and did not become final audit determinations prior to the applicable three-year statute of limitations. If it chooses to do so, the Controller may re-audit the relevant reimbursement claims based on the documentation requirements of the P & G's and claiming ***813** instructions when the mandate costs were incurred (i.e., not using the CSDR). In all other respects, the judgment is affirmed.

The parties shall each bear their own costs on appeal. (Cal. Rules of Court, rule 8.278(a)(3).)

We concur: SCOTLAND, P.J., and NICHOLSON, J.

Synopsis
Action against storekeeper for injuries sustained when business invitee fell after stepping on piece of chalk on sidewalk which was exclusively in control of storekeeper. The Superior Court, Los Angeles County, Otto J. Emme, J., entered judgment on verdict for plaintiff and an order denying defendant's motion for judgment notwithstanding the verdict. The defendant appealed. The District Court of Appeal, Fox, J., held that evidence failed to show that storekeeper was responsible for presence of chalk on sidewalk or that storekeeper had actual or constructive notice of chalk.

Judgment and order reversed with direction.

While walking on the sidewalk adjacent to one of defendant's stores, plaintiff stepped on a piece of chalk. It rolled and caused her to fall. She sued defendant for damages for the injuries thus sustained. The jury returned a verdict in her favor. Defendant appeals from the judgment and the order denying its motion for a judgment notwithstanding the verdict.

In seeking a reversal defendant (sometimes herein referred to as Sears) contends that the evidence fails to show that it was either responsible for the chalk being on the sidewalk, or that it had either actual or constructive notice of its presence there.

Sears operates a store at 12121 Victory Boulevard, in North Hollywood, California, which is known as the Valley Store. It is located on the north side of Victory, on which it has a frontage of approximately 150 feet; it has a depth of some 500 feet to Hamlin. There is a sidewalk and parking area on both the east and west sides of the store. The sidewalks are between 10 and 13 feet wide and are adjacent to the building. There are three doors opening onto the sidewalk on the east; one of these is toward the north end of the building, one toward the south, and the other about the middle. There are also three openings on the west. Only the employee's entrance, which is located near the middle, has any significance ***738** here. The stationery and drug departments are located on the first floor and generally in the southwest quadrant thereof. In the northeast corner nursery products are sold. There is a toy department on the second floor. The parking areas were not for the sole use of defendant's customers; there were other stores in the vicinity whose customers also used these parking facilities.

Plaintiff's fall occurred on the sidewalk adjacent to the east side of the store, between the southernmost and middle door-ways. It was stipulated that plaintiff was a business invitee at the time and place of the accident, and that defendant 'was exclusively in the control, operation and maintenance of the sidewalk in question.'

The piece of chalk on which plaintiff stepped was pink, round in shape, approximately 1 1/2 inches long and 5/16ths of an inch in diameter. There is no claim that anything else caused her to fall.

Plaintiff was 68 years of age at the time of the accident. She and her husband went to Sears' Valley Store for the purpose of purchasing a potted plant. They parked in the parking area on the east side near the center of the building. There were 'very few cars' on the lot and not many people around. They entered the store on the east side by the south door. It was about 9:30 in the morning; the store was 'just opening up.' Upon inquiring about garden plants, plaintiff was directed to the northeast corner of the store. There she was informed that the potted plant she desired was not in stock. She and her husband then left the store through the northerly door on the east side of the building; they proceeded in a southerly direction on the sidewalk toward their car. A short distance after passing the center door, plaintiff stepped on the piece of chalk and fell. She never saw what caused her to fall. Her husband, however, retrieved the offending object.

Plaintiff's first witness at the trial was Mrs. Worthen, who was then employed by Sears as a registered nurse at the Valley Store. She was summoned to the scene of the accident around 10:00 o'clock that morning. She called an ambulance service which, however, did not respond promptly, thus necessitating a check on it. Also, she called Dr. Goodman, a Sears approved doctor, and explained the situation to him. He advised the nurse that he would get in touch with Dr. Gamble 'because it sounds like she has a broken hip.' The nurse attended plaintiff until the ambulance took her to the hospital, where Dr. Gamble took charge.

***739** In the meantime, the nurse filled out the Customer Accident Report, in which she indicated by a checkmark that the location where the accident happened was swept daily. However, she had no personal knowledge as to how often the premises ****35** were swept. She received her information as to this matter from the personnel office.

While the nurse was at the scene, she observed two chalk marks. They were on separate but adjacent squares of the sidewalk. One was approximately 2 3/4 inches long while the other was a little more than half that length. The larger mark was near where plaintiff's 'knees would be.'

In further describing the sidewalk at the scene of the accident there was testimony indicating the presence of two or three globs of hardened gum, 'a black mark,' approximately a half dozen 'little pieces of something' that the nurse picked up and put in her pocket, and two or three places which the nurse rubbed with her foot 'as though she was trying to rub something out.' It is not claimed, however, that any of these items had anything to do with plaintiff's falling.

Charles W. Teed was defendant's operating superintendent, which included maintenance. As part of his duties, Teed inspected the sidewalks bordering the store three or four times daily. There was 'a definite schedule for constantly maintaining cleanliness.' It called, inter alia, for cleaning the sidewalks between 6:30 and 9:00 o'clock each morning. The system provided for 'constant patrol' with respect to the maintenance of the

WESTLAW © 2018 Thomson Reuters. No claim to original U.S. Government Works.

sidewalks and 'sweeping whenever necessary.'

Mr. Teed usually arrived at the store between 8:45 and 9:00 o'clock. After he parked, the first thing he did was to inspect the sidewalks. While he had no independent recollection of the morning of this accident, in this respect, he made such an inspection every day that he came to work and he was there that particular day, having been called to the scene of the accident before plaintiff was taken to the hospital.

Directly under Mr. Teed on the maintenance side of the store's operation was the building engineer, Mr. Schugt. Mr. Teed told him that 'he was to maintain a very high standard of cleanliness'; that the premises were 'to be maintained in a safe and clean manner at all times.' The porters and maids who did the cleaning were under the supervision of Schugt. The head porter was Mr. Clay. On his day off, Mr. Ham acted in his place.

***740** The porters' time cards disclose that on February 16, 1954, the date of plaintiff's accident, six porters reported for work on the 4:00 a.m. shift (other porters came to work at 9:30). It was Clay's day off, so Ham acted as head porter. Only the latter's testimony and that of Mr. Polley, whose duty it was to clean the sidewalks commencing at 6:30 a.m., are important.

The Valley Store had an alarm system, referred to as ADT, which operated and controlled until 7:40 a.m. If, before that time, any door was opened other than at a scheduled time an alarm would go off. Only the employees' entrance was scheduled for opening at an earlier hour. After the 4:00 a.m. opening of the employees' entrance, its next scheduled opening was 6:30; thereafter the scheduled openings were 7:00, 7:20 and 7:40 a.m.

Neither Ham nor Polley had any independent recollection of the day in question. However, every day that Polley worked he would, upon being let into the building with the other porters on the 4:00 a.m. opening, begin working on the inside. Part of his job was to clean the sidewalks. He was on a regular schedule for starting this part of his work and reported at the employees' entrance each day so as to be let out on the 6:30 ADT opening. He took with him a broom, a dustpan, pushcart and scraper. He always started his sidewalk cleaning at the employees' entrance. From there he worked south each morning to Victory and continued all the way around the building. It took about 2 1/2 hours to clean the sidewalks. When the finished this work he reported to the head porter (on this day Mr. Ham), who gave him his next assignment. Polley knew that the head porter and Schugt would inspect his work to see whether he had properly cleaned the sidewalks. Polley checked the sidewalks four or five times daily to see whether they were clean.

It was Ham's practice, in the absence of Clay, to unlock the various doors to the ****36** store between 9:00 and 9:30 each morning and at that time step out and look up and down the sidewalk, and then put the door on a hook so that no one could come in before opening time. When the store opened at 9:30 Ham would walk around the store inspecting the sidewalks.

Mr. Schugt was at work on the day of the accident. He inspected the sidewalks every day when he came to work between 8:00 and 8:30 a.m. and inspected them at frequent intervals throughout the day.

After the accident, Mr. Rowland, defendant's security ***741** supervisor, investigated to see whether chalk was sold in the store. He found that neither the stationery nor the toy departments had chalk on hand. He did not inquire at other departments.

While other employees of defendant, such as Miss Fife, personnel manager, and Mr. Carmichael, manager of the drug and cosmetic department, were at the scene of the accident after plaintiff fell, not one of them was able to throw any significant additional light on the circumstances surrounding her fall. Although plaintiff's husband was with her and attended the trial he did not testify.

[1] [2] [3] [4] [5] [6] [7] The occupier of business property owes to invitees a duty to exercise reasonable care in keeping the premises reasonably safe for such invitees. Louie v. Hagstrom's Food Stores, 81 Cal.App.2d 601, 608, 184 P.2d 708; Ahern v. S. H. Kress & Co., 97 Cal.App.2d 691, 693, 218 P.2d 108; Frank v. J. C. Penney Co., Inc., 133 Cal.App.2d 123, 125, 283 P.2d 291. As in other actions based on negligence a plaintiff, in order to recover damages, must also establish that the defendant breached that duty and that such breach was a proximate cause of injury to plaintiff. Palmer v. Crafts, 16 Cal.App.2d 370, 375, 60 P.2d 533. The burden is on the plaintiff to prove every essential fact on which she relies (McKellar v. Pendergast, 68 Cal.App.2d 485, 489, 156 P.2d 950). This burden is not met merely by proof that plaintiff invitee stepped on something while on invitor's premises and thereby was caused to fall and receive injuries, for 'no inference of negligence arises based simply upon proof of a fall upon the owner's floor. The doctrine of res ipsa loquitur is not applicable to such cases.' Vaughn v. Montgomery Ward & Co., 95 Cal.App.2d 553, 556, 213 P.2d 417, 419; Thomas v. Moore, 146 Cal.App.2d 59, 303 P.2d 624. Also, as pointed out in Reese v. Smith, 9 Cal.2d 324, at page 328, 70 P.2d 933, at page 935: 'If the existence of an essential fact upon which a party relies is

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

left in doubt or uncertainty, the party upon whom the burden rests to establish that fact should suffer, and not his adversary. [Citations.] A judgment cannot be based on guesses or conjectures. [Citation.]' Nor may a verdict be upheld 'only by resort to speculation.' Gray v. Carter, 100 Cal.App.2d 642, 645, 224 P.2d 28, 30. Substantial evidence is required to establish each essential affirmative allegation—a scintilla of evidence is not sufficient for that purpose. In re Estate of Teed, 112 Cal.App.2d 638, 644, 274 P.2d 54. Of course an inference ***742** is sufficient to establish a fact in issue but such an inference must be founded on 'a fact legally proved.' Code Civ.Proc. §§ 1958, 1960. In analyzing the testimony to determine whether there is sufficient evidence to support a particular finding, an 'appeallate court must accept as established all facts and all inferences favorable to respondent which find substantial support in the evidence.' New v. New, 148 Cal.App.2d 372, 306 P.2d 987, 994.

[8] [9] It is, of course, the province of the jury to determine the credibility of the witnesses. Naturally, in the exercise of their discretion, they may reject testimony as unworthy of credence, but 'disbelief does not create affirmative evidence to the contrary of that which is discarded.' Lubin v. Lubin, 144 Cal.App.2d 781, 302 P.2d 49, 60; In re Estate of Bould, 135 Cal.App.2d 260, 264, 287 P.2d 8, 289 P.2d 15. 'The fact that a jury may disbelieve the testimony of a witness who testifies to the negative of an issue does not of itself furnish any evidence in support of the affirmative of that issue, and does not warrant a finding in the affirmative thereof unless there is other ****37** evidence in the case to support such affirmative.' Marovich v. Central California T. Co., 191 Cal. 295, 304, 216 P. 595, 600; Miller v. Stults, 143 Cal.App.2d 592, 603, 300 P.2d 312; Moore v. Chesapeake & O. Ry. Co., 340 U.S. 573, 576, 71 S.Ct. 428, 95 L.Ed. 547.

Pertinent to a determination of this case are the principles enunciated by the Supreme Court in Hatfield v. Levy Brothers, 18 Cal.2d 798, at page 806, 117 P.2d 841, at page 845. It is there stated: 'Where the dangerous or defective condition of the property which causes the injury has been created by reason of the negligence of the owner of the property or his employee acting within the scope of the employment, the owner of the property cannot be permitted to assert that he had no notice or knowledge of the defective or dangerous condition in an action by an invitee for injuries suffered by reason of the dangerous condition. Under such circumstances knowledge thereof is imputed to him. [Citation.] Where the dangerous condition is brought about by natural wear and tear, or third persons, or acts of God or by other causes which are not due to the negligence of the owner, or his employees, then to impose liability the owner must have either actual or constructive knowledge of the dangerous condition or have been able by the exercise of ordinary care to discover the condition, which if known to him, he should realize as involving an unreasonable risk to invitees on his ***743** premises. His negligence in such cases is founded upon his failure to exercise ordinary care in remedying the defect after he has discovered it or as a man of ordinary prudence should have discovered it.'

[10] Plaintiff does not contend there is any direct evidence that defendant was responsible for the piece of chalk in question being on the sidewalk. Our search of the record fails to disclose any legally proved fact (C.C.P. § 1960) from which an inference reasonably may be drawn that defendant was responsible for its presence there. There is no testimony that defendant had chalk in stock at that time. In fact, the testimony on the question is that given by Mr. Rowland to the effect that he inquired at the toy and stationery departments on the day of the accident and was informed that neither of those departments had chalk in stock, and that he did not make such inquiry at other departments. If we assume the jury did not believe this testimony, plaintiff's case is not assisted for such disbelief does not 'warrant an inference that the truth is the direct converse of the rejected testimony.' In re Estate of Bould, supra, 135 Cal.App.2d at page 265, 287 P.2d at page 10; Lubin v. Lubin, supra. The failure of the jury to accept Mr. Rowland's testimony as true would not justify an inference that defendant did have chalk in stock and that defendant was responsible for the chalk's presence on the sidewalk on the fateful morning.

Only upon the basis of conjecture, speculation or guess may it be said that defendant was responsible for the piece of chalk in question being on the sidewalk. The law is clear that a verdict and judgment cannot rest on such a basis.

Plaintiff seeks also to sustain the verdict and judgment on the theory that even if the piece of chalk that caused her to fall was deposited on the sidewalk by some third person, defendant and constructive knowledge of its presence there and failed to exercise reasonable care to remove it and that such negligence was a proximate cause of her injury. To impose liability in such circumstances the occupier of business premises '* * * must have either actual or constructive knowledge of the dangerous condition or have been able by the exercise of ordinary care to discover the condition, which if known to him, he should realize as involving an unreasonable risk to invitees on his premises. His negligence in such cases is founded upon his failure to exercise ordinary care in remedying the defect after he has discovered it or as a man of ordinary prudence should have discovered it.' ***744** Hatfield v. Levy Brothers, supra; Louie v.

Hagstrom's Food Stores, 81 Cal.App.2d 601, 606, 184 P.2d 708; Girvetz v. Boy's Market, Inc., 91 Cal.App.2d 827, 829, 206 P.2d 6, 8. In the last cited ****38** case, the court pointed out that 'The fact alone that a dangerous condition existed at the time the accident occurred will not warrant an inference that the defendant was negligent. There must be some evidence, direct or circumstantial, to support the conclusion that the condition had existed long enough for the proprietor, in the exercise of reasonable care, to have discovered and remedied it.' To the same effect are Owen v. Beauchamp, 66 Cal.App.2d 750, 752, 152 P.2d 756; McKellar v. Pendergast, 68 Cal.App.2d 485, 491, 156 P.2d 950; Louie v. Hagstrom's Food Stores, supra, 81 Cal.App.2d at page 607, 184 P.2d 708.

There is no evidence that defendant had any actual knowledge of the presence of the piece of chalk on its sidewalk. There is no direct evidence that it was there for any particular period of time—no one testified to having seen it prior to plaintiff's fall.

In her attempt at 'reconstructing the evidence' plaintiff says it appears that one of the two previously mentioned chalk marks on the sidewalk was there prior to plaintiff's fall; that 'the pre-existing chalk mark in all probability was caused when appellant's sweeper swept the sidewalk some several hours earlier;' and that the chalk on which plaintiff fell must either have had its origin with defendant (an argument already considered), 'or the chalk had been on the sidewalk for such an appreciable period of time * * * that it had created a mark on the sidwalk before respondent fell as a result of its presence.' In thus 'reconstructing the evidence' plaintiff has indulged in a bit of what might be called 'poetic license.' There is nothing in the evidence to indicate that one of the chalk marks was on the sidewalk prior to the time plaintiff and her husband came along. It is not unlikely that plaintiff was responsible for both of these chalk marks. The smaller of the two marks was to the north of the larger one. Thus, in her walk south she first came to the point where the small mark was found. The larger mark was only a step or two further south in the direction she was walking. In taking a step, plaintiff may have kicked the chalk with such force that it rolled forward a few feet (thus remaining in her pathway) but the downward pressure of her foot may have been great enough to make a small mark where the initial impact occurred. Upon stepping ***745** on it more firmly a bigger mark was made and she was caused to fall. This hypothesis may be challenged as speculative but it is no more speculative than plaintiff's assertion that the mark was there before plaintiff arrived. In support of her theory that one of the chalk marks was on the sidewalk before plaintiff fell, she surmises that 'the pre-existing chalk mark in all probability was caused when appellant's sweeper swept the sidewalk some several hours earlier.' This statement on its face discloses it is a mere guess. Furthermore, it is unlikely that such a mark would be made in sweeping the sidewalk with a broom, which is the tool Polley testified he used for that purpose.

The hypothesis that 'the chalk had been on the sidewalk for such an appreciable period of time that it had created a mark thereon before plaintiff fell' is not only speculative, as previously pointed out, but without legal significance. True, it might have been dropped there and stepped on in such fashion as to produce a mark on the sidewalk five minutes before plaintiff came along. But what would not support the conclusion that the dangerous condition had existed long enough for the defendant, in the exercise of reasonable care, to have discovered and removed it. Constructive knowledge of the presence of the chalk would thus be lacking. Girvetz v. Boys' Market, Inc., supra; Owen v. Beauchamp, supra; Louie v. Hagstrom's Food Stores, supra. Plaintiff thus fails to establish any reasonable inference in support of her theory of constructive knowledge on the hypothesis that one of the chalk marks was on the sidewalk before she fell.

Plaintiff attaches significance to the condition of the sidewalk in the area where she fell. She draws the inference that it had not been properly maintained because there ****39** were two or three globs of hardened gum and 'a black mark' on it, and the nurse picked up approximately a half dozen 'little pieces of something' and rubbed two or three places with her foot 'as though she was trying to rub something out.' It is not claimed that these items had anything to do with plaintiff's falling. Nor is it suggested that they created a dangerous condition. Defendant therefore violated no duty to plaintiff in thus maintaining the sidewalk in this area. Furthermore, the presence of these items furnishes no basis for an inference that the piece of chalk had been there for such a period of time that defendant, in the exercise of reasonable care, should have discovered it and removed it. Hence, ***746** defendant was not charged with constructive knowledge of the presence of the chalk on the sidewalk. Owen v. Beauchamp, supra; McKellar v. Pendergast, supra; Frank v. J. C. Penney Co., Inc., supra.

The cases cited by plaintiff do not sustain her position. In each of them there was evidence affirmatively proving either that the condition was created by defendant or that the condition had existed for such length of time as to charge defendant with constructive knowledge thereof.[1]

[1] The following is a brief analysis of plaintiff's cases:
In Travis v. Metropolitan Theatres Corp., 91 Cal.App.2d 664, 205 P.2d 475, 477, there was evidence that the vomit upon which the plaintiff slipped had actually remained on the floor 'long enough to form a crust on its surface.' It could thus be inferred that the

substance had been there for a substantial period of time.

In Hamilton v. Pacific Elec. Ry. Co., 12 Cal.2d 598, 86 P.2d 829, 830, defendant was a common carrier. The evidence indicated that during the thirty minute period while plaintiff was in the waiting room, no one entered or left. The puddle of oil upon which plaintiff slipped was located in the room by the exit door. It was thus a question for the jury whether this proved that the oil was there 'for such a length of time that the defendant was charged with notice of the fact of its said existence and location.'

In Lehman v. Richfield Oil Corp., 121 Cal.App.2d 261, 263 P.2d 13, 15, plaintiff slipped on a telephone booth step. There was evidence 'that the oily or greasy spot had been on the step for many hours before the accident.'

In Louie v. Hagstrom's Food Stores, 81 Cal.App.2d 601, 184 P.2d 708, 712, there was much direct and circumstantial evidence indicating that the syrup which caused plaintiff to fall had been on the floor for a substantial length of time; the cashier could see the area from her position; no employee examined the area for at least twenty minutes before the accident; the puddle of syrup was quite large; the syrup was thick and the day was cold, indicating that a substantial period of time would have to elapse before the puddle would reach such proportions. The evidence showed the 'this condition existed long enough so that defendant should, in the exercise of ordinary care, have discovered and remedied it.'

In Tuttle v. Crawford, 8 Cal.2d 126, 63 P.2d 1128, the defendants carried wet lettuce across the cement floor of their market. After plaintiff fell she had vegetable particles adhering to her stockings and dress, and there were stains on her garments showing contact with unclean water. The evidence indicated that the dangerous condition was created by the defendants themselves, and that they either did not clear the place of that condition or improperly attempted to do so.

In Van Wye v. Robbins, 48 Cal.App.2d 660, 120 P.2d 507, 509, plaintiff fell upon a heavy black grease puddle, one-eighth of an inch thick and five inches in diameter. There was evidence to support the finding that the grease had remained upon the surface of the parking lot 'for more than twenty minutes.'

In Sears, Roebuck & Co. v. Meyer, 9 Cir., 205 F.2d 321, 322, the evidence indicated that oil upon which plaintiff slipped had remained on the cement for an hour and forty-five minutes before the accident. Plaintiff testified that the oil substance was 'dusty' and 'had dirt on it' when she slipped upon it, thus indicating that it had been there for some time. Furthermore, defendant 'knowingly permitted its customers to use a driveway which occupied a part of the sidewalk, thereby creating a condition which was likely to cause harm to persons using that part of the sidewalk.'

In Ahern v. S. H. Kress & Co., 97 Cal.App.2d 691, 218 P.2d 108, 113, the puddle of liquid in which plaintiff slipped and fell was located directly under a counter which contained paints, oils, turpentine, paint remover and related substances. Therefore, it was reasonable to infer that the puddle was the result of some leakage from the counter. Moreover, 'the size, location, shape and nature of the puddle, together with the other facts and circumstances' were sufficient to sustain a finding that the condition had existed for a substantial length of time.

In Goldsmith v. Mills, 130 Cal.App.2d 493, 279 P.2d 51, the area where plaintiff fell was littered with paper. The evidence indicated not only that the condition had existed for a substantial length of time, but also that defendants' employees had created the condition.

In Hale v. Safeway Stores, Inc., 129 Cal.App.2d 124, 276 P.2d 118, 120, plaintiff slipped on a banana in the aisle of defendant's store near the fruit counter. The banana had some 'small teeth marks' on it, apparently made by a child who bit into the banana and then dropped it on the floor. Plaintiff testified that in the thirty or more minutes during which she was in the store prior to the accident, she saw no one around the fruit counter, although an employee testified that he swept the area of few minutes before the injury occurred. Plaintiff also testified that no small children were in the store during the period she was there. The court reversed a judgment of nonsuit on the ground that there was some evidence from which a jury might have found that the banana had lain on the floor for a length of time sufficient enough to charge defendant with knowledge. The court went on to state: 'Concededly a person operating a fruit and vegetable section in a store should at least, as to that portion of the premises, in the exercise of ordinary care, maintain a more vigilant outlook than would be required in the operation of some other type of business where the danger of things falling on the floor upon which a person might easily slip and fall is not so obvious.' 129 Cal.App.2d at page 132, 276 P.2d at page 123.

In Wills v. J. J. Newberry Co., 43 Cal.App.2d 595, 111 P.2d 346, there was substantial evidence that defendant's employees had actual knowledge of the existence of the vomit upon which plaintiff slipped and fell. There were several salesgirls in the immediate vicinity when a small boy had vomited. Moreover, another patron slipped and fell at that spot a few minutes before the plaintiff's injury occurred.

In Harris v. Joffe, 28 Cal.2d 418, 170 P.2d 454, a landlord-tenant case, there had been several complaints by various tenants of the apartment house concerning the slippery condition of the vestibule floor (which had no floor covering) and the unlighted condition which prevailed most of the time. Thus, defendant had actual knowledge of the dangerous condition.

In Hatfield v. Levy Brothers, 18 Cal.2d 798, 117 P.2d 841, the evidence showed that the floor where plaintiff fell was extremely slippery. A skid mark was left by plaintiff's shoe and there was wax on her coat. The floor had been waxed by defendant's employee just prior to the accident. Thus, there was substantial evidence that defendant had created the dangerous

condition.

In Granucci v. Claasen, 204 Ca. 509, 269 P. 437, 59 A.L.R. 435, there was substantial evidence that defendant had not inspected the wooden driveway where plaintiff fell for many months before the accident. Some of the spikes or nails had worked as much as three-fourths of an inch upward and the boards were somewhat loosened by the heavy vehicles which had used the driveway for many years before the accident.

In Sanders v. MacFarlane's Candies, 119 Cal.App.2d 497, 259 P.2d 1010, the evidence showed that the floor where plaintiff slipped was highly polished and was slippery by reason of an excessive amount of wax. Defendant's employee had polished the floor on the weekend before the accident, which occurred on a Monday.

In Mattox v. Isley, 111 Cal.App.2d 774, 245 P.2d 664, the evidence showed that the dangerous condition at the back of a seat in defendant's theater had not been remedied after the accident. Moreover, other seats in the theater were found to be in the same condition. The court ruled that a presumption of constructive notice could arise from factors such as these, as well as from mere lapse of time.

****40 *747** Plaintiff's next contention is that the judgment may be sustained on the basis of admissions against interest in the Customer Accident Report which was filled out by defendant's ***748** nurse and signed by Mr. Teed, who was defendant's operating superintendent. Plaintiff argues that the fact that the space following the word 'inspected' on this report was not checked justifies an inference that 'the area in question had not been inspected prior to the accident.' This is not a legitimate inference. ****41** The obvious fact is that the report contains no statement relative to inspection. It is simply silent on that question. It is not an admission that the area had not been inspected. The failure of the nurse to answer the question relative to inspection is understandable since this was a matter outside the normal scope of her activities.

In this connection, plaintiff argues that from the fact the nurse placed a checkmark in the blank space following the words 'Swept Daily' on the report it may be inferred that the area in question was only swept once a day. Plaintiff then says '[t]hat evidence of failure to sweep and inspect can establish liability in the absence of any evidence of time lapse.' The cases relied on by plaintiff do not support her position (each is briefly analyzed in the footnote, supra). Where, as in this phase of her argument, plaintiff is relying upon constructive knowledge of the dangerous condition on the part of defendant, the basis of liability is not on the failure to sweep the premises but the fact that the dangerous condition has existed for such a period of time that defendant, in the exercise of reasonable care, should have discovered it and remedied it. There must be substantial evidence, either direct or circumstantial, to support this conclusion before a judgment on this theory can be sustained. Girvetz v. Boy's Market, Inc., supra; Owen v. Beauchamp, supra; McKellar v. Pendergast, supra; Louie v. Hagstrom's Food Stores, supra.

[11] Plaintiff's final contention is that defendant admitted ***749** liability for plaintiff's injury by paying the ambulance bill and the doctor bill for the emergency call. This contention is without merit. Courts generally have held or recognized as inadmissible, evidence of payment, or offer or promise of payment, of medical, hospital and similar expenses of an injured litigant by the opposing party, in the absence of other circumstances indicating an admission of negligence. For a collection of these cases, see Annotation, 20 A.L.R.2d 291. A concomitant principle found in the cases is that, apart from the admissibility of such evidence, the act itself does not tend to imply an acknowledgment of liability. Winningham v. Travelers Inc. Co., 5 Cir., 93 F.2d 520, 521; Martin v. Burgess, 5 Cir. 82 F.2d 321, 323; Potts v. Armour & Co., 183 Md. 483, 39 A.2d 552, 556; Norman v. Porter, 197 N.C. 222, 148 S.E. 41, 42; Young v. Creegan, La.App., 23 So.2d 820, 821; Ocean Accident & Guarantee Corp. v. Missouri Engineering & Contracting Co., Mo.App., 63 S.W.2d 196, 199. See also Annotation, 20 A.L.R.2d 291, 292 note 1. Logic and reason support this view. If a contrary rule were adopted, it would tend to deter, instead of encourage, one who has injured another from giving aid. Biddix v. Rex. Mills, Inc., 237 N.C. 660, 75 S.E.2d 777. In a well known parable, the Good Samaritan placed an injured man upon his own beast, poured wine and oil into his wounds, and paid his maintenance charges at the inn. He generously promised to give evne more, if necessary. No one would suggest that by his conduct he impliedly admitted that he was liable for the injuries the unfortunate man sustained. See Brown v. Wood, 201 N.C. 309, 160 S.E. 281. This conclusion is analogous to the doctrine, now well established, that evidence of precautions taken or repairs made after an accident is not admissible to show a negligent condition at the time of the accident. Helling v. Schindler, 145 Cal. 303, 312, 78 P. 710.

The judgment and the order are reversed, and the trial court is directed to grant defendant's motion for judgment notwithstanding the verdict.

107 Cal.App.3d 475
Court of Appeal, Third District, California.

The PEOPLE, Plaintiff and Respondent,
v.
Roy Eugene HENDERSON, Defendant and Appellant.

Cr. 9939.
|
June 25, 1980.
|
Hearing Denied Aug. 28, 1980.

Synopsis
The People petitioned for extension of defendant's commitment as a mentally disordered sex offender. The Superior Court, Sacramento County, William H. Lally, J., extended the commitment, and defendant appealed. The Court of Appeal, Puglia, P. J., held that (1) an estimate of an individual's dangerousness is a proper subject for expert psychiatric evaluation and testimony and may be considered by the fact finder; (2) application to defendant of the statutory procedure for extending the maximum term of commitment for certain mentally disordered sex offenders did not violate the prohibition against ex post facto laws; (3) singling out for extended commitment "treatable" mentally disordered sex offenders did not violate equal protection; (4) the extended commitment procedure comported with due process requirements; (5) the commitment provision was not void for vagueness; (6) the trial court did not commit error by refusing to give a proffered jury instruction; and (7) it was within the trial court's discretion to conclude that a statement made by a prospective juror during jury selection was not prejudicial and did not warrant dismissal of the entire jury panel.

Affirmed.

Blease, J., concurred in the result and filed opinion.

Vacating, Cal.App., 162 Cal.Rptr. 886.

West Headnotes (19)

[1] **Mental Health**
Appeal

Although it appeared that one-year extended commitment to state hospital as mentally disordered sex offender had expired, the challenge to the commitment was not moot where the records of the court, of which judicial notice was taken, disclosed that prior to the expiration of the extended one-year commitment, a second proceeding extended the defendant's commitment for another year and where a separate appeal from the second extension was pending before the court and any defect which would invalidate the first extension of commitment would necessarily render all subsequent extension orders invalid. West's Ann.Welfare & Inst.Code, § 6316.2.

Cases that cite this headnote

[2] **Mental Health**
Discharge or Continued Commitment

Both the prior criterion for extension of commitment as a mentally disordered sex offender, which demanded that the person present a serious threat of substantial harm to the health or safety of others, and the amended requirement of "a substantial danger of bodily harm to others" referred not only to existing mental state but also to the probability of certain types of future behavior. West's Ann.Welfare & Inst.Code, § 6316.2.

OPINION ON REHEARING

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

PUGLIA, Presiding Justice.

We deal here with recently enacted legislation providing the mechanism to extend the commitments of certain mentally disordered sex offenders (MDSO). The defendant, committed as an MDSO, challenges the constitutionality of Welfare and Institutions Code section 6316.2 (Stats.1977, ch. 164, s 3; all further statutory references are to sections of the Welfare and Institutions Code unless otherwise indicated); he aims his major thrust, however, at the permitted scope of expert testimony received at his trial conducted pursuant to section 6316.2. The trial resulted in a one-year extension of defendant's MDSO commitment. We shall affirm the judgment.

Defendant was charged by felony complaint filed August 11, 1975, with (1) forcing a minor to copulate him orally (Pen.Code, s 288a), (2) willfully causing a child to suffer unjustifiable physical pain and mental suffering under circumstances likely to produce great bodily injury and death (Pen.Code, s 273a, subd. (1)), and (3) assault with force likely to produce great bodily injury (Pen.Code, s 245, subd. (a)). These offenses were alleged to have been committed August 6, 1975, upon a four-year-old boy. Defendant entered a plea of guilty before the magistrate to the felony charge of violation of Penal Code section 273a, subdivision (1), and was certified thereon to the superior court for further proceedings (Pen.Code, s 859a).

On December 9, 1975, the superior court adjourned criminal proceedings and certified defendant for hearing and examination to determine if he was an MDSO (s 6302). Thereafter, defendant was found to be an MDSO and, on January 6, 1976, was committed to the Department of Mental Health for confinement in Atascadero State Hospital.

[1] On March 28, 1978, the People timely filed a petition in superior court to extend defendant's commitment as an MDSO ****24** under section 6316.2. The court appointed psychiatrists to examine defendant. (ss 6316.2, subd. (e), 6307.) Thereafter a trial was held before a jury which sustained the petition. As a result, on July 26, 1978, defendant ***481** was recommitted to the Department of Mental Health for confinement in Atascadero State Hospital for the extended term of one year. Defendant timely filed notice of appeal.[1]

[1] On its face, the present appeal appears moot because defendant's one-year extended commitment has now expired. However, the records of this court, of which we take judicial notice (Evid.Code, s 452, subd. (d)(1)), disclose that prior to the expiration of the extended one-year commitment with which this appeal is concerned, a second proceeding extended defendant's commitment for another year to end on August 7, 1980; a separate appeal from the second extension is now pending before this court. Since any defects which would invalidate the first extension of commitment would necessarily render all subsequent extension orders invalid (s 6316.2, subd. (h); In re Acosta (1971) 21 Cal.App.3d 51, 54, 98 Cal.Rptr. 208; People v. Thomas (1968) 260 Cal.App.2d 196, 199-201, 67 Cal.Rptr. 234), the present appeal is not moot.

I.

Admissibility of Expert Testimony That Defendant Constituted a Serious Threat of Substantial Harm to Others.

At trial it was shown that defendant had committed the underlying criminal offense upon Alex P., the four-year-old son of the family with whom defendant was then staying. While defendant was babysitting the child, he became furious with him for repeated bedwetting and beat him severely. During the beating, defendant became sexually aroused and forced the boy to copulate him orally. The child suffered severe injuries, including wounds to his genitals, all of which required his hospitalization for three days.

During his initial commitment, defendant told a psychiatric technician at Atascadero that he had several times before spanked another child and become sexually aroused. While at Atascadero, defendant repeatedly broke the rules; his behavior there was marked by anger, acts of verbal and physical aggression and resistance to therapy. In the past, defendant had also habitually made obscene telephone calls.

[2] Several mental health experts testified at defendant's extended commitment hearing. The significance of their testimony to this appeal can best be understood in relationship to the relevant terms of section 6316.2, the extended commitment statute, which at the time of defendant's trial provided in part:

"(a) A person may be committed beyond the term prescribed by Section 6316.1 only under the procedure set forth in this section and only if such person meets all of the following:

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

***482** "(1) The 'sex offense' as defined in subdivision (a) of Section 6302 of which the person has been convicted is a felony, . . .[2]

[2] The definition of "sex offense" in section 6302, subdivision (a), includes ". . . any felony . . . which is shown by clear proof . . . to have been committed primarily for purposes of sexual arousal or gratification."

"(2) Suffers from a mental . . . disorder, and as a result of such mental disorder, is predisposed to the commission of sexual offenses to such a degree that he presents a serious threat of substantial harm to the health and safety of others." (Emphasis added.)[3]

[3] The criterion that the person present "a serious threat of substantial harm to the health and safety of others" has been changed to require now that he present "a substantial danger of bodily harm to others" (Stats.1979, chs. 991, 992). Both criteria refer not only to existing mental state but also to the probability of a certain type of future behavior. Whether such predicted behavior constitutes "a serious threat of substantial harm" or "a substantial danger of bodily harm" to others is, we think, a distinction of no significance to the resolution of defendant's challenge to the permitted scope of expert testimony.

An earlier amendment to section 6316.2 substituted "disease, defect or disorder" for "disorder" in subdivision (a)(2) (Stats.1978, ch. 1036, s 1; Stats.1978, ch. 1039, s 2).

Each of the People's experts testified in detail that defendant met the statutory criteria ****25** for extended commitment. Their conclusions were based on somewhat different theories.

Dr. Wilcox, a psychiatrist with 12 years of experience, diagnosed defendant as having a character disorder of a nonspecific nature. He ruled out pedophilia. Dr. Wilcox believed that because defendant had not developed sufficient psychological insight, he remained predisposed to the commission of sexual offenses and constitutes a serious threat of substantial harm to others.

Dr. Bennett, a psychiatrist with 25 years of experience, ascribed to defendant the specific character disorders of aggressive sexuality and male pedophilia. Dr. Bennett based his diagnosis on defendant's history including the commitment offense, obscene telephone calls, and reported sexual fantasies. Because of the seriousness of the commitment offense and the lack of perceived change in defendant's pattern of rule-breaking and aggressiveness, Dr. Bennett believed defendant predisposed to the commission of sexual offenses to the extent he constituted a serious threat of substantial harm to others.

***483** Dr. Bitter, a psychologist, diagnosed defendant as a sociopath, a psychopathic character disorder manifested in impulsive behavior and lying. Based on the nature of the commitment offense, defendant's history and reported sexual fantasies, including a preoccupation with sexual dominance, Dr. Bitter also believed defendant predisposed to the commission of sexual offenses and a serious threat to do substantial harm to others.

Dr. Whippel, a psychiatrist with 16 years of experience, testified for the defense that in his opinion the commitment offense and defendant's past history provided an insufficient basis to establish defendant's predisposition to commit a sexual offense such that he would present a serious threat of substantial harm to others.

[3] Prior to the testimony of each of the People's expert witnesses, defendant challenged their qualifications to render an opinion whether defendant constituted a serious threat of substantial harm to the health and safety of others. After hearing, the court denied each such challenge and ruled each witness qualified to render an opinion on the subject.

At trial, defendant conceded the qualifications of the experts to render their opinions on his mental state. He reiterates that concession here. Defendant contends, however, that psychiatric opinions to the effect that he presents a threat of substantial harm to the health and safety of others were erroneously admitted because such testimony does not meet the minimal standards for admissibility, i. e., proven reliability and general acceptance in the relevant, professional community of the clinical method of examination as a mode for extrapolating predictions of future behavior. Defendant contests the qualifications of psychiatrists, psychologists and other mental health professionals to render expert opinions on such questions, arguing that the state of the art is not sufficiently advanced to enable such professionals to make "predictive judgments" about a person's future behavior with sufficient reliability to be accepted as evidence.

By framing the question in this way, defendant seeks to foreordain the answer. Indeed, if the lack of confidence within the psychiatric community concerning the capacity of its practitioners to predict future behavior is as general

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

as defendant contends, the question as posed by defendant assumes the rhetorical form.[4]

[4] The following articles were cited by defendant to the trial court to indicate the extent of psychiatric skepticism concerning the predictive powers of mental health professionals: Diamond, The Psychiatric Prediction of Dangerousness (1975) 123 U.Pa.L.Rev. 439; Ennis & Litwack, Psychiatry and the Presumption of Expertise: Flipping Coins in the Courtroom (1974) 62 Cal.L.Rev. 693; Hunt & Wiley, Operation Baxstrom After One Year (1968) 124 Am.J.Psych. 974; Rappeport, Lassen & Gruenwald, Evaluation and Follow-up of State Hospital Patients Who Had Sanity Hearings (1962) 118 Am.J.Psych. 1078; Steadman, Follow-Up on Baxstrom Patients Returned to Hospitals for the Criminally Insane (1973) 130 Am.J.Psych. 317; Steadman & Keveles, The Community Adjustment and Criminal Activity of the Baxstrom Patients: 1966-1970 (1972) 129 Am.J.Psych. 304; Task Force Report, Clinical Aspects of the Violent Individual (Am.Psych.Assn., 1974) p. 25; Wenk, Robison & Smith, Can Violence Be Predicted? (1972) 18 Crime & Del. 393.

***484 **26** It is obvious that an opinion that an individual poses a serious threat of substantial harm to others constitutes at least in part a prediction as to that person's future conduct. But in the context of MDSO proceedings, such an opinion also includes a significant contemporary component. It speaks as well to the present proclivities of the individual; it says that he is at this moment fully capable of conduct dangerous to the health and safety of others, and that the acting out of these aggressive propensities can be anticipated upon the unfortunate convergence of stimulus and opportunity. Thus whether the predictive component of the expert's opinion is ever validated by future events will likely depend on circumstances beyond the control of the actor. However, the very real statistical possibility that the prediction may never be fulfilled does not detract from the validity of the expert's opinion as to the present threat of substantial harm posed by the defendant.

In its present dimension, the expert's opinion is merely one way of characterizing defendant's existing mental condition, a subject relevant to these proceedings in which the expert is called upon to examine for and diagnose mental disorders which predispose to the commission of sexual offenses. Courts of this state have long recognized that a psychiatric expert's appraisal of an individual's dangerousness (serious threat to do substantial harm) is directly related to the expert's evaluation of that person's existing mental state. (People v. Hines (1967) 66 Cal.2d 348, 355, 57 Cal.Rptr. 757, 425 P.2d 557; People v. Hines (1964) 61 Cal.2d 164, 173, 37 Cal.Rptr. 622, 390 P.2d 398; People v. Bickley (1962) 57 Cal.2d 788, 793, 22 Cal.Rptr. 340, 372 P.2d 100.) As we have noted, defendant concedes the competence of the People's experts to testify to their opinion of defendant's present mental state.

[4] [5] Recently the United States Supreme Court has pointed out that "Whether the individual is mentally ill and dangerous to either himself or others . . . turns on the meaning of the facts which must be interpreted ***485** by expert psychiatrists and psychologists." (Emphasis added; Addington v. Texas (1979) 441 U.S. 418, 429, 99 S.Ct. 1804, 1811, 60 L.Ed.2d 323, 333.) "Psychiatric diagnosis . . . is to a large extent based on medical 'impressions' drawn from subjective analysis and filtered through the experience of the diagnostician." (Ibid.) "The subtleties and nuances of psychiatric diagnosis render certainties virtually beyond reach in most situations." (Ibid.) Even so, an estimate of an individual's dangerousness is a proper subject for expert psychiatric evaluation and testimony and must be considered by the finder of fact. (Ibid.) The mere fact that lay persons may be able rationally to draw the same inferences as to dangerousness from the same facts without the assistance of expert testimony does not deprive that testimony of all value where it is nonetheless "relatively illuminating" (Ballard v. Superior Court (1966) 64 Cal.2d 159, 174-175, 49 Cal.Rptr. 302, 410 P.2d 838). At least that much may be said for the predictive judgment of a mental health professional whose opinion of an individual's dangerous propensities is a "judgment which doctors and professionals must regularly render under accepted rules of responsibility." (Tarasoff v. Regents of University of California (1976) 17 Cal.3d 425, 438, 131 Cal.Rptr. 14, 25, 551 P.2d 334, 345.)

In proceedings under the MDSO statute, the court is required "with the assistance of psychiatrists" to identify those who come within the reach of the statute. (People v. Allen (1973) 29 Cal.App.3d 932, 935, 106 Cal.Rptr. 43; In re Perkins (1958) 165 Cal.App.2d 73, 78, 331 P.2d 712.) In proceedings under section 6316.2, the court is required to appoint the necessary psychologists or psychiatrists "in accordance with this article . . . ." (s 6316.2, subd. (e).) Section 6307 provides that the court shall appoint "not less than two nor more than ****27** three certified clinical psychologists . . . or psychiatrists . . . to make a personal examination of the alleged mentally disordered sex offender, directed toward ascertaining whether the person is a mentally disordered sex offender " (emphasis added). What then is the precise scope of the expert's inquiry under section 6307? The answer is provided in section 6300: ". . . 'mentally disordered sex

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

offender' means any person who by reason of mental defect, disease, or disorder, is predisposed to the commission of sexual offenses to such a degree that he is dangerous to the health and safety of others." (Emphasis added.)

[6] Thus appointed psychological and psychiatric experts have long been required by statute in original MDSO commitment proceedings to bring to bear on the question of an individual's future conduct, i. e., his dangerousness, ***486** their admittedly imprecise diagnostic techniques. Viewed in this perspective, the techniques employed by the experts herein are neither new nor experimental (cf. People v. Kelly (1976) 17 Cal.3d 24, 130 Cal.Rptr. 144, 549 P.2d 1240). Although admittedly those techniques do not produce certainty, the significance of this failure to meet an ideal of perfection is a consideration for the trier of fact in weighing the effect of the testimony. (Schnear v. Boldrey (1971) 22 Cal.App.3d 478, 484, 99 Cal.Rptr. 404; People v. Stuller (1970) 10 Cal.App.3d 582, 597, 89 Cal.Rptr. 158; People v. Brekke (1967) 250 Cal.App.2d 651, 661-662, 58 Cal.Rptr. 854.)

The People's experts all acknowledged that there is disagreement within the psychiatric profession concerning the predictive ability of its practitioners. However, they all implicitly share the opinion that, given certain facts, predictions of future dangerousness may rationally be projected, and that the drawing of such inferences is properly within the expertise of qualified mental health professionals.

[7] [8] The qualification of an expert is a matter addressed to the sound discretion of the trial judge whose determination will be upheld unless a clear abuse of discretion is shown (Evans v. Ohanesian (1974) 39 Cal.App.3d 121, 127, 112 Cal.Rptr. 236). The trial court acted within its discretion in admitting expert testimony that defendant constituted a substantial threat of harm to the health and safety of others.

II.

Constitutional Challenges to Section 6316.2

A. Ex Post Facto Issue.

[9] Defendant argues that section 6316.2 as applied to him is an ex post facto law, prohibited by both the federal and state Constitutions. U.S.Const. art. I, s 9, cl. 3; Cal.Const. art. I, s 9.) We disagree.

At the time of defendant's offense in 1975 and his MDSO commitment in January 1976, a violation of Penal Code section 273a, subdivision (1), was punishable by a maximum term of 10 years in prison (Stats.1965, ch. 697, s 1). However, under section 6316, defendant's MDSO commitment was of indefinite duration, up to life. (Stats.1971, ch. 1593, s 418.) Effective and operative January 1, 1977, section 6316 was amended to provide an indeterminate term of confinement ***487** under an MDSO commitment not to exceed, however, the aggregate maximum term of imprisonment which a defendant could receive if sentenced for the commitment offense. (Stats.1976, ch. 1101, s 9.) This amendment reduced defendant's maximum term of confinement as an MDSO from life to 10 years in conformance with the maximum term provided for violation of Penal Code section 273a, subdivision (1), at the time of defendant's offense and MDSO commitment.

In 1976, the Legislature enacted the Uniform Determinate Sentencing Law (DSL) which reduced the maximum penalty for violation of Penal Code section 273a, subdivision (1), to three years in state prison. (Stats.1976, ch. 1139, ss 165, 273.) While the DSL was enacted in 1976, and became effective on January 1, 1977, it expressly did not become operative until July 1, 1977. (Stats.1976, ch. 1139, s 351.5.)

Shortly after the passage of the DSL, the Legislature added ****28** Welfare and Institutions Code section 6316.2 to provide a procedure to extend the maximum term of confinement for certain MDSO's; section 6316.2 was effective June 29, 1977, and operative on July 1, 1977, the same date as the DSL. (Stats.1977, ch. 164, ss 3, 6, 7; Stats.1976, ch. 1139, s 351.5.)

Because defendant was incarcerated as an MDSO during the period from January 1, 1977, until July 1, 1977, he argues that the application of the extended commitment provision of section 6316.2, which was effective and operative subsequent to the January 1, 1977, effective date of the DSL, would constitute an ex post facto punishment. He claims that for ex post facto purposes he obtained a "vested interest" in the maximum three-year term fixed by the DSL as of its effective date rather than its operative date and cites as authority Rose v. Board of Retirement (1949) 92 Cal.App.2d 188, 193, 206 P.2d 903.

Defendant's reliance on Ross is misplaced. The Ross court was concerned with the limited question of whether an individual attained a vested interest in retirement privileges as of the effective date of a local ordinance,

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

rather than at the time of its operative date. In order to give effect to the manifest legislative intent, the court held that the effective date of the ordinance controlled (see People v. Hinojosa (1980) 103 Cal.App.3d 57, 62, 162 Cal.Rptr. 793). By contrast, we confront here statewide legislation which, in an abrupt break with time-honored practice, discards the hoary indeterminate sentencing law (ISL) and replaces it with a comprehensive system of determinate sentencing. Orderly ***488** transition required the Legislature to enact and render operative at one time all the components of the DSL and the many related changes required thereby. It was obviously necessary therefore to make the passage of certain provisions contingent on the passage of other interrelated provisions. (E. g., Stats.1976, ch. 1139, s 349.5.)

Under the California Constitution, a statute enacted at a regular session of the Legislature generally becomes effective on January 1 of the year following its enactment except where the statute is passed as an urgency measure and becomes effective sooner. (Cal.Const., art. IV, s 8, cl. (c)(1).) In the usual situation, the "effective" and "operative" dates are one and the same, and with regard to ex post facto restrictions, a statute has no force and effect until such effective-operative date. (DeWoody v. Superior Court (1970) 8 Cal.App.3d 52, 56, 87 Cal.Rptr. 210.) Yet, as here, the Legislature may deem it necessary to postpone the operation of certain statutes until a later time. (See 26 Ops.Cal.Atty.Gen. 141, 143 (1955).) Just as the Legislature may provide for an operative date subsequent to an effective date of a statute to allow persons affected to become acquainted with and implement its provisions (see op. cit. supra, at p. 144; 2 Sutherland, Statutory Construction (rev. 3d ed. 1973) s 33.07, p. 12), the Legislature may also wish to postpone the operative date to provide time for emergency clean-up amendments and the passage of interrelated legislation.

Thus, in the context of the comprehensive determinate-sentence legislation involving extensive statutory revision, where the Legislature specifically provides for uniform postponement in the operative date of the entire legislative scheme, we do not think the Legislature intended that a criminal defendant would accrue a vested interest in the application of only a small part of the whole on its effective date. (People v. Hinojosa, supra, 103 Cal.App.3d at pp. 65, 66, 162 Cal.Rptr. 793.)[5] An enactment is a law on its effective date only in the sense that it cannot be changed except by legislative process; the rights of individuals under its provisions are not substantially affected until the provision operates as law.

[5] Retroactive application of a punishment-mitigating statute is not a question of constitutional right but of legislative intent. (In re Estrada (1965) 63 Cal.2d 740, 744, 48 Cal.Rptr. 172, 408 P.2d 948.)

[10] "(A)n ex post facto law is ' "one which, in its operation, makes that criminal or penal which was not so at the time the ****29** action was performed; or which increases the punishment; or, in short, which, in ***489** relation to the offense or its consequences, alters the situation of a party to his disadvantage." ' " (People v. Benefield (1977) 67 Cal.App.3d 51, 58, 136 Cal.Rptr. 465, 468, quoting Thompson v. Missouri (1898) 171 U.S. 380, 383, 18 S.Ct. 922, 923, 43 L.Ed. 204, 206.) Since defendant could not have acquired a vested right in the ameliorative provisions of the DSL prior to its operative date (see In re Harper (1979) 96 Cal.App.3d 138, 139-140, 157 Cal.Rptr. 759; In re Bray (1979) 97 Cal.App.3d 506, 510, 516, 158 Cal.Rptr. 745), the application to him of section 6316.2, operative at the same time as the DSL, could not constitute an ex post facto penalty.

B. Equal Protection Issue.

[11] Defendant contends that section 6316.2, by singling out for extended commitment what he calls "amenable MDSO's" creates an unconstitutional classification in violation of equal protection of the laws guaranteed by both the federal and state Constitutions.

To the contrary, the California Supreme Court has recently indicated that MDSO's may be subjected to a period of extended commitment once the maximum term of punishment has expired without violating equal protection of the laws if the People establish that the person committed remains a danger to the health and safety of himself or others. (In re Moye (1978) 22 Cal.3d 457, 467, 149 Cal.Rptr. 491, 584 P.2d 1097.)

[12] Commitment of MDSO's to a state hospital is for the purposes of treatment not punishment. (22 Cal.3d at p. 466, 149 Cal.Rptr. 491, 584 P.2d 1097; s 6316.2, subd. (i).) Implicit in the MDSO statutory scheme is the legislative finding that certain MDSO's shall be committed to a state mental health facility because of their mental status, i. e., because they are in need of and will benefit by the special treatment afforded there. This difference in mental condition between the classes of ordinary offenders, "non-treatable" MDSO's and "treatable" MDSO's is an adequate constitutional ground for the difference in the terms of commitment of the classes, applying the requisite "compelling interest"

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

standard since personal liberty is at stake. (People v. Superior Court (Rigg) (1978) 80 Cal.App.3d 407, 414, 145 Cal.Rptr. 711; see also In re Moye, supra, 22 Cal.3d at pp. 462, 465, 149 Cal.Rptr. 491, 584 P.2d 1097; In re Franklin (1972) 7 Cal.3d 126, 146, 101 Cal.Rptr. 553, 496 P.2d 465; cf. People v. Saffell (1979) 25 Cal.3d 223, 157 Cal.Rptr. 897, 599 P.2d 92.)

***490** C. Due Process of Law Issue.

[13] Defendant contends that section 6316.2 violates due process of law because the standards for release from commitment as set forth in other statutes (ss 6325, 6325.1, 6327) are more "difficult" to meet than the standards for commitment in section 6316.2.[6]

[6] The standards for commitment are set forth and discussed in part I, ante. The standards for release from commitment are that the person will not benefit from further care and treatment and that he is no longer a danger to the health and safety of others. (ss 6325, 6325.1, 6327.)

Defendant argues that in order for any civil commitment statute to "pass constitutional muster," the standards for release must "equate with the absence of the requirements for commitment." Otherwise, he argues, a person "might" remain involuntarily confined in a mental institution after he has improved to the point where he could not be committed. We reject this contention and its supporting arguments.

Defendant relies upon the case of O'Connor v. Donaldson (1975) 422 U.S. 563, 95 S.Ct. 2486, 45 L.Ed.2d 396, which held that Florida cannot constitutionally confine in a mental hospital a nondangerous individual who is capable of surviving safely in freedom by himself or with the help of willing and responsible family members or friends. In so holding, the court stated that "The fact that state law may have authorized confinement of the harmless mentally ill ****30** does not itself establish a constitutionally adequate purpose for the confinement. (Citations.) Nor is it enough that Donaldson's original confinement was founded upon a constitutionally adequate basis, if in fact it was, because even if his involuntary confinement was initially permissible, it could not constitutionally continue after that basis no longer existed." (422 U.S. at pp. 574-575, 95 S.Ct. at pp. 2493, 45 L.Ed.2d at p. 406.

O'Connor was a civil suit for money damages against the superintendent of a state hospital who, in reliance on a state law, had allegedly held a mental patient in a hospital for nearly 15 years when the patient was dangerous to no one. The case did not involve statutes of the nature with which we are here concerned. As pointed out by the Supreme Court, the Florida commitment statutes provided "no judicial procedure whereby one still incompetent could secure his release on the ground that he was no longer dangerous to himself or others." (Emphasis added; 422 U.S. at pp. 566-567, fn. 2, 95 S.Ct. at pp. 2489, fn. 2, 45 L.Ed.2d at pp. 401-402, fn. 2.)

[14] ***491** The O'Connor opinion has no applicability to the California statutory pattern. (Cf. Suzuki v. Quisenberry (D.Haw.1976) 411 F.Supp. 1113.) The California statutes provide a comprehensive scheme for the release of MDSO's under appropriate circumstances. (ss 6325, 6325.1, 6327.) The statutes incorporate all the fundamental aspects of fair play by providing the MDSO with abundant safeguards and means for continuous review of his mental state. The statutes may logically be interpreted to require the patient's discharge when the basis for the original commitment no longer exists. (See People v. Youngs (1972) 23 Cal.App.3d 180, 183-184, 99 Cal.Rptr. 901; Suzuki v. Quisenberry, supra, 411 F.Supp. at p. 1134.) We note, finally, that an MDSO who claims he no longer fits the commitment criteria is entitled to judicial relief via a writ of habeas corpus. (See In re Gary W. (1971) 5 Cal.3d 296, 303, 96 Cal.Rptr. 1, 486 P.2d 1201.)

[15] Defendant also contends that section 6316.2 is in violation of due process of law since it does not require proof that he committed a recent overt act indicating that he presents a serious threat of substantial harm to the health and safety of others. This contention is based on federal district court decisions which have used language indicating under various circumstances that in order constitutionally to confine a person because he might in the future be dangerous, it must be shown he has actually been dangerous in the "recent" past. (See, e. g., Lynch v. Baxley (N.D.Ala.1974) 386 F.Supp. 378, 391; Lessard v. Schmidt (E.D.Wis.1972) 349 F.Supp. 1078, 1093; Bell v. Wayne County General Hospital at Eloise (S.D.Mich.1974) 384 F.Supp. 1085, 1096.) These cases do not require, as a matter of constitutional law, that the statute specifically provide for "recent" acts; the evidence is the significant thing.

In the instant case in 1975 defendant committed the offense of which he was convicted. Testimony indicated defendant committed acts of verbal and physical aggression thereafter at Atascadero. Conceding, arguendo, the constitutional requirement of a "recent" overt act, the evidence is present in this case.

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

[16] Defendant contends section 6316.2 violates due process of law in that it is "vague" and therefore void. He argues that to make the findings required by the section, the court must interpret and apply the terms "mental disorder," "predisposed," and "serious threat of substantial harm," all of which, according to defendant, are terms so vague that men of common intelligence must necessarily guess at their meaning ***492** and differ as to their application. This being so, defendant argues, it follows the statute is unconstitutional. (See Lanzetta v. New Jersey (1939) 306 U.S. 451, 453, 59 S.Ct. 618, 619, 83 L.Ed. 888, 890; In re Newbern (1960) 53 Cal.2d 786, 792, 3 Cal.Rptr. 364, 350 P.2d 116.)

As a general principle of law the definition of vagueness enunciated by the cases cited by defendant is sound. However, applied to the statute here in question, the ****31** principle does not call for invalidating this legislative enactment. Indeed, the principle recently was invoked unsuccessfully to challenge another portion of the MDSO statute. In the case of People v. Kirk (1975) 49 Cal.App.3d 765, 122 Cal.Rptr. 653, it was asserted the use of the word "dangerous" in the definition of an MDSO in section 6300 was unconstitutionally ambiguous and vague. The court, applying Lanzetta and Newbern, held such words were subject to dictionary definition and that as used in MDSO cases, juries (or judges) will have to be convinced on a case-to-case basis that a person "does pose a danger to the health and safety of others." (People v. Kirk, supra, 49 Cal.App.3d at p. 771, 122 Cal.Rptr. at p. 657). We apply the reasoning of the Kirk case to the phrases here challenged and hold that those terms can be understood by reference to "demonstrably established technical or common law meaning," and thus may be comprehended by men of ordinary intelligence. (Id., at p. 769, 122 Cal.Rptr. at p. 655.)

III.

Commitment as an MDSO requires antecedent conviction of a "sex offense." Sex offenses within the statute include any crime "committed primarily for purposes of sexual arousal or gratification." (s 6302, subd. (a).) At issue in the commitment extension proceedings was the question whether the offense for which defendant was convicted, child beating (Pen.Code, s 273a, subd. (1)), was committed primarily for the purposes of sexual arousal or gratification.

Defendant contends that the court erred in refusing to read to the jury his proffered instruction which stated, "such purposes (refer) to the defendant's princip(al) or primary conscious intent at the time the crime was committed." Defendant claims that the instruction defining "purpose" as "conscious intent" was important since the expert witnesses who testified often ascribed subconscious motivation to defendant's actions. Defendant concedes, however, that the usual, ordinary, and common import of the term "purpose" is conscious intent.

[17] [18] ***493** It is axiomatic that a court need not instruct a jury on terms which are well understood by all persons of average intelligence. (People v. Burke (1962) 208 Cal.App.2d 149, 164, 24 Cal.Rptr. 912.) Furthermore, the trial court properly instructed the jury on the statutory requirement and definition of a "sex offense" and the necessity that it find defendant had the required mental state at the time of the beating in order for the offense to constitute a sex offense under section 6302. There was no instructional error.

IV.

[19] During jury selection, a prospective juror was excused for cause after she revealed that the victim had been her client in psychotherapy "this year." The trial court denied defendant's motion to dismiss the entire panel of prospective jurors. It was within the sound discretion of the court to conclude the prospective juror's statement was nonprejudicial and to refuse to dismiss the entire jury panel. (People v. Vernon (1978) 89 Cal.App.3d 853, 865, 152 Cal.Rptr. 765.)

The judgment is affirmed.

EVANS, J., concur.

BLEASE, Associate Justice, concurring.

I concur in the result.

The majority opinion labors to resolve issues concerning provisions of a statute not now in effect. Its precedential value must be discounted by its inapplicability to the legislation which now governs.

The opinion interprets criteria for extended commitment which have been significantly amended by legislation effective January 1, 1980. The opinion also rejects constitutional challenges to the MDSO statute on the basis

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

of a standard of amenability for treatment which the Legislature intended to reject by the same legislation. In this posture the case lacks not only the concreteness of facts considered in the light of operative legislation, but also the " 'reasonable probability that the same questions **32 will again be litigated and appealed, . . .' " (6 Witkin, Cal. Procedure (2d ed. 1971) Appeal, s 470, p. 4427, citing to People v. West Coast Shows (1970) 10 Cal.App.3d 462, 468, 89 Cal.Rptr. 290.)

The opinion interprets and considers the constitutionality of Welfare and Institutions Code section 6316.2, as added by Statutes 1977, chapter *494 164, section 3. The section, subsequently amended by Statutes 1978, chapter 1039, section 2, was to have expired by its own terms on January 1, 1980. On September 22, 1979, the Legislature enacted two measures amending section 6316.2: Assembly Bill 1332 (A.B. 1332) and Senate Bill 898 (S.B. 898). The measures are contained in chapters 991 and 992 of the statutes of 1979.

Both chapters contain revisions of section 6316.2 intended to take effect on January 1, 1980. They are double-joined, a legislative device to order the priority of conflicting enactments. (In re Thierry S. (1977) 19 Cal.3d 727, 739-740, 139 Cal.Rptr. 708, 566 P.2d 610.) However, a flaw in the double-joining procedure leaves unresolved the issue of priority.[1] The issue of priority may affect the constitutionality of the MDSO law, as shown below. It does not affect the amended criteria for extended commitment since both chapters contain identical amendments. The amendments provide:

[1] The flaw in the double-joining procedure arises from its attempted application to chapters having different operative dates. The double-joining procedure is designed to provide a method of choosing which of two measures is to be operative if both "go into effect on the same day . . . ." (Emphasis added.) (Note, Statutory Construction: Conflicting Acts Passed at the Same Session: Higher Chapter Number Prevails (1956) 3 UCLA L.Rev. 417; and see Gov. Code, s 9605; In re Thierry S. (1977) 19 Cal.3d 727, 739-740, 139 Cal.Rptr. 708, 566 P.2d 610.) However, if it is applied, as here, to chapters, one of which has an urgency clause (and takes immediate effect) and the other does not (and takes effect by law on January 1 following its enactment) the premise upon which double-joining is based is destroyed and confusion engendered. That is what happened to chapters 991 and 992.

The measures were double-joined such that section 2 of the bill given the higher chapter number was to be given effect on January 1, 1980. The sections numbered as 2 in each measure are identical. However, S.B. 898, given the higher chapter number (992) actually took effect on the date of its enactment, September 22, 1979, because of an urgency clause. That is, the higher numbered chapter took effect before the lower numbered chapter. Since chapter 992 had an urgency clause, it took effect before chapter 991, making the later effective chapter 991 supersede chapter 992. But the double-joining clause of A.B. 1332 directed that its section 2 take effect only if A.B. 1332 were given a higher chapter number. That not being the case, only section 1 of A.B. 1332 (chapter 991) remains operative on January 1, 1980. A contingency note to chapter 991 in No. 5 Deering's Advance Legislative Service, page 1026, concludes that section 1 of A.B. 1332 (i. e., chapter 991) is operative.

However, the legislative intent seems clear that section 2 of either measure take effect (they are identical) despite the linguistic flaw. To square this with the urgency clause would require that section 2 of chapter 991 take effect.

"(a) A person may be committed beyond the term prescribed by section 6316.1 . . . only if such person meets all of the following:

". . .

*495 "(2) Suffers from a mental disease, defect, or disorder and as a result of such mental disease, defect, or disorder, is predisposed to the commission of sexual offenses to such a degree that he or she presents a substantial danger of bodily harm to others." (Welf. & Inst. Code, s 6316.2, subd. (a).)

It is apparent that amended section 6316.2 makes the predictive (or causal) link between mental disorder and effect much stronger than in the statute before this court by substituting "danger" for "threat" and "bodily" harm for "health and safety." These amendments, affecting "the most basic personal liberty interest" (People v. Saffell (1979) 25 Cal.3d 223, 228, 157 Cal.Rptr. 897, 900, 599 P.2d 92, 94), require the closest judicial scrutiny, a task not accomplished by the majority opinion's offhand assertions that the legislative changes are of "no significance . . . to the permitted scope of expert testimony" (majority opn., ante, fn. 3), a position which renders without meaning the Legislature's change in language.

**33 The majority opinion also upholds the constitutionality of the MDSO statute on the basis inter alia that "the difference in mental condition between ordinary offender, 'non-treatable' MDSO's and 'treatable' " MDSO's is an adequate constitutional ground for the difference in the commitment of the classes. (Majority opn., ante, p. 29.)

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

But if section 2 of chapter 991 is operative, as the Legislature intended (see ante, fn. 1), "(a)menability to treatment is not required for a finding" justifying an extended commitment of an MDSO beyond that served by an ordinary offender for the same offense. The removal of the amenability requirement renders the MDSO statute of doubtful constitutionality. (People v. Compelleebee (1979) 99 Cal.App.3d 296, 160 Cal.Rptr. 233; People v. Lakey (1980) 102 Cal.App.3d 962, 970-972, 162 Cal.Rptr. 653; People v. Feagley (1975) 14 Cal.3d 338, 121 Cal.Rptr. 509, 535 P.2d 373.)

Hearing denied: MOSK and NEWMAN, JJ., dissenting.

40 C.F.R. § 122.26

§ 122.26 Storm water discharges (applicable to State NPDES programs, see § 123.25).

Effective: December 21, 2015

Currentness

<For statute(s) affecting validity, see: The Clean Water Act, 33 USCA § 1251 et seq.>

(a) Permit requirement.

(1) Prior to October 1, 1994, discharges composed entirely of storm water shall not be required to obtain a NPDES permit except:

(i) A discharge with respect to which a permit has been issued prior to February 4, 1987;

(ii) A discharge associated with industrial activity (see § 122.26(a)(4));

(iii) A discharge from a large municipal separate storm sewer system;

(iv) A discharge from a medium municipal separate storm sewer system;

(v) A discharge which the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines to contribute to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States. This designation may include a discharge from any conveyance or system of conveyances used for collecting and conveying storm water runoff or a system of discharges from municipal separate

storm sewers, except for those discharges from conveyances which do not require a permit under paragraph (a)(2) of this section or agricultural storm water runoff which is exempted from the definition of point source at § 122.2.

The Director may designate discharges from municipal separate storm sewers on a system-wide or jurisdiction-wide basis. In making this determination the Director may consider the following factors:

(A) The location of the discharge with respect to waters of the United States as defined at 40 CFR 122.2.

(B) The size of the discharge;

(C) The quantity and nature of the pollutants discharged to waters of the United States; and

(D) Other relevant factors.

(2) The Director may not require a permit for discharges of storm water runoff from the following:

(i) Mining operations composed entirely of flows which are from conveyances or systems of conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation runoff and which are not contaminated by contact with or that have not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct, or waste products located on the site of such operations, except in accordance with paragraph (c)(1)(iv) of this section.

(ii) All field activities or operations associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities, including activities necessary to prepare a site for drilling and for the movement and placement of drilling equipment, whether or not such field activities or operations may be considered to be construction activities, except in accordance with paragraph (c)(1)(iii) of this section. Discharges of sediment from construction activities associated with oil and gas exploration, production, processing, or treatment operations or transmission facilities are not subject to the provisions of paragraph (c)(1)(iii)(C) of this section.

Note to paragraph (a)(2)(ii): EPA encourages operators of oil and gas field activities or operations to implement and maintain Best Management Practices (BMPs) to minimize discharges of pollutants, including sediment, in storm water both during and after construction activities to help ensure protection of surface water quality during storm events. Appropriate controls would be those suitable to the site conditions and consistent with generally accepted engineering design criteria and manufacturer specifications. Selection of BMPs could also be affected by seasonal or climate conditions.

(3) Large and medium municipal separate storm sewer systems.

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(i) Permits must be obtained for all discharges from large and medium municipal separate storm sewer systems.

(ii) The Director may either issue one system-wide permit covering all discharges from municipal separate storm sewers within a large or medium municipal storm sewer system or issue distinct permits for appropriate categories of discharges within a large or medium municipal separate storm sewer system including, but not limited to: all discharges owned or operated by the same municipality; located within the same jurisdiction; all discharges within a system that discharge to the same watershed; discharges within a system that are similar in nature; or for individual discharges from municipal separate storm sewers within the system.

(iii) The operator of a discharge from a municipal separate storm sewer which is part of a large or medium municipal separate storm sewer system must either:

(A) Participate in a permit application (to be a permittee or a co-permittee) with one or more other operators of discharges from the large or medium municipal storm sewer system which covers all, or a portion of all, discharges from the municipal separate storm sewer system;

(B) Submit a distinct permit application which only covers discharges from the municipal separate storm sewers for which the operator is responsible; or

(C) A regional authority may be responsible for submitting a permit application under the following guidelines:

(1) The regional authority together with co-applicants shall have authority over a storm water management program that is in existence, or shall be in existence at the time part 1 of the application is due;

(2) The permit applicant or co-applicants shall establish their ability to make a timely submission of part 1 and part 2 of the municipal application;

(3) Each of the operators of municipal separate storm sewers within the systems described in paragraphs (b)(4)(i), (ii), and (iii) or (b)(7)(i), (ii), and (iii) of this section, that are under the purview of the designated regional authority, shall comply with the application requirements of paragraph (d) of this section.

(iv) One permit application may be submitted for all or a portion of all municipal separate storm sewers within adjacent or interconnected large or medium municipal separate storm sewer systems. The Director may issue one system-wide permit covering all, or a portion of all municipal separate storm sewers in adjacent or interconnected large or medium municipal separate storm sewer systems.

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(v) Permits for all or a portion of all discharges from large or medium municipal separate storm sewer systems that are issued on a system-wide, jurisdiction-wide, watershed or other basis may specify different conditions relating to different discharges covered by the permit, including different management programs for different drainage areas which contribute storm water to the system.

(vi) Co-permittees need only comply with permit conditions relating to discharges from the municipal separate storm sewers for which they are operators.

(4) Discharges through large and medium municipal separate storm sewer systems. In addition to meeting the requirements of paragraph (c) of this section, an operator of a storm water discharge associated with industrial activity which discharges through a large or medium municipal separate storm sewer system shall submit, to the operator of the municipal separate storm sewer system receiving the discharge no later than May 15, 1991, or 180 days prior to commencing such discharge: the name of the facility; a contact person and phone number; the location of the discharge; a description, including Standard Industrial Classification, which best reflects the principal products or services provided by each facility; and any existing NPDES permit number.

(5) Other municipal separate storm sewers. The Director may issue permits for municipal separate storm sewers that are designated under paragraph (a)(1)(v) of this section on a system-wide basis, jurisdiction-wide basis, watershed basis or other appropriate basis, or may issue permits for individual discharges.

(6) Non-municipal separate storm sewers. For storm water discharges associated with industrial activity from point sources which discharge through a non-municipal or non-publicly owned separate storm sewer system, the Director, in his discretion, may issue: a single NPDES permit, with each discharger a co-permittee to a permit issued to the operator of the portion of the system that discharges into waters of the United States; or, individual permits to each discharger of storm water associated with industrial activity through the non-municipal conveyance system.

(i) All storm water discharges associated with industrial activity that discharge through a storm water discharge system that is not a municipal separate storm sewer must be covered by an individual permit, or a permit issued to the operator of the portion of the system that discharges to waters of the United States, with each discharger to the non-municipal conveyance a co-permittee to that permit.

(ii) Where there is more than one operator of a single system of such conveyances, all operators of storm water discharges associated with industrial activity must submit applications.

(iii) Any permit covering more than one operator shall identify the effluent limitations, or other permit conditions, if any, that apply to each operator.

(7) Combined sewer systems. Conveyances that discharge storm water runoff combined with municipal sewage are point sources that must obtain NPDES permits in accordance with the procedures of § 122.21 and are not subject to the provisions of this section.

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(8) Whether a discharge from a municipal separate storm sewer is or is not subject to regulation under this section shall have no bearing on whether the owner or operator of the discharge is eligible for funding under title II, title III or title VI of the Clean Water Act. See 40 CFR part 35, subpart I, appendix A(b)H.2.j.

(9)(i) On and after October 1, 1994, for discharges composed entirely of storm water, that are not required by paragraph (a)(1) of this section to obtain a permit, operators shall be required to obtain a NPDES permit only if:

(A) The discharge is from a small MS4 required to be regulated pursuant to § 122.32;

(B) The discharge is a storm water discharge associated with small construction activity pursuant to paragraph (b)(15) of this section;

(C) The Director, or in States with approved NPDES programs either the Director or the EPA Regional Administrator, determines that storm water controls are needed for the discharge based on wasteload allocations that are part of "total maximum daily loads" (TMDLs) that address the pollutant(s) of concern; or

(D) The Director, or in States with approved NPDES programs either the Director or the EPA Regional Administrator, determines that the discharge, or category of discharges within a geographic area, contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

(ii) Operators of small MS4s designated pursuant to paragraphs (a)(9)(i)(A), (a)(9)(i)(C), and (a)(9)(i)(D) of this section shall seek coverage under an NPDES permit in accordance with §§ 122.33 through 122.35. Operators of non-municipal sources designated pursuant to paragraphs (a)(9)(i)(B), (a)(9)(i)(C), and (a)(9)(i)(D) of this section shall seek coverage under an NPDES permit in accordance with paragraph (c)(1) of this section.

(iii) Operators of storm water discharges designated pursuant to paragraphs (a)(9)(i)(C) and (a)(9)(i)(D) of this section shall apply to the Director for a permit within 180 days of receipt of notice, unless permission for a later date is granted by the Director (see § 124.52(c) of this chapter).

(b) Definitions.

(1) Co-permittee means a permittee to a NPDES permit that is only responsible for permit conditions relating to the discharge for which it is operator.

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(2) Illicit discharge means any discharge to a municipal separate storm sewer that is not composed entirely of storm water except discharges pursuant to a NPDES permit (other than the NPDES permit for discharges from the municipal separate storm sewer) and discharges resulting from fire fighting activities.

(3) Incorporated place means the District of Columbia, or a city, town, township, or village that is incorporated under the laws of the State in which it is located.

(4) Large municipal separate storm sewer system means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 250,000 or more as determined by the 1990 Decennial Census by the Bureau of the Census (Appendix F of this part); or

(ii) Located in the counties listed in appendix H, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(4)(i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(4)(i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(4)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; and

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a large municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraph (b)(4)(i), (ii), (iii) of this section.

(5) Major municipal separate storm sewer outfall (or "major outfall") means a municipal separate storm sewer outfall that discharges from a single pipe with an inside diameter of 36 inches or more or its equivalent (discharge from a single conveyance other than circular pipe which is associated with a drainage area of more than 50 acres); or for municipal separate storm sewers that receive storm water from lands zoned for industrial activity (based on comprehensive zoning plans or the equivalent), an outfall that discharges from a single pipe with an inside diameter of 12 inches or more or from its equivalent (discharge from other than a circular pipe associated with a drainage area of 2 acres or more).

(6) Major outfall means a major municipal separate storm sewer outfall.

(7) Medium municipal separate storm sewer system means all municipal separate storm sewers that are either:

(i) Located in an incorporated place with a population of 100,000 or more but less than 250,000, as determined by the 1990 Decennial Census by the Bureau of the Census (appendix G of this part); or

(ii) Located in the counties listed in appendix I, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties; or

(iii) Owned or operated by a municipality other than those described in paragraph (b)(7)(i) or (ii) of this section and that are designated by the Director as part of the large or medium municipal separate storm sewer system due to the interrelationship between the discharges of the designated storm sewer and the discharges from municipal separate storm sewers described under paragraph (b)(7)(i) or (ii) of this section. In making this determination the Director may consider the following factors:

(A) Physical interconnections between the municipal separate storm sewers;

(B) The location of discharges from the designated municipal separate storm sewer relative to discharges from municipal separate storm sewers described in paragraph (b)(7)(i) of this section;

(C) The quantity and nature of pollutants discharged to waters of the United States;

(D) The nature of the receiving waters; or

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(E) Other relevant factors; or

(iv) The Director may, upon petition, designate as a medium municipal separate storm sewer system, municipal separate storm sewers located within the boundaries of a region defined by a storm water management regional authority based on a jurisdictional, watershed, or other appropriate basis that includes one or more of the systems described in paragraphs (b)(7) (i), (ii), (iii) of this section.

(8) Municipal separate storm sewer means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, man-made channels, or storm drains):

(i) Owned or operated by a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States;

(ii) Designed or used for collecting or conveying storm water;

(iii) Which is not a combined sewer; and

(iv) Which is not part of a Publicly Owned Treatment Works (POTW) as defined at 40 CFR 122.2.

(9) Outfall means a point source as defined by 40 CFR 122.2 at the point where a municipal separate storm sewer discharges to waters of the United States and does not include open conveyances connecting two municipal separate storm sewers, or pipes, tunnels or other conveyances which connect segments of the same stream or other waters of the United States and are used to convey waters of the United States.

(10) Overburden means any material of any nature, consolidated or unconsolidated, that overlies a mineral deposit, excluding topsoil or similar naturally-occurring surface materials that are not disturbed by mining operations.

(11) Runoff coefficient means the fraction of total rainfall that will appear at a conveyance as runoff.

(12) Significant materials includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under section 101(14) of CERCLA; any chemical the facility is required to report pursuant to section 313 of title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag and sludge

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

that have the potential to be released with storm water discharges.

(13) Storm water means storm water runoff, snow melt runoff, and surface runoff and drainage.

(14) Storm water discharge associated with industrial activity means the discharge from any conveyance that is used for collecting and conveying storm water and that is directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term does not include discharges from facilities or activities excluded from the NPDES program under this part 122. For the categories of industries identified in this section, the term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at part 401 of this chapter); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and final products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the purposes of this paragraph, material handling activities include storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product, by-product or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are federally, State, or municipally owned or operated that meet the description of the facilities listed in paragraphs (b)(14)(i) through (xi) of this section) include those facilities designated under the provisions of paragraph (a)(1)(v) of this section. The following categories of facilities are considered to be engaging in "industrial activity" for purposes of paragraph (b)(14):

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR subchapter N (except facilities with toxic pollutant effluent standards which are exempted under category (xi) in paragraph (b)(14) of this section);

(ii) Facilities classified within Standard Industrial Classification 24, Industry Group 241 that are rock crushing, gravel washing, log sorting, or log storage facilities operated in connection with silvicultural activities defined in 40 CFR 122.27(b)(2)-(3) and Industry Groups 242 through 249; 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373; (not included are all other types of silviculture facilities);

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(1) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations; (inactive mining operations are mining sites that are not being actively mined, but which have an identifiable owner/operator; inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined materials, nor sites where minimal activities are undertaken for the sole purpose of maintaining a mining claim);

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under subtitle C of RCRA;

(v) Landfills, land application sites, and open dumps that receive or have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under subtitle D of RCRA;

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093;

(vii) Steam electric power generating facilities, including coal handling sites;

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221–25), 43, 44, 45, and 5171 which have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or which are otherwise identified under paragraphs (b)(14) (i)–(vii) or (ix)–(xi) of this section are associated with industrial activity;

(ix) Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR part 403. Not included are farm lands, domestic gardens or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with section 405 of the CWA;

(x) Construction activity including clearing, grading and excavation, except operations that result in the disturbance of less than five acres of total land area. Construction activity also includes the disturbance of less than five acres of total land area that is a part of a larger common plan of development or sale if the larger common plan will ultimately disturb five acres or more;

(xi) Facilities under Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, and 4221–25;

(15) Storm water discharge associated with small construction activity means the discharge of storm water from:

(i) Construction activities including clearing, grading, and excavating that result in land disturbance of equal to or greater than one acre and less than five acres. Small construction activity also includes the disturbance of less than one

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

acre of total land area that is part of a larger common plan of development or sale if the larger common plan will ultimately disturb equal to or greater than one and less than five acres. Small construction activity does not include routine maintenance that is performed to maintain the original line and grade, hydraulic capacity, or original purpose of the facility. The Director may waive the otherwise applicable requirements in a general permit for a storm water discharge from construction activities that disturb less than five acres where:

(A) The value of the rainfall erosivity factor ("R" in the Revised Universal Soil Loss Equation) is less than five during the period of construction activity. The rainfall erosivity factor is determined in accordance with Chapter 2 of Agriculture Handbook Number 703, Predicting Soil Erosion by Water: A Guide to Conservation Planning with the Revised Universal Soil Loss Equation (RUSLE), pages 21–64, dated January 1997. The Director of the Federal Register approves this incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained at EPA's Water Docket, 1200 Pennsylvania Avenue NW, Washington, DC 20460. For information on the availability of this material at National Archives and Records Administration, call 202–741–6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html. An operator must certify to the Director that the construction activity will take place during a period when the value of the rainfall erosivity factor is less than five; or

(B) Storm water controls are not needed based on a "total maximum daily load" (TMDL) approved or established by EPA that addresses the pollutant(s) of concern or, for non-impaired waters that do not require TMDLs, an equivalent analysis that determines allocations for small construction sites for the pollutant(s) of concern or that determines that such allocations are not needed to protect water quality based on consideration of existing in-stream concentrations, expected growth in pollutant contributions from all sources, and a margin of safety. For the purpose of this paragraph, the pollutant(s) of concern include sediment or a parameter that addresses sediment (such as total suspended solids, turbidity or siltation) and any other pollutant that has been identified as a cause of impairment of any water body that will receive a discharge from the construction activity. The operator must certify to the Director that the construction activity will take place, and storm water discharges will occur, within the drainage area addressed by the TMDL or equivalent analysis.

(C) As of December 21, 2020 all certifications submitted in compliance with paragraphs (b)(15)(i)(A) and (B) of this section must be submitted electronically by the owner or operator to the Director or initial recipient, as defined in 40 CFR 127.2(b), in compliance with this section and 40 CFR part 3 (including, in all cases, subpart D to part 3), § 122.22, and 40 CFR part 127. Part 127 is not intended to undo existing requirements for electronic reporting. Prior to this date, and independent of part 127, owners or operators may be required to report electronically if specified by a particular permit or if required to do so by state law.

(ii) Any other construction activity designated by the Director, or in States with approved NPDES programs either the Director or the EPA Regional Administrator, based on the potential for contribution to a violation of a water quality standard or for significant contribution of pollutants to waters of the United States.

Exhibit 1 to § 122.26(b)(15).—Summary of Coverage of "Storm Water Discharges Associated with Small Construction Activity" Under the NPDES Storm Water Program

Automatic Designation: Required Nationwide	· Construction activities that result in a land

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

Coverage	disturbance of equal to or greater than one acre and less than five acres. · Construction activities disturbing less than one acre if part of a larger common plan of development or sale with a planned disturbance of equal to or greater than one acre and less than five acres. (see § 122.26(b)(15)(i).)
Potential Designation: Optional Evaluation and Designation by the NPDES Permitting Authority or EPA Regional Administrator.	· Construction activities that result in a land disturbance of less than one acre based on the potential for contribution to a violation of a water quality standard or for significant contribution of pollutants. (see § 122.26(b)(15)(ii).)
Potential Waiver: Waiver from Requirements as Determined by the NPDES Permitting Authority.	Any automatically designated construction activity where the operator certifies: (1) A rainfall erosivity factor of less than five, or (2) That the activity will occur within an area where controls are not needed based on a TMDL or, for non-impaired waters that do not require a TMDL, an equivalent analysis for the pollutant(s) of concern. (see § 122.26(b)(15)(i).)

(16) Small municipal separate storm sewer system means all separate storm sewers that are:

(i) Owned or operated by the United States, a State, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to State law) having jurisdiction over disposal of sewage, industrial wastes, storm water, or other wastes, including special districts under State law such as a sewer district, flood control district or drainage district, or similar entity, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States.

(ii) Not defined as “large” or “medium” municipal separate storm sewer systems pursuant to paragraphs (b)(4) and (b)(7) of this section, or designated under paragraph (a)(1)(v) of this section.

(iii) This term includes systems similar to separate storm sewer systems in municipalities, such as systems at military bases, large hospital or prison complexes, and highways and other thoroughfares. The term does not include separate storm sewers in very discrete areas, such as individual buildings.

(17) Small MS4 means a small municipal separate storm sewer system.

(18) Municipal separate storm sewer system means all separate storm sewers that are defined as “large” or “medium” or “small” municipal separate storm sewer systems pursuant to paragraphs (b)(4), (b)(7), and (b)(16) of this section, or designated under paragraph (a)(1)(v) of this section.

(19) MS4 means a municipal separate storm sewer system.

(20) Uncontrolled sanitary landfill means a landfill or open dump, whether in operation or closed, that does not meet the requirements for runon or runoff controls established pursuant to subtitle D of the Solid Waste Disposal Act.

(c) Application requirements for storm water discharges associated with industrial activity and storm water discharges associated with small construction activity—

(1) Individual application. Dischargers of storm water associated with industrial activity and with small construction activity are required to apply for an individual permit or seek coverage under a promulgated storm water general permit. Facilities that are required to obtain an individual permit or any discharge of storm water which the Director is evaluating for designation (see 124.52(c) of this chapter) under paragraph (a)(1)(v) of this section and is not a municipal storm sewer, shall submit an NPDES application in accordance with the requirements of § 122.21 as modified and supplemented by the provisions of this paragraph.

(i) Except as provided in § 122.26(c)(1)(ii)–(iv), the operator of a storm water discharge associated with industrial activity subject to this section shall provide:

(A) A site map showing topography (or indicating the outline of drainage areas served by the outfall(s) covered in the application if a topographic map is unavailable) of the facility including: each of its drainage and discharge structures; the drainage area of each storm water outfall; paved areas and buildings within the drainage area of each storm water outfall, each past or present area used for outdoor storage or disposal of significant materials, each existing structural control measure to reduce pollutants in storm water runoff, materials loading and access areas, areas where pesticides, herbicides, soil conditioners and fertilizers are applied, each of its hazardous waste treatment, storage or disposal facilities (including each area not required to have a RCRA permit which is used for accumulating hazardous waste under 40 CFR 262.34); each well where fluids from the facility are injected underground; springs, and other surface water bodies which receive storm water discharges from the facility;

(B) An estimate of the area of impervious surfaces (including paved areas and building roofs) and the total area drained by each outfall (within a mile radius of the facility) and a narrative description of the following: Significant materials that in the three years prior to the submittal of this application have been treated, stored or disposed in a manner to allow exposure to storm water; method of treatment, storage or disposal of such materials; materials management practices employed, in the three years prior to the submittal of this application, to minimize contact by these materials with storm water runoff; materials loading and access areas; the location, manner and frequency in which pesticides, herbicides, soil conditioners and fertilizers are applied; the location and a description of existing structural and non-structural control measures to reduce pollutants in storm water runoff; and a description of the

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

treatment the storm water receives, including the ultimate disposal of any solid or fluid wastes other than by discharge;

(C) A certification that all outfalls that should contain storm water discharges associated with industrial activity have been tested or evaluated for the presence of non-storm water discharges which are not covered by a NPDES permit; tests for such non-storm water discharges may include smoke tests, fluorometric dye tests, analysis of accurate schematics, as well as other appropriate tests. The certification shall include a description of the method used, the date of any testing, and the on-site drainage points that were directly observed during a test;

(D) Existing information regarding significant leaks or spills of toxic or hazardous pollutants at the facility that have taken place within the three years prior to the submittal of this application;

(E) Quantitative data based on samples collected during storm events and collected in accordance with § 122.21 of this part from all outfalls containing a storm water discharge associated with industrial activity for the following parameters:

(1) Any pollutant limited in an effluent guideline to which the facility is subject;

(2) Any pollutant listed in the facility's NPDES permit for its process wastewater (if the facility is operating under an existing NPDES permit);

(3) Oil and grease, pH, BOD5, COD, TSS, total phosphorus, total Kjeldahl nitrogen, and nitrate plus nitrite nitrogen;

(4) Any information on the discharge required under § 122.21(g)(7)(vi) and (vii);

(5) Flow measurements or estimates of the flow rate, and the total amount of discharge for the storm event(s) sampled, and the method of flow measurement or estimation; and

(6) The date and duration (in hours) of the storm event(s) sampled, rainfall measurements or estimates of the storm event (in inches) which generated the sampled runoff and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event (in hours);

(F) Operators of a discharge which is composed entirely of storm water are exempt from the requirements of § 122.21(g)(2), (g)(3), (g)(4), (g)(5), (g)(7)(iii), (g)(7)(iv), (g)(7)(v), and (g)(7)(viii); and

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(G) Operators of new sources or new discharges (as defined in § 122.2 of this part) which are composed in part or entirely of storm water must include estimates for the pollutants or parameters listed in paragraph (c)(1)(i)(E) of this section instead of actual sampling data, along with the source of each estimate. Operators of new sources or new discharges composed in part or entirely of storm water must provide quantitative data for the parameters listed in paragraph (c)(1)(i)(E) of this section within two years after commencement of discharge, unless such data has already been reported under the monitoring requirements of the NPDES permit for the discharge. Operators of a new source or new discharge which is composed entirely of storm water are exempt from the requirements of § 122.21 (k)(3)(ii), (k)(3)(iii), and (k)(5).

(ii) An operator of an existing or new storm water discharge that is associated with industrial activity solely under paragraph (b)(14)(x) of this section or is associated with small construction activity solely under paragraph (b)(15) of this section, is exempt from the requirements of § 122.21(g) and paragraph (c)(1)(i) of this section. Such operator shall provide a narrative description of:

(A) The location (including a map) and the nature of the construction activity;

(B) The total area of the site and the area of the site that is expected to undergo excavation during the life of the permit;

(C) Proposed measures, including best management practices, to control pollutants in storm water discharges during construction, including a brief description of applicable State and local erosion and sediment control requirements;

(D) Proposed measures to control pollutants in storm water discharges that will occur after construction operations have been completed, including a brief description of applicable State or local erosion and sediment control requirements;

(E) An estimate of the runoff coefficient of the site and the increase in impervious area after the construction addressed in the permit application is completed, the nature of fill material and existing data describing the soil or the quality of the discharge; and

(F) The name of the receiving water.

(iii) The operator of an existing or new discharge composed entirely of storm water from an oil or gas exploration, production, processing, or treatment operation, or transmission facility is not required to submit a permit application in accordance with paragraph (c)(1)(i) of this section, unless the facility:

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(A) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 117.21 or 40 CFR 302.6 at anytime since November 16, 1987; or

(B) Has had a discharge of storm water resulting in the discharge of a reportable quantity for which notification is or was required pursuant to 40 CFR 110.6 at any time since November 16, 1987; or

(C) Contributes to a violation of a water quality standard.

(iv) The operator of an existing or new discharge composed entirely of storm water from a mining operation is not required to submit a permit application unless the discharge has come into contact with, any overburden, raw material, intermediate products, finished product, byproduct or waste products located on the site of such operations.

(v) Applicants shall provide such other information the Director may reasonably require under § 122.21(g)(13) of this part to determine whether to issue a permit and may require any facility subject to paragraph (c)(1)(ii) of this section to comply with paragraph (c)(1)(i) of this section.

(2) [Reserved]

(d) Application requirements for large and medium municipal separate storm sewer discharges. The operator of a discharge from a large or medium municipal separate storm sewer or a municipal separate storm sewer that is designated by the Director under paragraph (a)(1)(v) of this section, may submit a jurisdiction-wide or system-wide permit application. Where more than one public entity owns or operates a municipal separate storm sewer within a geographic area (including adjacent or interconnected municipal separate storm sewer systems), such operators may be a coapplicant to the same application. Permit applications for discharges from large and medium municipal storm sewers or municipal storm sewers designated under paragraph (a)(1)(v) of this section shall include;

(1) Part 1. Part 1 of the application shall consist of;

(i) General information. The applicants' name, address, telephone number of contact person, ownership status and status as a State or local government entity.

(ii) Legal authority. A description of existing legal authority to control discharges to the municipal separate storm sewer system. When existing legal authority is not sufficient to meet the criteria provided in paragraph (d)(2)(i) of this section, the description shall list additional authorities as will be necessary to meet the criteria and shall include a schedule and commitment to seek such additional authority that will be needed to meet the criteria.

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(iii) Source identification.

(A) A description of the historic use of ordinances, guidance or other controls which limited the discharge of non-storm water discharges to any Publicly Owned Treatment Works serving the same area as the municipal separate storm sewer system.

(B) A USGS 7.5 minute topographic map (or equivalent topographic map with a scale between 1:10,000 and 1:24,000 if cost effective) extending one mile beyond the service boundaries of the municipal storm sewer system covered by the permit application. The following information shall be provided:

(1) The location of known municipal storm sewer system outfalls discharging to waters of the United States;

(2) A description of the land use activities (e.g. divisions indicating undeveloped, residential, commercial, agricultural and industrial uses) accompanied with estimates of population densities and projected growth for a ten year period within the drainage area served by the separate storm sewer. For each land use type, an estimate of an average runoff coefficient shall be provided;

(3) The location and a description of the activities of the facility of each currently operating or closed municipal landfill or other treatment, storage or disposal facility for municipal waste;

(4) The location and the permit number of any known discharge to the municipal storm sewer that has been issued a NPDES permit;

(5) The location of major structural controls for storm water discharge (retention basins, detention basins, major infiltration devices, etc.); and

(6) The identification of publicly owned parks, recreational areas, and other open lands.

(iv) Discharge characterization.

(A) Monthly mean rain and snow fall estimates (or summary of weather bureau data) and the monthly average number of storm events.

(B) Existing quantitative data describing the volume and quality of discharges from the municipal storm sewer,

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

including a description of the outfalls sampled, sampling procedures and analytical methods used.

(C) A list of water bodies that receive discharges from the municipal separate storm sewer system, including downstream segments, lakes and estuaries, where pollutants from the system discharges may accumulate and cause water degradation and a brief description of known water quality impacts. At a minimum, the description of impacts shall include a description of whether the water bodies receiving such discharges have been:

(1) Assessed and reported in section 305(b) reports submitted by the State, the basis for the assessment (evaluated or monitored), a summary of designated use support and attainment of Clean Water Act (CWA) goals (fishable and swimmable waters), and causes of nonsupport of designated uses;

(2) Listed under section 304(l)(1)(A)(i), section 304(l)(1)(A)(ii), or section 304(l)(1)(B) of the CWA that is not expected to meet water quality standards or water quality goals;

(3) Listed in State Nonpoint Source Assessments required by section 319(a) of the CWA that, without additional action to control nonpoint sources of pollution, cannot reasonably be expected to attain or maintain water quality standards due to storm sewers, construction, highway maintenance and runoff from municipal landfills and municipal sludge adding significant pollution (or contributing to a violation of water quality standards);

(4) Identified and classified according to eutrophic condition of publicly owned lakes listed in State reports required under section 314(a) of the CWA (include the following: A description of those publicly owned lakes for which uses are known to be impaired; a description of procedures, processes and methods to control the discharge of pollutants from municipal separate storm sewers into such lakes; and a description of methods and procedures to restore the quality of such lakes);

(5) Areas of concern of the Great Lakes identified by the International Joint Commission;

(6) Designated estuaries under the National Estuary Program under section 320 of the CWA;

(7) Recognized by the applicant as highly valued or sensitive waters;

(8) Defined by the State or U.S. Fish and Wildlife Services's National Wetlands Inventory as wetlands; and

(9) Found to have pollutants in bottom sediments, fish tissue or biosurvey data.

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(D) Field screening. Results of a field screening analysis for illicit connections and illegal dumping for either selected field screening points or major outfalls covered in the permit application. At a minimum, a screening analysis shall include a narrative description, for either each field screening point or major outfall, of visual observations made during dry weather periods. If any flow is observed, two grab samples shall be collected during a 24 hour period with a minimum period of four hours between samples. For all such samples, a narrative description of the color, odor, turbidity, the presence of an oil sheen or surface scum as well as any other relevant observations regarding the potential presence of non-storm water discharges or illegal dumping shall be provided. In addition, a narrative description of the results of a field analysis using suitable methods to estimate pH, total chlorine, total copper, total phenol, and detergents (or surfactants) shall be provided along with a description of the flow rate. Where the field analysis does not involve analytical methods approved under 40 CFR part 136, the applicant shall provide a description of the method used including the name of the manufacturer of the test method along with the range and accuracy of the test. Field screening points shall be either major outfalls or other outfall points (or any other point of access such as manholes) randomly located throughout the storm sewer system by placing a grid over a drainage system map and identifying those cells of the grid which contain a segment of the storm sewer system or major outfall. The field screening points shall be established using the following guidelines and criteria:

(1) A grid system consisting of perpendicular north-south and east-west lines spaced ¼ mile apart shall be overlaid on a map of the municipal storm sewer system, creating a series of cells;

(2) All cells that contain a segment of the storm sewer system shall be identified; one field screening point shall be selected in each cell; major outfalls may be used as field screening points;

(3) Field screening points should be located downstream of any sources of suspected illegal or illicit activity;

(4) Field screening points shall be located to the degree practicable at the farthest manhole or other accessible location downstream in the system, within each cell; however, safety of personnel and accessibility of the location should be considered in making this determination;

(5) Hydrological conditions; total drainage area of the site; population density of the site; traffic density; age of the structures or buildings in the area; history of the area; and land use types;

(6) For medium municipal separate storm sewer systems, no more than 250 cells need to have identified field screening points; in large municipal separate storm sewer systems, no more than 500 cells need to have identified field screening points; cells established by the grid that contain no storm sewer segments will be eliminated from consideration; if fewer than 250 cells in medium municipal sewers are created, and fewer than 500 in large systems are created by the overlay on the municipal sewer map, then all those cells which contain a segment of the sewer system shall be subject to field screening (unless access to the separate storm sewer system is impossible); and

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(7) Large or medium municipal separate storm sewer systems which are unable to utilize the procedures described in paragraphs (d)(1)(iv)(D) (1) through (6) of this section, because a sufficiently detailed map of the separate storm sewer systems is unavailable, shall field screen no more than 500 or 250 major outfalls respectively (or all major outfalls in the system, if less); in such circumstances, the applicant shall establish a grid system consisting of north-south and east-west lines spaced ¼ mile apart as an overlay to the boundaries of the municipal storm sewer system, thereby creating a series of cells; the applicant will then select major outfalls in as many cells as possible until at least 500 major outfalls (large municipalities) or 250 major outfalls (medium municipalities) are selected; a field screening analysis shall be undertaken at these major outfalls.

(E) Characterization plan. Information and a proposed program to meet the requirements of paragraph (d)(2)(iii) of this section. Such description shall include: the location of outfalls or field screening points appropriate for representative data collection under paragraph (d)(2)(iii)(A) of this section, a description of why the outfall or field screening point is representative, the seasons during which sampling is intended, a description of the sampling equipment. The proposed location of outfalls or field screening points for such sampling should reflect water quality concerns (see paragraph (d)(1)(iv)(C) of this section) to the extent practicable.

(v) Management programs.

(A) A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs. The description may address controls established under State law as well as local requirements.

(B) A description of the existing program to identify illicit connections to the municipal storm sewer system. The description should include inspection procedures and methods for detecting and preventing illicit discharges, and describe areas where this program has been implemented.

(vi) Fiscal resources.

(A) A description of the financial resources currently available to the municipality to complete part 2 of the permit application. A description of the municipality’s budget for existing storm water programs, including an overview of the municipality’s financial resources and budget, including overall indebtedness and assets, and sources of funds for storm water programs.

(2) Part 2. Part 2 of the application shall consist of:

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(i) Adequate legal authority. A demonstration that the applicant can operate pursuant to legal authority established by statute, ordinance or series of contracts which authorizes or enables the applicant at a minimum to:

(A) Control through ordinance, permit, contract, order or similar means, the contribution of pollutants to the municipal storm sewer by storm water discharges associated with industrial activity and the quality of storm water discharged from sites of industrial activity;

(B) Prohibit through ordinance, order or similar means, illicit discharges to the municipal separate storm sewer;

(C) Control through ordinance, order or similar means the discharge to a municipal separate storm sewer of spills, dumping or disposal of materials other than storm water;

(D) Control through interagency agreements among coapplicants the contribution of pollutants from one portion of the municipal system to another portion of the municipal system;

(E) Require compliance with conditions in ordinances, permits, contracts or orders; and

(F) Carry out all inspection, surveillance and monitoring procedures necessary to determine compliance and noncompliance with permit conditions including the prohibition on illicit discharges to the municipal separate storm sewer.

(ii) Source identification. The location of any major outfall that discharges to waters of the United States that was not reported under paragraph (d)(1)(iii)(B)(1) of this section. Provide an inventory, organized by watershed of the name and address, and a description (such as SIC codes) which best reflects the principal products or services provided by each facility which may discharge, to the municipal separate storm sewer, storm water associated with industrial activity;

(iii) Characterization data. When “quantitative data” for a pollutant are required under paragraph (d)(2)(iii)(A)(3) of this section, the applicant must collect a sample of effluent in accordance with 40 CFR 122.21(g)(7) and analyze it for the pollutant in accordance with analytical methods approved under part 136 of this chapter. When no analytical method is approved the applicant may use any suitable method but must provide a description of the method. The applicant must provide information characterizing the quality and quantity of discharges covered in the permit application, including:

(A) Quantitative data from representative outfalls designated by the Director (based on information received in part 1 of the application, the Director shall designate between five and ten outfalls or field screening points as representative of the commercial, residential and industrial land use activities of the drainage area contributing to the system or, where there are less than five outfalls covered in the application, the Director shall designate all outfalls) developed as follows:

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(1) For each outfall or field screening point designated under this subparagraph, samples shall be collected of storm water discharges from three storm events occurring at least one month apart in accordance with the requirements at § 122.21(g)(7) (the Director may allow exemptions to sampling three storm events when climatic conditions create good cause for such exemptions);

(2) A narrative description shall be provided of the date and duration of the storm event(s) sampled, rainfall estimates of the storm event which generated the sampled discharge and the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event;

(3) For samples collected and described under paragraphs (d)(2)(iii)(A)(1) and (A)(2) of this section, quantitative data shall be provided for: the organic pollutants listed in Table II; the pollutants listed in Table III (toxic metals, cyanide, and total phenols) of appendix D of 40 CFR part 122, and for the following pollutants:

Total suspended solids (TSS)

Total dissolved solids (TDS)

COD

BOD_5

Oil and grease

Fecal coliform

Fecal streptococcus

pH

Total Kjeldahl nitrogen

Nitrate plus nitrite

Dissolved phosphorus

Total ammonia plus organic nitrogen

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

Total phosphorus

(4) Additional limited quantitative data required by the Director for determining permit conditions (the Director may require that quantitative data shall be provided for additional parameters, and may establish sampling conditions such as the location, season of sample collection, form of precipitation (snow melt, rainfall) and other parameters necessary to insure representativeness);

(B) Estimates of the annual pollutant load of the cumulative discharges to waters of the United States from all identified municipal outfalls and the event mean concentration of the cumulative discharges to waters of the United States from all identified municipal outfalls during a storm event (as described under § 122.21(c)(7)) for BOD_5, COD, TSS, dissolved solids, total nitrogen, total ammonia plus organic nitrogen, total phosphorus, dissolved phosphorus, cadmium, copper, lead, and zinc. Estimates shall be accompanied by a description of the procedures for estimating constituent loads and concentrations, including any modelling, data analysis, and calculation methods;

(C) A proposed schedule to provide estimates for each major outfall identified in either paragraph (d)(2)(ii) or (d)(1)(iii)(B)(1) of this section of the seasonal pollutant load and of the event mean concentration of a representative storm for any constituent detected in any sample required under paragraph (d)(2)(iii)(A) of this section; and

(D) A proposed monitoring program for representative data collection for the term of the permit that describes the location of outfalls or field screening points to be sampled (or the location of instream stations), why the location is representative, the frequency of sampling, parameters to be sampled, and a description of sampling equipment.

(iv) Proposed management program. A proposed management program covers the duration of the permit. It shall include a comprehensive planning process which involves public participation and where necessary intergovernmental coordination, to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate. The program shall also include a description of staff and equipment available to implement the program. Separate proposed programs may be submitted by each coapplicant. Proposed programs may impose controls on a systemwide basis, a watershed basis, a jurisdiction basis, or on individual outfalls. Proposed programs will be considered by the Director when developing permit conditions to reduce pollutants in discharges to the maximum extent practicable. Proposed management programs shall describe priorities for implementing controls. Such programs shall be based on:

(A) A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls. At a minimum, the description shall include:

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(1) A description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers;

(2) A description of planning procedures including a comprehensive master plan to develop, implement and enforce controls to reduce the discharge of pollutants from municipal separate storm sewers which receive discharges from areas of new development and significant redevelopment. Such plan shall address controls to reduce pollutants in discharges from municipal separate storm sewers after construction is completed. (Controls to reduce pollutants in discharges from municipal separate storm sewers containing construction site runoff are addressed in paragraph (d)(2)(iv)(D) of this section;

(3) A description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities;

(4) A description of procedures to assure that flood management projects assess the impacts on the water quality of receiving water bodies and that existing structural flood control devices have been evaluated to determine if retrofitting the device to provide additional pollutant removal from storm water is feasible;

(5) A description of a program to monitor pollutants in runoff from operating or closed municipal landfills or other treatment, storage or disposal facilities for municipal waste, which shall identify priorities and procedures for inspections and establishing and implementing control measures for such discharges (this program can be coordinated with the program developed under paragraph (d)(2)(iv)(C) of this section); and

(6) A description of a program to reduce to the maximum extent practicable, pollutants in discharges from municipal separate storm sewers associated with the application of pesticides, herbicides and fertilizer which will include, as appropriate, controls such as educational activities, permits, certifications and other measures for commercial applicators and distributors, and controls for application in public right-of-ways and at municipal facilities.

(B) A description of a program, including a schedule, to detect and remove (or require the discharger to the municipal separate storm sewer to obtain a separate NPDES permit for) illicit discharges and improper disposal into the storm sewer. The proposed program shall include:

(1) A description of a program, including inspections, to implement and enforce an ordinance, orders or similar means to prevent illicit discharges to the municipal separate storm sewer system; this program description shall address all types of illicit discharges, however the following category of non-storm water discharges or flows shall be addressed where such discharges are identified by the municipality as sources of pollutants to waters of the United States: water line flushing, landscape irrigation, diverted stream flows, rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)) to separate storm sewers, uncontaminated pumped ground water, discharges from potable water sources, foundation drains, air conditioning condensation, irrigation water, springs, water from crawl space pumps, footing drains, lawn

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

watering, individual residential car washing, flows from riparian habitats and wetlands, dechlorinated swimming pool discharges, and street wash water (program descriptions shall address discharges or flows from fire fighting only where such discharges or flows are identified as significant sources of pollutants to waters of the United States);

(2) A description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens;

(3) A description of procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-storm water (such procedures may include: sampling procedures for constituents such as fecal coliform, fecal streptococcus, surfactants (MBAS), residual chlorine, fluorides and potassium; testing with fluorometric dyes; or conducting in storm sewer inspections where safety and other considerations allow. Such description shall include the location of storm sewers that have been identified for such evaluation);

(4) A description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer;

(5) A description of a program to promote, publicize, and facilitate public reporting of the presence of illicit discharges or water quality impacts associated with discharges from municipal separate storm sewers;

(6) A description of educational activities, public information activities, and other appropriate activities to facilitate the proper management and disposal of used oil and toxic materials; and

(7) A description of controls to limit infiltration of seepage from municipal sanitary sewers to municipal separate storm sewer systems where necessary;

(C) A description of a program to monitor and control pollutants in storm water discharges to municipal systems from municipal landfills, hazardous waste treatment, disposal and recovery facilities, industrial facilities that are subject to section 313 of title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA), and industrial facilities that the municipal permit applicant determines are contributing a substantial pollutant loading to the municipal storm sewer system. The program shall:

(1) Identify priorities and procedures for inspections and establishing and implementing control measures for such discharges;

(2) Describe a monitoring program for storm water discharges associated with the industrial facilities

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

identified in paragraph (d)(2)(iv)(C) of this section, to be implemented during the term of the permit, including the submission of quantitative data on the following constituents: any pollutants limited in effluent guidelines subcategories, where applicable; any pollutant listed in an existing NPDES permit for a facility; oil and grease, COD, pH, BOD_5, TSS, total phosphorus, total Kjeldahl nitrogen, nitrate plus nitrite nitrogen, and any information on discharges required under § 122.21(g)(7)(vi) and (vii).

(D) A description of a program to implement and maintain structural and non-structural best management practices to reduce pollutants in storm water runoff from construction sites to the municipal storm sewer system, which shall include:

(1) A description of procedures for site planning which incorporate consideration of potential water quality impacts;

(2) A description of requirements for nonstructural and structural best management practices;

(3) A description of procedures for identifying priorities for inspecting sites and enforcing control measures which consider the nature of the construction activity, topography, and the characteristics of soils and receiving water quality; and

(4) A description of appropriate educational and training measures for construction site operators.

(v) Assessment of controls. Estimated reductions in loadings of pollutants from discharges of municipal storm sewer constituents from municipal storm sewer systems expected as the result of the municipal storm water quality management program. The assessment shall also identify known impacts of storm water controls on ground water.

(vi) Fiscal analysis. For each fiscal year to be covered by the permit, a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs under paragraphs (d)(2)(iii) and (iv) of this section. Such analysis shall include a description of the source of funds that are proposed to meet the necessary expenditures, including legal restrictions on the use of such funds.

(vii) Where more than one legal entity submits an application, the application shall contain a description of the roles and responsibilities of each legal entity and procedures to ensure effective coordination.

(viii) Where requirements under paragraph (d)(1)(iv)(E), (d)(2)(ii), (d)(2)(iii)(B) and (d)(2)(iv) of this section are not practicable or are not applicable, the Director may exclude any operator of a discharge from a municipal separate storm sewer which is designated under paragraph (a)(1)(v), (b)(4)(ii) or (b)(7)(ii) of this section from such requirements. The Director shall not exclude the operator of a discharge from a municipal separate storm sewer identified in appendix F, G, H or I of part 122, from any of the permit application requirements under this paragraph except where authorized under

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

this section.

(e) Application deadlines. Any operator of a point source required to obtain a permit under this section that does not have an effective NPDES permit authorizing discharges from its storm water outfalls shall submit an application in accordance with the following deadlines:

(1) Storm water discharges associated with industrial activity.

(i) Except as provided in paragraph (e)(1)(ii) of this section, for any storm water discharge associated with industrial activity identified in paragraphs (b)(14)(i) through (xi) of this section, that is not part of a group application as described in paragraph (c)(2) of this section or that is not authorized by a storm water general permit, a permit application made pursuant to paragraph (c) of this section must be submitted to the Director by October 1, 1992;

(ii) For any storm water discharge associated with industrial activity from a facility that is owned or operated by a municipality with a population of less than 100,000 that is not authorized by a general or individual permit, other than an airport, powerplant, or uncontrolled sanitary landfill, the permit application must be submitted to the Director by March 10, 2003.

(2) For any group application submitted in accordance with paragraph (c)(2) of this section:

(i) Part 1.

(A) Except as provided in paragraph (e)(2)(i)(B) of this section, part 1 of the application shall be submitted to the Director, Office of Wastewater Enforcement and Compliance by September 30, 1991;

(B) Any municipality with a population of less than 250,000 shall not be required to submit a part 1 application before May 18, 1992.

(C) For any storm water discharge associated with industrial activity from a facility that is owned or operated by a municipality with a population of less than 100,000 other than an airport, powerplant, or uncontrolled sanitary landfill, permit applications requirements are reserved.

(ii) Based on information in the part 1 application, the Director will approve or deny the members in the group application within 60 days after receiving part 1 of the group application.

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(iii) Part 2.

(A) Except as provided in paragraph (e)(2)(iii)(B) of this section, part 2 of the application shall be submitted to the Director, Office of Wastewater Enforcement and Compliance by October 1, 1992;

(B) Any municipality with a population of less than 250,000 shall not be required to submit a part 1 application before May 17, 1993.

(C) For any storm water discharge associated with industrial activity from a facility that is owned or operated by a municipality with a population of less than 100,000 other than an airport, powerplant, or uncontrolled sanitary landfill, permit applications requirements are reserved.

(iv) Rejected facilities.

(A) Except as provided in paragraph (e)(2)(iv)(B) of this section, facilities that are rejected as members of the group shall submit an individual application (or obtain coverage under an applicable general permit) no later than 12 months after the date of receipt of the notice of rejection or October 1, 1992, whichever comes first.

(B) Facilities that are owned or operated by a municipality and that are rejected as members of part 1 group application shall submit an individual application no later than 180 days after the date of receipt of the notice of rejection or October 1, 1992, whichever is later.

(v) A facility listed under paragraph (b)(14) (i)–(xi) of this section may add on to a group application submitted in accordance with paragraph (e)(2)(i) of this section at the discretion of the Office of Water Enforcement and Permits, and only upon a showing of good cause by the facility and the group applicant; the request for the addition of the facility shall be made no later than February 18,1992; the addition of the facility shall not cause the percentage of the facilities that are required to submit quantitative data to be less than 10%, unless there are over 100 facilities in the group that are submitting quantitative data; approval to become part of group application must be obtained from the group or the trade association representing the individual facilities.

(3) For any discharge from a large municipal separate storm sewer system;

(i) Part 1 of the application shall be submitted to the Director by November 18, 1991;

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application;

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(iii) Part 2 of the application shall be submitted to the Director by November 16, 1992.

(4) For any discharge from a medium municipal separate storm sewer system;

(i) Part 1 of the application shall be submitted to the Director by May 18, 1992.

(ii) Based on information received in the part 1 application the Director will approve or deny a sampling plan under paragraph (d)(1)(iv)(E) of this section within 90 days after receiving the part 1 application.

(iii) Part 2 of the application shall be submitted to the Director by May 17, 1993.

(5) A permit application shall be submitted to the Director within 180 days of notice, unless permission for a later date is granted by the Director (see § 124.52(c) of this chapter), for:

(i) A storm water discharge that the Director, or in States with approved NPDES programs, either the Director or the EPA Regional Administrator, determines that the discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States (see paragraphs (a)(1)(v) and (b)(15)(ii) of this section);

(ii) A storm water discharge subject to paragraph (c)(1)(v) of this section.

(6) Facilities with existing NPDES permits for storm water discharges associated with industrial activity shall maintain existing permits. Facilities with permits for storm water discharges associated with industrial activity which expire on or after May 18, 1992 shall submit a new application in accordance with the requirements of 40 CFR 122.21 and 40 CFR 122.26(c) (Form 1, Form 2F, and other applicable Forms) 180 days before the expiration of such permits.

(7) The Director shall issue or deny permits for discharges composed entirely of storm water under this section in accordance with the following schedule:

(i)(A) Except as provided in paragraph (e)(7)(i)(B) of this section, the Director shall issue or deny permits for storm water discharges associated with industrial activity no later than October 1, 1993, or, for new sources or existing sources which fail to submit a complete permit application by October 1, 1992, one year after receipt of a complete permit

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

application;

(B) For any municipality with a population of less than 250,000 which submits a timely Part I group application under paragraph (e)(2)(i)(B) of this section, the Director shall issue or deny permits for storm water discharges associated with industrial activity no later than May 17, 1994, or, for any such municipality which fails to submit a complete Part II group permit application by May 17, 1993, one year after receipt of a complete permit application;

(ii) The Director shall issue or deny permits for large municipal separate storm sewer systems no later than November 16, 1993, or, for new sources or existing sources which fail to submit a complete permit application by November 16, 1992, one year after receipt of a complete permit application;

(iii) The Director shall issue or deny permits for medium municipal separate storm sewer systems no later than May 17, 1994, or, for new sources or existing sources which fail to submit a complete permit application by May 17, 1993, one year after receipt of a complete permit application.

(8) For any storm water discharge associated with small construction activities identified in paragraph (b)(15)(i) of this section, see § 122.21(c)(1). Discharges from these sources require permit authorization by March 10, 2003, unless designated for coverage before then.

(9) For any discharge from a regulated small MS4, the permit application made under § 122.33 must be submitted to the Director by:

(i) March 10, 2003 if designated under § 122.32(a)(1) unless your MS4 serves a jurisdiction with a population under 10,000 and the NPDES permitting authority has established a phasing schedule under § 123.35(d)(3) (see § 122.33(c)(1)); or

(ii) Within 180 days of notice, unless the NPDES permitting authority grants a later date, if designated under § 122.32(a)(2) (see § 122.33(c)(2)).

(f) Petitions.

(1) Any operator of a municipal separate storm sewer system may petition the Director to require a separate NPDES permit (or a permit issued under an approved NPDES State program) for any discharge into the municipal separate storm sewer system.

(2) Any person may petition the Director to require a NPDES permit for a discharge which is composed entirely of

storm water which contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

(3) The owner or operator of a municipal separate storm sewer system may petition the Director to reduce the Census estimates of the population served by such separate system to account for storm water discharged to combined sewers as defined by 40 CFR 35.2005(b)(11) that is treated in a publicly owned treatment works. In municipalities in which combined sewers are operated, the Census estimates of population may be reduced proportional to the fraction, based on estimated lengths, of the length of combined sewers over the sum of the length of combined sewers and municipal separate storm sewers where an applicant has submitted the NPDES permit number associated with each discharge point and a map indicating areas served by combined sewers and the location of any combined sewer overflow discharge point.

(4) Any person may petition the Director for the designation of a large, medium, or small municipal separate storm sewer system as defined by paragraph (b)(4)(iv), (b)(7)(iv), or (b)(16) of this section.

(5) The Director shall make a final determination on any petition received under this section within 90 days after receiving the petition with the exception of petitions to designate a small MS4 in which case the Director shall make a final determination on the petition within 180 days after its receipt.

(g) Conditional exclusion for “no exposure” of industrial activities and materials to storm water. Discharges composed entirely of storm water are not storm water discharges associated with industrial activity if there is “no exposure” of industrial materials and activities to rain, snow, snowmelt and/or runoff, and the discharger satisfies the conditions in paragraphs (g)(1) through (g)(4) of this section. “No exposure” means that all industrial materials and activities are protected by a storm resistant shelter to prevent exposure to rain, snow, snowmelt, and/or runoff. Industrial materials or activities include, but are not limited to, material handling equipment or activities, industrial machinery, raw materials, intermediate products, by-products, final products, or waste products. Material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, final product or waste product.

(1) Qualification. To qualify for this exclusion, the operator of the discharge must:

(i) Provide a storm resistant shelter to protect industrial materials and activities from exposure to rain, snow, snow melt, and runoff;

(ii) Complete and sign (according to § 122.22) a certification that there are no discharges of storm water contaminated by exposure to industrial materials and activities from the entire facility, except as provided in paragraph (g)(2) of this section;

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(iii) Submit the signed certification to the NPDES permitting authority once every five years. As of December 21, 2020 all certifications submitted in compliance with this section must be submitted electronically by the owner or operator to the Director or initial recipient, as defined in 40 CFR 127.2(b), in compliance with this section and 40 CFR part 3 (including, in all cases, subpart D to part 3), § 122.22, and 40 CFR part 127. Part 127 is not intended to undo existing requirements for electronic reporting. Prior to this date, and independent of part 127, owners or operators may be required to report electronically if specified by a particular permit or if required to do so by state law.

(iv) Allow the Director to inspect the facility to determine compliance with the "no exposure" conditions;

(v) Allow the Director to make any "no exposure" inspection reports available to the public upon request; and

(vi) For facilities that discharge through an MS4, upon request, submit a copy of the certification of "no exposure" to the MS4 operator, as well as allow inspection and public reporting by the MS4 operator.

(2) Industrial materials and activities not requiring storm resistant shelter. To qualify for this exclusion, storm resistant shelter is not required for:

(i) Drums, barrels, tanks, and similar containers that are tightly sealed, provided those containers are not deteriorated and do not leak ("Sealed" means banded or otherwise secured and without operational taps or valves);

(ii) Adequately maintained vehicles used in material handling; and

(iii) Final products, other than products that would be mobilized in storm water discharge (e.g., rock salt).

(3) Limitations.

(i) Storm water discharges from construction activities identified in paragraphs (b)(14)(x) and (b)(15) are not eligible for this conditional exclusion.

(ii) This conditional exclusion from the requirement for an NPDES permit is available on a facility-wide basis only, not for individual outfalls. If a facility has some discharges of storm water that would otherwise be "no exposure" discharges, individual permit requirements should be adjusted accordingly.

(iii) If circumstances change and industrial materials or activities become exposed to rain, snow, snow melt, and/or

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

runoff, the conditions for this exclusion no longer apply. In such cases, the discharge becomes subject to enforcement for un-permitted discharge. Any conditionally exempt discharger who anticipates changes in circumstances should apply for and obtain permit authorization prior to the change of circumstances.

(iv) Notwithstanding the provisions of this paragraph, the NPDES permitting authority retains the authority to require permit authorization (and deny this exclusion) upon making a determination that the discharge causes, has a reasonable potential to cause, or contributes to an instream excursion above an applicable water quality standard, including designated uses.

(4) Certification. The no exposure certification must require the submission of the following information, at a minimum, to aid the NPDES permitting authority in determining if the facility qualifies for the no exposure exclusion:

(i) The legal name, address and phone number of the discharger (see § 122.21(b));

(ii) The facility name and address, the county name and the latitude and longitude where the facility is located;

(iii) The certification must indicate that none of the following materials or activities are, or will be in the foreseeable future, exposed to precipitation:

(A) Using, storing or cleaning industrial machinery or equipment, and areas where residuals from using, storing or cleaning industrial machinery or equipment remain and are exposed to storm water;

(B) Materials or residuals on the ground or in storm water inlets from spills/leaks;

(C) Materials or products from past industrial activity;

(D) Material handling equipment (except adequately maintained vehicles);

(E) Materials or products during loading/unloading or transporting activities;

(F) Materials or products stored outdoors (except final products intended for outside use, e.g., new cars, where exposure to storm water does not result in the discharge of pollutants);

 © 2018 Thomson Reuters. No claim to original U.S. Government Works.

(G) Materials contained in open, deteriorated or leaking storage drums, barrels, tanks, and similar containers;

(H) Materials or products handled/stored on roads or railways owned or maintained by the discharger;

(I) Waste material (except waste in covered, non-leaking containers, e.g., dumpsters);

(J) Application or disposal of process wastewater (unless otherwise permitted); and

(K) Particulate matter or visible deposits of residuals from roof stacks/vents not otherwise regulated, i.e., under an air quality control permit, and evident in the storm water outflow;

(iv) All "no exposure" certifications must include the following certification statement, and be signed in accordance with the signatory requirements of § 122.22: "I certify under penalty of law that I have read and understand the eligibility requirements for claiming a condition of "no exposure" and obtaining an exclusion from NPDES storm water permitting; and that there are no discharges of storm water contaminated by exposure to industrial activities or materials from the industrial facility identified in this document (except as allowed under paragraph (g)(2)) of this section. I understand that I am obligated to submit a no exposure certification form once every five years to the NPDES permitting authority and, if requested, to the operator of the local MS4 into which this facility discharges (where applicable). I understand that I must allow the NPDES permitting authority, or MS4 operator where the discharge is into the local MS4, to perform inspections to confirm the condition of no exposure and to make such inspection reports publicly available upon request. I understand that I must obtain coverage under an NPDES permit prior to any point source discharge of storm water from the facility. I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based upon my inquiry of the person or persons who manage the system, or those persons directly involved in gathering the information, the information submitted is to the best of my knowledge and belief true, accurate and complete. I am aware there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

Re: Draft Proposed Decision, Schedule for Comments, and Notice of Hearing
California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049, 16-TC-03
California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049, Provisions C.3.j, C.8., C.10.a., C.10.b., C.11.a., C.11.b., C.11.c., C.12.a., C.12.c., C.12.d., and C.12.e, Adopted on November 19, 2015 and Effective on January 1, 2016
City of Union City, Claimant

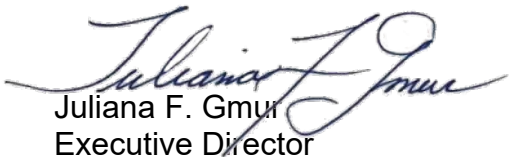
Dear Mr. Hill and Mr. Newmark:

The Draft Proposed Decision for the above-captioned matter is enclosed for your review and comment.

Written Comments: Written comments may be filed on the Draft Proposed Decision no later than **January 13, 2026**. Please note that all representations of fact submitted to the Commission must be signed under penalty of perjury by persons who are authorized and competent to do so and must be based upon the declarant's personal knowledge, information, or belief. (Cal. Code Regs., tit. 2, § 1187.5.) Hearsay evidence may be used for the purpose of supplementing or explaining other evidence but shall not be sufficient in itself to support a finding unless it would be admissible over an objection in civil actions. (Cal. Code Regs., tit. 2, § 1187.5.) The Commission's ultimate findings of fact must be supported by substantial evidence in the record.[1]

You are advised that comments filed with the Commission are required to be electronically filed (e-filed) in an unlocked legible and searchable PDF file, using the Commission's Dropbox. (Cal. Code Regs., tit. 2, § 1181.3(d)(2) and (f), effective January 1, 2026.) Refer to https://www.csm.ca.gov/dropbox.shtml on the Commission's website for electronic filing instructions. If e-filing would cause the filer undue hardship or significant prejudice, filing may occur by first class mail, overnight delivery or personal service only upon approval of a written request to the executive director. (Cal. Code Regs., tit. 2, § 1181.3(j), effective January 1, 2026.)

If you would like to request an extension of time to file comments, please refer to section 1187.9(a) of the Commission's regulations.



[1] Government Code section 17559(b), which provides that a claimant or the state may commence a proceeding in accordance with the provisions of section 1094.5 of the Code of Civil Procedure to set aside a decision of the Commission on the ground that the Commission's decision is not supported by substantial evidence in the record.

Hearing: This matter is set for hearing on **Friday, April 10, 2026** at 10:00 a.m. The Proposed Decision will be issued on or about March 27, 2026.

If you plan to address the Commission on this item, please notify the Commission Office not later than noon on the Tuesday prior to the hearing, **April 7, 2026.** Please also include the names of the people who will be speaking for inclusion on the witness list and the names and emails addresses of the people who will be speaking both in person and remotely to receive a hearing panelist link in Zoom. When calling or emailing, please identify the item you want to testify on and the entity you represent. The Commission Chairperson reserves the right to impose time limits on presentations as may be necessary to complete the agenda.

If you would like to request postponement of the hearing, please refer to section 1187.9(b) of the Commission's regulations.

Very truly yours,

Juliana F. Gmur
Executive Director

Hearing Date: April 10, 2026

TEST CLAIM

DRAFT PROPOSED DECISION

California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049, Provisions C.3.j., C.8., C.10.a., C.10.b., C.11.a., C.11.b., C.11.c., C.12.a., C.12.c., C.12.d., and C.12.e., Adopted on November 19, 2015 and Effective on January 1, 2016

16-TC-03

City of Union City, Claimant

EXECUTIVE SUMMARY

Overview

This Test Claim alleges reimbursable state mandated activities arising from Order R2-2015-0049, effective January 1, 2016.[1] The claimant has pled the following provisions from Order R2-2015-0049, alleging these provisions impose a reimbursable state-mandated program within the meaning of article XIII B, section 6 of the California Constitution:

- Provision C.8., which the claimant included "out of an abundance of caution" as it sought reimbursement for the continued costs of monitoring programs that were originally imposed by the prior permit (Order R2-2009-0074) and which were addressed by the prior Test Claims in this series (*California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, and 10-TC-05).[2]
- Provisions C.10.a.i., ii., and iii. and C.10.b.i. and ii., addressing the reduction of trash loads.[3]
- The following provisions which implement previously adopted TMDLs for mercury and PCBs:

[1] Exhibit A, Test Claim, page 4.

[2] Exhibit A, Test Claim, pages 30-31 (Test Claim Narrative).

[3] Exhibit A, Test Claim, pages 476-478 (test claim permit, Provisions C.10.a.i.-iii.) and 478-479 (test claim permit, Provisions C.10.b.i.-ii.).

- Provision C.3.j. requires the permittees to develop a Green Infrastructure Plan, adopt policies and ordinances, conduct outreach, and report progress on the planning.[4]
- Provisions C.11.c. and C.12.c. require the permittees to implement Green Infrastructure projects to achieve the load reductions for mercury and PCBs, in accordance with the TMDLs, prepare a reasonable assurance analysis of future mercury and PCBs load reductions, which demonstrate how Green Infrastructure projects will achieve the total load reduction by 2040, and to report on Green Infrastructure implementation.[5]
- Provision C.11.a. requires the permittees to implement mercury source and treatment control measures and pollution prevention strategies to reduce loads throughout the permit area and submit various reports.[6]
- Provision C.11.b. requires permittees to develop and implement an assessment methodology and data collection program to quantify mercury loads reduced through implementation of any and all pollution prevention, source control and treatment control efforts required by the test claim permit's provisions or load reductions achieved through other relevant efforts.[7]
- Provision C.12.a. requires the permittees to implement PCBs source and treatment control measures and pollution prevention strategies to reduce loads throughout the permit area, develop and implement an assessment methodology and data collection program to quantify in a technically sound manner mercury and PCBs loads reduced; and submit various reports.[8]
- Provision C.12.d. requires the permittees to prepare a plan and schedule of future PCBs control measure implementation and reasonable assurance analysis demonstrating that sufficient control measures will be implemented to attain the PCBs TMDL wasteload allocations by 2030.[9]

[4] Exhibit A, Test Claim, page 422-427 (test claim permit, Provision C.3.j.).

[5] Exhibit A, Test Claim, pages 488-490 (test claim permit, Provision C.11.c.) and 495-497 (test claim permit, Provision C.12.c.).

[6] Exhibit A, Test Claim, pages 486-487 (test claim permit, Provisions C.11.a.-b.) and 492-494 (test claim permit, Provisions C.12.a.-b.).

[7] Exhibit A, Test Claim, page 487-488 (test claim permit, Provision C.11.b.).

[8] Exhibit A, Test Claim, pages 492-495 (test claim permit, Provisions C.12.a.).

[9] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.).

- Provision C.12.e. requires permittees to evaluate the presence of PCBs in caulks and sealants used in storm drains or roadway infrastructure in public rights-of-way.[10]

For the reasons stated herein, Staff recommends that the Commission partially approve this Test Claim.

Procedural History

The claimant filed the Test Claim on June 30, 2017.[11] On October 10, 2017, The Department of Finance (Finance) filed comments on the Test Claim.[12] On November 7 and 16, 2017, the claimant and the Regional Board each requested extensions on the time to file comments, which were respectively granted and partially granted for good cause. On February 1, 2018, The Regional Board submitted late comments on the test claim, and filed the administrative record of the permit in eight parts.[13] On March 6 and April 19, 2018, the claimant filed two extensions of time to file rebuttal comments, which were granted for good cause. The claimant filed rebuttal comments on May 28, 2018.[14]

Commission staff issued the Draft Proposed Decision on December 23, 2025.[15]

Commission Responsibilities

Under article XIII B, section 6 of the California Constitution, local agencies and school districts are entitled to reimbursement for the costs of state-mandated new programs or higher levels of service. In order for local government to be eligible for reimbursement, one or more similarly situated local agencies or school districts must file a test claim with the Commission. "Test claim" means the first claim filed with the Commission alleging that a particular statue or executive order imposes costs mandated by the state. Test claims function similarly to class actions and all members of the class have the opportunity to participate in the test claim process and all are bound by the final decision of the Commission for purposes of that test claim.

[11] Exhibit A, Test Claim, page 4.

[12] Exhibit B, Finance's Comments on the Test Claim, page 1.

[13] Exhibit C, Regional Board's Late Comments on the Test Claim, page 1. Because of its enormous size, the administrative record cannot reasonably be included as an exhibit. Documents contained therein and cited in this document are being included as excerpts. However, the entirety of all eight parts are available on the Commission's website on the matter page for this Test Claim: https://csm.ca.gov/matters/16-TC-03.shtml.

[14] Exhibit D, Claimant's Rebuttal Comments, page 1.

[15] Exhibit E, Draft Proposed Decision.

The Commission is the quasi-judicial body vested with exclusive authority to adjudicate disputes over the existence of state-mandated programs within the meaning of article XIII B, section 6 of the California Constitution and not apply it as an "equitable remedy to cure the perceived unfairness resulting from political decisions on funding priorities."[16]

Claims

The following chart provides a brief summary of the claims and issues raised and staff's recommendation.

Issue	Description	Staff Recommendation
Was the test claim timely filed?	Government Code section 17551(c) provides that Test Claims "shall be filed not later than 12 months following the effective date of a statute or executive order, or within 12 months of incurring increased costs as a result of a statute or executive order, whichever is later."[17] The Commission's regulations effective at the time this claim was filed provided that "[f]or purposes of claiming based on the date of first incurring costs, 'within 12 months' means by June 30 of the fiscal year following the fiscal year in which increased costs were first incurred by the test claimant."[18]	Yes, the Test Claim was timely filed. The Test Claim was filed on June 30, 2017, more than a year after the effective date of the stormwater permit on January 1, 2016.[19] However, evidence shows that the earliest date when costs were first incurred as a result of the permit after its effective date was January 4, 2016.[20] Thus under the regulations at the time of filing, the claimant had until June 30, 2017 to file its claim. The Test Claim was filed on June 30, 2017, and is therefore timely.[21] Government Code section 17557(e) requires a test

[21] Exhibit A, Test Claim, page 4.

Issue	Description	Staff Recommendation
		claim to be "submitted on or before June 30 following a fiscal year in order to establish eligibility for reimbursement for that fiscal year." Because the Test Claim was filed on June 30, 2017, the potential period of reimbursement under Government Code section 17557 begins on July 1, 2015. However, since the test claim permit has a later effective date, the potential period of reimbursement for this claim begins on the permit's effective date, or January 1, 2016.
Do the Provisions pled by the claimant impose a reimbursable state-mandated program within the meaning of article XIII B, section 6 of the California Constitution?	The purpose of article XIII B, section 6 is to prevent the state from forcing extra programs on local government each year in a manner that negates their careful budgeting of increased expenditures counted against the local government's annual spending limit and, thus, article XIII B, section 6 requires a showing that the test claim statute or executive order mandates *new* activities and associated costs compared to prior law, forcing them to spend their local proceeds of taxes.[22]	Partially approve. The test claim permit requires some new activities, when compared to prior law. Not all properly pleaded Provisions impose new state-mandated activities that result in a new program or higher level of service, however. Those activities are denied. Permittees have regulatory development fee authority as to some of the Provisions that are a new state-mandated activity that create a new program or higher level of service, namely those related to

[22] California Constitution, articles XIII B, sections 1, 8(a) and (b); *County of Los Angeles v. State of California* (1987) 43 Cal.3d 46, 56; *Lucia Mar Unified School Dist. v. Honig* (1988) 44 Cal.3d 830, 835; *Hayes v. Commission on State Mandates* (1992) 11

Issue	Description	Staff Recommendation
		developing and implementing a Green Infrastructure Plan under Provision C.3.j. These do not result in increased costs mandated by the state, as Permittees have fee authority sufficient as a matter of law pursuant to Government Code section 17556(d). For the remaining activities, these constitute state-mandated new programs or higher levels of service, and impose costs mandated by the state from December 1, 2009, through December 31, 2017. Beginning January 1, 2018, reimbursement is denied because there are no costs mandated by the state; claimants have fee authority sufficient as a matter of law to cover the costs of the mandated activities pursuant to Government Code section 17556(d).[23]

Staff Analysis

The Test Claim was timely filed on June 30, 2017, with a potential period of reimbursement beginning on the permit's effective date of January 1, 2016.[24]

The Commission does not have authority to re-address the monitoring requirements in Provision C.8. The Commission addressed the monitoring requirements in Provision C.8. imposed by the prior permit in Test Claim *California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, and 10-TC-05, and issued a Decision on January 24, 2025.[25] The claimant has not alleged that this test claim permit requires any new activities for Provision C.8. when compared to the prior permit, and there are no allegations that the activities in Provision C.8. found to be state mandates under the prior permit have changed. The Commission's Decision in the prior Test Claim is a final binding decision, which cannot be disturbed unless litigated and directed by the court to be set aside or modified pursuant to Government Code section 17559(b) or if a request for a new test claim decision based on a subsequent change in law is filed pursuant to Government Code section 17570.[26]

Staff finds that the trash provisions are not new and do not mandate a new program or higher level of service. Provision C.10.a.i. requires permittees to reduce trash discharges to receiving waters from their 2009 levels according to a schedule that requires them to attain 70 percent reduction by July 1, 2017, and 80 percent reduction by July 1, 2019.[27] Provision C.10.a.ii. requires the implementation of "trash prevention and control actions, including full trash capture systems and other trash management actions, or combinations of actions, with trash discharge control equivalent to or better than full trash capture systems, to reduce trash to a Low trash generation rating or better," and to ensure that lands they do not own or operate but are plumbed directly to their storm drain system in a Very High, High, or Moderate trash generation area are either equipped with full trash capture systems or are managed with trash discharge control actions equivalent to or better than a full trash capture system.[28] Provision C.10.a.iii. requires permittees to install and maintain a mandatory minimum number of full trash capture systems, to treat runoff from an area equivalent to 30 percent of the retail/wholesale land area, as documented by the Association of Bay Area

---

[24] Exhibit A, Test Claim, pages 4 (Written Narrative), 383 (test claim permit). See California Code of Regulations, title 2, section 1183.1(c) (Register 2016, No. 38); Government Code section 17557(e).

[25] See Commission on State Mandates, Test Claim Decision on *California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, 10-TC-05, adopted January 24, 2025, https://csm.ca.gov/matters/10-TC-01-02-03-05/doc68.pdf (accessed February 27, 2025).

[26] *California School Boards Assoc. v. State of California* (2009) 171 Cal.App.4th 1183, 1200.

[27] Exhibit A, Test Claim, page 476 (test claim permit, Provision C.10.a.i.).

[28] Exhibit A, Test Claim, page 477 (test claim permit, Provision C.10.a.ii.).

Governments, which drains into the storm drain system within their jurisdiction.[29] Provision C.10.b.i. provides specific standards for proper maintenance and documentation of permittees' full trash capture systems, and requires permittees to annually certify each of their full trash capture systems has been operated and maintained to meet those standards.[30] Provision C.10.b.ii. requires permittees to maintain documentation for all of their non-full trash capture system control actions, and to conduct visual on-land assessments of each area where they implemented non-full trash capture system control actions or a combination of actions other than full trash capture, to determine or verify the effectiveness of the action or combination of actions.[31]

The prior permit required the timely implementation of control measures to reduce trash loads by 40 percent by 2014, by 70 percent by 2017, and by 100 percent by 2022.[32] This is the same schedule for compliance as in the test claim permit and the requirement to reduce trash loads by 80 percent by 2019 is in line with the existing schedule and therefore is not new. The prior permit also had a specific provision requiring permittees to install a mandatory minimum number of full trash capture systems, which has not changed with this permit and is not new.[33] For the requirement to inspect and maintain full trash capture systems, federal law has always required permittees to properly operate and maintain their facilities and systems of treatment and control, and to maintain documentation.[34] This duty also applies for non-full trash capture system control actions, and the on-land visual assessments are a quality assurance procedure, which federal regulations require for proper operation and maintenance of these facilities and systems of treatment and control.[35] Though the claimant may complain that these provisions are more prescriptive, burdensome, and costly than what was required under the prior permit, the fact is they were always required to perform these activities; all the test claim permit has done is specify what proper performance entails.

Staff further finds the test claim permit imposes the following new requirements on the permittees when compared to prior law.

1. Green Infrastructure Plan (Provision C.3.j.i.-iv.):
    a. Green Infrastructure Plan (Provision C.3.j.i.)

[35] Code of Federal Regulations, title 40, section 122.41(e).

- Prepare a framework or workplan describing specific tasks and timeframes for development for its Green Infrastructure Plan, to be approved by the Permittee's governing body, mayor, city manager, or county manager by June 30, 2017. This framework or workplan shall include a statement of purpose, tasks, and timeframe needed to complete all requirements in Provision C.3.j.i.2. (discussed below).[36]
- Prepare a Green Infrastructure Plan, subject to Executive Officer approval, that contains all the following:
    - A mechanism (such as SFEI's Green PlanIT tool) to prioritize and map areas for potential and planned projects, both public and private, on a drainage-area specific basis, for implementation by 2020, by 2030, and by 2040, that includes criteria for prioritization and outputs that can be incorporated into the Permittees' long-term planning and capital improvement processes.
    - Outcomes from the above-described mechanism, including but not limited to, the prioritization criteria, maps, lists, and all other information, as appropriate. Individual project-specific reviews do not need to be submitted with the Plan, but shall be made available for review upon request.
    - Targets for the amount of impervious surface from public and private projects within the Permittee's jurisdiction to be retrofitted by 2020, by 2030, and by 2040.
    - A process for tracking and mapping completed projects, public and private, and making the information publicly available online (i.e., SFEI's Green PlanIT tool).
    - General guidelines for overall streetscape and project design and construction so that projects have a unified complete design that implements the range of functions associated with the project.
    - Standard specifications, and as appropriate, typical design details and related information necessary for the Permittee to implement Green Infrastructure Projects in its jurisdiction, which shall be sufficient to address the different street and project types within a Permittee's jurisdiction, as defined by land use and transportation characteristics.
    - Requirements that projects be designed to meet the treatment and hydromodification sizing requirements outline in Provisions C.3.c. and C.3.d. For projects that are not subject to these requirements according to Provision C.3.b.ii. (non-regulated projects), Permittees may collectively propose a single approach for how to proceed when project constraints

[36] Exhibit A, Test Claim, page 423 (test claim permit, Provision C.3.j.i.1.).

preclude fully meeting the sizing requirements, which can include options for addressing specific issues or scenarios.

- A summary of planning documents the permittee has updated or otherwise modified to incorporate Green Infrastructure requirements (General Plans, Specific Plans, Complete Street Plans, Active Transportation Plans, Storm Drain Master Plans, Pavement Work Plans, Urban Forestry Plans, Flood Control/Management Plans, and any other plans that may impact the future alignment, configuration or design of impervious surfaces within the Permittee's jurisdiction). These modifications are to be completed by no later than the end of the permit term.
- A workplan identifying how the Permittee will ensure that Green Infrastructure and low impact development are appropriately included in future plans.
- A workplan to complete prioritized projects identified as part of an Alternative Compliance Program or Early Implementation as outlined in Provision C.3.e. or C.3.j.ii.
- An evaluation of prioritized project funding options including, but not limited to: Alternative Compliance funds; grant monies, including transportation project grants from federal, State, and local agencies; existing Permittee resources; new tax or other levies; and other sources of funds.[37]

- Adopt policies, ordinances, and/or other appropriate legal mechanisms to ensure implementation of the Green Infrastructure Plan in accordance with the requirements of this provision.[38]
- Conduct outreach and education in accordance with the following:
  - Conduct public outreach on the requirements of this provision, including outreach coordinated with adoption or revision of standard specifications and planning documents, and with the initiation and planning of infrastructure projects. Such outreach shall include general outreach and targeted outreach to and training for professionals involved in infrastructure planning and design.
  - Train appropriate staff, including planning, engineering, public works maintenance, finance, fire/life safety, and management staff on the requirements of this provision and methods of implementation.

[37] Exhibit A, Test Claim, pages 423-425 (test claim permit, Provision C.3.j.i.2.).

[38] Exhibit A, Test Claim, page 425 (test claim permit, Provision C.3.j.i.3.).

- Educate appropriate Permittee elected officials (e.g., mayors, city council members, county supervisors, district board members) on the requirements of this provision and methods of implementation.[39]

- Each permittee shall report on its planning progress as follows:
  - Submit documentation in the 2017 Annual Report that its framework or workplan for development of its Green Infrastructure Plan was approved by its governing body, mayor, city manager, or county manager by June 30, 2017.
  - Submit its completed Green Infrastructure Plan with the 2019 Annual Report.
  - Submit documentation of its legal mechanisms to ensure implementation of its Green Infrastructure Plan with the 2019 Annual Report.
  - Submit a summary of its outreach and education efforts in each Annual Report.[40]

b. Early Implementation – List of Green Infrastructure Projects (Provision C.3.j.ii.):

- *Except for a permittee's own public project (which does not mandate a new program or higher level of service)*, prepare and maintain a list of Green Infrastructure Projects, public and private, that are already planned for implementation during the permit term and infrastructure projects planned for implementation during the permit term that have potential for Green Infrastructure measures.[41]
- *Except for a permittee's own public project (which does not mandate a new program or higher level of service)*, submit the list with each Annual Report and a summary of planning or implementation status for each public Green Infrastructure Project and each private Green Infrastructure Project that is not also a Regulated Project as defined in Provision C.3.b.ii. Include a summary of how each public infrastructure project with Green Infrastructure potential will include Green Infrastructure measures to the maximum extent practicable during the permit term. For any public infrastructure project where implementation of Green Infrastructure measures is not practicable, submit a brief description of the project and the reasons Green Infrastructure measures were impracticable to implement.[42]

c. Participation in Processes to Promote Green Infrastructure (Provision C.3.j.iii.):

---

[39] Exhibit A, Test Claim, pages 425-426 (test claim permit, Provision C.3.j.i.4.).

[40] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.i.5.).

[41] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.ii.1.).

[42] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.ii.2.).

- Either individually or collectively, track processes, assemble and submit information, and provide informational materials and presentations as needed to assist relevant regional, State, and federal agencies to plan, design, and fund incorporation of Green Infrastructure measures into local infrastructure projects, including transportation projects. Issues to be addressed include coordinating the timing of funding from different sources, changes to standard designs and design criteria, ranking and prioritizing projects for funding, and implementation of cooperative in-lieu programs.[43]
- In each Annual Report, report on the goals and outcomes during the reporting year of work undertaken to participate in processes to promote Green Infrastructure.[44]
- In the 2019 Annual Report, submit a plan and schedule for new and ongoing efforts to participate in processes to promote Green Infrastructure.[45]

d. Tracking and Reporting Progress (Provision C.3.j.iv.):

- Either individually or collectively, develop and implement regionally-consistent methods to track and report implementation of Green Infrastructure measures including treated area and connected and disconnected impervious area on both public and private parcels within their jurisdictions. The methods shall also address tracking needed to provide reasonable assurance that wasteload allocations for TMDLs, including the San Francisco Bay PCBs and mercury TMDLs, and reductions for trash, are being met.[46]
- In each Annual Report, report progress on development and implementation of the tracking methods.[47]
- In the 2019 Annual Report, submit the tracking methods and report implementation of Green Infrastructure measures including treated area, and connected and disconnected impervious area on both public and private parcels within their jurisdictions.[48]

2. Reasonable Assurance Analysis (Provisions C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., and C.12.c.iii.1.-3.):

- Prepare a reasonable assurance analysis of future mercury and PCBs load reductions by doing the following:

[43] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.iii.1.).

[44] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.3.j.iii.2.).

[45] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.3.j.iii.3.).

[46] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.3.j.iv.1.).

[47] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.2.j.iv.2.).

[48] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.2.j.iv.3.).

- Quantify the relationship between areal extent of Green Infrastructure implementation and mercury and PCBs load reductions, taking into consideration the scale of contamination of the treated area as well as the pollutant removal effectiveness of likely green infrastructure strategies.[49]
- Estimate the amount and characteristics of land area that will be treated through Green Infrastructure by 2020, 2030, and 2040.[50]
- Estimate the amount of mercury/PCBs load reductions that will result from Green Infrastructure implementation by 2020, 2030, and 2040.[51]
- Quantitatively demonstrate that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/yr will be realized by 2040 through implementation of Green Infrastructure Projects.[52]
- Ensure that the calculation methods, models, model inputs, and modeling assumptions used to fulfill provisions C.11.c.ii.2.a.-d. and C.12.c.ii.2.a.-d. above have been validated through a peer review process.[53]

- Submit in the 2018 Annual Report as part of the reporting required for Provisions C.11.b.iii.2. and C.12.b.iii.3., the quantitative relationship between Green Infrastructure implementation and mercury and PCBs load reductions. This submittal shall include all data used and a full description of the models and model inputs relied on to establish this relationship.[54]
- Submit in the 2020 Annual Report an estimate of the amount and characteristics of land area that will be treated through Green Infrastructure implementation by 2020, 2030, and 2040. This submittal shall include all data used and a full description of the models and model inputs relied on to generate this estimate.[55]

---

[49] Exhibit A, Test Claim, pages 489, 497 (test claim permit, Provisions C.11.c.ii.2.a., C.12.c.ii.2.a.).

[50] Exhibit A, Test Claim, pages 489, 497 (test claim permit, Provisions C.11.c.ii.2.b., C.12.c.ii.2.b.).

[51] Exhibit A, Test Claim, pages 489, 497 (test claim permit, Provisions C.11.c.ii.2.c., C.12.c.ii.2.c.).

[52] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.ii.2.d., C.12.c.ii.2.d.).

[53] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.ii.2.e., C.12.c.ii.2.e.).

[54] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.1., C.12.c.iii.1.).

[55] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.2., C.12.c.iii.2.).

- Submit in the 2020 Annual Report a reasonable assurance analysis to demonstrate quantitatively that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/yr will be realized by 2040 through the implementation of Green Infrastructure Projects. This submittal shall include all data used and a full description of models and model inputs relied on to make the demonstration and documentation of peer review of the reasonable assurance analysis.[56]

3. Progress Report on List of Watersheds and Management Areas Where Mercury Control Measures are or will be Implemented (Provision C.11.a.iii.1.).
    - By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where mercury control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[57]
4. PCBs Reporting (Provisions C.12.a.iii.1. and C.12.a.iii.2.):
    - By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where PCBs control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[58]
    - In the 2016 Annual Report, include the following information:
        - A cumulative listing of all potentially PCB-contaminated sites permittees have discovered and referred to the Water Board to date, with a brief summary description of each site and where to obtain further information.
        - For each structural control and non-structural BMP, interim implementation progress milestones (e.g., construction milestones for structural controls or other relevant implementation milestones for structural controls and non-structural BMPs) and a schedule for milestone achievement.
        - Clear statements of the roles and responsibilities of each participating permittee for implementation of pollution prevention or control measures for PCBs.[59]

[59] Exhibit A, Test Claim, pages 493-494 (test claim permit, Provision C.12.a.iii.2.).

5. Prepare PCBs control measures implementation plan, schedule, and reasonable assurance analysis to achieve the PCBs TMDL wasteload allocations by 2030 (Provision C.12.d.):
    - Prepare a PCBs control measures implementation plan, which must identify all technically and economically feasible PCBs control measures to be implemented (including green infrastructure projects).[60]
    - Include a schedule for PCBs control measure implementation according to which these technically and economically feasible PCBs control measures will be fully implemented by 2030.[61]
    - Provide an evaluation and quantification of the PCBs load reduction of such measures as well as an evaluation of costs, control measure efficiency and significant environmental impacts resulting from their implementation.[62]
    - Prepare a reasonable assurance analysis demonstrating that sufficient control measures will be implemented to attain the PCBs TMDL wasteload allocations by 2030.[63]
    - Submit the plan and schedule required by Provision C.12.d. in the 2020 Annual Report.[64]
6. Evaluate the presence of PCBs in caulks/sealants in storm drain or roadway infrastructure in public rights-of-way (Provision C.12.e.):
    - Collect at least 20 samples from throughout the permit-area of the caulks and sealants used in storm drains or roadway infrastructure in public rights-of-way.[65]
    - Analyze the samples taken for PCBs in such a way that is able to detect a minimum PCB concentration of 200 parts per billion.[66]
    - Report on the results of this investigation, including all data gathered, no later than the 2018 Annual Report.[67]

[60] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.1.).

[61] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.2.).

[62] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.3.).

[63] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.i.).

[64] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.iii.).

[65] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[66] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[67] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.iii.).

The remaining requirements alleged by the claimant are either not new, not mandated by the state, or are not a new program or higher level of service.

Finally, staff finds that the new state-mandated activities result in costs mandated by the state for some of the activities based on the following findings:

1. There is substantial evidence in the record that permittees incurred costs exceeding $1,000 and used proceeds of taxes to comply with the test claim permit.
2. Pursuant to Government Code section 17556(d), permittees have regulatory fee authority sufficient as a matter of law to fund the new state-mandated activities related to developing and implementing the Green Infrastructure Plan (Provision C.3.j.i.-iv.), and thus, there are no costs mandated by the state for these activities.
3. The Permittees have constitutional and statutory authority to charge property-related fees for the reasonable assurance analysis of future mercury and PCBs load reductions (C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., and C.12.c.iii.1.-3.); required mercury progress report on list of watersheds and management areas where control measures are or will be implemented (C.11.a.iii.); PCBs reporting (C.12.a.iii.1. and 2.); PCBs control measures implementation plan (C.12.d.); and PCBs caulk and sealant testing (C.12.e.). However, from January 1, 2016 (the beginning date of the potential period of reimbursement) to December 31, 2017, these fees are subject to the voter approval requirement in article XIII D, section 6(c), and therefore fee authority is not sufficient as a matter of law.[68] Under these limited circumstances, Government Code section 17556(d) does not apply, and there are costs mandated by the state.[69] Any fee revenues received must be identified as offsetting revenue. In addition, reimbursement for this mandate from any source, including but not limited to, service fees collected, federal funds, other state funds, and other funds that are not a claimant's local proceeds of taxes shall be identified and deducted from this claim.

   On or after January 1, 2018, there are no costs mandated by the state to comply with these activities because the claimants have constitutional and statutory authority to charge property-related fees for these costs subject only to the voter protest provisions of article XIII D, which is sufficient as a matter of law to cover

[68] See *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98 Cal.App.4th 1351, and *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 579-581.

[69] *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 579-581; Government Code sections 57350 and 57351 (SB 231, eff. January 1, 2018, which overturned *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98 Cal.App.4th 1351); *Paradise Irrigation District v. Commission on State Mandates* (2019) 33 Cal.App.5th 174, 195.

the costs of the mandated activities within the meaning of Government Code section 17556(d).[70]

Based on *Paradise Irrigation District* case and the Legislature's enactment of Government Code sections 57350 and 57351 (which overturned *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98 Cal.App.4th 1351), there are no costs mandated by the state on or after January 1, 2018, to comply with these activities, because claimants have constitutional and statutory authority to charge property-related fees for these costs subject only to the voter protest provisions of article XIII D, which is sufficient as a matter of law to cover the costs of the mandated activities within the meaning of Government Code section 17556(d).

Conclusion

Staff recommends the Commission partially approve this Test Claim and find the reasonable assurance analysis of future mercury and PCBs load reductions (C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., and C.12.c.iii.1.-3.); required mercury progress report on list of watersheds and management areas where control measures are or will be implemented (C.11.a.iii.); PCBs reporting (C.12.a.iii.1. and 2.); PCBs control measures implementation plan (C.12.d.); and PCBs caulk and sealant testing (C.12.e.) impose a reimbursable state-mandated program from January 1, 2016, to December 31, 2017 only.

In addition, reimbursement for these mandated activities from any source, including but not limited to, state and federal funds, any service charge, fees, or assessments to offset all or part of the costs of this program, and any other funds that are not the claimant's proceeds of taxes that are used to pay for the mandated activities, shall be identified and deducted from any claim submitted for reimbursement.

All other sections, activities, and costs pled in the Test Claim are denied.

Staff Recommendation

Staff recommends that the Commission adopt the Proposed Decision to partially approve the Test Claim and authorize staff to make any technical, non-substantive changes to the Proposed Decision following the hearing.

[70] See *Paradise Irrigation District v. Commission on State Mandates* (2019) 33 Cal.App.5th 174, and Government Code sections 57350 and 57351 (which overturned *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98 Cal.App.4th 1351).

IN RE TEST CLAIM California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049, Provisions C.3.j., C.8., C.10.a., C.10.b., C.11.a., C.11.b., C.11.c., C.12.a., C.12.c., C.12.d., and C.12.e., Adopted on November 19, 2015, and Effective on January 1, 2016 Filed on June 30, 2017 City of Union City, Claimant	Case No.: 16-TC-03 *California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049* DECISION PURSUANT TO GOVERNMENT CODE SECTION 17500 ET SEQ.; CALIFORNIA CODE OF REGULATIONS, TITLE 2, DIVISION 2, CHAPTER 2.5, ARTICLE 7. (*Adopted April 10, 2026*)

DECISION

The Commission on State Mandates (Commission) heard and decided this Test Claim during a regularly scheduled hearing on April 10, 2026. [Witness list will be included in the adopted Decision.]

The law applicable to the Commission's determination of a reimbursable state-mandated program is article XIII B, section 6 of the California Constitution, Government Code sections 17500 et seq., and related case law.

The Commission [adopted/modified] the Proposed Decision to [approve/partially approve/deny] the Test Claim by a vote of [vote will be included in the adopted Decision], as follows:

Member	**Vote**
Lee Adams, County Supervisor	
Deborah Gallegos, Representative of the State Controller, Vice Chairperson	
Karen Greene Ross, Public Member	
Renee Nash, School District Board Member	
William Pahland, Representative of the State Treasurer	
Michele Perrault, Representative of the Director of the Department of Finance, Chairperson	
Alexander Powell, Representative of the Director of the Governor's Office of Land Use and Climate Innovation	

Summary of the Findings

This Test Claim alleges reimbursable state mandated activities arising from Order R2-2015-0049, adopted by the San Francisco Bay Regional Water Quality Control Board effective January 1, 2016.[71] The claimant has pled the following provisions from Order R2-2015-0049, alleging these provisions impose a reimbursable state-mandated program within the meaning of article XIII B, section 6 of the California Constitution:

- Provision C.8., which the claimant included "out of an abundance of caution" as it sought reimbursement for the continued costs of monitoring programs that were originally imposed by the prior permit and which were addressed by the prior Test Claims in this series (*California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, and 10-TC-05).[72]
- Provisions C.10.a.i., ii., and iii. and C.10.b.i. and ii., addressing the reduction of trash loads.[73]
- The following provisions which implement previously adopted TMDLs for mercury and PCBs:
    - Provision C.3.j. requires the permittees to develop a Green Infrastructure Plan, adopt policies and ordinances, conduct outreach, and report progress on the planning.[74]
    - Provisions C.11.c. and C.12.c. require the permittees to implement Green Infrastructure projects to achieve the load reductions for mercury and PCBs, in accordance with the TMDLs, prepare a reasonable assurance analysis of future mercury and PCBs load reductions, which demonstrate how Green Infrastructure projects will achieve the total load reduction by 2040, and to report on Green Infrastructure implementation.[75]
    - Provision C.11.a. requires the permittees to implement mercury source and treatment control measures and pollution prevention strategies to reduce loads throughout the permit area and submit various reports.[76]
    - Provision C.11.b. requires permittees to develop and implement an assessment methodology and data collection program to quantify mercury

[71] Exhibit A, Test Claim, page 4.

[72] Exhibit A, Test Claim, pages 30-31 (Written Narrative).

[73] Exhibit A, Test Claim, pages 476-478 (test claim permit, Provisions C.10.a.i.-iii.) and 478-479 (Test Claim Permit, Provisions C.10.b.i.-ii.).

[74] Exhibit A, Test Claim, pages 422-427 (test claim permit, Provision C.3.j.).

[75] Exhibit A, Test Claim, pages 488-490 (test claim permit, Provision C.11.c.) and 495-497 (Test Claim Permit, Provision C.12.c.).

[76] Exhibit A, Test Claim, pages 486-487 (test claim permit, Provisions C.11.a.).

loads reduced through implementation of any and all pollution prevention, source control and treatment control efforts required by the test claim permit's provisions or load reductions achieved through other relevant efforts.[77]

- Provision C.12.a. requires the permittees to implement PCBs source and treatment control measures and pollution prevention strategies to reduce loads throughout the permit area, develop and implement an assessment methodology and data collection program to quantify in a technically sound manner mercury and PCBs loads reduced; and submit various reports.[78]
- Provision C.12.d. requires the permittees to prepare a plan and schedule of future PCBs control measure implementation and reasonable assurance analysis demonstrating that sufficient control measures will be implemented to attain the PCBs TMDL wasteload allocations by 2030.[79]
- Provision C.12.e. requires permittees to evaluate the presence of PCBs in caulks and sealants used in storm drains or roadway infrastructure in public rights-of-way.[80]

The Test Claim was timely filed on June 30, 2017, with a potential period of reimbursement beginning on the permit's effective date of January 1, 2016.[81]

The Commission does not have the authority to re-address the monitoring requirements in Provision C.8. The Commission addressed the monitoring requirements in Provision C.8. imposed by the prior permit in Test Claim *California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, and 10-TC-05, and issued a Decision on January 24, 2025.[82] The claimant has not alleged that this test claim permit requires any new activities for Provision C.8. when compared to the prior permit, and there are no allegations that the activities in Provision C.8. found to be state mandates under the prior permit have changed. The Commission's Decision on the prior Test Claim is a final, binding decision, which cannot be disturbed unless

[81] Exhibit A, Test Claim, pages 4 (Written Narrative), 383 (test claim permit). See California Code of Regulations, title 2, section 1183.1(c) (Register 2016, No. 38); Government Code section 17557(e).

[82] See Commission on State Mandates, Test Claim Decision on *California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074,* 10-TC-02, 10-TC-03, 10-TC-05, adopted January 24, 2025, https://csm.ca.gov/matters/10-TC-01-02-03-05/doc68.pdf (accessed February 27, 2025).

litigated and directed by the court to be set aside or modified pursuant to Government Code section 17559(b) or a request for a new test claim decision based on a subsequent change in the law is filed pursuant to Government Code section 17570.[83]

The Commission finds that the trash provisions are not new and do not mandate a new program or higher level of service. Provision C.10.a.i. requires permittees to reduce trash discharges to receiving waters from their 2009 levels according to a schedule that requires them to attain 70 percent reduction by July 1, 2017, and 80 percent reduction by July 1, 2019.[84] To comply with the reduction requirements, Provision C.10.a.ii. requires the implementation of "trash prevention and control actions, including full trash capture systems and other trash management actions, or combinations of actions, with trash discharge control equivalent to or better than full trash capture systems, to reduce trash to a Low trash generation rating or better," and to ensure that lands they do not own or operate but are plumbed directly to their storm drain system in a Very High, High, or Moderate trash generation area are either equipped with full trash capture systems or are managed with trash discharge control actions equivalent to or better than a full trash capture system.[85] Provision C.10.a.iii. requires permittees to install and maintain a mandatory minimum number of full trash capture systems, to treat runoff from an area equivalent to 30 percent of the retail/wholesale land area, as documented by the Association of Bay Area Governments, which drains into the storm drain system within their jurisdiction.[86] Provision C.10.b.i. provides specific standards for proper maintenance and documentation of permittees' full trash capture systems, and requires permittees to annually certify each of their full trash capture systems has been operated and maintained to meet those standards.[87] Provision C.10.b.ii. requires permittees to maintain documentation for all of their non-full trash capture system control actions, and to conduct visual on-land assessments of each area where they implemented non-full trash capture system control actions or a combination of actions other than full trash capture, to determine or verify the effectiveness of the action or combination of actions.[88]

The prior permit required the timely implementation of control measures to reduce trash loads by 40 percent by 2014, by 70 percent by 2017, and by 100 percent by 2022.[89] This is the same schedule for compliance as in the test claim permit and the requirement to reduce trash loads by 80 percent by 2019 is in line with the existing

---

[89] Exhibit A, Test Claim, page 174 (prior permit, Provision C.10).

schedule and therefore is not new. The prior permit also had a specific provision requiring permittees to install a mandatory minimum number of full trash capture systems, which has not changed with this permit and is not new.[90] For the requirement to inspect and maintain full trash capture systems, federal law has always required permittees to properly operate and maintain their facilities and systems of treatment and control, and to maintain documentation.[91] This duty also applies for non-full trash capture system control actions, and the on-land visual assessments are a quality assurance procedure, which federal regulations require for proper operation and maintenance of these facilities and systems of treatment and control.[92] Though the claimant may complain that these provisions are more prescriptive, burdensome, and costly than what was required under the prior permit, the fact is the permittees were always required to perform these activities; all the test claim permit has done is specify what proper performance entails.

The Commission further finds the test claim permit imposes the following new requirements when compared to prior law:

1. Green Infrastructure Plan (Provision C.3.j.i.-iv.):
    a. Green Infrastructure Plan (Provision C.3.j.i.)
        - Prepare a framework or workplan describing specific tasks and timeframes for development for its Green Infrastructure Plan, to be approved by the Permittee's governing body, mayor, city manager, or county manager by June 30, 2017. This framework or workplan shall include a statement of purpose, tasks, and timeframe needed to complete all requirements in Provision C.3.j.i.2. (discussed below).[93]
        - Prepare a Green Infrastructure Plan, subject to Executive Officer approval, that contains all the following:
            - A mechanism (such as SFEI's Green PlanIT tool) to prioritize and map areas for potential and planned projects, both public and private, on a drainage-area specific basis, for implementation by 2020, by 2030, and by 2040, that includes criteria for prioritization and outputs that can be incorporated into the Permittees' long-term planning and capital improvement processes.
            - Outcomes from the above-described mechanism, including but not limited to, the prioritization criteria, maps, lists, and all other information, as appropriate. Individual project-specific reviews do not need to be

[90] Exhibit A, Test Claim, page 175 (prior permit, Provision C.10.a.iii.).

[91] Code of Federal Regulations, title 40, sections 122.41(e), 122.41(j)(2), and 122.42(c)(4).

[92] Code of Federal Regulations, title 40, section 122.41(e).

[93] Exhibit A, Test Claim, page 423 (test claim permit, Provision C.3.j.i.1.).

submitted with the Plan, but shall be made available for review upon request.

- Targets for the amount of impervious surface from public and private projects within the Permittee's jurisdiction to be retrofitted by 2020, by 2030, and by 2040.
- A process for tracking and mapping completed projects, public and private, and making the information publicly available online (I.E., SFEI's Green PlanIT tool).
- General guidelines for overall streetscape and project design and construction so that projects have a unified complete design that implements the range of functions associated with the project.
- Standard specifications, and as appropriate, typical design details and related information necessary for the Permittee to implement Green Infrastructure Projects in its jurisdiction, which shall be sufficient to address the different street and project types within a Permittee's jurisdiction, as defined by land use and transportation characteristics.
- Requirements that projects be designed to meet the treatment and hydromodification sizing requirements outline in Provisions C.3.c. and C.3.d. For projects that are not subject to these requirements according to Provision C.3.b.ii. (non-regulated projects), Permittees may collectively propose a single approach for how to proceed when project constraints preclude fully meeting the sizing requirements, which can include options for addressing specific issues or scenarios.
- A summary of planning documents the permittee has updated or otherwise modified to incorporate Green Infrastructure requirements (General Plans, Specific Plans, Complete Street Plans, Active Transportation Plans, Storm Drain Master Plans, Pavement Work Plans, Urban Forestry Plans, Flood Control/Management Plans, and any other plans that may impact the future alignment, configuration or design of impervious surfaces within the Permittee's jurisdiction). These modifications are to be completed by no later than the end of the permit term.
- A workplan identifying how the Permittee will ensure that Green Infrastructure and low impact development are appropriately included in future plans.
- A workplan to complete prioritized projects identified as part of an Alternative Compliance Program or Early Implementation as outlined in Provision C.3.e. or C.3.j.ii.
- An evaluation of prioritized project funding options including, but not limited to: Alternative Compliance funds; grant monies, including transportation project grants from federal, State, and local agencies;

existing Permittee resources; new tax or other levies; and other sources of funds.[94]

- Adopt policies, ordinances, and/or other appropriate legal mechanisms to ensure implementation of the Green Infrastructure Plan in accordance with the requirements of this provision.[95]
- Conduct outreach and education in accordance with the following:
  - Conduct public outreach on the requirements of this provision, including outreach coordinated with adoption or revision of standard specifications and planning documents, and with the initiation and planning of infrastructure projects. Such outreach shall include general outreach and targeted outreach to and training for professionals involved in infrastructure planning and design.
  - Train appropriate staff, including planning, engineering, public works maintenance, finance, fire/life safety, and management staff on the requirements of this provision and methods of implementation.
  - Educate appropriate Permittee elected officials (e.g., mayors, city council members, county supervisors, district board members) on the requirements of this provision and methods of implementation.[96]
- Each permittee shall report on its planning progress as follows:
  - Submit documentation in the 2017 Annual Report that its framework or workplan for development of its Green Infrastructure Plan was approved by its governing body, mayor, city manager, or county manager by June 30, 2017.
  - Submit its completed Green Infrastructure Plan with the 2019 Annual Report.
  - Submit documentation of its legal mechanisms to ensure implementation of its Green Infrastructure Plan with the 2019 Annual Report.
  - Submit a summary of its outreach and education efforts in each Annual Report.[97]

b. Early Implementation – List of Green Infrastructure Projects (Provision C.3.j.ii.):

- *Except for a permittee's own public project (which does not mandate a new program or higher level of service)*, prepare and maintain a list of Green Infrastructure Projects, public and private, that are already planned for

[94] Exhibit A, Test Claim, pages 423-425 (test claim permit, Provision C.3.j.i.2.).

[95] Exhibit A, Test Claim, page 425 (test claim permit, Provision C.3.j.i.3.).

[96] Exhibit A, Test Claim, pages 425-426 (test claim permit, Provision C.3.j.i.4.).

[97] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.i.5.).

implementation during the permit term and infrastructure projects planned for implementation during the permit term that have potential for Green Infrastructure measures.[98]

- *Except for a permittee's own public project (which does not mandate a new program or higher level of service)*, submit the list with each Annual Report and a summary of planning or implementation status for each public Green Infrastructure Project and each private Green Infrastructure Project that is not also a Regulated Project as defined in Provision C.3.b.ii. Include a summary of how each public infrastructure project with Green Infrastructure potential will include Green Infrastructure measures to the maximum extent practicable during the permit term. For any public infrastructure project where implementation of Green Infrastructure measures is not practicable, submit a brief description of the project and the reasons Green Infrastructure measures were impracticable to implement.[99]

c. Participation in Processes to Promote Green Infrastructure (Provision C.3.j.iii.):

- Either individually or collectively, track processes, assemble and submit information, and provide informational materials and presentations as needed to assist relevant regional, State, and federal agencies to plan, design, and fund incorporation of Green Infrastructure measures into local infrastructure projects, including transportation projects. Issues to be addressed include coordinating the timing of funding from different sources, changes to standard designs and design criteria, ranking and prioritizing projects for funding, and implementation of cooperative in-lieu programs.[100]
- In each Annual Report, report on the goals and outcomes during the reporting year of work undertaken to participate in processes to promote Green Infrastructure.[101]
- In the 2019 Annual Report, submit a plan and schedule for new and ongoing efforts to participate in processes to promote Green Infrastructure.[102]

d. Tracking and Reporting Progress (Provision C.3.j.iv):

- Either individually or collectively, develop and implement regionally-consistent methods to track and report implementation of Green Infrastructure measures including treated area and connected and disconnected impervious area on both public and private parcels within their jurisdictions. The methods shall also address tracking needed to provide reasonable assurance that

[98] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.ii.1.).

[99] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.ii.2.).

[100] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.iii.1.).

wasteload allocations for TMDLs, including the San Francisco Bay PCBs and mercury TMDLs, and reductions for trash, are being met.[103]

- In each Annual Report, report progress on development and implementation of the tracking methods.[104]
- In the 2019 Annual Report, submit the tracking methods and report implementation of Green Infrastructure measures including treated area, and connected and disconnected impervious area on both public and private parcels within their jurisdictions.[105]

2. Reasonable Assurance Analysis (Provisions C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., and C.12.c.iii.1.-3.):
    - Prepare a reasonable assurance analysis of future mercury and PCBs load reductions by doing the following:
        - Quantify the relationship between areal extent of Green Infrastructure implementation and mercury and PCBs load reductions, taking into consideration the scale of contamination of the treated area as well as the pollutant removal effectiveness of likely green infrastructure strategies.[106]
        - Estimate the amount and characteristics of land area that will be treated through Green Infrastructure by 2020, 2030, and 2040.[107]
        - Estimate the amount of mercury/PCBs load reductions that will result from Green Infrastructure implementation by 2020, 2030, and 2040.[108]
        - Quantitatively demonstrate that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/yr will be realized by 2040 through implementation of Green Infrastructure Projects.[109]
        - Ensure that the calculation methods, models, model inputs, and modeling assumptions used to fulfill provisions C.11.c.ii.2.a.-d. and

[109] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.ii.2.d., C.12.c.ii.2.d.).

C.12.c.ii.2.a.-d. above have been validated through a peer review process.[110]

- Submit in the 2018 Annual Report as part of the reporting required for Provisions C.11.b.iii.2. and C.12.b.iii.3., the quantitative relationship between Green Infrastructure implementation and mercury and PCBs load reductions. This submittal shall include all data used and a full description of the models and model inputs relied on to establish this relationship.[111]
- Submit in the 2020 Annual Report an estimate of the amount and characteristics of land area that will be treated through Green Infrastructure implementation by 2020, 2030, and 2040. This submittal shall include all data used and a full description of the models and model inputs relied on to generate this estimate.[112]
- Submit in the 2020 Annual Report a reasonable assurance analysis to demonstrate quantitatively that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/yr will be realized by 2040 through the implementation of Green Infrastructure Projects. This submittal shall include all data used and a full description of models and model inputs relied on to make the demonstration and documentation of peer review of the reasonable assurance analysis.[113]

3. Progress Report on List of Watersheds and Management Areas Where Mercury Control Measures are or will be Implemented (Provision C.11.a.iii.1.):
    - By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where mercury control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[114]
4. PCBs Reporting (Provisions C.12.a.iii.1. and C.12.a.iii.2.):
    - By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where PCBs

[110] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.ii.2.e., C.12.c.ii.2.e.).

[111] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.1., C.12.c.iii.1.).

[112] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.2., C.12.c.iii.2.).

[113] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.3., C.12.c.iii.3.).

[114] Exhibit A, Test Claim, page 486 (test claim permit, Provision C.11.a.iii.1.).

control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[115]

- In the 2016 Annual Report, include the following information:
    - A cumulative listing of all potentially PCB-contaminated sites permittees have discovered and referred to the Water Board to date, with a brief summary description of each site and where to obtain further information.
    - For each structural control and non-structural BMP, interim implementation progress milestones (e.g., construction milestones for structural controls or other relevant implementation milestones for structural controls and non-structural BMPs) and a schedule for milestone achievement.
    - Clear statements of the roles and responsibilities of each participating permittee for implementation of pollution prevention or control measures for PCBs.[116]

5. Prepare PCBs control measures implementation plan, schedule, and reasonable assurance analysis to achieve the PCBs TMDL wasteload allocations by 2030 (Provision C.12.d.):
    - Prepare a PCBs control measures implementation plan, which must identify all technically and economically feasible PCBs control measures to be implemented (including green infrastructure projects).[117]
    - Include a schedule for PCBs control measure implementation according to which these technically and economically feasible PCBs control measures will be fully implemented by 2030.[118]
    - Provide an evaluation and quantification of the PCBs load reduction of such measures as well as an evaluation of costs, control measure efficiency and significant environmental impacts resulting from their implementation.[119]
    - Prepare a reasonable assurance analysis demonstrating that sufficient control measures will be implemented to attain the PCBs TMDL wasteload allocations by 2030.[120]

---

[115] Exhibit A, Test Claim, page 492 (test claim permit, Provision C.12.a.iii.1.).

[116] Exhibit A, Test Claim, pages 493-494 (test claim permit, Provision C.12.a.iii.2.).

[117] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.1.).

[118] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.2.).

[119] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.3.).

[120] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.i.).

- Submit the plan and schedule required by Provision C.12.d. in the 2020 Annual Report.[121]

6. Evaluate the presence of PCBs in caulks/sealants in storm drain or roadway infrastructure in public rights-of-way (Provision C.12.e.):
    - Collect at least 20 samples from throughout the permit-area of the caulks and sealants used in storm drains or roadway infrastructure in public rights-of-way.[122]
    - Analyze the samples taken for PCBs in such a way that is able to detect a minimum PCB concentration of 200 parts per billion.[123]
    - Report on the results of this investigation, including all data gathered, no later than the 2018 Annual Report.[124]

The remaining requirements alleged by the claimant are either not new, not mandated by the state, or are not a new program or higher level of service.

Finally, the Commission finds that the new state-mandated activities result in costs mandated by the state for some of the activities based on the following findings:

1. There is substantial evidence in the record that permittees incurred costs exceeding $1,000 and used proceeds of taxes to comply with the test claim permit.
2. Pursuant to Government Code section 17556(d), permittees have regulatory fee authority sufficient as a matter of law to fund the new state-mandated activities related to developing and implementing the Green Infrastructure Plan (Provision C.3.j.i.-iv.), and thus, there are no costs mandated by the state for these activities.
3. The Permittees have constitutional and statutory authority to charge property-related fees for the reasonable assurance analysis of future mercury and PCBs load reductions (C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., and C.12.c.iii.1.-3.); required mercury progress report on list of watersheds and management areas where control measures are or will be implemented (C.11.a.iii.); PCBs reporting (C.12.a.iii.1. and 2.); PCBs control measures implementation plan (C.12.d.); and PCBs caulk and sealant testing (C.12.e.). However, from January 1, 2016 (the beginning date of the potential period of reimbursement) to December 31, 2017, these fees are subject to the voter approval requirement in article XIII D, section

[121] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.iii.).

[122] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[123] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[124] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.iii.).

6(c), and therefore fee authority is not sufficient as a matter of law.[125] Under these limited circumstances, Government Code section 17556(d) does not apply, and there are costs mandated by the state.[126] Any fee revenues received must be identified as offsetting revenue. In addition, reimbursement for this mandate from any source, including but not limited to, service fees collected, federal funds, other state funds, and other funds that are not a claimant's local proceeds of taxes shall be identified and deducted from this claim.

On or after January 1, 2018, there are no costs mandated by the state to comply with these activities because the claimants have constitutional and statutory authority to charge property-related fees for these costs subject only to the voter protest provisions of article XIII D, which is sufficient as a matter of law to cover the costs of the mandated activities within the meaning of Government Code section 17556(d).[127]

Based on *Paradise Irrigation District* case and the Legislature's enactment of Government Code sections 57350 and 57351 (which overturned *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98 Cal.App.4th 1351), there are no costs mandated by the state on or after January 1, 2018, to comply with these activities, because claimants have constitutional and statutory authority to charge property-related fees for these costs subject only to the voter protest provisions of article XIII D, which is sufficient as a matter of law to cover the costs of the mandated activities within the meaning of Government Code section 17556(d).

Accordingly, the Commission partially approves this Test Claim for the reasonable assurance analysis of future mercury and PCBs load reductions (C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., and C.12.c.iii.1.-3.); required mercury progress report on list of watersheds and management areas where control measures are or will be implemented (C.11.a.iii.); PCBs reporting (C.12.a.iii.1. and 2.); PCBs control measures implementation plan (C.12.d.); and PCBs caulk and sealant testing (C.12.e.) from January 1, 2016, to December 31, 2017 only.

In addition, reimbursement for these mandated activities from any source, including but not limited to, state and federal funds, any service charge, fees, or assessments to

IV. Discussion 49
A. The Commission Has Jurisdiction Over This Test Claim. 50
1. The Test Claim Was Timely Filed and Has a Potential Period of Reimbursement Beginning January 1, 2016. 50
2. The Claimants Are Not Required to Exhaust Administrative Remedies with the State Water Board Prior to Filing a Test Claim with the Commission. 51
3. The Commission Does Not Have the Authority to Re-Address the Monitoring Requirements in Provision C.8. Imposed by the Prior Permit, Since the Legal Findings on that Provision in Test Claim *California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, and 10-TC-05, Are Final and Binding. 53
4. The Requirements Pled in the 2015 Test Claim Permit Are Compared to the Law in Effect Immediately Prior to the Adoption of the Test Claim Permit, Including the 2009 Permit, to Determine if the Activities Required by the 2015 Test Claim Permit Are New. 55
B. Some of the Requirements Imposed by the Provisions of the Test Claim Permit Pled Impose New State-Mandated Requirements that Constitute a New Program or Higher Level of Service Within the Meaning of Article XIII B, Section 6 of the California Constitution. 58

1. The Requirements Pled in Provisions C.10.a.i., ii., and iii. and C.10.b.i. and ii, Addressing the Reduction of Trash Loads, Do Not Mandate New Programs or Higher Levels of Service. 58

2. Some Requirements in the Provisions Implementing the Mercury and PCBs TMDLs (Provisions C.3.j., C.11.a., C.11.b., C.11.c., C.12.a., C.12.c., C.12.d., and C.12.e.) Impose State-Mandated New Programs or Higher Levels of Service..... 78

C. Pursuant to Government Code 17556(d), There Are No Costs Mandated by the State When the Claimants Have the Authority to Impose Fees Sufficient to Pay for the New State-Mandated Requirements. 155

1. There Is Substantial Evidence in the Record that Permittees Incurred Increased Costs and Used Proceeds of Taxes to Comply with the Test Claim Permit. 165

2. Pursuant to Government Code Section 17556(d), Permittees Have Authority to Impose Regulatory Fees on Development Sufficient as a Matter of Law to Fund the New State-Mandated Activities Related to Developing and Implementing the Green Infrastructure Plan Requirements (Provision C.3.j.i.-iv.), and thus, There Are No Costs Mandated by the State for These Activities. Permittees also Have Authority to Impose Property-Related Stormwater Fees Sufficient as a Matter of Law to Fund the Remaining New State-Mandated Activities Imposed by Provisions C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., C.12.c.iii.1.-3., C.11.a.iii.1., C.12.a.iii.1.-2., C.12.d., and C.12.e., Beginning January 1, 2018, and, thus, There Are No Costs Mandated by the State for Those Activities Beginning January 1, 2018. 170

V. Conclusion 207

COMMISSION FINDINGS

I. Chronology

11/19/2015 The Test Claim Permit, San Francisco Bay Regional Water Quality Control Board, Order No. R2-2015-0049 was adopted; the test claim permit became effective on January 1, 2016.[128]

06/30/2017 The claimant filed the Test Claim.[129]

09/11/2017 Commission staff issued the Notice of Complete Test Claim Filing, Schedule for Comments, Request for Administrative Records, and Notice of Tentative Hearing Date.

10/10/2017 The Department of Finance (Finance) filed comments on the Test Claim.[130]

[128] Exhibit A, Test Claim, page 374 (test claim permit).

[129] Exhibit A, Test Claim, page 4.

[130] Exhibit B, Finance's Comments on the Test Claim, page 1.

11/07/2017-11/16/2017	The claimant and the Regional Board each requested extensions of time to file comments, which were respectively granted and partially granted for good cause.
02/01/2018	The Regional Board submitted late comments on the Ttest Claim.[131]
02/01/2018	The Regional Board filed the administrative record of the permit in eight parts.[132]
03/06/2018-04/19/2018	The claimant requested two extensions of time to file rebuttal comments, which were granted for good cause.
05/29/2018	The claimant filed rebuttal comments.[133]
12/23/2025	Commission staff issued the Draft Proposed Decision.[134]

II. Background

A. Federal Clean Water Act.

The federal Clean Water Act was enacted in 1972 and is a comprehensive water quality statute designed to restore and maintain the chemical, physical, and biological integrity of the nation's waters.[135] The Act's national goal was to eliminate "the discharge of pollutants into the navigable waters" of the United States by the year 1985.[136] "To accomplish this goal the Act established 'effluent limitations,' which are restrictions on the 'quantities, rates, and concentrations of chemical, physical, biological, and other constituents'; these effluent limitations allow the discharge of pollutants only when the water has been satisfactorily treated to conform with federal water quality standards."[137]

The Clean Water Act prohibits pollutant discharges unless they comply with: (1) a permit; (2) established effluent limitations or standards; or (3) established national

[132] Because of its enormous size, this record cannot reasonably be included as an exhibit. Documents contained therein and cited in this document are being included as excerpts. However, the entirety of all eight parts are available on the Commission's website on the matter page for this Test Claim: https://csm.ca.gov/matters/16-TC-03.shtml.

[133] Exhibit D, Claimant's Rebuttal Comments, page 1.

[134] Exhibit E, Draft Proposed Decision.

[135] United States Code, title 33, section 1251 et seq.; *City of Burbank v. State Water Resources Control Board* (2005) 35 Cal.4th 613, 620; *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 757.

[136] United States Code, title 33, section 1251(a)(1).

[137] *City of Burbank v. State Water Resources Control Board* (2005) 35 Cal.4th 613, 620, citing United States Code, title 33, sections 1311, 1362(11).

standards of performance.[138] The term “discharge of a pollutant” means “any addition of any pollutant to navigable waters from any point source.”[139] A “point source” is any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged.”[140]

The Clean Water Act created the National Pollutant Discharge Elimination System (NPDES), authorizing the Environmental Protection Agency (EPA) to issue a permit for any pollutant discharge that will satisfy all requirements established by the Act or the EPA Administrator, which must be designed to ensure that discharges do not violate applicable water quality standards established by EPA or the state.[141] A state may administer its own permitting system if authorized by EPA, so long as those standards and limitations are not “less stringent” than those in effect under the Clean Water Act [142]

In 1973, EPA adopted regulations to implement the Act which provided exclusions for several types of discharges including “uncontrolled discharges composed entirely of storm runoff when these discharges are uncontaminated by any industrial or commercial activity” and have not been identified “as a significant contributor of pollution.”[143] This particular exclusion applied only to municipal separate storm sewer systems (MS4s). In 1977, however, the Court in *Natural Resources Defense Council v. Costle* held EPA had no authority to exempt point source discharges, including stormwater discharges from MS4s, from the requirements of the Act and doing so contravened Congress’ intent.[144] Since the Act prohibits “the discharge of any pollutant by any person” without an NPDES permit, MS4 municipal storm sewer systems are included in the definition of a point source.[145]

Thus, the Clean Water Act was amended by the Water Quality Act of 1987 to require NPDES permits for stormwater discharges from MS4s, stormwater discharges associated with industrial and construction activities, and designated stormwater

[141] United States Code, title 33, section 1342(a)(1), (2).

[142] United States Code, title 33, section 1370.

[143] Code of Federal Regulations, title 40, sections 124.5 and 124.11 (30 FR 18003, July 5, 1973).

[144] *Natural Res. Def. Council v. Costle* (D.C.Cir.1977) 568 F.2d 1369, 1379 (holding unlawful EPA's exemption of stormwater discharges from NPDES permitting requirements).

[145] United States Code, title 33, section 1311(a).

discharges considered significant contributors of pollutants to waters of the United States.[146] Federal law states that permits for discharges from MS4 municipal storm sewers:

- may be issued on a system- or jurisdiction-wide basis;
- shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and
- shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.[147]

Discharges from MS4s include stormwater runoff, which "…is generated from rain and snowmelt events that flow over land or impervious surfaces, such as paved streets, parking lots, and building rooftops, and does not soak into the ground."[148] Polluted stormwater runoff is commonly transported through MS4s, and then often discharged, untreated, into local water bodies and, thus, stormwater runoff requires "best management practices" (BMPs) and controls to the maximum extent practicable to reduce the discharge of these pollutants as stated above. As the Ninth Circuit Court of Appeal stated:

> Storm water runoff is one of the most significant sources of water pollution in the nation, at times "comparable to, if not greater than, contamination from industrial and sewage sources." [Citation omitted.] Storm sewer waters carry suspended metals, sediments, algae-promoting nutrients (nitrogen and phosphorus), floatable trash, used motor oil, raw sewage, pesticides, and other toxic contaminants into streams, rivers, lakes, and estuaries across the United States. [Citation omitted.] In 1985, three-quarters of the States cited urban storm water runoff as a major cause of waterbody impairment, and forty percent reported construction site runoff as a major cause of impairment. Urban runoff has been named as the foremost cause of impairment of surveyed ocean waters. Among the sources of storm water contamination are urban development, industrial facilities, construction sites, and illicit discharges and connections to storm sewer systems.[149]

[147] United States Code, title 33, section 1342(p)(3)(B).

[148] See Code of Federal Regulations, title 40, section 122.26(b)(13).

[149] *Environmental Defense Center, Inc. v. EPA* (9th Cir. 2003) 344 F.3d 832, 840-841(citing *Natural Res. Def. Council v. EPA* (9th Cir. 1992) 966 F.2d 1292, 1295, and Regulation for Revision of the Water Pollution Control Program Addressing Storm Water

A discharge to a MS4 that "is *not* composed entirely of stormwater" is considered an illicit non-stormwater, or dry weather discharge.[150] According to a fact sheet issued by EPA, illicit non-stormwater discharges may contribute to high levels of pollutants, including heavy metals, toxics, oil and grease, solvents, nutrients, viruses, and bacteria to receiving waterbodies.[151] Examples of illicit non-stormwater discharges include trash, sanitary wastewater, effluent from septic tanks, car wash wastewater, improper oil disposal, radiator flushing disposal, laundry wastewaters, spills from roadway accidents, and improper disposal of automobile and household toxics.[152] As stated above, federal law requires MS4 permits to "include a requirement to effectively prohibit non-stormwater discharges into the storm sewers," except as authorized by an NPDES permit.[153]

On November 16, 1990, EPA published regulations (40 CFR Part 122), which prescribe permit application requirements for MS4s under the Clean Water Act. EPA regulations specify the information to be included in a permit application.[154] Among other things, an applicant must set out a proposed management program that includes management practices; control techniques; and system, design, and engineering methods to reduce the discharge of pollutants to the maximum extent practicable; a program including inspections and ordinances to detect and remove prohibited, illicit discharges; a monitoring program to ensure compliance with water quality standards; an assessment of controls and reporting; and a fiscal analysis of the necessary capital and operation and maintenance expenditures necessary to accomplish the activities of the programs.[155] The permit-issuing agency has discretion to determine which practices, whether or not proposed by the applicant, will be imposed as conditions to ensure

(64 Fed.Reg. 68722, 68724, 68727 (December 8, 1999) codified at Code of Federal Regulations, title 40, parts. 9, 122, 123, and 124)).

[150] Code of Federal Regulations, title 40, section 122.26(b)(2) defines "Illicit discharge" as "any discharge to a municipal separate storm sewer that is *not* composed entirely of storm water except discharges pursuant to a NPDES permit (*other than the NPDES permit for discharges from the municipal separate storm sewer*) and discharges resulting from firefighting activities." Emphasis added.

[151] Exhibit X (1), Stormwater Phase II Final Rule, Illicit Discharge Detection and Elimination, USEPA Fact Sheet 2.5.

compliance with water quality standards.[156] The state is required to transmit to EPA a copy of each permit application and permit proposed to be issued.[157]

In addition, the Clean Water Act requires states to develop water quality standards and criteria to protect the beneficial uses of any given waterbody, which are included in the Regional Board's Basin Plans.[158] States are required to adopt water quality standards and criteria based on sound scientific rationale that identifies sufficient parameters or constituents to protect the designated use, and numerical values related to any constituents should be based on the U.S. EPA's guidance documents or other defensible methods.[159] The water quality standard or criteria can be expressed in narrative form, which are broad statements of desirable water quality goals, or in a numeric form, which identifies specific pollutant concentrations.[160] When water quality criteria are met, water quality will generally protect the designated use."[161] Federal regulations state the purpose of a water quality standard as follows:

> A water quality standard defines the water quality goals of a water body, or portion thereof, by designating the use or uses to be made of the water and by setting criteria that protect the designated uses. States adopt water quality standards to protect public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act (the Act). "Serve the purposes of the Act" (as defined in sections 101(a)(2) and 303(c) of the Act) means that water quality standards should, wherever attainable, provide water quality for the protection and propagation of fish, shellfish and wildlife and for recreation in and on the water and take into consideration their use and value of public water supplies, propagation of fish, shellfish, and wildlife, recreation in and on the water, and agricultural, industrial, and other purposes including navigation.[162]

EPA publishes water quality criteria in receiving waters to reflect the latest scientific knowledge on the kind and extent of all identifiable effects on health and welfare, which may be expected from the presence of pollutants in any body of water.[163] In addition,

on May 18, 2000, U.S. EPA also established numeric water quality criteria for priority toxic pollutants and other provisions for water quality standards to be applied to waters in the state of California, which is known as the California Toxics Rule (CTR).[164] As the courts have explained, the CTR is a water quality standard that applies to "'all waters' for 'all purposes and programs under the CWA.'"[165]

States are required to hold public hearings from time to time but "at least once each three year period" for the purpose of reviewing applicable water quality standards and, as appropriate, modifying and adopting standards:

> Whenever the State revises or adopts a new standard, such revised or new standard shall be submitted to the [US EPA] Administrator. Such revised or new water quality standard shall consist of the designated uses of the navigable waters involved and the water quality criteria for such waters based upon such uses. Such standards shall protect the public health or welfare, enhance the quality of water and serve the purposes of this chapter. Such standards shall be established taking into consideration their use and value for public water supplies, propagation of fish and wildlife, recreational purposes, and agricultural, industrial, and other purposes, and also taking into consideration their use and value for navigation.[166]

When reviewing, revising, or adopting new water quality standards, the state is required to adopt numeric criteria for all toxic pollutants listed in federal law.[167]

The Clean Water Act also requires states to develop a list of "impaired" waters within their jurisdiction, meaning that existing controls of pollutants are not sufficient to meet water quality standards necessary to permit the designated beneficial uses, such as fishing or recreation.[168] States must then rank those impaired waters by priority, and establish a TMDL, which includes a calculation of the maximum amount of each

[168] See United States Code, title 33, section 1313(d)(1)(A) (codifying CWA § 303(d) and stating: "Each State shall identify [as impaired] those waters within its boundaries for which the effluent limitations … are not stringent enough to implement any water quality standard applicable to such waters. The State shall establish a priority ranking for such waters, taking into account the severity of the pollution and the uses to be made of such waters.")

constituent pollutant that the water body can assimilate and still meet water quality standards.[169]

B. The California Water Pollution Control Program

California's water pollution control laws were substantially overhauled in 1969 with the Porter-Cologne Water Quality Control Act (Porter-Cologne).[170] Beginning with section 13000, Porter-Cologne provides:

> The Legislature finds and declares that the people of the state have a primary interest in the conservation, control, and utilization of the water resources of the state, and that the quality of all the waters of the state shall be protected for use and enjoyment by all the people of the state.
>
> The Legislature further finds and declares that activities and factors which may affect the quality of the waters of the state shall be regulated to attain the highest water quality which is reasonable, considering all demands being made and to be made on those waters and the total values involved, beneficial and detrimental, economic and social, tangible and intangible.
>
> The Legislature further finds and declares that the health, safety, and welfare of the people of the state requires that there be a statewide program for the control of the quality of all the waters of the state…and that the statewide program for water quality control can be most effectively administered regionally, within a framework of statewide coordination and policy.[171]

The state water pollution control program was again modified, beginning in 1972, to substantially comply with the Clean Water Act, and "on May 14, 1973, California became the first state to be approved by the EPA to administer the NPDES permit program."[172]

Section 13160 provides the State Water Resources Control Board (State Board) "is designated as the state water pollution control agency for all purposes stated in the Federal Water Pollution Control Act…[and is] authorized to exercise any powers delegated to the state by the Federal Water Pollution Control Act (33 U.S.C. § 1251 et seq.) and acts amendatory thereto."[173] Section 13001 describes the state and the nine

[173] Water Code section 13160.

regional boards as being “the principal state agencies with primary responsibility for the coordination and control of water quality.”

To achieve the objectives of conserving and protecting the water resources of the state, and in exercise of the powers delegated, Porter-Cologne, like the Clean Water Act, employs a combination of water quality standards and point source pollution controls.[174]

Under Porter Cologne, the nine regional boards’ primary regulatory tools are the water quality control plans, or Basin Plans.[175] These plans fulfill the planning function for the water boards, are regulations adopted under the Administrative Procedure Act with a specialized process,[176] and provide the underlying basis for most of the regional board’s actions (e.g., NPDES permit conditions, cleanup levels). Basin plans consist of three elements:

- Determination of beneficial uses;
- Water quality objectives to reasonably protect beneficial uses; and
- An implementation program to achieve water quality objectives.[177]

Water Code sections 13240-13247 address the development and implementation of the basin plans, including “water quality objectives,” defined in section 13050 as “the limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area.”[178] Section 13241 provides each regional board “shall establish such water quality objectives in water quality control plans as in its judgment will ensure the reasonable protection of beneficial uses and the prevention of nuisance.”[179]

Beneficial uses, in turn, are defined in section 13050 as including, but not limited to “domestic, municipal, agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves.”[180] In addition, section 13243 permits a regional board to define “certain conditions or areas where the discharge of waste, or certain types of waste, will not be permitted.”[181]

Sections 13260-13274 address the development of “waste discharge requirements,” which section 13374 states “is the equivalent of the term ‘permits’ as used” in federal

[181] Water Code section 13243.

law.[182] Section 13263 authorizes the regional boards, after a public hearing, to prescribe waste discharge requirements "as to the nature of any proposed discharge, existing discharge, or material change in an existing discharge, except discharges into a community sewer system." Section 13263 provides "[a]ll discharges of waste into waters of the state are privileges, not rights."[183] Section 13372 states "[t]his chapter shall be construed to ensure consistency with the requirements for state programs implementing the Federal Water Pollution Control Act and acts amendatory thereof or supplementary thereto." Section 13377 permits a regional board to issue waste discharge requirements "which apply and ensure compliance with all applicable provisions of the [Federal Water Pollution Control Act]."[184] In effect, sections 13263 and 13377 permit the issuance of waste discharge requirements concurrently with an NPDES permit "if a discharge is to waters of both California and the United States."

The California Supreme Court explained the interplay between state and federal law in *Department of Finance v. Commission on State Mandates* as follows:

> California was the first state authorized to issue its own pollutant discharge permits. (Citations omitted.) Shortly after the CWA's enactment, the Legislature amended the Porter–Cologne Act, adding chapter 5.5 (Wat. Code, § 13370 et seq.) to authorize state issuance of permits (Wat. Code, § 13370, subd. (c)). The Legislature explained the amendment was "in the interest of the people of the state, in order to avoid direct regulation by the federal government of persons already subject to regulation under state law pursuant to [the Porter–Cologne Act]." (*Ibid*.) The Legislature provided that Chapter 5.5 be "construed to ensure consistency" with the CWA. (Wat. Code, § 13372, subd. (a).) It directed that state and regional boards issue waste discharge requirements "ensur[ing] compliance with all applicable provisions of the [CWA] ... *together with any more stringent effluent standards or limitations* necessary to implement water quality control plans, or for the protection of beneficial uses, or to prevent nuisance." (Wat. Code, § 13377, italics added.) To align the state and federal permitting systems, the legislation provided that the term " 'waste discharge requirements' " under the Act was equivalent to the term " 'permits' " under the CWA. (Wat. Code, § 13374.) Accordingly, California's permitting system now regulates discharges under both state and federal law. (Citations omitted.)[185]

California has adopted an Ocean Plan in accordance with federal law, applicable to interstate waters, and two other state-wide plans (California Inland Surface Waters Plan (ISWP) and the Enclosed Bays and Estuaries Plan (EBEP)), which establish water

[185] *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 757.

quality criteria or objectives for all fresh waters, bays and estuaries in the State.[186] These statewide plans contain narrative and numeric water quality criteria for toxic pollutants, in part to satisfy the Clean Water Act (United States Code, title 33, section 1313(c)(2)(B)). The water quality criteria contained in these statewide plans, together with the designated uses in each of the Basin Plans, create a set of water quality standards for waters within the State of California.[187]

C. The Test Claim Permit

The claimant contends that certain sections of the California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049, impose a reimbursable state-mandated program. This is the second stormwater permit adopted by the San Francisco Bay Regional Water Quality Control Board the Commission has reviewed to determine if reimbursement is required under article XIII B, section 6.[188] The following local government permittees are subject to this permit:

- The cities of Alameda, Albany, Berkeley, Dublin, Emeryville, Fremont, Hayward, Livermore, Newark, Oakland, Piedmont, Pleasanton, San Leandro, and Union City, Alameda County (Unincorporated area), the Alameda County Flood Control and Water Conservation District, and Zone 7 of the Alameda County Flood Control and Water Conservation District, who joined together to form the Alameda Countywide Clean Water Program (collectively, the Alameda Permittees);
- The cities of Campbell, Cupertino, Los Altos, Milpitas, Monte Sereno, Mountain View, Palo Alto, San Jose, Santa Clara, Saratoga, and Sunnyvale, the towns of Los Altos Hills and Los Gatos, the Santa Clara Valley Water District, and Santa Clara County, who joined together to form the Santa Clara Valley Urban Runoff Pollution Prevention Program (collectively, the Santa Clara Permittees);
- The cities of Fairfield and Suisun City, and Fairfield-Suisun Sewer District, who joined together to form the Fairfield-Suisun Urban Runoff Management Program (collectively, the Fairfield-Suisun permittees);
- The cities of Clayton, Concord, El Cerrito, Hercules, Lafayette, Martinez, Orinda, Pinole, Pittsburg, Pleasant Hill, Richmond, San Pablo, San Ramon, and Walnut

---

[186] United States Code, title 33, section 1313(c)(3)(A), (B).

[187] See also, Water Code section 13170, which provides that the statewide plans supersede the Basin Plans to the extent any conflict exists.

[188] The prior permit was R2-2009-0074, at issue in 10-TC-02-03-05 (https://www.csm.ca.gov/decisions/10-TC-02-03-05-012425.pdf). See Commission on State Mandates, *Test Claim Decision on California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074,* 10-TC-02, 10-TC-03, 10-TC-05, adopted January 24, 2025. A subsequent third permit, R2-2022-0018 (as modified by Order No. R2-2023-0019), is at issue in 22-TC-07, which is currently pending (https://csm.ca.gov/matters/22-TC-07.shtml).

Creek, the towns of Danville and Moraga, Contra Costa County, and the Contra Costa County Flood Control and Water Conservation District, who joined together to form the Contra Costa Clean Water Program (collectively the Contra Costa Permittees);

- The cities of Belmont, Brisbane, Burlingame, Daly City, East Palo Alto, Foster City, Half Moon Bay, Menlo Park, Millbrae, Pacifica, Redwood City, San Bruno, San Carlos, San Mateo, and South San Francisco, the towns of Atherton, Colma, Hillsborough, Portola Valley, and Woodside, the San Mateo County Flood Control District and San Mateo County, who joined together to form the San Mateo Countywide Water Pollution Prevention Program (collectively the San Mateo Permittees); and
- The City of Vallejo and the Vallejo Sanitary District (collectively the Vallejo Permittees).

III. Positions of the Parties and Interested Parties

A. City of Union City

The claimant sorts the provisions in the test claim permit it alleges to impose new, reimbursable state mandates into two main categories: trash load reduction (Provisions C.10.a. and C.10.b.); and mercury and PCBs control (Provisions C.3.j., C.11.a., C.11.b., C.11.c., C.12.a., C.12.c., C.12.d., and C.12.e.).[189] It also includes the continuation of monitoring costs from Provision C.8. imposed by the prior test claim permit (*California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, and 10-TC-05), but states this is only included out of an abundance of caution, and acknowledged it would be willing to withdraw the C.8. issues from this Test Claim if the Commission provided assurance that no waiver, forfeiture, or abandonment of rights to subvention would result.[190]

The claimant says that Provision C.10.a. requires it to undertake new activities to achieve the goal of 100 percent trash load reduction by July 1, 2022, specifically by mandating compliance with a schedule that requires permittees to reduce their trash loads 70 percent by July 1, 2017, and by 80 percent by July 1, 2019.[191] Although the claimant acknowledges that the prior permit stated that permittees must achieve 100 percent trash load reduction by 2022, it claims the prior permit was rescinded when the test claim permit took effect, and that the prior permit described these requirements as goals. The claimant alleges the increased load reductions are new compared to the prior permit's planning and 40 percent load reduction requirements..[192] The claimant also states that "Provision C.10.b. requires Permittees to maintain, and provide for inspection and review upon request, documentation of the design, operation, and

[189] Exhibit A, Test Claim, page 20 (Written Narrative).

[190] Exhibit A, Test Claim, page 20 (Written Narrative).

[191] Exhibit A, Test Claim, page 21 (Written Narrative).

[192] Exhibit A, Test Claim, page 22 (Written Narrative).

maintenance of each of their full trash capture systems, including the mapped location and drainage area served by each system," and provides specific detailed instructions for installing and maintaining full trash capture systems.[193] The claimant alleges the state requires it to install full trash capture systems because the conditions for complying with its load reduction requirements through other trash management actions "has become so burdensome and costly" it determined full trash capture systems are "the least costly compliance option."[194]

For the Mercury and PCBs controls, the claimant says that Provision C.3.j. requires it to complete and implement a Green Infrastructure Plan for the inclusion of low impact development (LID) drainage design into storm drain infrastructure on public and private lands, concluding that this is a new program that did not exist in the prior permit.[195]

Provisions C.11.a. and C.12.a. require permittees to implement control measures to achieve mercury and PCBs load reductions, respectively, and that permittees are required to identify the watersheds and management areas where these measures will be implemented and submit a timed schedule of implementation.[196] Provision C.11.b. also requires permittees to develop and implement an assessment methodology and data collection program to quantify mercury loads reduced through control actions.[197] Provisions C.11.c. and C.12.c. require permittees to implement Green Infrastructure projects to reduce mercury loads by 48 g/year and PCBs loads by 120 g/year by June 30, 2020, which is a new program that was not required by the prior permit.[198] Lastly, Provision C.12.d. requires permittees to prepare a plan for implementing PCBs control measures and a corresponding reasonable assurance analysis that quantitatively demonstrates that sufficient control measures will achieve the PCBs TMDL, and Provision C.12.e. requires permittees to collect samples of caulks and sealants used in storm drains and between concrete curbs and street pavements and investigate whether PCBs are present in such materials and their concentrations, both of which are new.[199] The claimant argues these are new programs not required by the previous permit, which only required various pilot programs and monitoring and evaluation, but not these specific provisions.[200]

According to the claimant, *Department of Finance v. Commission on State Mandates*, (2016) 1 Cal.5th 749, holds that the burden is on the State to prove that it had "no true

choice" but to implement something allegedly required by a federal mandate, as well as any other exceptions the State may claim applies, such as fee authority under Government Code section 17556(d).[201] It claims that the Regional Board's argument that the mercury and PCBs provisions were necessary to meet the Mercury and PCBs TMDLs fail to meet this burden, because the Regional Board was the one who drafted the terms of those TMDLs in the first place.[202]

The claimant also disputes the argument raised in Finance's comments that the ability to propose new fees for voter approval is sufficient fee authority within the meaning of Government Code section 17556(d) and disagrees that Senate Bill 231 has any effect on this Test Claim, as it became effective in 2018, while this Test Claim must be approved based on fiscal years 2015-2016 and 2016-2017.[203]

The claimant states that its actual or estimated costs exceed $1,000.[204] The claimant further states that for fiscal year 2016-2017, the C.10. Trash Load Reduction mandates are estimated to cause $16,324,000 in costs statewide; the C.3.j., C.11. and C.12. Green Infrastructure mandates are estimated to cause $414,029 in costs statewide; and the continuation of the C.8. monitoring obligations is estimated to cause $1,397,892 in costs statewide.[205]

B. Regional Board

The Regional Board filed late comments opposing the Test Claim, and raises the following objections:[206]

1. Not Mandated by the State

The Regional Board argues that the test claim permit is required by the Clean Water Act and its regulations, and each of the contested provisions is compelled by federal law. The provisions are required by TMDLs, the EPA-approved Basin Plan, the Clean Water Act and other federal statutes.

The Clean Water Act requires that MS4 permittees effectively prohibit non-stormwater discharges to their MS4s, while Section 301 prohibits the discharge of any pollutant by any person without a permit.[207] Federal law mandates that permits issued to MS4s must require management practices that will result in reducing stormwater pollutants to

[206] Exhibit C, Regional Board's Late Comments on the Test Claim.

[207] Exhibit C, Regional Board's Late Comments on the Test Claim, page 18.

the maximum extent practicable (MEP) yet at the same time requires that non-stormwater discharges be effectively prohibited from entering the MS4. The San Francisco Bay is impaired for both mercury and PCBs, and the EPA approved TMDLs for both pollutants.[208] These TMDLs require municipal stormwater agencies to take aggressive actions to reduce mercury and PCBs from their stormwater discharges that are anticipated to be implemented over multiple permit terms. Requirements in Provisions C.3.j., C.11.c., C.12.a., C.12.c., C.12.d., and C.12.e. are thus required by section 303(d), and are not part of a new program, do not impose a higher level of service, and are not unique to local government.[209]

2. Not a New Program or Higher Level of Service

The Regional Board argues that the test claim permit does not impose a new program or higher level of service as a whole because it is just a continuation of the prior permit. Furthermore, the mercury and PCBs provisions are based on the TMDLs and their respective implementation plans, which the EPA approved in 2008 and 2010, respectively.[210] Both TMDLs anticipated taking approximately 20 years, or four five-year permit cycles, and anticipated that this permit term would include broadly applicable requirements based on information gathered during the prior permit term.[211] The mercury TMDL anticipated these requirements would include source and treatment controls and management methods, while anticipated PCBs control actions included technologies to treat or filter stormwater, increased use of routine maintenance BMPs, industrial inspections to identify and direct removal PCBs-containing equipment, and a program to control demolition waste.[212] Permittees have been aware of the TMDL load reduction requirements for years, and had opportunities to participate, and did participate in, TMDL development. If there was concern that the TMDLs imposed unfunded state mandates they should have been challenged on such grounds, and to do so now is not timely.[213]

Additionally, the schedule for trash load reduction is not new, but based on the schedule laid out in the prior permit, which required 40% reduction by 2014, 70% reduction by 2017, and 100% reduction by 2022.[214] While the claimant argues that these were merely goals in the prior permit whereas now they are enforceable deadlines, the Regional Board asserts this is a distinction without a difference.[215]

[214] Exhibit C, Regional Board's Late Comments on the Test Claim, page 40.

[215] Exhibit C, Regional Board's Late Comments on the Test Claim, page 40.

The permit requirements for trash are also not a higher level of service because they are uniformly applied to all stormwater dischargers. Federal law requires all NPDES permits to include monitoring "sufficient to yield data which are representative of the monitored activity including, when appropriate continuous monitoring." The specific monitoring provisions in the test claim permit are common to non-municipal NPDES permits in the Bay Area. Discharging any solid waste and floating materials, including trash, is prohibited, and outside the context of municipal stormwater, would require strict compliance, and achieving zero discharge over a period of time would not be allowed. In this sense the test claim permit's requirements are generally applicable to all dischargers, but are less stringent than individual permits.[216]

3. No Costs Mandated by the State Because the Claimants Have Fee Authority

The Regional Board asserts that there are no costs mandated by the state because the claimants have fee authority sufficient to cover costs pursuant to Government Code section 17556(d) and they have not been forced to use their proceeds of taxes.

The Regional Board contends that voter approval under Proposition 218 is not required to impose or increase fees, as demonstrated by the Legislature's recent approval of Senate Bill 231, which reiterated that the exception from the voter approval requirements for fees and charges for sewer, water, and refuse collection services found in Article XIII D, Section 6, subdivision (c), of the California Constitution, included stormwater in the definition of "sewer," and statutorily overturned *Howard Jarvis Taxpayers Ass'n v. City of Salinas* (2002) 98 Cal.App.4th 1351.[217]

The Regional Board also argues that the provisions at issue regarding trash, mercury, PCBs, and Green Infrastructure are all issues for which the claimant is capable of crafting regulatory fees. "Permittees' police power is 'broad enough to include mandatory remedial measures to mitigate the *past, present or future* adverse impact of the fee payer's operations,' in situations, like those present here, where there is a causal connection or nexus between the adverse effects and the fee payer's activities."[218] It also asserts that permittees' authority to impose regulatory fees for these services comes from Public Resources Code section 40059(a)(1) and Health and Safety Code section 5471(a), which each grant fee authority for "aspects of solid waste

---

[216] The Regional Board's comments also made arguments that Provisions C.11.f and C.12.f have general applicability as well. These sections were plead in the prior Test Claim for MRP1, (*California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, and 10-TC-05) and the pilot feasibility study required was not carried over to the test claim permit. The claimant did not identify these sections as requiring anything new of them in this Test Claim.

[217] Exhibit C, Regional Board's Late Comments on the Test Claim, pages 6-7.

[218] Exhibit C, Regional Board's Late Comments on the Test Claim, page 7 quoting *Sinclair Paint Co. v. State Board of Equalization,* (1997) 15 Cal.4th 866, 877, emphasis added by Regional Board.

handling," and "services…furnished…in connection with…storm drainage," respectively.[219]

Additionally, the Regional Board argues that the record shows that permittees are not required to use their proceeds of taxes for these programs, as they have been able to use other funding sources. Examples include:

- A presentation made at the 2017 Stormwater Finance Forum held in Oakland on how to fund various stormwater related programs including street sweeping and installing and maintaining full trash capture systems and catch basins by imposing trash and sewer related fees and surcharges that would not be subject to Proposition 218;
- Records that other permittees such as the cities of Alameda and Palo Alto have implemented or raised their stormwater fees to fund their programs;
- Alternate funding methods used by other permittees such as Oakland's excess litter fee for high trash generating business;
- The claimant's own Test Claim, which acknowledges that it has so far avoided needing to raise its stormwater fees through the use for grant money for most of the claimed expenses for Green Infrastructure Projects;
- The use of Business Improvement Districts (BID) or Community Benefit Districts (CBD) in which property owners within specific areas vote on assessment fees used to pay for maintenance and beautification within the district; and
- Multiple instances of CalTrans offering grants or partnerships to cities to install full trash capture devices or Green Infrastructure Projects.[220]

C. Department of Finance

Finance defers to the State Water Resources Control Board and the Regional Board on whether there is a state-mandated program and whether any asserted activities impose a new program or higher level of service.[221] Finance's comments address only the fee authority issue. Finance contends there are no costs mandated by the state pursuant to Government Code 17556(d), as it argues that the ability to propose fees for voter approval under Proposition 218 is sufficient fee authority as a matter of law, regardless of whether it is politically feasible to get those fees approved.[222]

Alternatively, if the Commission does find the test claim permit imposes reimbursable mandated costs, Finance points out that the claimant identified potentially offsetting revenue that should reduce costs and be identified by the Commission to reduce the

[219] Exhibit C, Regional Board's Late Comments on the Test Claim, page 8.

claims; namely Proposition 84 grant funds, other grant funds, and the Clean Water Fund.[223]

IV. Discussion

Article XIII B, section 6 of the California Constitution provides in relevant part the following:

> Whenever the Legislature or any state agency mandates a new program or higher level of service on any local government, the state shall provide a subvention of funds to reimburse such local government for the costs of such programs or increased level of service…

The purpose of article XIII B, section 6 is to "preclude the state from shifting financial responsibility for carrying out governmental functions to local agencies, which are 'ill equipped' to assume increased financial responsibilities because of the taxing and spending limitations that articles XIII A and XIII B impose."[224] Thus, the subvention requirement of section 6 is "directed to state-mandated increases in the services provided by [local government] …"[225]

Reimbursement under article XIII B, section 6 is required when the following elements are met:

- A state statute or executive order requires or "mandates" local agencies or school districts to perform an activity.[226]
- The mandated activity constitutes a "program" that either:
    a. Carries out the governmental function of providing a service to the public; or
    b. Imposes unique requirements on local agencies or school districts and does not apply generally to all residents and entities in the state.[227]
- The mandated activity is new when compared with the legal requirements in effect immediately before the enactment of the test claim statute or executive order and it increases the level of service provided to the public.[228]

[227] *San Diego Unified School Dist. v. Commission on State Mandates* (2004) 33 Cal.4th 859, 874-875 reaffirming the test set out in *County of Los Angeles* (1987) 43 Cal.3d 46, 56.

[228] *San Diego Unified School Dist. v. Commission on State Mandates* (2004) 33 Cal.4th 859, 874-875, 878; *Lucia Mar Unified School District v. Honig* (1988) 44 Cal3d 830, 835.

- The mandated activity results in the local agency or school district incurring increased costs, within the meaning of section 17514. Increased costs, however, are not reimbursable if an exception identified in Government Code section 17556 applies to the activity.[229]

The Commission is vested with the exclusive authority to adjudicate disputes over the existence of state-mandated programs within the meaning of article XIII B, section 6 of the California Constitution.[230] The determination whether a statute or executive order imposes a reimbursable state-mandated program is a question of law.[231] In making its decisions, the Commission must strictly construe article XIII B, section 6 of the California Constitution, and not apply it as an "equitable remedy to cure the perceived unfairness resulting from political decisions on funding priorities."[232]

A. The Commission Has Jurisdiction Over This Test Claim.

1. The Test Claim Was Timely Filed and Has a Potential Period of Reimbursement Beginning January 1, 2016.

Government Code section 17551(c) provides that Test Claims "shall be filed not later than 12 months following the effective date of a statute or executive order, or within 12 months of incurring increased costs as a result of a statute or executive order, whichever is later."[233] The Commission's regulations effective at the time this claim was filed provided that "[f]or purposes of claiming based on the date of first incurring costs, 'within 12 months' means by June 30 of the fiscal year following the fiscal year in which increased costs were first incurred by the test claimant."[234]

The Test Claim was filed on June 30, 2017, more than a year after the effective date of the stormwater permit on January 1, 2016.[235] However, evidence shows that the earliest date when costs were first incurred as a result of the permit after its effective date was January 4, 2016.[236] Thus under the regulations at the time of filing, the

[233] Government Code section 17551(c) (Stats. 2007, ch. 329).

[234] California Code of Regulations, title 2, section 1183.1(c) (Register 2016, No. 38).

[235] Exhibit A, Test Claim, pages 4 (Written Narrative), 383 (test claim permit).

[236] Exhibit A, Test Claim, page 78 (Declaration of James Scanlin, Associate Environmental Compliance Specialist, Alameda County).

claimant had until June 30, 2017 to file its claim. The Test Claim was filed on June 30, 2017, and is therefore timely.[237]

Government Code section 17557(e) requires a test claim to be "submitted on or before June 30 following a fiscal year in order to establish eligibility for reimbursement for that fiscal year." Because the Test Claim was filed on June 30, 2017, the potential period of reimbursement under Government Code section 17557 begins on July 1, 2015. However, since the test claim permit has a later effective date, the potential period of reimbursement for this claim begins on the permit's effective date, or January 1, 2016.

2. The Claimants Are Not Required to Exhaust Administrative Remedies with the State Water Board Prior to Filing a Test Claim with the Commission.

The Regional Board asserts that the Test Claim is untimely since the claimant should have challenged the provisions implementing the TMDLs to the State Water Board. It contends that the load reduction requirements in the mercury and PCBs TMDLs have been known about since their adoption in 2008, and that permittees had been active participants in the TMDLs development.[238] Furthermore the permittees were active participants in the pilot Green Infrastructure program and discussions on scaling up the program over the course of the prior permit.[239] If the claimant was concerned that the TMDLs created unfunded state mandates, it should have challenged them on such grounds.[240] The Regional Board asserts that this Test Claim is a collateral attack on the TMDLs by way of the test claim permit's provisions, and is not timely.[241]

The Regional Board's argument is unfounded. The Commission, and not the State Water Board, has exclusive jurisdiction to determine whether a statute or executive order imposes a reimbursable state-mandated program.[242]

In *Department of Finance v. Commission on State Mandates*, the Court explained, "The Legislature has enacted comprehensive procedures for the resolution of reimbursement claims and created the Commission to adjudicate them."[243] The Court distinguished

[242] Government Code section 17552; *County of Los Angeles v. Commission on State Mandates* (2007) 150 Cal.App.4th 898, 917-920, which concludes that NPDES permits are executive orders pursuant to Government Code section 17516 and that the existence of a state mandate is a matter for the Commission's determination.

[243] *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 759.

between challenging the substance of a stormwater permit and seeking reimbursement under article XIII B, section 6 in the context of a test claim:

> Certainly, in a trial court action challenging the board's authority to impose specific permit conditions, the board's findings regarding what conditions satisfied the federal standard would be entitled to deference. (See, e.g., *City of Rancho Cucamonga v. Regional Water Quality Control Bd*. (2006) 135 Cal.App.4th 1377, 1384, 38 Cal.Rptr.3d 450, citing *Fukuda v. City of Angels* (1999) 20 Cal.4th 805, 817-818, 85 Cal.Rptr.2d 696, 977 P.2d 693) Resolution of those questions would bring into play the particular technical expertise possessed by members of the regional board. In those circumstances, the party challenging the board's decision would have the burden of demonstrating its findings were not supported by substantial evidence or that the board otherwise abused its discretion. (*Rancho Cucamonga*, at p. 1387, 38 Cal.Rptr.3d 450; *Building Industry* [*Assn. of San Diego County v. State Water Resources Control Board* (2004)] 124 Cal.App.4th [866,] 888-889, 22 Cal.Rptr.3d 128.)
>
> Reimbursement proceedings before the Commission are different. The question here was not whether the Regional Board had authority to impose the challenged requirements. It did. The narrow question here was who will pay for them. In answering that legal question, the Commission applied California's constitutional, statutory, and common law to the single issue of reimbursement. In the context of these proceedings, the State has the burden to show the challenged conditions were mandated by federal law.
>
> [¶…¶]
>
> Moreover, the policies supporting article XIII B of the California Constitution and section 6 would be undermined if the Commission were required to defer to the Regional Board on the federal mandate question.[244]

Thus, the Commission's role is different from a direct challenge on the merits of the permit's TMDL load allocations: "[t]he narrow question here [is] who will pay" for an alleged mandate, which the Commission is charged with determining in the first instance.[245]

Therefore, the claimant is not required to exhaust administrative remedies with the State Water Board prior to filing a Test Claim with the Commission.

[244] *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 768-769.

[245] *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 769.

3. The Commission Does Not Have the Authority to Re-Address the Monitoring Requirements in Provision C.8. Imposed by the Prior Permit, Since the Legal Findings on that Provision in Test Claim *California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, and 10-TC-05, Are Final and Binding.

The claimant seeks reimbursement for the continuing costs to comply with the monitoring requirements found in Provision C.8., which were originally required by the prior 2009 permit (Order R2-2009-0074). The Test Claim acknowledges these activities were already addressed in the prior Test Claim (*California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, and 10-TC-05) and the claimant has not alleged any new requirements imposed by Provision C.8. of the test claim permit, but the claimant pled the activities again "out of an abundance of caution."[246]

The Commission addressed the monitoring requirements in Provision C.8. imposed by the prior permit (Order R2-2009-0074) in Test Claim *California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, and 10-TC-05 and issued a Decision on January 24, 2025.[247] In its Decision, the Commission found that reimbursement was required under article XIII B, section 6 for the following activities arising out of Provision C.8. until December 31, 2017:

> Geomorphic Study
>
> - Permittees shall select a waterbody/reach, preferably one containing significant fish and wildlife resources, and conduct one of the following projects within each county, except only one such project must be completed within the collective Fairfield-Suisun and Vallejo Permittees' jurisdictions:
>
> (1) Gather geomorphic data to support the efforts of a local watershed partnership [fn. omitted] to improve creek conditions; or
>
> (2) Inventory locations for potential retrofit projects in which decentralized, landscape-based stormwater retention units can be installed; or
>
> (3) Conduct a geomorphic study which will help in development of regional curves which help estimate equilibrium channel conditions for different-sized drainages. Select a waterbody/reach not

[246] Exhibit A, Test Claim, page 11 (Written Narrative).

[247] See Commission on State Mandates, Test Claim Decision on *California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074,* 10-TC-02, 10-TC-03, 10-TC-05, adopted January 24, 2025, https://csm.ca.gov/matters/10-TC-01-02-03-05/doc68.pdf (accessed February 27, 2025).

undergoing changing land use. Collect and report the following data:

- Formally surveyed channel dimensions (profile), planform, and cross-sections. Cross-sections shall include the topmost floodplain terrace and be marked by a permanent, protruding (not flush with ground) monument.
- Contributing drainage area.
- Best available information on bankfull discharges and width and depth of channel formed by bankfull discharges.
- Best available information on average annual rainfall in the study area.

- Report selected geomorphic project results in the Integrated Monitoring Report. [R2-2009-0074 section C.8.d.iii]

Sediment Delivery Estimate/Budget

- Permittees shall develop a design for a robust sediment delivery estimate/sediment budget in local tributaries and urban drainages by July 1, 2011, and implement the study by July 1, 2012. [R2-2009-0074 section C.8.e.vi]

Citizen Monitoring and Participation – for the City of Vallejo and the Vallejo Sanitary District only:

- Encourage Citizen Monitoring
- In developing Monitoring Projects and evaluating Status & Trends data, make reasonable efforts to seek out citizen and stakeholder information and comment regarding waterbody function and quality.
- Demonstrate annually the permittee has encouraged citizen and stakeholder observations and reporting of waterbody conditions. Report on these outreach efforts in the annual Urban Creeks Monitoring Report. [R2-2009-0074 section C.8.f]

Monitoring Reporting and Notice

- Permittees shall maintain an information management system that supports electronic transfer of data to the Regional Data Center of the California Environmental Data Exchange Network (CEDEN), located within the San Francisco Estuary Institute. [R2-2009-0074 section C.8.g.ii, footnote 46]
- Permittees shall submit an Electronic Status Monitoring Data Report, compatible with the SWAMP database, no later than January 15 of each year, reporting on all data collected during the previous October 1-September 30 period. Water quality objective

exceedances are required to be highlighted in the report. [R2-2009-0074 section C.8.g.ii]

- Permittees shall notify stakeholders and members of the general public about the availability of electronic and paper monitoring reports through notices distributed through appropriate means, such as an electronic mailing list. [R2-2009-0074 section C.8.g.vii][248]

All other activities in the prior permit's Provision C.8. were denied.

The Commission's Decision on the prior Test Claim is a final, binding decision, which cannot be disturbed unless litigated and directed by the court to be set aside or modified pursuant to Government Code section 17559(b) or a request for a new test claim decision based on a subsequent change in the law is filed pursuant to Government Code section 17570.[249]

Moreover, Government Code section 17553(b)(1) requires that a test claim include a detailed description of the new activities and costs that arise from the alleged mandate and a detailed description of existing activities and costs that are modified by the alleged mandate. The claimant does not allege that this Test Claim permit requires any new activities for Provision C.8. when compared to the prior permit, and there are no allegations that the activities in Provision C.8. found to be state mandates under the prior permit have changed.

Therefore, the Commission does not have the authority to re-address the monitoring requirements in Provision C.8. of the test claim permit.

4. The Requirements Pled in the 2015 Test Claim Permit Are Compared to the Law in Effect Immediately Prior to the Adoption of the Test Claim Permit, Including the 2009 Permit, to Determine if the Activities Required by the 2015 Test Claim Permit Are New.

The claimant also argues that the trash load reduction deadlines required by the test claim permit of 70 percent reduction by July 1, 2017 and 100 percent reduction by July 1, 2022 are new, even if they were required by the prior 2009 permit, because the 2009 prior permit was rescinded when the test claim permit took effect.[250]

In other words, the claimant wants the Commission to interpret stormwater permits as contracts that expire, and that every permit is a new contract, at least for this specific

---

[250] Exhibit A, Test Claim, page 22 (Written Narrative).

issue, as it does not attempt to take this position with any other requirements continued from the prior permit. This interpretation is not consistent with article XIII B, section 6 or the courts' interpretation of these permits as executive orders.

Under the Clean Water Act, the term of an NPDES permit is five years.[251] However, states authorized to administer the NPDES program may continue the state-issued permit until the effective date of a new permit, if state law allows.[252] California's regulations provide that the terms and conditions of an expired permit are automatically continued pending issuance of a new permit if all requirements of the federal NPDES regulations on continuation of expired permits have been complied with.[253] Thus, there was no gap in time between the prior permit and the test claim permit.

The courts have found NPDES permits are executive orders issued by a state agency within the meaning of article XIII B, section 6.[254] The purpose of article XIII B, section 6 is to prevent the state from forcing extra programs on local government each year in a manner that negates their careful budgeting of increased expenditures counted against the local government's annual spending limit and, thus, article XIII B, section 6 requires a showing that the test claim statute or executive order mandates *new* activities and associated costs compared to the prior year.[255] This was the case in *Department of Finance. v. Commission on State Mandates* (2021) 59 Cal.App.5th 546. There, the court found installing and maintaining trash receptacles at transit stops and performing certain inspections, as required by that stormwater permit, were *new duties* that local governments were required to perform, when compared to prior law ("the mandate to install and maintain trash receptacles at transit stops is a 'new program' within the meaning of section 6 because it was not required prior to the Regional Board's issuance of the permit").[256]

---

[251] 33 United States Code section 1342(b).

[255] California Constitution, articles XIII B, sections 1, 8(a) and (b); *County of Los Angeles v. State of California* (1987) 43 Cal.3d 46, 56; *Lucia Mar Unified School Dist. v. Honig* (1988) 44 Cal.3d 830, 835; *Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1564, 1595; *County of Sonoma v. Commission on State Mandates* (2000) 84 Cal.App.4th 1264, 1283; *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 763.

[256] *Department of Finance. v. Commission State Mandates* (2021) 59 Cal.App.5th 546, 558.

Other examples include *Lucia Mar Unified School Dist.*, which addressed a 1981 test claim statute requiring local school districts to pay the cost of educating pupils in state schools for the severely handicapped — costs the state had previously paid in full until the 1981 statute became effective.[257] The court held the requirement imposed on local school districts to fund the cost of educating these pupils was new "*since at the time [the test claim statute] became effective* they were not required to contribute to the education of students from their districts at such schools."[258] The same analysis was applied in *County of San Diego*, where the court found the state took full responsibility to fund the medical care of medically indigent adults in 1979, which lasted until the 1982 test claim statute shifted the costs back to counties.[259] In *City of San Jose*, the court addressed a 1990 test claim statute, which authorized counties to charge cities for the costs of booking into county jails persons who had been arrested by employees of the cities.[260] The court denied the city's claim for reimbursement, finding the costs were not shifted by the state since "*at the time [the test claim statute] was enacted*, and indeed long before that statute, the financial and administrative responsibility associated with the operation of county jails and detention of prisoners was borne entirely by the county."[261] In *San Diego Unified School District*, the court determined the required activities imposed by test claim statutes, which addressed the suspension and expulsion of K-12 students from school, were "new in comparison with the preexisting scheme in view of the circumstances that they did not exist prior to the enactment of [the test claim statutes]."[262]

Thus, it is not legally correct or consistent with article XIII B, section 6 to ignore the requirements imposed on the claimants by the prior permit to determine what is new.

Therefore, the requirements pled in the 2015 test claim permit are compared to the law in effect immediately prior to the adoption of the test claim permit, including the 2009 permit, to determine if the activities required by the 2015 test claim permit are new.

B. Some of the Requirements Imposed by the Provisions of the Test Claim Permit Pled Impose New State-Mandated Requirements that Constitute a New Program or Higher Level of Service Within the Meaning of Article XIII B, Section 6 of the California Constitution.

1. The Requirements Pled in Provisions C.10.a.i., ii., and iii. and C.10.b.i. and ii, Addressing the Reduction of Trash Loads, Do Not Mandate New Programs or Higher Levels of Service.

a. The claimant's pleadings regarding Provisions C.10.a. and C.10.b. are vague and ambiguous; the written narrative and declarations only identify some of the requirements found in Provisions C.10.a.i., ii., and iii., relating to the schedule and deadline for the reduction of trash and the installation of full trash capture devices and other control measures, and in C.10.b.i. and ii., to maintain their full trash capture systems, and thus discussion of the trash provisions is limited to these provisions.

The Government Code requires that a test claim's written narrative identify the specific sections of the statutes or executive orders pled and provide a detailed description of the new activities that are alleged to contain a mandate.[263] The Government Code also requires the Test Claim to be supported with declarations signed under penalty of perjury, which identify the actual or estimated increased costs incurred to implement the alleged new mandated activities.[264] It is not enough under the Government Code to generally cite a statute or executive order in the test claim, without a discussion of the specific sections and detailed discussion of the new activities and costs alleged to be reimbursable.

This Test Claim requests reimbursement to comply with Provisions C.10.a. (Trash Reduction Requirements) and C.10.b. (Demonstration of Trash Reduction Outcomes).[265] These provisions contain several subsections each, but the Test Claim does not specifically identify the subsections or all of the requirements in these subsections. Instead, the narrative and the declaration filed with the Test Claim generally refer to Provisions C.10.a. and C.10.b. and limit the discussion of the "new" requirements as described below.

With respect to Provision C.10.a., the Test Claim requests reimbursement for the following requirements:

- Compliance with "a new schedule and deadline" for the reduction of trash; namely, 70 percent reduction by July 1, 2017, and 80 percent reduction by July 1, 2019.

  The Test Claim narrative and declaration acknowledge that the prior permit required the permittees to achieve phased annual reductions in trash loading,

[263] Government Code section 17553(b)(1)(A).

[264] Government Code section 17553(b)(2).

[265] Exhibit A, Test Claim, pages 21-24 (Written Narrative).

culminating in a 100 percent reduction by 2022 and included an enforceable deadline of 40 percent reduction by 2014. However, the narrative and declaration allege that the prior permit was rescinded when the test claim permit took effect, that the 2017 deadline is a new enforceable mandatory deadline where previously it was only a goal, and the 2019 deadline requiring an 80 percent reduction in trash is a new mandated requirement.[266]

The schedule and deadlines for the reduction of trash are in Provision C.10.a.i. of the test claim permit.[267]

- The Test Claim also identifies costs incurred under the prior permit to install full trash capture systems and estimates costs to install trash capture devices "to comply with MRP2" (the test claim permit) as follows:

> As part of the City's Long Term Trash Reduction Plan, in June 2015, the City commissioned United Storm Water, Inc. to install an additional 200 full trash capture devices for a total of $99,994.52. The City had anticipated the new full trash capture installation requirements set forth in the MRP2 and commissioned the installation of the trash capture devices in order to comply with Provision C.10 just prior to the MRP2's effective date. This cost was paid out of the City's clean water fund. The City had previously installed 150 units, paid by a grant from the EPA. The City is planning to install an additional 200 units in the summer of 2018, totaling 550 full trash capture devices. It is estimated that the purchase and installation of the additional 200 devices will cost the City another $100,000. Therefore, in total, Union City's cost to install trash capture devices required to comply with the MRP2 is approximately $200,000.[268]

- The Test Claim identifies the following best management practices and control measures, including those other than full trash capture devices, used by the claimant to achieve the reduction deadlines:

> City staff has worked to identify best management practices and control measures that they believe will be necessary in order to achieve the target of 100% trash reduction from municipal separate storm sewer systems by July 1, 2022, and with interim milestones of 70% reduction by July 1, 2017 and 80% by July 1, 2019, as required by Provision C.10.a. These practices and measures include the following:

---

[266] Exhibit A, Test Claim, pages 21-22, 38-39 (Declaration of Thomas Ruark, City Engineer, City of Union City).

[267] Exhibit A, Test Claim, page 476 (Test Claim Permit, Provision C.10.a.i.).

[268] Exhibit A, Test Claim, pages 23, 42-43 (Declaration of Thomas Ruark, City Engineer, City of Union City).

- Installed full trash capture devices in our high trash generating areas
- Increased cleaning of Continuous Deflection Separators (CDS) Units and Catch basins pre and post storm event season.
- Increased public awareness by installing clean water advertisement in all of Union City's transit buses
- Increased Public Outreach with at least 8 different yearly events
- Distributed over 500 reusable bags
- Passed a Plastic Bag Ban
- Conducted a least two creek clean up events per year
- Utilized Work furlough crews to assist in weekly trash pick-up along major arterials and collector streets.
- Installed over 150 trash capture devices (TCD) in our city-owned catch basins which surround our retail and commercial properties as well as a portion of our high density residential properties.
- In addition, the City has a total of 12 CDS units installed on both private and public properties.

It is estimated that these measures serve a combined area of 293.28 acres.[269]

Implementing trash prevention and control actions such as full trash capture devices and other control measures to achieve the reduction of trash requirements are in Provisions C.10.a.ii. and C.10.a.iii. and, although not specifically cited in the Test Claim, this Decision will address those provisions with respect to full trash capture devices and other control measures since activities and costs have been alleged.

However, Provision C.10.a.ii. imposes additional requirements to map the location, or otherwise record the location, of all lands greater than 10,000 square feet not owned by the permittee but plumbed to the permittee's storm drain systems in Very High, High, or Moderate trash generation areas by July 1, 2018, identify the trash control status of these areas, and retain this documentation for inspection.[270] These requirements have not been identified in the Test Claim or the declaration submitted with the Test Claim and, thus, have not been pled in accordance with Government Code section 17553 and, therefore, this Decision will not address those requirements.

[269] Exhibit A, Test Claim, pages 23-24 (Written Narrative); 43-44 (Declaration of Thomas Ruark, City Engineer, City of Union City).

[270] Exhibit A, Test Claim, page 477 (test claim permit, Provision C.10.a.ii.b.).

The Test Claim's allegations regarding Provision C.10.b. are also not clear. The Test Claim states the following:

> Provision C.10.b requires Permittees to maintain, and provide for inspection and review upon request, documentation of the design, operation, and maintenance of each of their full trash capture systems, including the mapped location and drainage area served by each system. (MRP2 at 99-102.) This provision specifies detailed full trash capture system installation and maintenance instructions, which are more prescriptive, burdensome and costly than MRP1 to fulfill. The MRP1 generally required Permittees to install and maintain full trash capture devices, which allowed each municipality greater discretion in identifying effective as well as cost efficient methods for meeting trash load reduction goals. Now, under the MRP2, compliance by means of Other Trash Management Actions (meaning non-full trash capture systems) has become so burdensome and costly that Union City has determined installation of full trash capture systems is the least costly compliance option. Provision C.10.b requires increased activities by Union City that are best characterized as a higher level of service in comparison to the MRP1.[271]

Although the paragraph above references the pages in the test claim permit for Provision C.10.b. in its entirety, the only activity specifically identified by the Test Claim is the "detailed full trash capture system installation and maintenance instructions, which are more prescriptive, burdensome and costly than MRP1 to fulfill." The Test Claim makes the following claims regarding the costs incurred to maintain the full capture systems:

> In April 2017, the City adopted a resolution approving an appropriation of $432,500.57 from the City's Vehicle Replacement Fund and awarded a contract in the amount of $432,423.57 to Owen Equipment of Fairfield, California for the procurement of one Storm Drain Cleaner. This contract award was determined to be vital to minimize stormwater pollution, and maintain and clean the newly installed full trash capture devices so as to be in compliance with the MRP2. The City had already owned a Vactor truck; however, it is an old device and unable to fulfill the full trash capture maintenance requirements set forth in the MRP2. Renting a Vactor truck costs $10,000 per month. The City ultimately determined that purchasing a new Vactor truck would be more cost effective than renting a device. The procurement for the equipment purchase was made available from the City's Vehicle Replacement Fund.
>
> The MRP2 requires the City to clean the trash capture devices twice a year. It will take an estimated three months to clean all 550 units once.

[271] Exhibit A, Test Claim, pages 22-23 (Written Narrative); see also, page 39 (Declaration of Thomas Ruark, City Engineer, City of Union City).

> Three months of crew time of the Vactor crew is estimated to cost $42,500. Thus, cleaning the units twice per year will take the City six months. At a cost of $85,000 for labor for six months of the crew time, yearly maintenance costs are estimated to total $145,000.[272]

Provision C.10.b.i.a.-c. addresses the requirements to maintain, and provide for inspection and review upon request, documentation of the design, operation, and maintenance of each of their full trash capture systems, and this Provision is addressed in this Decision.[273]

And Provision C.10.b.ii. addresses the maintenance and inspection of documentation for the non-full trash capture control actions.[274] Since performing non-full trash capture control actions is discussed in the Test Claim narrative, this Decision will address Provision C.10.b.ii.

However, there is no discussion, request for reimbursement, or identification of any costs incurred to comply with Provisions C.10.b.iii., iv., and v. These provisions state the formula to be used when calculating a permittee's total percent trash load reduction; allow permittees to claim up to ten percent of their trash load reduction using jurisdiction-wide source control actions, with substantive and credible evidence of the control action's claimed effectiveness; and require permittees to conduct receiving water monitoring and develop receiving water monitoring tools and protocols and a receiving water monitoring program to determine if their control actions are effective.[275] Thus, the requirements in Provision C.10.b.iii.-v. have not been pled in accordance with Government Code section 17553 and this Decision will not address these subsections.

Accordingly, based on the Test Claim pleading, the activities in Provision C.10.a. specifically identified above, and Provisions C.10.b.i. and ii., are addressed below.

b. Provision C.10.a.i., ii., and iii. require permittees to implement trash control measures and other actions to reduce trash loads by a specified schedule, and Provision C.10.b.i. and ii. require permittees to maintain documentation on their full trash capture systems and other control actions and specify adequate inspection and maintenance as specified.

Provision C.10., in its introductory paragraph, requires permittees to "demonstrate compliance with Discharge Prohibition A.1., for trash discharges, Discharge Prohibition A.2., and trash-related Receiving Water Limitations through the timely implementation of control measures and other actions to reduce trash loads from municipal separate storm

---

[273] Exhibit A, Test Claim, page 478 (test claim permit, Provision C.10.b.i.).

[274] Exhibit A, Test Claim, pages 478-479 (test claim permit, Provision C.10.b.ii.).

[275] Exhibit A, Test Claim, pages 479-481 (test claim permit, Provisions C.10.b.iii., iv., and v.).

sewer systems."[276] Discharge prohibitions A.1. and A.2. prohibit non-stormwater discharges and states that "[i]t shall be prohibited to discharge rubbish, refuse, bark, sawdust, or other solid wastes into surface waters or at any place where they would contact or where they would be eventually transported to surface waters, including flood plain areas."[277]

Provisions C.10.a.i., ii. and iii. and C.10.b.i. and ii. describe the following requirements:

- Trash Reduction Requirements:

  Provision C.10.a.i. requires that the permittees shall implement trash load reduction control actions in accordance with the following schedule, to meet the goal of 100 percent trash load reduction or no adverse impact to receiving waters from trash by July 1, 2022. Permittees shall reduce trash discharges from their 2009 levels to receiving waters in accordance with the following schedule:

  a. 70 percent by July 1, 2017; and

  b. 80 percent by July 1, 2019.[278]

  Provision C.10.a.ii.a. states that "Permittees shall implement trash prevention and control actions, including full trash capture systems or other trash management actions, or combinations of actions, with trash discharge control equivalent to or better than full trash capture systems, to reduce trash generation to a Low trash generation rate or better."[279]

  Provision C.10.a.ii.b. states that "Permittees shall ensure that lands that they do not own or operate, but that are plumbed directly to their storm drain systems in Very High, High, and Moderate trash generation areas are equipped with full trash capture systems or are managed with trash discharge control actions equivalent to or better than full trash capture systems."[280]

  Provision C.10.a.iii. requires that "Permittees shall install and maintain a mandatory minimum number of full trash capture devices, to treat runoff from an area equivalent to 30 percent of retail/wholesale land area, as documented by the Association of Bay Area Governments, which drains to the storm drain system within their jurisdictions."[281]

- Maintenance of Full Trash Capture Systems:

---

[276] Exhibit A, Test Claim, page 476 (test claim permit, Provision C.10.).

[277] Exhibit A, Test Claim, page 384 (test claim permit, Provisions A.1 and A.2).

[278] Exhibit A, Test Claim, page 476 (test claim permit, Provision C.10.a.i.).

[279] Exhibit A, Test Claim, page 477 (test claim permit, Provision C.10.a.ii.a.).

[280] Exhibit A, Test Claim, page 477 (test claim permit, Provision C.10.a.ii.b.).

[281] Exhibit A, Test Claim, page 477 (test claim permit, Provision C.10.a.iii.).

Provision C.10.b.i.a. requires that the maintenance of each full capture device shall be adequate to prevent plugging, including plugging of the 5 mm screen leading to trash overflow and bypass, flooding, or a full condition of the device's trash reservoir causing bypassing of trash.[282]

This provision also requires that all full trash capture devices shall be inspected and maintained at least once per year. All such devices in High or Very High trash generation areas shall be inspected at least two times per year, with the inspections spaced at least three months or more apart. If this frequency of inspection is found excessive after two inspections, the inspection frequency can be reduced to once per year.[283]

Finally, this provision states that "[i]f any such device is found to have a plugged or blinded screen or is greater than 50 percent full of trash during a maintenance event, the maintenance frequency shall be increased so that the device is neither plugged nor more than half full of trash at the next maintenance event."[284]

Provision C.10.b.i.b. requires permittees to retain device specific maintenance records, including, at a minimum: the date(s) of maintenance, the capacity condition of the device at the time of maintenance (full and overflowing or with storage capacity remaining), any special problems such as flooding, screen blinding or plugging from leaves, plastic bags, or other debris causing overflow, damage reducing function, or other negative conditions. A summary of this information shall be reported in each Annual Report which may be limited to the number of full capture devices maintained that exhibited a plugged, full or overflowing condition upon maintenance.[285]

Provision C.10.b.i.c. requires the permittees to annually certify that each of their full trash capture systems is operated and maintained to meet full trash capture system requirements.[286]

- Maintenance of Other Trash Actions:

  Provision C.10.b.ii.a. requires permittees to maintain, and provide for inspection and review upon request, documentation of non-full trash capture system control actions that verify implementation of each action. The provision states:

  "Permittees shall maintain documentation of trash control actions that describes each action or combination of actions, the level of implementation, the timing and frequency of implementation, standard operating procedures if applicable, location(s) of implementation actions including mapped location(s) and drainage

[282] Exhibit A, Test Claim, page 478 (test claim permit, Provision C.10.b.i.a.).

[283] Exhibit A, Test Claim, page 478 (test claim permit, Provision C.10.b.i.a.).

[284] Exhibit A, Test Claim, page 478 (test claim permit, Provision C.10.b.i.a.).

[285] Exhibit A, Test Claim, page 478 (test claim permit, Provision C.10.b.i.b.).

[286] Exhibit A, Test Claim, page 478 (test claim permit, Provision C.10.b.i.c.).

area(s) affected or description of areal extent, tracking and enforcement procedures if applicable, and other information relevant to effective implementation of the action or combination of actions."[287]

- Visual Assessment of Outcomes of Other Trash Management Actions:

  Provision C.10.b.ii.b. requires permittees to conduct visual on-land assessment, including photo documentation, or other acceptable assessment method, of each trash generation area within which it is implementing other trash management actions or combination of actions other than full trash capture, to determine or verify the effectiveness of the action or combination of actions. Permittees may assess and account for one or more trash generation areas in a single trash management area within which a control action or combination of control actions is implemented. The visual on-land assessment method used shall meet or exceed the following criteria: conduct observations of the sidewalk, curb and gutter, locations associated with trash generation sources, randomly selected locations covering at least ten percent of a trash management area's street miles, and at a frequency consistent with known or estimated trash generation rates.[288]

The test claim permit specifies that flood management agencies are not subject to the requirements in C.10. "except for continued implementation of requirements for full trash capture systems. . . , as specified in subsection C.10.b.i. . . ."[289]

Additionally, C.10.a.i also states that permittees "should" achieve 60 percent reduction by July 1, 2016, but clarifies this is not a mandatory deadline, but rather a performance guideline.[290] It is essentially meant to show the permittee is on track to meet its actual deadlines, or to give warning if a permittee needs to step up its efforts. If a permittee does not meet this performance guideline, it shall submit documentation of a plan and schedule of additional trash load reduction control actions that will attain the July 1, 2017 deadline.[291] This is not a required activity from the state, as the additional documentation is only required if a permittee fails to meet the performance guideline, which will not happen if the permittee is complying with its existing obligation to attain 70 percent reduction by July 1, 2017.

Both the prior permit and the test claim permit indicate trash to be a pervasive problem near and in creeks and in San Francisco Bay. Trash is defined to consist of litter and particles of litter, using the definition of litter from Government Code section 68055.1(g) to mean "all improperly discarded waste material, including, but not limited to, convenience food, beverage, and other product packages or containers constructed of

steel, aluminum, glass, paper, plastic, and other natural and synthetic materials, thrown or deposited on the lands and waters of the state, but not including the properly discarded waste of the primary processing of agriculture, mining, logging, sawmilling, and manufacturing."[292] The Fact Sheet explains the significant impact of trash on the environment as follows:

> Controlling trash continues to be one of the priorities for this Permit reissuance, not only because of the trash discharge prohibition, but also because trash causes major impacts on our enjoyment of creeks and the Bay. There are also significant impacts on aquatic life and habitat in those waters, and eventually to the global ocean ecosystem, where plastic often floats; persists in the environment for hundreds of years - if not forever; concentrates organic toxins; and is ingested by aquatic life. There are also physical impacts, as aquatic species can become entangled and ensnared, and can ingest plastic that looks like prey, losing the ability to feed properly.[293]

The Commission finds that these requirements do not impose a new program or higher level of service, as discussed below.

c. <u>The requirements pled in Provisions C.10.a.i., ii., and iii. and C.10.b.i. and ii. are not new.</u>

i. Prior law required the permittees to implement control measures and other actions to comply with federal and state prohibitions on discharging trash; the prior permit set a schedule for achieving compliance of 40% reduction by 2014, 70% reduction by 2017, and 100% by 2022.

Federal law prohibits non-stormwater discharges and requires controls to reduce the discharge of pollutants to the maximum extent possible. Trash is addressed in the CWA as both a stormwater discharge and an illicit non-stormwater discharge. Federal law defines stormwater as "storm water runoff, snow melt runoff, and surface runoff and drainage; events related to precipitation," which can carry with it pollutants such as trash.[294] A discharge to an MS4 that "is *not* composed entirely of stormwater" is

[292] Exhibit A, Test Claim, page 619 (test claim permit, Fact Sheet, Finding C.10-1.).

[293] Exhibit A, Test Claim, page 619 (test claim permit, Fact Sheet, Finding C.10-1.).

[294] Code of Federal Regulations, title 40, section 122.26(b)(13).

considered a non-stormwater, or dry weather discharge.[295] A non-stormwater discharge that is prohibited by law is an illicit discharge.[296]

Federal law requires permits for discharges from municipal stormwater systems "shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers," unless those discharges are conditionally exempted from this prohibition.[297] Trash is not an exempted discharge and, thus, must be effectively prohibited under federal law. The test claim permit defines trash as follows:

> Trash consists of litter and particles of litter. California Government Code Section 68055.1 (g) defines litter as all improperly discarded waste material, including, but not limited to, convenience food, beverage, and other product packages or containers constructed of steel, aluminum, glass, paper, plastic, and other natural and synthetic materials, thrown or deposited on the lands and waters of the State, but not including the properly discarded waste of the primary processing of agriculture, mining, logging, sawmilling, or manufacturing.[298]

To "effectively prohibit" non-stormwater discharges requires implementation of a program to detect and remove illicit discharges. This shall include:

- A description of procedures to conduct on-going field screening activities during the life of the permit, including areas or locations that will be evaluated by such field screens.
- A description of procedures to be followed to investigate portions of the separate storm sewer system that, based on the results of the field screen, or other appropriate information, indicate a reasonable potential of containing illicit discharges or other sources of non-stormwater.
- A description of procedures to prevent, contain, and respond to spills that may discharge into the municipal separate storm sewer.[299]

Federal law also requires permits for discharges from municipal stormwater systems "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design

---

[295] Code of Federal Regulations, title 40, section 122.26(b)(2) defines "illicit discharge" as "any discharge to a municipal separate storm sewer that is *not* composed entirely of storm water except discharges pursuant to a NPDES permit (*other than the NPDES permit for discharges from the municipal separate storm sewer*) and discharges resulting from firefighting activities." Emphasis added.

[296] Exhibit A, Test Claim, page 527 (test claim permit, Glossary).

[299] Code of Federal Regulations, title 40, section 122.26(d)(2)(iv)(B)(2)-(4).

and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."[300]

Applications for a large or medium municipal separate storm sewer discharge permit are required to include, "A description of the existing management programs to control pollutants from the municipal separate storm sewer system. The description shall provide information on existing structural and source controls, including operation and maintenance measures for structural controls, that are currently being implemented. Such controls may include, but are not limited to: Procedures to control pollution resulting from construction activities; floodplain management controls; wetland protection measures; best management practices for new subdivisions; and emergency spill response programs."[301]

The application shall also include a proposed management program, which involves public participation and intergovernmental coordination, "to reduce the discharge of pollutants to the maximum extent practicable using management practices, control techniques and system, design and engineering methods, and such other provisions which are appropriate."[302] The proposed management program is specifically required to include "A description of structural and source control measures to reduce pollutants from runoff from commercial and residential areas that are discharged from the municipal storm sewer system that are to be implemented during the life of the permit, accompanied with an estimate of the expected reduction of pollutant loads and a proposed schedule for implementing such controls."[303] Among other things, the control measures shall include "a description of maintenance activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers,"[304] and "a description of practices for operating and maintaining public streets, roads and highways and procedures for reducing the impact on receiving waters of discharges from municipal storm sewer systems, including pollutants discharged as a result of deicing activities."[305]

Finally, federal law requires an NPDES permittee to monitor its discharges into the waters of the United States in a manner sufficient to determine whether it is in

---

[301] Code of Federal Regulations, title 40, section 122.26(d)(1)(v)(A).

[302] Code of Federal Regulations, title 40, section 122.26(d)(2)(iv).

[303] Code of Federal Regulations, title 40, section 122.26(d)(2)(iv)(A).

[304] Code of Federal Regulations, title 40, section 122.26(d)(2)(iv)(A)(1). Code of Federal Regulations, title 40, section 122.41(e) also requires "The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit."

[305] Code of Federal Regulations, title 40, section 122.26(d)(2)(iv)(A)(3).

compliance with the permit, which must ensure compliance with the Clean Water Act and its implementing regulations.[306]

Besides federal law, the state also adopted several statewide plans, including the prior permit, that prohibit trash. The 2007 Basin Plan prohibits floating materials, settleable materials, and suspended materials.[307] The Basin Plan also prohibits the discharge of rubbish, refuse, bark, sawdust, or other solid wastes into surface waters or any place where they would contact or eventually be transported to surface waters.[308] These prohibitions have existed in the Basin Plan since it was adopted in 1975. In 2015, the Water Board amended the Ocean Plan and Inland Surface Waters and Inland Bays and Estuaries Plans to establish a narrative water quality objective prohibiting the discharge of trash.[309] Additionally, 26 water bodies in the permit area are listed on the Clean Water Act section 303(d) list as being impaired for trash, most of which are receiving waters for permittees' municipal storm drain systems.[310]

The prior permit required compliance with water quality standards and objectives and imposed monitoring requirements to ensure water quality standards were met as required by federal law. Specifically, the prior permit contained discharge prohibitions and receiving water limitations that required the permittees to effectively prohibit the discharge of non-stormwater into the storm drain systems and required discharges shall not cause or contribute to a violation of any applicable water quality standard or objective for the receiving waters that were contained in the Regional Board's Basin Plan.[311]

The prior permit further said that discharges shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of waters of the State:

a. Floating, suspended, or deposited macroscopic particulate matter, or foam;

b. Bottom deposits or aquatic growths;

c. Alteration of temperature, turbidity, or apparent color beyond present natural background levels;

d. Visible, floating, suspended, or deposited oil or other products of petroleum origin; and

---

[306] United States Code, title 33, section 1342(a)(2) (Public Law 100-4); Code of Federal Regulations, title 40, sections 122.44(i)(1), 122.43(a).

[307] Exhibit X (2), Basin Plan 2007, pages 74-75.

[308] Exhibit X (2), Basin Plan 2007, page 203 (Table 4-1).

[309] Exhibit X (3), Amendment to the Water Quality Control Plan for the Ocean Waters of California to Control Trash.

[310] Exhibit A, Test Claim, page 621 (test claim permit, Attachment A, Finding C.10-7).

[311] Exhibit A, Test Claim, page 91 (prior permit, Provision A).

e. Substances present in concentrations or quantities that would cause deleterious effects on aquatic biota, wildlife, or waterfowl, or that render any of these unfit for human consumption.[312]

Additionally, the prior permit included specific provisions regarding trash, which required that "[t]he Permittees shall demonstrate compliance with Discharge Prohibition A.2 and trash-related receiving water limitations through the timely implementation of control measures and other actions to reduce trash loads from municipal separate storm sewer systems (MS4s) by 40% by 2014, 70% by 2017, and 100% by 2022 as further specified below," giving the permittees more time to comply with the Basin Plan and discharge prohibitions on trash.[313] During the permit term, permittees were required to develop and implement a Short-Term Trash Load Reduction Plan to attain 40% reduction in trash loads by July 1, 2014, which included implementing a mandatory minimum level of full trash capture devices and maintenance of these devices; cleanup and abatement progress on a mandatory minimum number of Trash Hot Spots; and implementation of other control measures and best management practices.[314] One of the activities required as part of performing Trash Hotspot cleanup was to document the cleanup activities and assess their effectiveness by taking before and after photographs along the entire Trash Hotspot area at a minimum rate of one photo for every 50 feet of hot spot length.[315] The prior permit also required permittees to develop and begin implementation on a Long-Term Trash Load Reduction Plan to attain a 70% reduction in trash loads from their MS4s by July 1, 2017, and 100% by July 1, 2022.[316]

ii. The requirements in Provision C.10.a.i., ii., and iii. are not new and do not mandate a new program or higher level of service.

The plain language of Provision C.10.a.i. requires permittees to reduce trash discharges into receiving waters from their 2009 levels by 70 percent by July 1, 2017, and by 80 percent by July 1, 2019, with the ultimate goal of 100 percent trash load reduction or no adverse impact to receiving waters from trash by July 1, 2022.[317] Provision C.10.a.ii.a. states that "Permittees shall implement trash prevention and control actions, including full trash capture systems or other trash management actions, or combinations of actions, with trash discharge control equivalent to or better than full trash capture systems, to reduce trash generation to a Low trash generation rate or better."[318] The Fact Sheet explains that the permittees can use a variety of means to comply with this

[312] Exhibit A, Test Claim, page 91 (prior permit, Provision B).

[313] Exhibit A, Test Claim, page 174 (prior permit, Provision C.10).

[314] Exhibit A, Test Claim, page 174 (prior permit, Provision C.10.).

[315] Exhibit A, Test Claim, page 176 (prior permit, Provision C.10.b.iii.).

[316] Exhibit A, Test Claim, pages 174, 176 (prior permit, Provisions C.10 and C.10.c.).

[317] Exhibit A, Test Claim, page 476 (test claim permit, Provision C.10.a.i.).

[318] Exhibit A, Test Claim, page 477 (test claim permit, Provision C.10.a.ii.a.).

requirement.[319] Provision C.10.a.ii.b. states that "Permittees shall ensure that lands that they do not own or operate, but that are plumbed directly to their storm drain systems in Very High, High, and Moderate trash generation areas are equipped with full trash capture systems *or* are managed with trash discharge control actions equivalent to or better than full trash capture systems."[320] And Provision C.10.a.iii. requires that "Permittees shall install and maintain a mandatory minimum number of full trash capture devices, to treat runoff from an area equivalent to 30 percent of retail/wholesale land area, as documented by the Association of Bay Area Governments, which drains to the storm drain system within their jurisdictions."[321] The Fact Sheet explains that the requirement in Provision C.10.a.iii. "is carried forward from the previous permit."[322] These requirements do not mandate a new program or higher level of service.

The prior 2009 permit, required compliance with the water quality standards in the Basin Plan, including the prohibition on the discharge of trash, by stating the following:

> A.2. It shall be prohibited to discharge rubbish, refuse, bark, sawdust, or other solid wastes into surface waters or at any place where they would contact or where they would be eventually transported to surface waters, including flood plain areas.
>
> […]
>
> B.1. The discharge shall not cause the following conditions to create a condition of nuisance or to adversely affect beneficial uses of the waters of the State:
>
> a. Floating, suspended, or deposited macroscopic particulate matter, or foam;
>
> b. Bottom deposits or aquatic growth;
>
> c. Alteration of temperature, turbidity, or apparent color beyond natural background levels;
>
> d. Visible, floating, suspended, or deposited oil or other products of petroleum origin; and
>
> e. Substances present in concentrations or quantities that would cause deleterious effects on aquatic biota, wildlife, or waterfowl, or that render any of these unfit for human consumption.[323]

Additionally, the prior permit required permittees to notify and submit a report to the Regional Board when discharges cause an exceedance of an applicable water quality

---

[319] Exhibit A, Test Claim, page 622 (Fact Sheet).

[320] Exhibit A, Test Claim, page 477 (test claim permit, Provision C.10.a.ii.b.).

[321] Exhibit A, Test Claim, page 477 (test claim permit, Provision C.10.a.iii.).

[322] Exhibit A, Test Claim, page 623 (Fact Sheet).

[323] Exhibit A, Test Claim, page 91 (prior permit, Provisions A and B).

standard, including the BMPs that are currently being implemented and additional BMPs and monitoring that will be implemented to prevent or reduce the pollutants that are causing or contributing to the exceedance in water quality standards.[324]

Although the Basin Plan prohibited the discharge of trash, the prior permit gave the permittees additional time to comply with this prohibition. The prior permit required permittees to develop and implement a Short-Term Trash Load Reduction Plan to reduce trash load from their MS4s by 40 percent by July 1, 2014, and to develop and begin implementation of a Long-Term Trash Load Reduction Plan that would attain 70 percent reduction in trash loads from their MS4s by July 1, 2017 and 100 percent reduction by July 1, 2022.[325] This is the same schedule for compliance in Provision C.10.a. and C.10.a.i. of the test claim permit and, thus, the schedule for compliance is not new.

In addition, the requirement to reduce trash by 80 percent by July 1, 2019, is not new and does not mandate a new program or higher level of service. The fact sheet notes that "the compliance deadlines are consistent with the previous permit goals of 70 percent trash load reduction by 2017 and 100 percent trash load reduction (or no adverse trash impact) by 2022."[326] The prior permit gave permittees five years, from 2009 to 2014, to reduce trash loads by 40 percent; three years, from 2014 to 2017, to reduce trash an additional 30 percent for 70 percent reduction total; and five years, from 2017 to 2022, to achieve that final 30 percent reduction for 100 percent trash load reduction total. The additional interim deadline of 80 percent trash load reduction by July 1, 2019, is in line with the prior requirement to attain a 100 percent trash load reduction by 2022 and therefore abiding by this interim deadline does not impose a new program or higher level of service.

Furthermore, the activities required to implement the trash load deadlines are not new. Permittees already had a duty to implement control measures and best management practices to comply with the discharge prohibitions and prevent all trash discharges in receiving waters. Federal law requires the implementation of a program to effectively prohibit illicit, non-stormwater discharges, and trash is an illicit discharge.[327] Federal law also requires controls to prevent the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods.[328] Since 1975, the San Francisco Bay Basin Plan has

---

[324] Exhibit A, Test Claim, page 92 (prior permit, Provision C.1.).

[325] Exhibit A, Test Claim, pages 174, 176 (prior permit, Provisions C.10.a.i. and C.10.c.).

[326] Exhibit A, Test Claim, page 622 (test claim permit, Fact Sheet).

[327] United States Code, title 33, section 1342(p)(3)(B)(ii); Code of Federal Regulations, title 40, section 122.26(d)(2)(iv)(B)(1). All non-stormwater discharges are illicit unless they have been permitted with an NPDES permit or are conditionally exempt. There is no exemption for trash.

[328] United States Code, title 33, section 1342(p)(3)(B)(iii); Code of Federal Regulations, title 40, section 122.26(d)(2)(iv)(B).

contained a narrative water quality objective which prohibits all floating material (waters shall not contain floating material, including solids, liquids, foams, and scum, in concentrations that cause nuisance or adversely affect beneficial uses); settleable material (waters shall not contain substances in concentrations that result in the deposition of material that cause nuisance or adversely affect beneficial uses); and suspended material (waters shall not contain suspended material in concentrations that cause nuisance or adversely affect beneficial uses).[329]

The prior permit's trash provisions also required installing a minimum number of full trash capture systems and performing annual cleanups of a minimum number of trash hot spots as part of permittees' trash load reduction actions. Permittees were required to install and maintain a mandatory minimum number of full trash capture systems that treat runoff from an area equivalent to 30% of the retail/wholesale land that drain to MS4s within their jurisdiction, excluding population-based permittees with a population less than 2,000 or a population less than 12,000 and retail/wholesale land less than 40 acres.[330] Permittees were also required to identify a minimum number of high-trash impacted locations along state waters, or "Hot Spots" — one per 30,000 population or one per 100 acres of retail/wholesale land, whichever was greater, minimum one — and cleanup those locations for at least 100 yards of creek length or 200 yards of shoreline length to a level of no visible impact at least once per year.[331] Non-population based permittees were each given a specific number of full trash capture systems they were required to install and maintain and trash hot spots they were required to identify and cleanup.[332] These requirements dictating the permittees' trash load reduction methods still carry on in the test claim permit, and have not increased.[333]

Thus, the requirements imposed by Provision C.10.a.i., ii., and iii. are not new and do not mandate a new program or higher level of service.

iii. The requirements in Provisions C.10.b.i. and ii. are not new and do not mandate a new program or higher level of service.

Provision C.10.b.i. requires permittees to maintain their full trash capture systems, as follows:

a. **Maintenance** – The maintenance of each full capture device shall be adequate to prevent plugging, including plugging of the 5 mm screen leading to trash overflow and bypass, flooding, or a full condition of the device's trash reservoir causing bypassing of trash. All full trash capture devices shall be inspected and maintained at least once per year. All such

[329] Exhibit X (2), Basin Plan 2007, pages 58-59.

[330] Exhibit A, Test Claim, page 175 (prior permit, Provision C.10.a.iii.).

[331] Exhibit A, Test Claim, page 176 (prior permit, Provision C.10.b.).

[332] Exhibit A, Test Claim, page 357 (prior permit, Attachment J, Table 10-2).

[333] Exhibit A, Test Claim, pages 477-478, 481-482, 684-692 (test claim permit, Provisions C.10.a.iii. and C.10.c., Attachment E).

devices in high or very high trash generation areas shall be inspected at least two times per year, with the inspections spaced at least three months or more apart. If this frequency of inspection is found excessive after two inspections, the inspection frequency can be reduced to once per year.

If any such device is found to have a plugged or blinded screen or is greater than 50 percent full of trash during a maintenance event, the maintenance frequency shall be increased so that the device is neither plugged nor more than half full of trash at the next maintenance event.[334]

b. **Maintenance Records** – Permittees shall retain device specific maintenance records, including, at a minimum: the date(s) of maintenance, the capacity condition of the device at the time of maintenance (full and overflowing or with storage capacity remaining), any special problems such as flooding, screen blinding or plugging from leaves, plastic bags, or other debris causing overflow, damage reducing function, or other negative conditions. A summary of this information shall be reported in each Annual Report which may be limited to the number of full capture devices maintained that exhibited a plugged, full or overflowing condition upon maintenance.[335]

c. **Certification** – Permittees shall certify annually that each of their full trash capture systems is operated and maintained to meet full trash capture system requirements. Drainage areas served by an adequately maintained full trash capture system will be considered equivalent to or better than a Low trash generation area.[336]

Provision C.10.b.ii. also requires permittees to maintain documentation of implementation for their non-full trash capture system control actions; to conduct assessments of the effectiveness of these control actions; and to provide documentation of the control measure implementation and assessments upon request for review. Specifically, Provision C.10.b.ii.a. and b. requires as follows:

a. **Implementation Documentation** – Permittees shall maintain documentation of trash control actions that describes each action or combination of actions, the level of implementation, the timing and frequency of implementation, standard operating procedures if applicable, location(s) of implementation actions including mapped location(s) and drainage area(s) affected or description of areal extent, tracking and enforcement procedures if applicable, and other information relevant to effective implementation of the action or combination of actions.[337]

---

[334] Exhibit A, Test Claim, page 478 (test claim permit, Provision C.10.b.i.a.).

[335] Exhibit A, Test Claim, page 478 (test claim permit, Provision C.10.b.i.b.).

[336] Exhibit A, Test Claim, page 478 (test claim permit, Provision C.10.b.i.c.).

[337] Exhibit A, Test Claim, page 479 (test claim permit, Provision C.10.b.ii.a.).

b. **Visual Assessment of Outcomes of Other Trash Management Actions** – Permittees shall conduct visual on-land assessment, including photo documentation, or other acceptable assessment method (see C.10.b.ii.b.(iv.)), of each trash generation area within which it is implementing other trash management actions or combination of actions other than full trash capture, to determine or verify the effectiveness of the action or combination of actions. Permittees may assess and account for one or more trash generation areas in a single trash management area within which a control action or combination of control actions is implemented. The visual on-land assessment method used shall meet or exceed the following criteria:

(i) Conduct observations within a trash management area of the sidewalk, curb and gutter, or locations associated with trash generation sources.

(ii) Conduct observations at randomly selected locations covering at least ten percent of a trash management area's street miles; or conduct observations at strategic locations with justification they are representative of trash generation in the management area and they will represent the effectiveness of the control action(s) implemented or planned in the management area.

(iii) Conduct observations at a frequency consistent with known or estimated trash generation rate(s) within a trash management area and the time frequency of implementation of the control action(s) implemented or planned in the management area. Conduct observations for effectiveness approximately at the halfway point of the interval between instances of recurring trash control actions such as street sweeping and on-land cleanup.

(iv) Permittees may put forth substantive and credible evidence that certain management actions or sets of management actions when performed to a specified performance standard yield a certain trash reduction outcome reliably. Such a proposal shall be made to the Executive Officer as a submittal separate from any other submittals or reports. If this evidence is accepted by the Executive Officer, the Permittees may claim a similar trash reduction outcome by demonstrating that they have performed these trash reduction actions within certain trash management areas to the same performance standard accepted by the Executive Officer.[338]

It is not a new requirement to inspect and maintain full trash capture systems. Federal law requires that applications for a large or medium municipal separate storm sewer discharge permit to include a description of the structural controls that will be used to prevent pollutants, and more importantly to this issue, "a description of maintenance

[338] Exhibit A, Test Claim, page 479 (test claim permit, Provision C.10.b.ii.b.).

activities and a maintenance schedule for structural controls to reduce pollutants (including floatables) in discharges from municipal separate storm sewers."[339] Federal regulations further require "[t]he permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit."[340] Keeping maintenance records is also required by federal regulations, as is summarizing these records in permittees' Annual Reports.[341] Permittees are also required to certify all applications reports, or information they submit.[342]

The prior permit also specified that permittees were required to perform maintenance on the full trash capture systems in their jurisdiction.[343] Regular maintenance is necessary to ensure that full trash capture systems are operating properly. Inspecting full trash capture systems, though discussed as a separate action from maintenance, is a step to the maintenance process, a preliminary act to determine whether further maintenance is necessary.

This duty to properly operate and maintain all facilities and systems of treatment and control also applies to the activities required by Provision C.10.b.ii for their non-full trash capture system control actions. Permittees have a duty to reduce trash loads as specified by implementing control measures and other actions, and such actions taken to fulfill this duty qualify as "facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance."[344] Permittees are required by federal regulations to ensure these control actions are being performed as specified, which requires them to document or keep records of their implementation.[345] Federal regulations require permittees to provide access to copies of any records they are required to keep as a permit condition.[346] It is therefore not a new requirement to maintain documentation of implementing a control action and provide that documentation for review upon request.

As for the visual assessments of the outcomes of other trash management actions, according to federal regulations, proper operation and maintenance of these facilities and systems of treatment and control includes appropriate quality assurance procedures.[347] The test claim permit requires permittees' combination of non-full trash

---

[347] Code of Federal Regulations, title 40, section 122.41(e).

capture system control actions to be "equivalent to or better than full trash capture systems," which it defines to mean the control actions would "send no more trash down the storm drain system than a full trash capture device would allow, which is essentially no trash discharge except in very large storm flows."[348] To provide appropriate quality assurance, there needs to be a method for assessing non-full trash capture system control actions to determine their effectiveness. "The primary tool currently available for determining trash reduction action success and positive outcomes is visual assessment, with photo documentation of trash generation and conditions in areas that drain to storm drains."[349] This history of visual assessments documented with photographic records being the primary tool for determining a trash control action's effectiveness can be seen in the Trash Hotspot Cleanup program that was first required under the prior permit, where permittees' documented their trash hotspot cleanup activities by taking before and after photographs every 50 feet along the trash hotspot cleanup area.[350] Permittees also have the option of avoiding performing these visual assessments by providing substantial and credible evidence that a control measure will reliably yield a certain trash reduction outcome when performed to a certain standard, and then provide evidence they performed the trash control action to that standard.[351] These activities all are meant as quality assurance procedures, which are required by federal law, and thus are not mandated by the state.

Though the claimant may complain that the specifications laid out in the test claim permit for what is considered adequate inspection and maintenance of their full trash capture systems make these acts "more prescriptive, burdensome, and costly" than what was required by the prior permit, and that the documentation and assessments required for other trash management activities are so "burdensome and costly" they determined full trash capture systems to be the least costly method of complying with their trash load reduction requirements, the fact is they were always required to perform maintenance on their full trash capture devices as part of their duty to keep their structural source controls operating effectively. Documentation and assessment of their other trash management activities is likewise required by federal law to ensure those activities are being performed to an adequate quality standard. All the test claim permit has done is provide additional detail as to what proper maintenance, documentation, and assessment of the effectiveness of Permittees' trash management activities entails.

Thus, the requirements to inspect and maintain full trash capture systems; to keep records of their maintenance records and provide them for inspection upon request; to

---

[348] Exhibit A, Test Claim, page 477 (test claim permit, Provision C.10.a.ii.a.).

[349] Exhibit A, Test Claim, page 623 (test claim permit, Fact Sheet).

[350] Exhibit A, Test Claim, page 176 (prior permit, Provision C.10.b.iii.). This requirement has carried on in the test claim permit, although it decreased the number of photographs needed to document Trash Hotspot Cleanup activities to one photograph for every 100 feet of hot spot length. See Exhibit A, Test Claim, page 482 (test claim permit, Provision C.10.c.iii.).

[351] Exhibit A, Test Claim, page 479 (test claim permit, Provision C.10.b.ii.b.iv.).

annually certify their full trash capture systems are being operated and maintained to the prescribed standard; to maintain documentation of their other trash management control actions; and to perform assessments as to the effectiveness of these other trash management control actions, are not new and do not mandate a new program or higher level of service.

2. Some Requirements in the Provisions Implementing the Mercury and PCBs TMDLs (Provisions C.3.j., C.11.a., C.11.b., C.11.c., C.12.a., C.12.c., C.12.d., and C.12.e.) Impose State-Mandated New Programs or Higher Levels of Service.

The claimant pleads various provisions of the test claim permit that implement TMDLs previously adopted for mercury and PCBs. These provisions generally do the following:

- Provision C.3.j. requires the permittees to develop a Green Infrastructure Plan, adopt policies and ordinances, conduct outreach, and report progress on the planning.[352]
- Provisions C.11.c. and C.12.c. require the permittees to implement Green Infrastructure projects to achieve the load reductions for mercury and PCBs, in accordance with the TMDLs; prepare a reasonable assurance analysis of future mercury and PCBs load reductions, which demonstrate how Green Infrastructure projects will achieve the total load reduction by 2040; and to report on Green Infrastructure implementation.[353]
- Provision C.11.a. requires the permittees to implement mercury and PCBs source and treatment control measures and pollution prevention strategies to reduce loads throughout the permit area, develop and implement an assessment methodology and data collection program to quantify in a technically sound manner mercury and PCBs loads reduced; and submit various reports.[354]
- Provision C.11.b. requires the permittees to develop and implement an assessment methodology and data collection program to quantify mercury loads reduced through implementation of any and all pollution prevention, source control and treatment control efforts required by the test claim permit's provisions or load reductions achieved through other relevant efforts.[355]
- Provision C.12.a. requires the permittees to implement PCBs source and treatment control measures and pollution prevention strategies to reduce loads throughout the permit area, develop and implement an assessment methodology

[352] Exhibit A, Test Claim, pages 422-427 (test claim permit, Provision C.3.j.).

[353] Exhibit A, Test Claim, pages 488-490 (test claim permit, Provision C.11.c.) and 495-497 (test claim permit, Provision C.12.c.).

[354] Exhibit A, Test Claim, pages 486-487 (test claim permit, Provisions C.11.a.).

[355] Exhibit A, Test Claim, page 487-488 (test claim permit, Provision C.11.b.).

and data collection program to quantify in a technically sound manner mercury and PCBs loads reduced, and submit various reports.[356]

- Provision C.12.d. requires the permittees to prepare a plan and schedule of future PCBs control measure implementation and reasonable assurance analysis demonstrating that sufficient control measures will be implemented to attain the PCBs TMDL wasteload allocations by 2030.[357]
- Provision C.12.e. requires permittees to evaluate the presence of PCBs in caulks and sealants used in storm drains or roadway infrastructure in public rights-of-way.[358]

As explained below, some of the requirements imposed by these provisions constitute state-mandated new programs or higher levels of service.

a. Federal law requires Regional Boards to include effluent limits consistent with the assumptions and requirements of any wasteload allocations in an established TMDL.

The CWA requires states to develop a list of "impaired" waters within their jurisdiction, meaning that existing controls of pollutants are not sufficient to meet water quality standards necessary to permit the designated beneficial uses, such as fishing or recreation. States must then rank those impaired waters by priority, and establish a Total Maximum Daily Load (TMDL), which includes a calculation of the maximum amount of each constituent pollutant that the water body can assimilate and still meet water quality standards.[359] A TMDL represents the total assimilative capacity of a water body for a specific constituent pollutant, with a margin of safety, which is protective of that water body's identified beneficial uses. Usually, a TMDL will also include wasteload allocations (WLAs), which divide up the total assimilative capacity of the receiving waters among the known point source dischargers, and load allocations (LAs) for non-point source discharges.[360] The development of a TMDL triggers further regulatory action by the state, as explained by the court in *City of Arcadia v. U.S. EPA*:

---

[356] Exhibit A, Test Claim, pages 492-495 (test claim permit, Provisions C.12.a.).

[357] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.).

[358] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.).

[359] United States Code, title 33, section 1313(d); Code of Federal Regulations, title 40, section 130.7(c).

[360] United States Code, title 33, section 1313(d). Code of Federal Regulations, title 40, section 130.2(h) defines WLA as "The portion of a receiving water's loading capacity that is allocated to one of its existing or future point sources of pollution. WLAs constitute a type of water quality-based effluent limitation." Code of Federal Regulations, title 40, section 130.2(g) defines LA as "The portion of a receiving water's loading capacity that is attributed either to one of its existing or future nonpoint sources of pollution or to natural background sources. Load allocations are best estimates of the loading, which may range from reasonably accurate estimates to gross allotments,

> TMDLs established under Section 303(d)(1) of the CWA function primarily as planning devices and are not self-executing. *Pronsolino v. Nastri*, 291 F.3d 1123, 1129 (9th Cir.2002) ("TMDLs are primarily informational tools that allow the states to proceed from the identification of waters requiring additional planning to the required plans.") (citing *Alaska Ctr. for the Env't v. Browner*, 20 F.3d 981, 984–85 (9th Cir.1994)). A TMDL does not, by itself, prohibit any conduct or require any actions. Instead, each TMDL represents a goal that may be implemented by adjusting pollutant discharge requirements in individual NPDES permits or establishing nonpoint source controls. See, e.g., *Sierra Club v. Meiburg*, 296 F.3d 1021, 1025 (11th Cir.2002) ("Each TMDL serves as the goal for the level of that pollutant in the waterbody to which that TMDL applies.... The theory is that individual-discharge permits will be adjusted and other measures taken so that the sum of that pollutant in the waterbody is reduced to the level specified by the TMDL."); *Idaho Sportsmen's Coalition v. Browner*, 951 F.Supp. 962, 966 (W.D.Wash.1996) ("TMDL development in itself does not reduce pollution.... TMDLs inform the design and implementation of pollution control measures."); *Pronsolino*, 291 F.3d at 1129 ("TMDLs serve as a link in an implementation chain that includes ... state or local plans for point and nonpoint source pollution reduction ...."); *Idaho Conservation League v. Thomas*, 91 F.3d 1345, 1347 (9th Cir.1996) (noting that a TMDL sets a goal for reducing pollutants). Thus, a TMDL forms the basis for further administrative actions that may require or prohibit conduct with respect to particularized pollutant discharges and waterbodies.
>
> For point sources, limitations on pollutant loadings may be implemented through the NPDES permit system. 40 C.F.R. § 122.44(d)(1)(vii)(B). EPA regulations require that effluent limitations in NPDES permits be "consistent with the assumptions and requirements of any available wasteload allocation" in a TMDL. *Id*.[361]

Once a TMDL is adopted, it must be approved by U.S. EPA. If U.S. EPA does not approve the TMDL, it must, within 30 days after disapproval "establish such loads for such waters as [it] determines necessary to implement the water quality standards applicable to such waters."[362] A regional board is then required by federal law to

---

depending on the availability of data and appropriate techniques for predicting the loading. Wherever possible, natural and nonpoint source loads should be distinguished."

[361] *City of Arcadia v. U.S. EPA* (2003) 265 F.Supp.2d 1142, 1145.

[362] United States Code, title 33, section 1313(d)(2); Code of Federal Regulations, title 40, section 130.7(d)(2).

incorporate the TMDL into the Basin Plan.[363] Basin Plan amendments do not become effective until approved by the State Water Board and the Office of Administrative Law (OAL).[364]

Federal law then requires regional boards to include effluent limits in compliance with "all applicable water quality standards" and "consistent with the assumptions and requirements of any available wasteload allocation for the discharge" in NPDES permits as follows:

> When developing water quality-based effluent limits under this paragraph the permitting authority shall ensure that:
>
> (A) The level of water quality to be achieved by limits on point sources established under this paragraph is derived from, and complies with all applicable water quality standards; and
>
> (B) Effluent limits developed to protect a narrative water quality criterion, a numeric water quality criterion, or both, are consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA pursuant to 40 CFR 130.7.[365]

b. Mercury and PCBs TMDLs were approved prior to the permit term establishing mercury allocations of 82 kg/year for urban stormwater runoff, and PCBs allocations of 2 kg/year for urban stormwater runoff and requiring load reductions by the permittees.

The San Francisco Bay is impaired for both mercury and PCBs, and accordingly TMDLs have been established for both pollutants.[366]

i. The Mercury TMDL.

Before the adoption of the TMDL for mercury, the Basin Plan provided that surface waters shall not contain concentrations of chemical constituents in amounts that adversely affected any designated beneficial use.[367] In 1998, the Regional Board adopted a 303(d) impaired water body list classifying all of San Francisco Bay as

---

[363] United States Code, title 33, section 1313(d)(2); Code of Federal Regulations, title 40, sections 130.6, 130.7(d)(2).

[364] California Government Code section 11353.

[365] Code of Federal Regulations, title 40, section 122.44(d)(1)(vii).

[366] California Code of Regulations, title 23, section 3915 (Register 2007, No. 45) (codifying the San Francisco Bay mercury TMDL adopted by R2-2006-005). California Code of Regulations, title 23, section 3919.6 (Register 2010, No. 9) (codifying the San Francisco Bay PCBs TMDL adopted by R2-2008-0012).

[367] Exhibit X (4), Order R2-2006-0052, Mercury TMDL, page 6.

impaired due to mercury.[368] Mercury concentrations in the Bay were high enough to threaten the health of humans who consume fish caught in the Bay, accounted for abnormally high rates of bird eggs failing to hatch, and adversely affected beneficial uses of the Bay including sport fishing and preservation of endangered species and wildlife habitat.[369]

The Regional Board adopted the mercury TMDL on August 9, 2006, to ensure attainment of the water quality objectives and beneficial uses; it was adopted by the State Board on July 17, 2007; was approved by the Office of Administrative Law on November 7, 2007; and was approved by the U.S. EPA on February 12, 2008.[370] The aggregate, regionwide urban runoff wasteload allocation from the San Francisco Bay mercury TMDL to meet water quality standards is 82 kg/yr.[371] The mercury TMDL implementation plan calls for attaining the allocation by February 2028, with an interim milestone of 120 kg/yr by February 2018.[372] Of the 82 kg/yr aggregate mercury allocation for urban stormwater runoff, approximately 64.41 kg/yr were allocated to permittees, requiring a 62.87 load reduction from permittees.[373] Wasteload allocations were also established for other entities, including industrial companies discharging wastewater and petroleum wastewater.[374]

Order R2-2006-0052 imposed the following mercury load allocations and resulting required load reductions for permittee's stormwater programs:

Entity	Allocation (kg/year)	Reduction (kg/year)
Santa Clara Valley Urban Runoff Pollution Prevention Program	23	21
Alameda Countywide Clean Water Program	20	19
Contra Costa Clean Water Program	11	11
San Mateo County Stormwater Pollution Prevention Program	8.4	8.0

Vallejo Sanitation and Flood Control District	1.6	1.6
Fairfield-Suisun Urban Runoff Management Program	1.6	1.5
Solano County Area	0.81	0.77[375]

The mercury TMDL says that the urban stormwater management agencies' NPDES permit shall require implementation of best management practices and control measures designed to achieve the load allocations or accomplish the load reductions derived from the allocations, and include actions to reduce mercury-related risks to humans and wildlife.[376] Requirements shall be based on an updated assessment of control measures intended to reduce pollutants in stormwater to the maximum extent practicable and consistent with the TMDL.[377] Additionally, the mercury TMDL said that stormwater permits shall incorporate the following requirements:

ii) Evaluate and report on the spatial extent, magnitude, and cause of contamination for locations where elevated mercury concentrations exist;

iii) Develop and implement a mercury source control program;

iv) Develop and implement a monitoring system to quantify either mercury loads or loads reduced through treatment, source control, and other management efforts;

v) Monitor levels of methylmercury in discharges;

vi) Conduct or cause to be conducted studies aimed at better understanding mercury fate, transport, and biological uptake in San Francisco Bay an tidal areas;

vii) Develop an equitable allocation-sharing scheme in consultation with Caltrans (see below) to address Caltrans roadway and non-roadway facilities in the program area, and report the details to the Water Board;

viii) Prepare an annual report that documents compliance with the above requirements and documents either mercury loads discharged, or loads reduced through ongoing pollution prevention and control activities; and

ix) Demonstrate progress towards (a) the interim load milestone, or (b) attainment of the allocations shown in Table 4-w, by using one of the following methods:

1) Quantify the annual average mercury load reduced by implementing (a) pollution prevention activities, and (b) source and treatment controls. The

[375] Exhibit X (4), Order R2-2006-0052, Mercury TMDL, page 14.

[376] Exhibit X (4), Order R2-2006-0052, Mercury TMDL, page 19.

[377] Exhibit X (4), Order R2-2006-0052, Mercury TMDL, page 19.

benefit of efforts to reduce mercury-related risk to wildlife and humans should also be quantified. The Water Board will recognize such efforts as progress towards achieving the interim milestone and the mercury-related water quality standards upon which the allocations and corresponding load reductions are based. Loads reduced as a result of actions implemented after 2001 (or earlier if actions taken are not reflected in the 2001 load estimate) may be used to estimate load reductions.

2) Quantify the mercury load as a rolling five-year annual average using data on flow and water column mercury concentrations.

3) Quantitatively demonstrate that the mercury concentration of suspended sediment that best represents sediment discharged with urban runoff is below the suspended sediment target.[378]

ii. The PCBs TMDL.

PCBs are a potential carcinogen and are suspected of having negative impacts on the human immune system, reproductive system, nervous system, endocrine system, and digestive system. Although their manufacture is banned in the United States, PCBs continue to pose a serious risk due to their presence in the environment and tend to accumulate in fatty tissue in fish.[379]

Before the adoption of the TMDL, the Basin Plan contained a narrative water quality objective stating that controllable water quality factors shall not cause a detrimental increase in toxic substances found in bottom sediments or aquatic life.[380] In addition, in May 2000, the CTR established numeric water quality criteria of 0.00017 ug/L total PCBs in water that apply to the San Francisco Bay.[381] As indicated above, the CTR is a water quality standard that applies to "'all waters' for 'all purposes and programs under the CWA.'"[382] However, all segments of the San Francisco Bay were impaired for PCBs and were 303(d) listed in 1998 because neither the narrative nor numeric water quality objectives were being met and the beneficial uses of the water bodies of commercial and sport fishing were not fully supported.[383]

The Regional Board adopted the PCBs TMDL on February 13, 2008, to ensure attainment of the water quality objectives and beneficial uses; it was approved by the State Board on October 20, 2009; was approved by the Office of Administrative Law on

March 1, 2010; and was approved by the U.S. EPA on March 29, 2010.[384] The PCBs TMDL found the baseline of PCBs loads into the San Francisco is 33 kg/yr total from all sources, of which 20 kg/yr came from urban and non-urban stormwater runoff.[385] The TMDL set the wasteload allocation for the entire Bay at 10 kg/yr, of which 2 kg/yr is allotted to stormwater runoff.[386] And 1.6 kg/yr of the wasteload allocation was allocated to permittees, to be achieved by March 2030.[387] This is an 18 kg/yr reduction from the 2003 PCBs baseline, with the permittees responsible for 14.4 kg/yr of that reduction.[388] The TMDL also established WLAs for municipal and industrial wastewater dischargers.[389]

Order R2-2008-0012 imposed the following PCBs load allocations for stormwater runoff based on county:[390]

County	Allocation (kg/year)
Alameda	0.5
Contra Costa	0.3
San Mateo	0.2
Santa Clara	0.5
Solano	0.1

According to the PCBs TMDL, requirements in the NPDES permits shall be based on an updated assessment of the best management practices and control measures intended to reduce PCBs in stormwater runoff, and control measures shall reduce PCBs to the maximum extent practicable.[391] The PCBs TMDL laid out the following roadmap for how it intended urban stormwater permittees to achieve their WLAs over several permit terms:

> In the first five-year permit term, stormwater permittees will be required to implement control measures on a pilot scale to determine their effectiveness and technical feasibility. In the second permit term, stormwater permittees will be required to implement effective control

measures, that will not cause significant adverse environmental impacts, in strategic locations, and to develop a plan to fully implement control measures that will result in attainment of allocations, including an analysis of costs, efficiency of control measures and an identification of any significant environmental impacts. Subsequent permits will include requirements and a schedule to implement technically feasible, effective and cost efficient control measures to attain allocations. If, as a consequence, allocations cannot be attained, the Water Board will take action to review and revise the allocations and these implementation requirements as part of adaptive implementation.

In addition, stormwater permittees will be required to develop and implement a monitoring system to quantify PCBs urban stormwater runoff loads and the load reductions achieved through treatment, source control and other actions; support actions to reduce the health risks of people who consume PCBs-contaminated San Francisco Bay fish; and conduct or cause to be conducted monitoring, and studies to fill critical data needs identified in the adaptive implementation section.[392]

c. The prior permit implemented the mercury and PCBs TMDLs by requiring regulated projects treat their stormwater runoff using low-impact development (LID); and by implementing mercury and PCBs control measures, primarily a series of pilot projects and studies to determine which methods were feasible, effective, and economically feasible.

The TMDL for mercury was adopted, became effective, and was included in the Basin Plan before the prior permit became effective on December 1, 2009.[393] The TMDL for PCBs had been adopted by the Regional Board and State Water Board when the prior permit became effective, but was awaiting approval from OAL and U.S. EPA, which came in 2010.[394] The prior permit implemented the PCBs TMDL, however, stating that one of the goals was to "achieve Waste Load Allocations adopted under Total Maximum Daily Loads" and "to implement the urban runoff requirements of the PCBs TMDL and reduce PCBs loads to make substantial progress toward achieving the urban runoff PCBs load allocation."[395]

[394] Exhibit X (5), Order R2-2008-0012, PCBs TMDL, pages 3, 5; California Code of Regulations, title 23, section 3919.6.

[395] Exhibit A, Test Claim, pages 185, 220 (prior permit, Provision C.12. and Fact Sheet); see also page 299 "The C.12 provisions are consistent with the regulatory approach and implementation plan of the San Francisco Bay PCBs TMDL adopted by the Water Board." (prior permit, Fact Sheet).

The prior permit's receiving water limitations prohibited discharges from causing or contributing to any applicable water quality standard for receiving waters contained in the Basin Plan.[396] The prior permit also prohibited discharges from creating a condition of nuisance or adversely affecting beneficial uses of waters of the State through any of the following conditions: floating, suspended, or deposited macroscopic particulate matter, or foam; bottom deposits or aquatic growths; alteration of temperature, turbidity, or apparent color beyond present natural background levels; visible, floating, suspended, or deposited oil or other products of petroleum origin; and substances present in concentrations or quantities that would cause deleterious effects on aquatic biota, wildlife, or waterfowl, or that render any of these unfit for human consumption.[397] Compliance with the prior permit's receiving water limitations required timely implementation of control measures pursuant to Provision C.1 "and other actions specified in Provisions C.2 through C.15" and if an exceedance was detected through monitoring, permittees were required to report to the Regional Board and modify their BMPs.[398]

The prior permit's new development and redevelopment provisions required permittees to use their planning authorities to include appropriate source control, site design, and stormwater treatment in new development and redevelopment projects to address both soluble and insoluble stormwater runoff pollutant discharges, primarily through the use of low-impact development (LID).[399] Because these provisions were intended to address soluble and insoluble stormwater runoff discharges, and mercury and PCBs are two such examples of these types of discharges, these provisions are part of how the prior permit implemented control measures for mercury and PCBs.[400]

The prior permit required permittees to require all Regulated Projects[401] to treat 100 percent of their stormwater runoff by implementing onsite LID measures, although alternative compliance methods were allowed, such as treatment at an off-site joint

[400] Exhibit A, Test Claim, page 239 (prior permit, Fact Sheet, Finding C.3-2.).

[401] Regulated Projects either: 1) create or replace 5,000 square feet or more of impervious surfaces collectively over the project site and include development or redevelopment of auto service facilities, retail gasoline outlets, restaurants, or uncovered parking lots; 2) create or replace 10,000 square feet or more of impervious surface collectively over the project site for development or redevelopment of all other land use types, except detached single-family homes that aren't part of a larger development plan; or 3) road projects that create 10,000 square feet or more of new contiguous impervious surface, including sidewalks, bicycle lanes, and impervious trails that are greater than 10 feet wide or are creek-side. See Exhibit A, Test Claim, pages 100-105 (prior permit, Provision C.3.b.).

stormwater treatment facility.[402] Non-Regulated Projects were encouraged, but not required, to also include source control measures to limit pollutant generation, discharge, and runoff.[403]

The prior permit also required permittees to collectively complete ten pilot green streets projects, which would incorporate LID techniques for site design and be sized according to hydraulic sizing criteria.[404] The green street pilot projects contained the following elements:

(i) Stormwater storage for landscaping reuse or stormwater treatment and/or infiltration for groundwater replenishment through the use of natural feature systems;

(ii) Creation of attractive streetscapes that enhance neighborhood livability by enhancing the pedestrian environment and introducing park-like elements into neighborhoods;

(iii) Service as an urban greenway segment that connects neighborhoods, parks, recreation facilities, schools, mainstreets, and wildlife habitats;

(iv) Parking management that includes maximum parking space requirements as opposed to minimum parking space requirements, parking requirement credits for subsidized transit or shuttle service, parking structures, shared parking, car sharing, or on-street diagonal parking;

(v) Meets broader community goals by providing pedestrian and, where appropriate, bicycle access; and

(vi) Located in a Priority Development Area as designated under the Association of Bay Area Government's and Metropolitan Transportation Commission's FOCUS4 program.[405]

Permittees annually reported on the status of the green street pilot projects; reported each completed project's capital costs, operational and maintenance costs, legal and procedural arrangements, the sustainable landscaping measures incorporated into the project, and its score according to the Bay-Friendly Landscape Scorecard; and summarized in the 2013 Annual Report each project's location, size, including impervious surface treated, maps of areas treated, types of LID treatment measures included, total and specific project costs, funding sources broken down by percentage paid by each funding source, lessons learned and recommendations for future projects,

and identification of the responsible party and funding source for operation and maintenance.[406]

The prior permit also identified specific provisions to implement the mercury and PCBs TMDLs. With respect to mercury, Provision C.11. of the prior permit stated the following:

> The Permittees shall implement the following control programs for mercury. The Permittees shall perform the control measures and provide reporting on those control measures according to the provisions below. The purpose of this provision is to implement the urban runoff requirements of the San Francisco Bay mercury TMDL and reduce mercury loads to make substantial progress toward achieving the urban runoff mercury load allocation established for the TMDL. The aggregate, regionwide, urban runoff wasteload load allocation is 82 kg/yr. This allocation should be achieved by February 2028 and, as a way to measure progress, an interim loading milestone of 120 kg/yr, halfway between the current load and the allocation, should be achieved by February 2018. If the interim loading milestone is not achieved, the Permittees shall demonstrate reasonable and measurable progress toward achieving the milestone. The Permittees may comply with any requirement of this provision through a collaborative effort.[407]

The prior permit required the permittees to implement a series of mercury control programs and report on their findings.[408] These programs required permittees to: a) implement a region-wide mercury collection and recycling program for consumer-level devices and equipment containing mercury such as thermometers, thermostats, switches, and bulbs; b) monitor methylmercury in runoff discharges; c) conduct a pilot program to investigate and abate mercury sources in drainages, including public rights-of-way, and stormwater conveyances with accumulated sediment that contains elevated mercury concentrations; d) conduct a pilot program to evaluate and enhance municipal sediment removal and management practices; e) complete pilot projects to evaluate on-site stormwater treatment via retrofit; f) complete pilot projects to evaluate reducing mercury loads by diverting dry weather and first flush stormwater flows to sanitary sewers; g) develop and implement a monitoring program to quantify mercury loads and loads reduced through source control treatment and other management measures; h) conduct studies aimed to better understand the fate, transport, and biological uptake of mercury discharged in urban runoff to the San Francisco Bay and tidal areas; i) develop effective programs to reduce mercury-related risks to humans and quantify the resulting risk reduction; and j) develop an allocation sharing scheme with Caltrans.[409]

[408] Exhibit A, Test Claim, page 178 (prior permit, Provision C.11.).

[409] Exhibit A, Test Claim, pages 178-184 (prior permit, Provisions C.11.a-j.).

The pilot program evaluating on-site stormwater treatment via retrofit involved implementing on-site treatment projects at ten locations during the permit term to evaluate and quantify the removal of mercury by retrofitting on-site treatment systems into existing storm drain systems.[410] Examples of on-site treatment systems included detention basins, bioretention units, sand filters, infiltration basins, and treatment wetlands.[411] When choosing project locations, permittees were required to identify locations draining to a variety of land uses, evaluate the technical feasibility, and discuss economic feasibility.[412] Permittees reported the results of these retrofitting projects in their 2014 integrated monitoring report, reporting on the project status, results, mercury removal effectiveness, and lessons learned from the pilot projects, and a plan for implementing this type of treatment on an expanded basis throughout the jurisdiction during the next permit term.[413]

Provision C.12. in the prior permit said the following regarding PCBs:

> The Permittees shall implement the following control programs for PCBs. The Permittees shall perform the control measures and provide reporting on those control measures according to the provisions below. The purpose of these provisions is to implement the urban runoff requirements of the PCBs TMDL and reduce PCBs loads to make substantial progress toward achieving the urban runoff PCBs load allocation. The Permittees may comply with any requirement of this Provision through a collaborative effort.[414]

As directed in the PCBs TMDL, the prior permit's PCBs control measures primarily involved a series of pilot programs, many of which were the same programs required by the mercury provisions. These control actions required permittees to implement: a) a region-wide program to train municipal building inspectors to identify PCBs and PCBs-containing equipment during the course of routine inspections; b) pilot programs to evaluate managing PCBs-containing materials and wastes during building demolition and renovation; c) pilot projects to investigate and abate on-land locations with elevated PCBs concentrations, including public rights-of-way, and stormwater conveyances with accumulated sediments with elevated PCBs concentrations; d) pilot projects to evaluate and enhance municipal sediment removal and management practices; e) pilot projects to evaluate on-site stormwater treatment via retrofit; f) pilot projects to evaluate reducing PCBs loads through diverting dry weather and first flush stormwater to sanitary sewers; g) a monitoring program to quantify PCBs loads reduced through the source control, treatment, and other management measures implemented as part of the pilot studies; h) studies on the fate, transport, and biological uptake of PCBs discharged in urban runoff;

and i) programs to reduce PCBs-related risks to humans and quantify the resulting risk reduction from these activities.[415] The pilot projects evaluating on-site stormwater treatment via retrofit imposed the same conditions as the pilot projects evaluating the effectiveness of using retrofit to treat mercury, and the two provisions acknowledged that a project at a site with both elevated mercury and PCBs concentrations could satisfy both provisions.[416]

d. Some of the requirements in Provisions C.3.j., C.11.c., and C.12.c. of the test claim permit, regarding the development and implementation of Green Infrastructure plans to achieve the TMDL reductions in mercury and PCBs are state-mandated new programs or higher levels of service.

The Test Claim pleads Provisions C.3.j., C.11.c., and C.12.c. of the test claim permit, which require permittees to develop and implement Green Infrastructure plans and projects to comply with mercury and PCBs load reduction requirements imposed by two prior TMDLs.[417]

Green infrastructure is defined in the test claim permit as: "Infrastructure that uses vegetation, soils, and natural processes to manage water and create healthier urban environments. At the scale of a city or county, green infrastructure refers to the patchwork of natural areas that provides habitat, flood protection, cleaner air, and cleaner water. At the scale of a neighborhood or site, green infrastructure refers to stormwater management systems that mimic nature by soaking up and storing water."[418] "A critical part of the strategy to reduce urban runoff mercury loads will be the widespread implementation of Green Infrastructure control measures to intercept mercury-containing sediment and stormwater before it is discharged to receiving water."[419]

Provision C.3.j. requires permittees to "complete and implement a Green Infrastructure Plan for the inclusion of low impact development (LID) drainage design into storm drain infrastructure on public and private lands, including streets, roads, storm drains, parking lots, building roofs, and other storm drain infrastructure elements."[420] The purpose of this plan is to serve as an implementation guide and reporting tool to provide reasonable assurance that the San Francisco Bay mercury and PCBs TMDL wasteload allocations will be met.[421] The Fact Sheet explains that the Green Infrastructure Plan "is

[415] Exhibit A, Test Claim, pages 185-191 (prior permit, Provisions C.12.a-i.).

[416] Exhibit A, Test Claim, pages 188-189 (prior permit, Provision C.12.e.).

[417] Exhibit A, Test Claim, pages 25-27 (Written Narrative).

[418] Exhibit A, Test Claim, page 526 (test claim permit, Glossary).

[419] Exhibit A, Test Claim, page 639 (test claim permit, Fact Sheet).

[420] Exhibit A, Test Claim, page 422 (test claim permit, Provision C.3.j.).

[421] Exhibit A, Test Claim, page 422 (test claim permit, Provision C.3.j.).

in lieu of expanding the definition of Regulated Projects" for this permit term.[422] Over the long term, the Plan is intended to describe how the permittees will shift their impervious surfaces and storm drain infrastructure from gray to green; i.e., "to a more resilient, sustainable system that slows runoff by dispersing it to vegetated areas, harvests and uses runoff, promotes infiltration and evapotranspiration, and uses bioretention and other Green Infrastructure practices to clean stormwater runoff."[423]

Provision C.11. establishes mercury controls to implement the urban runoff requirements in the mercury TMDL and reduce mercury loads to achieve the TMDL waste load allocations.[424] Provision C.11.c. says that permittees shall implement Green Infrastructure projects during the permit term to collectively achieve 48 g/year mercury load reduction through Green Infrastructure by June 30, 2020, and prepare a reasonable assurance analysis quantitatively demonstrating they can achieve mercury load reductions of at least 10 kg/year through green infrastructure by 2040.[425]

Provision C.12. implements the urban runoff requirements of the PCBs TMDL and establishes control measures to achieve the wasteload allocations adopted in the TMDL.[426] Provision C.12.c. also requires permittees to implement Green Infrastructure projects and prepare a reasonable assurance analysis, but with a goal of achieving a total of 120 g/year PCBs load reduction through Green Infrastructure by June 30, 2020, and the reasonable assurance analysis demonstrating they can achieve 3 kg/year PCBs load reduction by 2040.[427] The Fact Sheet explains that mercury is distributed more evenly throughout the Bay Area than PCBs which tend to be highly concentrated in areas where PCBs were historically heavily used, however both benefit from widespread implementation of Green Infrastructure.[428] The Green Infrastructure projects required by Provisions C.11.c. and C.12.c. are thus one and the same, and recognize that the "planning, financing and implementation of green infrastructure is going to take a long time, perhaps as much as 25 years or more."[429]

Because the requirements for Green Infrastructure projects are based on the Green Infrastructure plan in Provision C.3.j, Provisions C.3.j, C.11.c., and C.12.c. are discussed together.

The claimant asserts that Green Infrastructure is a new term that was not used at all in the prior permit, making the requirements to create a Green Infrastructure plan and to

---

[428] Exhibit A, Test Claim, pages 639, 652 (test claim permit, Fact Sheet).

[429] Exhibit A, Test Claim, page 640 (test claim permit, Fact Sheet).

implement Green Infrastructure to reduce mercury and PCBs loads by specified amounts by June 30, 2020 new requirements.[430] The claimant states that it adopted a Green Infrastructure Plan, is hiring a consultant for preparation of some of the tasks in the "Framework for Green Infrastructure Plan Development," and has identified the following Green Infrastructure projects and the costs to comply with the test claim permit:

- First Green Street Infrastructure Project. The claimant awarded the first green street contract to Star Construction, for a total cost of $1,405,840.
- South Decoto Green Streets Project. This is a sustainable redevelopment project in the Decoto district that aims to create Green Infrastructure that mimics natural systems to reduce reliance on the city's storm drain, with costs totaling $3,618,712.
- H Street Green Street Improvements, for estimated costs of $3,874,000.[431]

The claimant also estimates future costs of $72.5 million ($3 million per year for 23 years) to achieve the load reductions for mercury and PCBs.[432]

The claimant argues in its Rebuttal Comments that the Regional Board exercised discretion and implemented a true choice when it developed and implemented the mercury and PCBs TMDLs, as it controls how load allocations are distributed among known dischargers.[433]

The Regional Board's response is that the Green Infrastructure requirements are required by federal law, as they are meant to implement the mercury and PCBs TMDLs.[434] Although the term "Green Infrastructure" did not appear in the prior permit, the prior permit had requirements regarding low impact development (LID), which is defined as a type of Green Infrastructure.[435] The Board also alleges that the Green Infrastructure planning requirements were included in the test claim permit at permittees' request as a means for them to meet their TMDL load reduction requirements.[436] The EPA supported including Green Infrastructure requirements in the test claim permit, and as there is evidence EPA commonly includes Green Infrastructure or low impact development requirements in federally issued permits, it is likely the EPA

[436] Exhibit C, Regional Board's Late Comments on the Test Claim, page 15.

would have imposed the same or similar requirements, further supporting they are federally mandated.[437] The Board also argues that the Green Infrastructure program was not new to permittees in 2015, as permittees have been aware of the TMDL load reduction requirements since 2008; had opportunities to and did in fact participate in TMDL development; were aware that achieving load allocations would be difficult and that the permits were designed to become more stringent as implementation deadlines approached; and permittees actively participated in a pilot Green Infrastructure program and workshops discussing how to "scale up" Green Infrastructure implementation during the prior permit's life cycle.[438] It argues that the permit's provisions cannot be viewed in isolation, but must be viewed in the greater context of TMDL adoption and implementation as a whole, and that "[v]iewed in this way, the green infrastructure provisions are not a new program at all, but the continuation of a program that had been ongoing for the better part of a decade by the time the Board adopted MRP 2.0."[439]

As described below, the Commission finds that the some of the activities required by Provisions C.3.j., C.11.c., and C.12.c., impose a state mandated new program or higher level of service.

i. Provision C.3.j. imposes new requirements to develop a Green Infrastructure Plan, adopt policies and procedures, conduct outreach, conduct early implementation activities, and report progress on the planning. Except for the "early implementation" requirements for a permittee's own public projects, which do not mandate a new program or higher level of service, the remaining requirements in Provision C.3.j. mandate a new program or higher level of service.

Provision C.3.j. requires permittees to comply with the following activities to develop a Green Infrastructure Plan, adopt policies and ordinances, conduct outreach, and report progress as follows:

1. Green Infrastructure Plan Development (Provision C.3.j.i.):
    - Prepare a framework or workplan describing specific tasks and timeframes for development for its Green Infrastructure plan, to be approved by the Permittee's governing body, mayor, city manager, or county manager by June 30, 2017. This framework or workplan shall include a statement of purpose, tasks, and timeframe needed to complete all requirements in Provision C.3.j.i.2. (discussed below).[440]
    - Prepare a Green Infrastructure Plan, subject to Executive Officer approval, that contains all the following:

[437] Exhibit C, Regional Board's Late Comments on the Test Claim, pages 15-16, 22-25.

[438] Exhibit C, Regional Board's Late Comments on the Test Claim, page 39.

[439] Exhibit C, Regional Board's Late Comments on the Test Claim, pages 39-40.

[440] Exhibit A, Test Claim, page 423 (test claim permit, Provision C.3.j.i.1.).

- A mechanism (such as SFEI's Green PlanIT tool) to prioritize and map areas for potential and planned projects, both public and private, on a drainage-area specific basis, for implementation by 2020, by 2030, and by 2040, that includes criteria for prioritization and outputs that can be incorporated into the Permittees' long-term planning and capital improvement processes.
- Outcomes from the above-described mechanism, including but not limited to, the prioritization criteria, maps, lists, and all other information, as appropriate. Individual project-specific reviews do not need to be submitted with the Plan, but shall be made available for review upon request.
- Targets for the amount of impervious surface from public and private projects within the Permittee's jurisdiction to be retrofitted by 2020, by 2030, and by 2040.
- A process for tracking and mapping completed projects, public and private, and making the information publicly available online (I.E., SFEI's Green PlanIT tool).
- General guidelines for overall streetscape and project design and construction so that projects have a unified complete design that implements the range of functions associated with the project.
- Standard specifications, and as appropriate, typical design details and related information necessary for the Permittee to implement Green Infrastructure projects in its jurisdiction, which shall be sufficient to address the different street and project types within a Permittee's jurisdiction, as defined by land use and transportation characteristics.
- Requirements that projects be designed to meet the treatment and hydromodification sizing requirements outline in Provisions C.3.c. and C.3.d. For projects that are not subject to these requirements according to Provision C.3.b.ii. (non-regulated projects), Permittees may collectively propose a single approach for how to proceed when project constraints preclude fully meeting the sizing requirements, which can include options for addressing specific issues or scenarios.
- A summary of planning documents the permittee has updated or otherwise modified to incorporate green infrastructure requirements (General Plans, Specific Plans, Complete Street Plans, Active Transportation Plans, Storm Drain Master Plans, Pavement Work Plans, Urban Forestry Plans, Flood Control/Management Plans, and any other plans that may impact the future alignment, configuration or design of impervious surfaces within the Permittee's jurisdiction). These modifications are to be completed by no later than the end of the permit term.

- A workplan identifying how the Permittee will ensure that Green Infrastructure and low impact development are appropriately included in future plans.
- A workplan to complete prioritized projects identified as part of an Alternative Compliance Program or Early Implementation as outlined in Provision C.3.e. or C.3.j.ii.
- An evaluation of prioritized project funding options including, but not limited to: Alternative Compliance funds; grant monies, including transportation project grants from federal, State, and local agencies; existing Permittee resources; new tax or other levies; and other sources of funds.[441]

- Adopt policies, ordinances, and/or other appropriate legal mechanisms to ensure implementation of the Green Infrastructure Plan in accordance with the requirements of this provision.[442]
- Conduct outreach and education in accordance with the following:
  - Conduct public outreach on the requirements of this provision, including outreach coordinated with adoption or revision of standard specifications and planning documents, and with the initiation and planning of infrastructure projects. Such outreach shall include general outreach and targeted outreach to and training for professionals involved in infrastructure planning and design.
  - Train appropriate staff, including planning, engineering, public works maintenance, finance, fire/life safety, and management staff on the requirements of this provision and methods of implementation.
  - Educate appropriate Permittee elected officials (e.g., mayors, city council members, county supervisors, district board members) on the requirements of this provision and methods of implementation.[443]
- Each permittee shall report on its planning progress as follows:
  - Submit documentation in the 2017 Annual Report that its framework or workplan for development of its Green Infrastructure Plan was approved by its governing body, mayor, city manager, or county manager by June 30, 2017.
  - Submit its completed Green Infrastructure Plan with the 2019 Annual Report.

[441] Exhibit A, Test Claim, pages 423-425 (test claim permit, Provision C.3.j.i.2.).

[442] Exhibit A, Test Claim, page 425 (test claim permit, Provision C.3.j.i.3.).

[443] Exhibit A, Test Claim, pages 425-426 (test claim permit, Provision C.3.j.i.4.).

- Submit documentation of its legal mechanisms to ensure implementation of its Green Infrastructure Plan with the 2019 Annual Report.
- Submit a summary of its outreach and education efforts in each Annual Report.[444]

2. Early Implementation – List of Green Infrastructure Projects (Provision C.3.j.ii.):
   - Prepare and maintain a list of Green Infrastructure Projects, public and private, that are already planned for implementation during the permit term and infrastructure projects planned for implementation during the permit term that have potential for Green Infrastructure measures.[445]
   - Submit the list with each Annual Report and a summary of planning or implementation status for each public Green Infrastructure Project and each private Green Infrastructure Project that is not also a Regulated Project as defined in Provision C.3.b.ii. Include a summary of how each public infrastructure project with Green Infrastructure potential will include Green Infrastructure measures to the maximum extent practicable during the permit term. For any public infrastructure project where implementation of Green Infrastructure measures is not practicable, submit a brief description of the project and the reasons Green Infrastructure measures were impracticable to implement.[446]
3. Participation in Processes to Promote Green Infrastructure (Provision C.3.j.iii.):
   - Either individually or collectively, track processes, assemble and submit information, and provide informational materials and presentations as needed to assist relevant regional, State, and federal agencies to plan, design, and fund incorporation of Green Infrastructure measures into local infrastructure projects, including transportation projects. Issues to be addressed include coordinating the timing of funding from different sources, changes to standard designs and design criteria, ranking and prioritizing projects for funding, and implementation of cooperative in-lieu programs.[447]
   - In each Annual Report, report on the goals and outcomes during the reporting year of work undertaken to participate in processes to promote Green Infrastructure.[448]

---

[444] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.i.5.).

[445] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.ii.1.).

[446] Exhibit A, Test Claim, page 426 (test claim permit, section C.3.j.ii.2.).

[447] Exhibit A, Test Claim, page 426 (test claim permit, section C.3.j.iii.1.).

[448] Exhibit A, Test Claim, page 427 (test claim permit, section C.3.j.iii.2.).

- In the 2019 Annual Report, submit a plan and schedule for new and ongoing efforts to participate in processes to promote Green Infrastructure.[449]

4. Tracking and Reporting Progress (Provision C.3.j.iv.):

   - Either individually or collectively, develop and implement regionally-consistent methods to track and report implementation of Green Infrastructure measures including treated area and connected and disconnected impervious area on both public and private parcels within their jurisdictions. The methods shall also address tracking needed to provide reasonable assurance that wasteload allocations for TMDLs, including the San Francisco Bay PCBs and mercury TMDLs, and reductions for trash, are being met.[450]
   - In each Annual Report, report progress on development and implementation of the tracking methods.[451]
   - In the 2019 Annual Report, submit the tracking methods and report implementation of Green Infrastructure measures including treated area, and connected and disconnected impervious area on both public and private parcels within their jurisdictions.[452]

a) <u>The requirements imposed by Provision C.3.j. are new.</u>

These requirements are new. Under the prior permit, permittees were required to impose low impact development (LID) requirements and hydraulic sizing design criteria on Regulated Projects.[453] Projects that required permittees' review but did not meet the definition of a Regulated Project were encouraged, but not required, to include site

[449] Exhibit A, Test Claim, page 427 (test claim permit, section C.3.j.iii.3.).

[450] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.3.j.iv.1.).

[451] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.2.j.iv.2.).

[452] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.2.j.iv.3.).

[453] Exhibit A, Test Claim, pages 108-114 (test claim permit, Provisions C.3.c. and C.3.d.). Regulated Projects are all projects that are within a permittee's building and planning authority that fall into one of three main categories: 1) development and redevelopment projects for a finite list of land use categories that create or replace 5,000 square feet or more of impervious surface over the project area; 2) all development and redevelopment projects that create or replace 10,000 square feet or more of impervious surface, excluding single family homes that are not part of a larger development project; and 3) Road projects that create 10,000 square feet or more of newly constructed contiguous road surface for new streets, roads, bike lanes, sidewalks, or trails, or when widening existing roads by adding additional lanes. Interior remodels and routine maintenance and repair are exempt from these categories, as are Caltrans projects, and bike lane, sidewalk, or trail projects that are designed to direct stormwater runoff into adjacent vegetated areas or use permeable surfaces. See Exhibit A, Test Claim, pages 101-105 (prior permit, Provision C.3.b.ii.).

design measures, such as minimizing land disturbances, directing roof runoff to vegetated areas, or including restoration of riparian areas and wetlands as a project amenity.[454] Permittees were also required to install ten green streets pilot projects which tested the effectiveness of such projects at treating stormwater through the use of natural feature systems, and ten pilot projects which tested treating mercury and PCBs through retrofitting on-site treatment systems such as detention basins, bioretention units, sand filters, infiltration basins, and treatment wetlands onto existing storm drain systems.[455] LID, green street projects, and retrofitting, are all examples of Green Infrastructure[456]

Although these types of Green Infrastructure were required by the prior permit, there were no prior requirements to have a specific plan for implementing Green Infrastructure into public and private projects which sets targets for the amount of impervious surfaces to be retrofitted within certain timeframes, and to provide guidelines for project design and standard specifications. In addition, there was no prior requirement to create a framework or workplan for developing a Green Infrastructure Plan. While federal law does require permittees to have adequate legal authority to implement permit conditions and submit annual reports on permit conditions' implementation status, and the prior permit specifically required permittees to train staff and conduct outreach for the public on the conditions in Provision C.3. of the prior permit, here the state has specifically imposed a new requirement to develop and implement a Green Infrastructure Plan.[457] Since the plan is new, adopting legal authority to implement the plan, educating people on the plan's requirements, and reporting on the plan's implementation are all new requirements as well. Thus, the activities required for C.3.j.i. are new.

The requirement in Provision C.3.j.ii. to compile a list of all projects already planned for implementation during the permit term that either include Green Infrastructure or are an infrastructure project with potential to add Green Infrastructure measures, is also new. The prior permit required the permittees to list in each Annual Report each Regulated

---

[454] Exhibit A, Test Claim, pages 99, 391 (prior permit, Provision C.3.a.i.6.; test claim permit, Provision C.3.a.i.6.).

[455] Exhibit A, Test Claim, pages 105-106, 180-181, and 188-189 (prior permit, Provisions C.3.b.iii., C.11.e., and C.12.e.).

[456] Exhibit A, Test Claim, page 526 (test claim permit, Glossary), which defines Green Infrastructure as "infrastructure that uses vegetation, soils, and natural processes to manage water and create healthier urban environments. At the scale of a city or county, green infrastructure refers to the patchwork of natural areas that provides habitat, flood protection, cleaner air, and cleaner water. At the scale of a neighborhood or site, green infrastructure refers to stormwater management systems that mimic nature by soaking up and storing water."

[457] 33 U.S. Code section 1342(a)(2); 40 C.F.R. section 122.42(c).

Project approved during that fiscal year.[458] All Regulated Projects are required to either treat 100% of their stormwater runoff using LID treatment measures, or to follow an alternative compliance method where it is not feasible to treat 100% through LID, and LID is defined as a type of green infrastructure, meaning most Regulated Projects would also be considered Green Infrastructure Projects.[459] However, the requirement to maintain the list required by Provision C.3.j.ii. is separate from and in addition to the requirement to list approved Regulated Projects, which is still required by the test claim permit..[460] Moreover, not all Green Infrastructure Projects are Regulated Projects, as one of the purposes of the Green Infrastructure Plan is to require all Green Infrastructure Projects to meet the treatment and hydromodification sizing requirements already imposed on regulated projects, and to plan an approach for how to deal with non-regulated projects where project constraints prevent fully meeting the sizing requirements.[461] Although non-Regulated Projects were previously encouraged to include site design measures that could be considered Green Infrastructure under the test claim permit's requirements, such measures were voluntary and there were no requirements to report that a non-Regulated Project chose to incorporate such measures.[462]

Provision C.3.j.ii. also requires permittees to annually report on the planning and implementation status for each public Green Infrastructure Project and private Green Infrastructure Project that is not also a Regulated Project. Although permittees previously reported on Regulated Projects, this requirement specifically calls out public infrastructure and private non-Regulated Projects, and requires specific analysis of information on public infrastructure projects that was not previously required for Regulated Projects, namely a summary of how public infrastructure projects with Green Infrastructure potential included Green Infrastructure to the maximum extent practicable, or a description of the reasons why it was deemed impracticable to implement these measures. Thus, the requirements in C.3.j.ii. are new.

The requirements in Provision C.3.j.iii. to participate in processes to promote Green Infrastructure, which involves tracking processes, assembling and submitting information, and providing informational materials and presentations as needed to assist regional, State, and Federal agencies to plan, design, and fund incorporation of green infrastructure into local infrastructure projects; reporting on the goal and outcomes of the work done to satisfy this requirement in the Annual Report; and submit a plan and schedule for new and ongoing efforts to participate in processes to promote Green

[458] Exhibit A, Test Claim, pages 106-107, (prior permit, Provision C.3.b.v.1.); 396-397 (test claim permit, Provision C.3.b.iv.2.).

[459] Exhibit A, Test Claim, pages 109-110, (prior permit, Provision C.3.c.i.2.b.).

[460] See Exhibit A, Test Claim, page 396 (test claim permit, Provision C.3.b.iv.2.) (The requirement to annually report on each Regulated Project approved each year).

[461] Exhibit A, Test Claim, page 424, (test claim permit, Provision C.3.j.i.2.g.).

[462] Exhibit A, Test Claim, page 99 (prior permit, Provision C.3.a.i.6.).

Infrastructure in the 2019 Annual Report, are new. Provision C.3.a.i.5. of both the prior permit and this permit require the permittees to "provide outreach adequate to implement the requirements of Provision C.3., including providing educational materials to municipal staff, developers, contractors, construction site operators, and owners/builders, early in the planning process and as appropriate."[463] Although providing educational materials to municipal staff, developers, contractors, construction site operators, and owners/builders sounds similar to the requirement in Provision C.3.j.iii., Provision C.3.j.iii. adds a separate requirement to track processes, assemble, and submit information, and provide the informational materials and presentations to regional, state, and federal agencies. Regional, State, and federal agencies may be involved in implementing infrastructure projects, but the specific roles they play may not always fit into the categories of "municipal staff, developers, contractors, construction site operators, and owners/builders." Additionally, although federal law requires annual reports that include the status of implementing components of the stormwater management program that are established as permit conditions, to the extent it was the State's discretionary decision to require permittees participate in processes to promote Green Infrastructure, the reporting requirements are new.[464] The requirements in Provision C.3.j.iii. are therefore new.

Lastly, Provision C.3.j.iv. requires permittees to develop and implement regionally-consistent methods for tracking and reporting implementing Green Infrastructure measures; to report progress on developing these methods in each Annual Report; and to submit the tracking methods and report implementation of Green Infrastructure measures in the 2019 Annual Report. These requirements are new. Although federal law requires permittees to file an annual report on the status of implementing established permit conditions, proposed changes to the stormwater management program, and a summary of data accumulated throughout the reporting year, to the extent it was the State's discretionary decision to require green infrastructure plans, the reporting requirements in C.3.j.iv. are new.

b) Except for the "early implementation" requirements for a permittee's own public projects, which do not mandate a new program or higher level of service, the remaining requirements in Provision C.3.j. are new, mandated by the state, and impose a new program or higher level of service.

However, the following "early implementation" requirements imposed by Provision C.3.j.ii.1. and 2. are *not* mandated by the state for a permittee's own public projects.

- Prepare and maintain a list of *public* Green Infrastructure Projects that are already planned for implementation during the permit term and *public*

[463] Exhibit A, Test Claim, pages 99, 391 (prior permit, Provision C.3.a.i.5.; test claim permit, Provision C.3.a.i.5.).

[464] United States Code, title 33, section 1342(a)(2); 40 Code of Federal Regulations, section 122.42(c).

infrastructure projects planned for implementation during the permit term that have potential for Green Infrastructure measures.[465]

- Submit the list with each Annual Report and a summary of planning or implementation status for each *public* Green Infrastructure Project that is not also a Regulated Project as defined in Provision C.3.b.ii. Include a summary of how each public infrastructure project with Green Infrastructure potential will include Green Infrastructure measures to the maximum extent practicable during the permit term. For any *public* infrastructure project where implementation of Green Infrastructure measures is not practicable, submit a brief description of the project and the reasons Green Infrastructure measures were impracticable to implement.[466]

The courts have explained that even though the test claim statute or executive order may contain new requirements, the determination of whether those requirements are mandated by the state depends on whether the claimant's participation in the underlying program is voluntary or compelled.[467] When local government elects to participate in the underlying program, then reimbursement under article XIII B, section 6 is not required.[468]

Thus, the issue is whether the underlying decision of the claimants to develop a municipal project is mandated by the state or is a discretionary decision of local government. Activities undertaken at the option or discretion of local government, without legal or practical compulsion, do not trigger a state-mandated program within the meaning or article XIII B, section 6.[469]

There are two distinct theories for determining whether a program is compelled or mandated by the state: legal compulsion and practical compulsion.[470] In the recent case of *Coast Community College Dist. v. Commission on State Mandates* (2022) 13 Cal.5th 800, 815, the California Supreme Court reiterated the legal standards applicable to these two theories of mandate:

---

[466] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.ii.2.).

[467] *Department of Finance v. Commission on State Mandates* (*Kern*) (2003) 30 Cal.4th 727, 731.

[468] *Department of Finance v. Commission on State Mandates* (*Kern*) (2003) 30 Cal.4th 727, 743.

[469] *City of Sacramento v. State of California* (1990) 50 Cal.3d 51, 73-76; *Department of Finance v. Commission on State Mandates* (*Kern*) (2003) 30 Cal.4th 727; *Department of Finance v. Commission on State Mandates* (POBRA) (2009) 170 Cal.App.4th 1355, 1365-1366.

[470] *Coast Community College Dist. v. Commission on State Mandates* (2022) 13 Cal.5th 800, 807, 815.

> Legal compulsion occurs when a statute or executive action uses mandatory language that require[s] or command[s] a local entity to participate in a program or service… Stated differently, legal compulsion is present when the local entity has a mandatory, legally enforceable duty to obey. This standard is similar to the showing necessary to obtain a traditional writ of mandate, which requires the petitioning party to establish the respondent has a clear, present, and usually ministerial duty to act. ... Mandate will not issue if the duty is ... mixed with discretionary power.
>
> Thus, as a general matter, a local entity's voluntary or discretionary decision to undertake an activity cannot be said to be legally compelled, even if that decision results in certain mandatory actions.[471]
>
> * * *
>
> "[P]ractical compulsion," [is] a theory of mandate that arises when a statutory scheme does not command a local entity to engage in conduct, but rather induces compliance through the imposition of severe consequences that leave the local entity no reasonable alternative but to comply.[472]

Thus, in the absence of legal compulsion, the courts have acknowledged the possibility that a state mandate can be found if local government can show that it faces "certain and severe penalties, such as double taxation or other draconian consequences," leaving local government no choice but to comply with the conditions established by the state.[473]

All costs incurred by a municipality as a project proponent can be analogized to *City of Merced v. State* (1984) 153 Cal.App.3d 777 and *Department of Finance v. Commission on State Mandates* (*Kern*) (2003) 30 Cal.4th 727. In *City of Merced*, the statute at issue required a local government when exercising the power of eminent domain to compensate a business owner for the loss of business goodwill, as part of compensating for the property subject to the taking.[474] The court found that nothing *required* the local entity to exercise the power of eminent domain, and thus any costs experienced as a result of the requirement to compensate for business goodwill was the result of an initial discretionary act.[475]

[475] *City of Merced v. State* (1984) 153 Cal.App.3d 777, 783.

In *Kern*, the statute at issue required certain local school committees to comply with notice and agenda requirements in conducting their public meetings.[476] There, the Court held that the underlying school site councils and advisory committees were part of several separate voluntary grant-funded programs, and therefore any notice and agenda costs were an incidental impact of participating or continuing to participate in those programs.[477] The Court acknowledged that the district was already participating in the underlying programs, and "as a practical matter, they feel they must participate in the programs, accept program funds, and…incur expenses necessary to comply with the procedural conditions imposed on program participants."[478] However, the Court held that "[c]ontrary to the situation that we described in *City of Sacramento* [*v. State* (1990)] 50 Cal.3d 51, a claimant that elects to discontinue participation in one of the programs here at issue does not face 'certain and severe…penalties' such as 'double…taxation' or other 'draconian' consequences, but simply must adjust to the withdrawal of grant money along with the lifting of program obligations."[479]

Similarly in this case, the permittees have the authority to develop property,[480] but are not legally compelled to develop property. There is no evidence that local agencies are

[476] *Department of Finance v. Commission on State Mandates* (*Kern*) (2003) 30 Cal.4th 727, 732.

[477] *Department of Finance v. Commission on State Mandates* (*Kern*) (2003) 30 Cal.4th 727, 744-745.

[478] *Department of Finance v. Commission on State Mandates* (*Kern*) (2003) 30 Cal.4th 727, 753.

[479] *Department of Finance v. Commission on State Mandates* (*Kern*) (2003) 30 Cal.4th 727, 754 citing *City of Sacramento v. State* (1990) 50 Cal.3d 51, 74 (The "certain and severe…penalties" and "double…taxation" referred to the situation in *City of Sacramento* in which the state was compelled, by the potential loss of *both* federal tax credits *and* subsidies provided to businesses statewide, to impose mandatory unemployment insurance coverage on public agencies consistent with a change in federal law.).

[480] For example, see Government Code section 23004 (counties *may* purchase, receive by gift or bequest, and hold land within its limits, or elsewhere when permitted by law; and manage, sell, lease, or otherwise dispose of its property as the interests of its inhabitants require); Government Code sections 37350-37353 (cities *may* purchase, lease, receive, hold, and enjoy real and personal property, and control and dispose of it for the common benefit; may erect and maintain buildings for municipal purposes; and may acquire property for parking motor vehicles, and for opening and laying out any street; Government Code 37111 ("When the legislative body deems it necessary that land purchased for park or other purposes be used for construction of public buildings or creation of a civic center, it *may* adopt an ordinance by a four-fifths vote declaring the necessity and providing for such use"); Streets and Highways Code, sections 1800 ("The legislative body of any city *may* do any and all things necessary to lay out, acquire, and construct any section or portion of any street or highway within its

practically compelled, as the only reasonable means necessary to carry out core mandatory functions, to develop or redevelop property and comply with the Green Infrastructure requirements on their own public property.[481] Nor is there evidence that a failure to develop property would subject the claimant to "certain and severe…penalties" such as "double…taxation" or other "draconian" consequences.[482]

Moreover, compliance with the Green Infrastructure requirements on a permittee's own public development is not unique to government, does not provide a governmental service to the public, and thus does not impose a new program or higher level of service since the test claim permit subjects both public and private projects to the requirements.[483]

Thus, the "early implementation" requirements imposed by Provision C.2.j.ii.1. and 2. are not mandated by the state for a permittee's own public projects.

The remaining new requirements in Provisions C.3.j. impose a state-mandated new program or higher level of service, however, and are not triggered by a permittee's local discretionary decision. Permittees are legally compelled to develop and implement the Green Infrastructure Plan outlined in Provision C.3.j., including each of the remaining components for private and public development projects within a permittee's regulatory authority. The subsections within C.3.j. use the mandatory language "shall" to preface each requirement.

Moreover, these activities are mandated by the state, and not the federal government. The California Supreme Court, in *Department of Finance v. Commission on State Mandates*, identified the following test to determine whether certain conditions imposed by an NPDES stormwater permit issued by the Los Angeles Regional Water Board were mandated by the state or federal government:

> If federal law compels the state to impose, or itself imposes, a requirement, that requirement is a federal mandate. On the other hand, if federal law gives the state discretion whether to impose a particular

---

jurisdiction as a freeway, and to make any existing street or highway a freeway."); 1801 ("The legislative body of any city *may* close any street or highway within its jurisdiction at or near the point of its intersection with any freeway, or *ma*y make provision for carrying such street or highway over, under, or to a connection with the freeway, and *may* do any and all necessary work on such street or highway.").

[481] *Department of Finance v. Commission on State Mandates* (2009) 170 Cal.App.4th 1355, 1368 (POBRA).

[482] *Department of Finance v. Commission on State Mandates* (*Kern)* (2003) 30 Cal.4th 727, 754 citing *City of Sacramento v. State* (1990) 50 Cal.3d 51, 74.

[483] Exhibit A, Test Claim, pages 488, 496 (Test Claim Permit, Provisions C.11.c.i. and C.12.c.i.) (Stating that Green Infrastructure Projects on both public and private lands can serve towards achieving the stated mercury and PCBs load reduction requirements).

> implementing requirement, and the state exercises its discretion to impose the requirement by virtue of a "true choice," the requirement is not federally mandated.[484]

The courts have also explained "except where a regional board finds the conditions are the *only means* by which the [federal] 'maximum extent practicable' standard can be met, the State exercises a true choice by determining what controls are necessary to meet the standard."[485]

Here, the Regional Board argues that Provision C.3.j. is federally mandated, because the San Francisco Bay is impaired for mercury and PCBs, and the Green Infrastructure Plan is needed to ensure compliance with the respective TMDLs for those pollutants.

> The [Green Infrastructure] Plan is intended to serve as an implementation guide and reporting tool during this and subsequent Permit terms to provide reasonable assurance that urban runoff TMDL wasteload allocations (e.g., for the San Francisco Bay mercury and PCBs TMDLs) will be met, and to set goals for reducing, over the long term, the adverse water quality impacts of urbanization and urban runoff on receiving waters.
>
> The [Green Infrastructure planning and tracking] methods shall also address tracking needed to provide reasonable assurance that wasteload allocations for TMDLs, including the San Francisco Bay PCBs and mercury TMDLs, and reductions for trash, are being met.[486]

While the EPA supported the inclusion of a Green Infrastructure Plan in its comments on the draft test claim permit, there is nothing that supports that this is the only means of meeting the maximum extent practicable standard. As the court pointed out in *Department of Finance v. Commission on State Mandates (Municipal Stormwater),* when drafting permit conditions regional boards are authorized to impose conditions that are more exacting than what is required by federal law.[487] The federal government approving of a regional board's permit conditions only shows that the conditions would satisfy federal law, not that they are the only means by which to do so, or even that the EPA would have imposed the same conditions if this were a federal permit. Even if the EPA might have included some sort of Green Infrastructure provision in a federal permit, there is no evidence that supports this would have looked identical or even similar to the requirements imposed by the Green Infrastructure Plan, or that these requirements were the only way to meet the maximum extent practicable standard. The

[486] Exhibit C, Regional Board's Late Comments on the Test Claim, page 14 quoting findings in the test claim permit.

[487] *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 768.

Regional Board has therefore exercised a true choice in making these requirements mandated by the state.

Finally, these activities constitute a new program or higher level of service. Courts have found two ways in which a mandated program constitutes a new program or higher level of service. The first is if the activities carry out the governmental function of providing services to the public.[488] The second is if the activities impose unique requirements on local government that do not apply to all residents and entities within the state.[489] Here, the requirements are unique to government and provide a governmental service to the public. The Fact Sheet described the importance of Green Infrastructure as follows:

> Available information suggests that mercury is distributed more uniformly throughout the Bay Area landscape than is the case for PCBs. Therefore, a focus on highly contaminated areas (with mercury) may not be enough to achieve the TMDL-required load reductions. A critical part of the strategy to reduce urban runoff mercury loads will be the widespread implementation of green infrastructure control measures to intercept mercury-containing sediment and stormwater before it is discharged to receiving water.
>
> […]
>
> Some Bay Area drainages contain notably elevated PCBs concentrations in suspended or bedded sediment (e.g., > 500 ppb in bedded sediment). A recent analysis of soil PCBs and mercury data collected in the Bay Area identifies 15 sites where maximum concentrations exceed 3.8 mg/kg for PCBs and 1.6 mg/kg for total mercury. Areas with moderately high PCBs concentrations (e.g., 100-500 ppb) were found throughout areas where historical industrial activity involved use of PCBs (McKee and Yee 2015). Placing green infrastructure in highly- and moderately-contaminated areas will form an important element in achieving the PCBs TMDL-required load reductions. However, green infrastructure implementation is a long-term proposition and there is value in placing green infrastructure across the broader landscape to intercept PCBs before they are discharged to receiving water.[490]

Thus, by requiring permittees to develop and implement a Green Infrastructure Plan, to require early implementation of the plan for Green Infrastructure Projects approved to

---

[488] *Carmel Valley Fire Protection Dist. v. State of California* (1987) 190 Cal.App.3d 521, (finding that regulations requiring that firefighters be given protective clothing and equipment constituted a new program or higher level of service since fire protection is a basic function of local government).

[489] *County of Los Angeles v. Department of Industrial Relations* (1989) 214 Cal.App.3d 1538, (finding that regulations imposing certain safety precautions for all elevators, both public and private alike, was not unique to local government).

[490] Exhibit A, Test Claim, pages 639, 652 (test claim permit, Fact Sheet).

be implemented during the permit term, to participate in processes to promote Green Infrastructure, and to track and report progress, the Regional Board is requiring permittees to exercise its authority over regulating development and redevelopment projects within its jurisdiction, which is both a governmental service to the public as well as a requirement imposed uniquely on local governments and not on all residents or entities within the state.

Accordingly, the following requirements in Provision C.3.j. mandate a new program or higher level of service within the meaning of article XIII B, section 6 of the California Constitution:

1. Green Infrastructure Plan Development (Provision C.3.j.i.):
    - Prepare a framework or workplan describing specific tasks and timeframes for development for its Green Infrastructure Plan, to be approved by the Permittee's governing body, mayor, city manager, or county manager by June 30, 2017. This framework or workplan shall include a statement of purpose, tasks, and timeframe needed to complete all requirements in Provision C.3.j.i.2 (discussed below).[491]
    - Prepare a Green Infrastructure Plan, subject to Executive Officer approval, that contains all the following:
        - A mechanism (such as SFEI's Green PlanIT tool) to prioritize and map areas for potential and planned projects, both public and private, on a drainage-area specific basis, for implementation by 2020, by 2030, and by 2040, that includes criteria for prioritization and outputs that can be incorporated into the Permittees' long-term planning and capital improvement processes.
        - Outcomes from the above-described mechanism, including but not limited to, the prioritization criteria, maps, lists, and all other information, as appropriate. Individual project-specific reviews do not need to be submitted with the Plan, but shall be made available for review upon request.
        - Targets for the amount of impervious surface from public and private projects within the Permittee's jurisdiction to be retrofitted by 2020, by 2030, and by 2040.
        - A process for tracking and mapping completed projects, public and private, and making the information publicly available online (I.E., SFEI's Green PlanIT tool).
        - General guidelines for overall streetscape and project design and construction so that projects have a unified complete design that implements the range of functions associated with the project.

[491] Exhibit A, Test Claim, page 423 (test claim permit, Provision C.3.j.i.1.).

- Standard specifications, and as appropriate, typical design details and related information necessary for the Permittee to implement Green Infrastructure Projects in its jurisdiction, which shall be sufficient to address the different street and project types within a Permittee's jurisdiction, as defined by land use and transportation characteristics.
- Requirements that projects be designed to meet the treatment and hydromodification sizing requirements outline in Provisions C.3.c. and C.3.d. For projects that are not subject to these requirements according to Provision C.3.b.ii. (non-regulated projects), Permittees may collectively propose a single approach for how to proceed when project constraints preclude fully meeting the sizing requirements, which can include options for addressing specific issues or scenarios.
- A summary of planning documents the permittee has updated or otherwise modified to incorporate Green Infrastructure requirements (General Plans, Specific Plans, Complete Street Plans, Active Transportation Plans, Storm Drain Master Plans, Pavement Work Plans, Urban Forestry Plans, Flood Control/Management Plans, and any other plans that may impact the future alignment, configuration or design of impervious surfaces within the Permittee's jurisdiction). These modifications are to be completed by no later than the end of the permit term.
- A workplan identifying how the Permittee will ensure that Green Infrastructure and low impact development are appropriately included in future plans.
- A workplan to complete prioritized projects identified as part of an Alternative Compliance Program or Early Implementation as outlined in Provision C.3.e. or C.3.j.ii.
- An evaluation of prioritized project funding options including, but not limited to: Alternative Compliance funds; grant monies, including transportation project grants from federal, State, and local agencies; existing Permittee resources; new tax or other levies; and other sources of funds.[492]

- Adopt policies, ordinances, and/or other appropriate legal mechanisms to ensure implementation of the Green Infrastructure Plan in accordance with the requirements of this provision.[493]
- Conduct outreach and education in accordance with the following:
  - Conduct public outreach on the requirements of this provision, including outreach coordinated with adoption or revision of standard specifications

[492] Exhibit A, Test Claim, pages 423-425 (test claim permit, Provision C.3.j.i.2.).

[493] Exhibit A, Test Claim, page 425 (test claim permit, Provision C.3.j.i.3.).

and planning documents, and with the initiation and planning of infrastructure projects. Such outreach shall include general outreach and targeted outreach to and training for professionals involved in infrastructure planning and design.

- Train appropriate staff, including planning, engineering, public works maintenance, finance, fire/life safety, and management staff on the requirements of this provision and methods of implementation.
- Educate appropriate Permittee elected officials (e.g., mayors, city council members, county supervisors, district board members) on the requirements of this provision and methods of implementation.[494]

- Each permittee shall report on its planning progress as follows:
  - Submit documentation in the 2017 Annual Report that its framework or workplan for development of its Green Infrastructure Plan was approved by its governing body, mayor, city manager, or county manager by June 30, 2017.
  - Submit its completed Green Infrastructure Plan with the 2019 Annual Report.
  - Submit documentation of its legal mechanisms to ensure implementation of its Green Infrastructure Plan with the 2019 Annual Report.
  - Submit a summary of its outreach and education efforts in each Annual Report.[495]

2. Early Implementation – List of Green Infrastructure Projects (Provision C.3.j.ii.):
   - *Except for a permittee's own public project (which does not mandate a new program or higher level of service)*, prepare and maintain a list of Green Infrastructure Projects, public and private, that are already planned for implementation during the permit term and infrastructure projects planned for implementation during the permit term that have potential for Green Infrastructure measures.[496]
   - *Except for a permittee's own public project (which does not mandate a new program or higher level of service)*, submit the list with each Annual Report and a summary of planning or implementation status for each public Green Infrastructure Project and each private Green Infrastructure Project that is not also a Regulated Project as defined in Provision C.3.b.ii. Include a summary of how each public infrastructure project with Green Infrastructure potential will include Green Infrastructure measures to the maximum extent practicable

[494] Exhibit A, Test Claim, pages 425-426 (test claim permit, Provision C.3.j.i.4.).

[495] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.i.5.).

[496] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.ii.1.).

during the permit term. For any public infrastructure project where implementation of Green Infrastructure measures is not practicable, submit a brief description of the project and the reasons Green Infrastructure measures were impracticable to implement.[497]

3. Participation in Processes to Promote Green Infrastructure (Provision C.3.j.iii.):
    - Either individually or collectively, track processes, assemble and submit information, and provide informational materials and presentations as needed to assist relevant regional, State, and federal agencies to plan, design, and fund incorporation of Green Infrastructure measures into local infrastructure projects, including transportation projects. Issues to be addressed include coordinating the timing of funding from different sources, changes to standard designs and design criteria, ranking and prioritizing projects for funding, and implementation of cooperative in-lieu programs.[498]
    - In each Annual Report, report on the goals and outcomes during the reporting year of work undertaken to participate in processes to promote Green Infrastructure.[499]
    - In the 2019 Annual Report, submit a plan and schedule for new and ongoing efforts to participate in processes to promote Green Infrastructure.[500]
4. Tracking and Reporting Progress (Provision C.3.j.iv.):
    - Either individually or collectively, develop and implement regionally-consistent methods to track and report implementation of Green Infrastructure measures including treated area and connected and disconnected impervious area on both public and private parcels within their jurisdictions. The methods shall also address tracking needed to provide reasonable assurance that wasteload allocations for TMDLs, including the San Francisco Bay PCBs and mercury TMDLs, and reductions for trash, are being met.[501]
    - In each Annual Report, report progress on development and implementation of the tracking methods.[502]
    - In the 2019 Annual Report, submit the tracking methods and report implementation of Green Infrastructure measures including treated area, and

[497] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.ii.2.).

[498] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.iii.1.).

[499] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.3.j.iii.2.).

[500] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.3.j.iii.3.).

[501] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.3.j.iv.1.).

[502] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.2.j.iv.2.).

connected and disconnected impervious area on both public and private parcels within their jurisdictions.[503]

ii. Provisions C.11.c. and C.12.c. mandate a new program or higher level of service to prepare a reasonable assurance analysis of future mercury and PCBs load reductions and reporting. However, implementing Green Infrastructure Projects to reduce mercury and PCB loads is not new and does not mandate a new program or higher level of service.

As part of permittees' load reduction allocations under the mercury and PCBs TMDLs, Provisions C.11.c. and C.12.c. each require permittees to reduce their mercury and PCBs loads by minimum amounts by June 30, 2020 (during the term of the test claim permit), through implementing sufficient green infrastructure projects.[504] This deadline can be extended to December 31, 2020 if the permittees provide sufficient documentation that control measures that will attain the load reduction will be implemented by December 31, 2020.[505] Both public and private Green Infrastructure Projects count towards these requirements, as well as any projects that were implemented during the prior permit term if the load reduction was not realized or credited until this permit term.[506] The Fact Sheet explains that the interim load reduction requirement for mercury is intended to set a clear performance expectation during the permit term toward achieving the TMDL and is feasible since it is approximately equivalent to the load reductions achieved during the prior permit through Green Infrastructure:

> This green infrastructure load reduction requirement is feasible in that these load reductions are approximately equivalent to the scale of load reduction achieved during the Previous Permit term through green infrastructure and C.3- related treatment controls (Integrated Monitoring Report 2014). It is reasonable to expect that a similar or greater pace of redevelopment plus green infrastructure implementation on public property can be achieved during this Permit term. The green infrastructure load reduction requirement is warranted because it is important to provide a clear performance expectation for Permittees for green infrastructure implementation because widespread and effective green infrastructure implementation will be an important component of achieving the load

---

[503] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.2.j.iv.3.).

[504] Exhibit A, Test Claim, pages 488-490, 495-497 (test claim permit, Provisions C.11.c. and C.12.c.).

[505] Exhibit A, Test Claim, pages 488, 496 (test claim permit, Provisions C.11.c.ii.1. and C.12.c.ii.1.).

[506] Exhibit A, Test Claim, pages 488, 496 (test claim permit, Provisions C.11.c.i., C.11.c.ii.1., C.12.c.i., and C.12.c.ii.1.).

reductions necessary to achieve the mercury TMDL wasteload allocation.[507]

Similarly, the Fact Sheet also found that the PCBs load reductions required this permit term are achievable based on the information learned and reported on from pilot projects in the prior term.[508]

Permittees are also required prepare a reasonable assurance analysis, showing that mercury load reductions of at least 10 kg/year and PCBs load reductions of at least 3 kg/year will be realized by 2040 through implementing Green Infrastructure Projects.[509] The Fact Sheet recognizes that the planning, financing, and implementation of Green Infrastructure could take 25 years or more; that load reduction benefits from the implementation of Green Infrastructure will be realized over an extended time frame; and, thus the reasonable assurance provisions require permittees to "rigorously and quantitatively demonstrate" the specified reductions "throughout the permit area will be achieved over the course of the next 25 years (i.e., by 2040) through implementation of green infrastructure throughout the permit area."[510]

Provisions C.11.c. and C.12.c. impose the following requirements:

1. Implementing Green Infrastructure Projects (C.11.c.ii.1. and C.12.c.ii.1.). Permittees shall implement sufficient Green Infrastructure Projects to collectively reduce mercury loads by 48 g/year by June 30, 2020, and PCBs loads by 120 g/year by June 30, 2020, respectively.[511] The share of these load reduction requirements within each county to collectively achieve the reduction requirements by June 30, 2020, are as follows:

    - Alameda Permittees: Mercury 15 g/year; PCBs 37 g/year
    - Contra Costa Permittees: Mercury 9 g/year; PCBs 23 g/year
    - San Mateo Permittees: Mercury 6 g/year; PCBs 15 g/year
    - Santa Clara Permittees: Mercury 16 g/year; PCBs 37 g/year
    - Solano Permittees: Mercury 2 g/year; PCBs 8 g/year[512]

[507] Exhibit A, Test Claim, page 639 (test claim permit, Fact Sheet).

[508] Exhibit A, Test Claim, page642 (test claim permit, Fact Sheet).

[509] Exhibit A, Test Claim, pages 489-490 497 (test claim permit, Provisions C.11.c.ii.2. and C.12.c.ii.2.).

[510] Exhibit A, Test Claim, page 640 (test claim permit, Fact Sheet); see also page 652 (test claim permit, Fact Sheet).

[511] Exhibit A, Test Claim, pages 488 and 496 (test claim permit, Provisions C.11.c.ii. and C.12.c.ii.).

[512] Exhibit A, Test Claim, pages 489 and 496 (Table 11.1. and 12.2.).

2. Reasonable Assurance Analysis (C.11.c.ii.2. and C.12.c.ii.2.). Prepare a reasonable assurance analysis of future mercury and PCBs load reductions by doing the following:

   - Quantify the relationship between areal extent of Green Infrastructure implementation and mercury/PCBs load reductions, taking into consideration scale of contamination of the treated area as well as the pollutant removal effectiveness of likely Green Infrastructure strategies.[513]
   - Estimate the amount and characteristics of land area that will be treated through Green Infrastructure by 2020, by 2030, and by 2040.[514]
   - Estimate the amount of mercury/PCBs load reductions that will result from Green Infrastructure implementation by 2020, by 2030, and by 2040.[515]
   - Quantitatively demonstrate that mercury load reductions of at least 10 kg/year and PCBs load reductions of at least 3 kg/year will be realized by 2040 through implementing Green Infrastructure Projects.[516]
   - Ensure that the calculation methods, models, model inputs, and model assumptions used in this analysis have been validated through a peer review process.[517]

3. Reporting (C.11.c.iii. and C.12.c.iii.)

   - Submit in the 2018 Annual Report as part of the reporting required for Provisions C.11.b.iii.2. and C.12.b.iii.3., the quantitative relationship between Green Infrastructure implementation and mercury and PCBs load reductions.

---

[513] Exhibit A, Test Claim, pages 489, 497 (test claim permit, Provisions C.11.c.ii.2.a., C.12.c.ii.2.a.).

[514] Exhibit A, Test Claim, pages 489, 497 (test claim permit, Provisions C.11.c.ii.2.b., C.12.c.ii.2.b.).

[515] Exhibit A, Test Claim, pages 489, 497 (test claim permit, Provisions C.11.c.ii.2.c., C.12.c.ii.2.c.).

[516] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.ii.2.d., C.12.c.ii.2.d.). The Fact Sheet explains that the planning, financing, and implementation of green infrastructure will take a long time, as much as 25 years or more. To ensure permittees are working effectively and expeditiously towards implementing effective green infrastructure controls, the test claim permit requires permittees to prepare a reasonable assurance analysis to quantitatively demonstrate mercury load reductions of 10 kg/year and PCBs load reductions of 3 kg/year will be attained within 25 years (i.e., by 2040) by implementing green infrastructure throughout the permit area. See Exhibit A, Test Claim, pages 640, 652 (test claim permit, Fact Sheet.).

[517] Exhibit A, Test Claim, pages 489-490, 497 (test claim permit, Provisions C.11.c.ii.2.e. and C.12.c.ii.2.e.).

This submittal shall include all data used and a full description of models and model inputs relied on to establish this relationship.[518]

- Submit in the 2020 Annual Report an estimate of the amount and characteristics of land area that will be treated through Green Infrastructure implementation by 2020, 2030, and 2040. This submittal shall include all data used and a full description of models and model inputs relied on to generate this estimate.[519]
- Submit in the 2020 Annual Report a reasonable assurance analysis to quantitatively demonstrate that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/year will be realized by 2040 through implementation of Green Infrastructure Projects. This submittal shall include all data used and a full description of models and model inputs relied on to make the demonstration and documentation of peer review of the reasonable assurance analysis.[520]
- Beginning with the 2019 Annual Report, submit as part of reporting for C.11.b.iii.2. and C.12.b.iii.4., an estimate of the amount of mercury and PCBs load reductions resulting from Green Infrastructure implementation during the term of the Permit. This submittal shall include all data used and a full description of models and model inputs relied on to generate this estimate.[521]

  a. Provisions C.11.c.ii.1. and C.12.c.ii.1., which require permittees to reduce mercury loads by 48 g/year and PCBs loads by 120 g/year, respectively, by June 30, 2020, through Green Infrastructure Projects, do not mandate a new program or higher level of service.

First, the Commission finds that the requirement to implement Green Infrastructure Projects to achieve the interim mercury and PCBs load reductions by June 30, 2020, is not new.

As indicated above, the prior permit implemented the WLAs set in the mercury and PCBs TMDLs.[522] Under the prior permit's receiving water limitations and discharge prohibitions, permittees were required to comply with the Basin Plan, which included the

[518] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.1., C.12.c.iii.1.).

[519] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.2., C.12.c.iii.2.).

[520] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.3., C.12.c.iii.3.).

[521] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.4. and C.12.c.iii.4.).

[522] Exhibit A, Test Claim, pages 295 and 299 (prior permit, Fact Sheet, Findings C.11-1. and C.12.).

TMDL WLAs for mercury, and prohibited the permittees from violating water quality standards for these pollutants, including the standards for both mercury and PCBs.[523] To achieve these water quality standards, the prior permit required permittees to implement control measures *and* other actions required in Provisions C.2. through C.15. of the prior permit.[524] Provision C.3.c. of the prior permit required all Regulated Projects, including public and private regulated projects, to treat 100 percent of their stormwater runoff through onsite low impact development (LID), which is a type of Green Infrastructure.[525] Thus, under prior law, permittees were already required to impose Green Infrastructure requirements on any Regulated Projects within their jurisdictions, based on their regulatory authority and for their own public projects, to reduce their mercury and PCBs loads to meet water quality standards. The Fact Sheet notes that the amount of mercury load reductions required to be achieved through Green Infrastructure by Provisions C.11.c. and C.12.c. of the test claim permit were deemed feasible because they are equivalent to the scale of load reductions achieved through the Green Infrastructure and other C.3-related treatment controls implemented during the prior permit term; and the PCBs load reductions were similarly found to be achievable based on information learned from pilot projects in the prior term.[526] Thus, implementing Green Infrastructure requirements to satisfy the TMDL wasteload allocations for mercury and PCBs on public and private Regulated Projects (the definition of which has not changed since the prior permit), is not new, but continues the existing obligation to reduce mercury and PCBs loads to meet the wasteload allocations.

In addition, the state has not mandated compliance with these provisions by requiring Green Infrastructure on a permittee's own public projects. Although the test claim permit says that permittees "shall implement green infrastructure projects" during the permit term, it also specifies that both private and public projects count towards

---

[523] Exhibit A, Test Claim, page 91 (prior permit, Provision B.2); California Code of Regulations, title 23, section 3915 (Register 2007, No. 45) (codifying the San Francisco Bay mercury TMDL adopted by R2-2006-005); see also, Exhibit A, Test Claim, page 178 (prior permit, Provision C.11., which identified the same WLA for mercury of 82 kg/yr for urban runoff, "to be achieved by February 2028 and, as a way to measure progress an interim loading milestone of 120 kg/yr, halfway between the current load and the allocation, should be achieved by February 2018.") and pages 185, 220 (prior permit, Provision C.12., which states the purpose of the PCBs control provisions was to "achieve Waste Load Allocations adopted under Total Maximum Daily Loads" and "to implement the urban runoff requirements of the PCBs TMDL and reduce PCBs loads to make substantial progress toward achieving the urban runoff PCBs load allocation."); Exhibit X (2), Basin Plan 2007, page 57.

[524] Exhibit A, Test Claim, page 92 (prior permit, Provision C.1.).

[525] Exhibit A, Test Claim, page 108 (prior permit, Provisions C.3.c.).

[526] Exhibit A, Test Claim, pages 639, 642 (test claim permit, Fact Sheet).

achieving the required reductions.[527] Permittees have the option of satisfying this requirement entirely through approving private projects and requiring LID or other Green Infrastructure measures as permit conditions. No evidence has been presented to support a finding that requiring Green Infrastructure on private projects would not be able to meet the load reduction requirements of the test claim permit. Even if a permittee was required to install Green Infrastructure on their own public projects to meet the TMDL requirements, these costs would not be mandated by the state. As explained above, activities undertaken at the option or discretion of local government, without legal or practical compulsion, do not trigger a state-mandated program within the meaning or article XIII B, section 6.[528] In this case, the permittees have the authority to develop property,[529] but are not legally compelled to develop property. There is no evidence that local agencies are practically compelled, as the only reasonable means necessary to carry out core mandatory functions, to develop or redevelop property and comply with the Green Infrastructure requirements on their own public property.[530] Nor is there evidence that a failure to develop property would subject

---

[527] Exhibit A, Test Claim, pages 488, 496 (test claim permit, Provisions C.11.c.i., and C.12.c.i.).

[528] *City of Sacramento v. State of California* (1990) 50 Cal.3d 51, 73-76; *Department of Finance v. Commission on State Mandates* (*Kern*) (2003) 30 Cal.4th 727; *Department of Finance v. Commission on State Mandates* (POBRA) (2009) 170 Cal.App.4th 1355, 1365-1366.

[529] For example, see Government Code section 23004 (counties *may* purchase, receive by gift or bequest, and hold land within its limits, or elsewhere when permitted by law; and manage, sell, lease, or otherwise dispose of its property as the interests of its inhabitants require); Government Code sections 37350-37353 (cities *may* purchase, lease, receive, hold, and enjoy real and personal property, and control and dispose of it for the common benefit; may erect and maintain buildings for municipal purposes; and may acquire property for parking motor vehicles, and for opening and laying out any street; Government Code 37111 ("When the legislative body deems it necessary that land purchased for park or other purposes be used for construction of public buildings or creation of a civic center, it *may* adopt an ordinance by a four-fifths vote declaring the necessity and providing for such use"); Streets and Highways Code, sections 1800 ("The legislative body of any city *may* do any and all things necessary to lay out, acquire, and construct any section or portion of any street or highway within its jurisdiction as a freeway, and to make any existing street or highway a freeway."); 1801 ("The legislative body of any city *may* close any street or highway within its jurisdiction at or near the point of its intersection with any freeway, or *ma*y make provision for carrying such street or highway over, under, or to a connection with the freeway, and *may* do any and all necessary work on such street or highway.").

[530] *Department of Finance v. Commission on State Mandates* (2009) 170 Cal.App.4th 1355, 1368 (POBRA).

the claimant to "certain and severe…penalties" such as "double…taxation" or other "draconian" consequences.[531]

Moreover, implementing the Green Infrastructure requirements on a permittee's own public development is not unique to government and does not impose a new program or higher level of service since the test claim permit subjects both public and private projects to the requirements.

Accordingly, although the test claim permit may result in increased costs to implement Green Infrastructure requirements to achieve water quality standards for mercury and PCBs on more projects (which, alone, does not trigger the reimbursement requirement under article XIII B, section 6),[532] Provisions C.11.c.ii.1. and C.12.c.ii.1. do not mandate a new program or higher level of service.

b. Provisions C.11.c.ii.2., C.11.c.iii.1., C.11.c.iii.2., C.11.c.iii.3., C.12.c.ii.2., C.12.c.iii.1., C.12.c.iii.2., and C.12.c.iii.3. mandate a new program or higher level of service to prepare a reasonable assurance analysis of their future mercury and PCBs reductions that will be achieved through Green Infrastructure and to submit one-time reports on information based on the reasonable assurance analysis. However, the annual reporting requirements in Provisions C.11.c.iii.4. and C.12.c.iii.4. are not new and do not mandate a new program or higher level of service.

Provisions C.11.c.ii.2. and C.12.c.ii.2. require the permittees to prepare a reasonable assurance analysis of *future* mercury and PCBs load reductions that quantifies the relationship between the area of Green Infrastructure implementation and the loads reduced, taking into consideration the scale of contamination and the pollutant removal effectiveness of the Green Infrastructure strategies; estimates the amount of land area that will be treated through Green Infrastructure and the loads reduced by 2020, 2030, and 2040; quantitatively demonstrates permittees will achieve the specific load reductions for mercury and PCBs through Green Infrastructure by 2040; and ensures that the calculation methods, models, model inputs, and model assumptions used in the analysis are validated through a peer review process [533] The Fact Sheet explains that the permittees can use the reasonable assurance guidelines already underway in Southern California to comply with this requirement:

> Fortunately, the permittees in the Bay Area can take advantage of related (reasonable assurance analysis) efforts already underway in Southern California. The Los Angeles Regional Water Board has produced a useful set of guidelines for conducting a Reasonable Assurance Analysis (RAA) for the watershed management programs that are required through their

[531] *Department of Finance v. Commission on State Mandates* (*Kern)* (2003) 30 Cal.4th 727, 754 citing *City of Sacramento v. State* (1990) 50 Cal.3d 51, 74.

[532] *City of Anaheim v. State of California* (1987) 189 Cal.App.3d 1478, 1483.

[533] Exhibit A, Test Claim, pages 489-490, 497 (test claim permit, Provisions C.11.c.ii.2. and C.12.c.ii.2.).

> MS4 permits. [Fn. omitted.] These guidelines provide an excellent reference and starting point for the RAA required through C.11/12.c in terms of the mechanics of the analysis, BMP identification, critical condition selection, choice of models, model calibration criteria, modeling inputs, and model outputs. The crucial feature of the Southern California RAAs is that they must demonstrate with sufficient analytical rigor that the suite of foreseeable control measures to reduce loads will result in compliance with final WLAs. The RAA performed for PCBs and mercury for the San Francisco Bay Area will be similar in many respects to the type of analysis described in the Southern California guidance document, but they must also account for the local watershed characteristics as well as what has been learned about the distribution, fate, and transport characteristics of PCBs and mercury.[534]

The Fact Sheet further states that preparing the reasonable assurance analysis will be a step-wise process, requiring the permittees to "establish the relationship between areal extent of green infrastructure implementation and mercury load reductions, estimate the amount and characteristics of land area that will be treated through green infrastructure in future years, and estimate the amount of mercury load reductions that will result from green infrastructure implementation by specific future years. Ultimately, the reasonable assurance analysis will require the use of one or more models."[535]

In addition, Provisions C.11.c.iii. and C.12.c.iii. require permittees to include the reasonable assurance information in several stages in the Annual Reports. In the 2018 Annual Report, they provide the quantitative relationship between Green Infrastructure and mercury/ PCBs load reduction, including all data used and a full description of the models and model inputs relied on.[536] Beginning with the 2019 Annual Report, permittees provide an estimate of the mercury and PCBs loads reduced through Green Infrastructure during the permit term, including all data and a description of the models and model inputs used.[537] And in the 2020 Annual Report, they estimate the amount and characteristics of land area that will be treated through Green Infrastructure by 2020, 2030, and 2040, and give the reasonable assurance analysis which quantitatively demonstrates they will realize 10 kg/year mercury load reduction and 3 kg/year PCBs load reduction through Green Infrastructure by 2040, including all data used and a description of the models and model inputs relied on.[538]

[535] Exhibit A, Test Claim, page 640 (test claim permit, Fact Sheet).

[536] Exhibit A, Test Claim, pages 490 and 497 (test claim permit, Provisions C.11.c.iii.1. and C.12.c.iii.1.)

[537] Exhibit A, Test Claim, pages 490 and 497 (test claim permit, Provisions C.11.c.iii.4. and C.12.c.iii.4.).

[538] Exhibit A, Test Claim, pages 490 and 497 (test claim permit, Provisions C.11.c.iii.2., C.11.c.iii.3., C.12.c.iii.3., and C.12.c.iii.2.)

Preparing a reasonable assurance analysis of future mercury and PCBs load reductions is new. Federal law requires annual assessments of the controls used by the permittees to ensure compliance with water quality standards during the permit term, including the WLAs established in TMDLs, and an annual report that includes the implementation status of all permit conditions.[539] Federal law does not require a reasonable assurance analysis of *future* reductions, however. In addition, the prior permit did not require a reasonable assurance analysis.[540] Thus, this requirement is new.

However, the requirement in Provisions C.11.c.iii.4. and C.12.c.iii.4. to provide an estimate beginning with the 2019 Annual Report of the mercury and PCBs loads reduced through Green Infrastructure during the permit term, including all data and a description of the models and model inputs used, is not new.[541] Federal law requires stormwater programs to be accompanied with an estimate of the expected reduction of pollutant loads, an annual assessment of the program, and annual reports that identify the status of implementing the stormwater management programs established as permit conditions, a summary of data including monitoring data accumulated during the year, and identification of water quality improvements.[542] The prior permit also required the permittees to file annual reports on the estimated loads of mercury and PCBs reduced as a result of the pilot projects.[543] Thus, the annual reporting required by C.11.c.iii.4. and C.12.c.iii.4. is not new.

The remaining reporting requirements all relate to the reasonable assurance analysis and are one-time in nature:

- Submit in the 2018 Annual Report as part of the reporting required for Provisions C.11.b.iii.2. and C.12.b.iii.3., the quantitative relationship between Green Infrastructure implementation and mercury and PCBs load reductions. This submittal shall include all data used and a full description of models and model inputs relied on to establish this relationship.[544]
- Submit in the 2020 Annual Report an estimate of the amount and characteristics of land area that will be treated through Green Infrastructure implementation by 2020, 2030, and 2040. This submittal shall include all data

[539] Code of Federal Regulations, title 40, section 122.42(c).

[542] Code of Federal Regulations, title 40, sections 122.26(d)(2)(iv); 122.42(c).

[543] Exhibit A, Test Claim pages 178-191, 206 (test claim permit, Provisions C.11., C.12., C.16.).

[544] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.1., C.12.c.iii.1.).

used and a full description of models and model inputs relied on to generate this estimate.[545]

- Submit in the 2020 Annual Report a reasonable assurance analysis to quantitatively demonstrate that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/year will be realized by 2040 through implementation of Green Infrastructure Projects. This submittal shall include all data used and a full description of models and model inputs relied on to make the demonstration and documentation of peer review of the reasonable assurance analysis.[546]

These reports are not required by federal law or the prior permit and, thus, they are new.

The Commission also finds that the requirements to prepare a reasonable assurance analysis of future mercury and PCBs load reductions and the new one-time reporting requirements are mandated by the state. The California Supreme Court, in *Department of Finance v. Commission on State Mandates*, identified the following test to determine whether certain conditions imposed by an NPDES stormwater permit issued by the Los Angeles Regional Water Board were mandated by the state or federal government:

> If federal law compels the state to impose, or itself imposes, a requirement, that requirement is a federal mandate. On the other hand, if federal law gives the state discretion whether to impose a particular implementing requirement, and the state exercises its discretion to impose the requirement by virtue of a "true choice," the requirement is not federally mandated.[547]

The courts have also explained "except where a regional board finds the conditions are the *only means* by which the [federal] 'maximum extent practicable' standard can be met, the State exercises a true choice by determining what controls are necessary to meet the standard."[548]

Here, the Regional Board argues that all activities required by Provisions C.11. and C.12. are federally mandated, because the San Francisco Bay is impaired for mercury and PCB, and these provisions are needed to ensure compliance with the respective TMDLs for those pollutants.

[546] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.3., C.12.c.iii.3.).

[547] *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 765.

[548] *Department of Finance v. Commission on State Mandates* (2017) 18 Cal.App.5th 661, 682 citing to *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 768, emphasis added.

> Both TMDLs require municipal stormwater agencies to take aggressive action to reduce mercury and PCBs in stormwater discharges and envision that these load reductions will be implemented in successive municipal stormwater permits. Both TMDLS recognized that identification of control measures that will effectively implement the load allocations will be a process of trial and error, and will not be possible within one permit term. U.S. EPA echoed this in its comments on the draft permit, stating, "EPA supports the Water Board's inclusion of specific numeric mercury and PCB milestones and deadlines within this permit cycle." EPA noted that these numeric milestones were consistent with federal guidance and recognized that the "pollutant-specific values are interim milestones to achieve step-wise progress in this permit as well as to measure progress towards attaining the final TMDL wasteload allocations (mercury in 2028 and PCBs in 2030)…." Accordingly, the TMDL provisions in the permit, described below, are (1) required pursuant to 303(d); (2) even if not a federal mandate, are not part of a new program and do not impose a higher level of service, and are not unique to local governments.[549]

Although the TMDLs require permittees to implement control measures to reduce mercury and PCBs loads, the reasonable assurance analysis of future mercury and PCBs load reductions and the new reporting one-time reporting requirements were imposed at the discretion of the Regional Board and there is no evidence in the record to support a finding that the requirements are the only means by which the federal MEP standard can be met.

In addition, these new state-mandated requirements are uniquely imposed on local government and provide a governmental service to the public and, thus, impose a new program or higher level of service.[550] Provisions C.11. and C.12. implement TMDLs restricting the discharge of pollutants into the San Francisco Bay. Although these TMDLs apply to all dischargers, both public and private entities, the specific requirements here are to prepare a reasonable assurance analysis, and include specific information found in the reasonable assurance analysis in one-time annual reports. These are requirements uniquely imposed on permittees, utilizing knowledge possessed through their regulatory permitting authority for projects built within their jurisdiction. They also provide the governmental service of helping to achieve necessary mercury and PCBs load reductions.

Accordingly, the following requirements imposed by Provisions C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., C.12.c.iii.1.-3., mandate a new program or higher level of service:

- Prepare a reasonable assurance analysis of future mercury and PCBs load reductions by doing the following:

---

[549] Exhibit C, Regional Board's Late Comments on the Test Claim, page 13.

[550] *Carmel Valley Fire Protection Dist. v. State of California* (1987) 190 Cal.App.3d 521, 537.

- Quantify the relationship between areal extent of Green Infrastructure implementation and mercury and PCBs load reductions, taking into consideration the scale of contamination of the treated area as well as the pollutant removal effectiveness of likely green infrastructure strategies.[551]
- Estimate the amount and characteristics of land area that will be treated through Green Infrastructure by 2020, 2030, and 2040.[552]
- Estimate the amount of mercury/PCBs load reductions that will result from Green Infrastructure implementation by 2020, 2030, and 2040.[553]
- Quantitatively demonstrate that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/yr will be realized by 2040 through the implementation of Green Infrastructure Projects.[554]
- Ensure that the calculation methods, models, model inputs, and modeling assumptions used to fulfill provisions C.11.c.ii.2.a.-d. and C.12.c.ii.2.a.-d. above have been validated through a peer review process.[555]

- Submit in the 2018 Annual Report as part of the reporting required for Provisions C.11.b.iii.2. and C.12.b.iii.3., the quantitative relationship between Green Infrastructure implementation and mercury and PCBs load reductions. This submittal shall include all data used and a full description of the models and model inputs relied on to establish this relationship.[556]
- Submit in the 2020 Annual Report an estimate of the amount and characteristics of land area that will be treated through Green Infrastructure implementation by 2020, 2030, and 2040. This submittal shall include all data used and a full description of the models and model inputs relied on to generate this estimate.[557]

- Submit in the 2020 Annual Report a reasonable assurance analysis to demonstrate quantitatively that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/yr will be realized by 2040 through the implementation of Green Infrastructure Projects. This submittal shall include all data used and a full description of models and model inputs relied on to make the demonstration and documentation of peer review of the reasonable assurance analysis.[558]

    e. Most of the requirements in Provisions C.11.a. and C.11.b., regarding control measures to achieve mercury load reductions in accordance with the mercury TMDL, are not new and do not mandate a new program or higher level of service. However, the requirement in Provision C.11.a.iii.1. to report on progress towards developing a list of the watersheds and management areas where control measures are currently being implemented or will be implemented during the permit term, is new and imposes a state-mandated new program or higher level of service.

For the reasons below, the Commission finds that except for the requirement to provide a progress report on preparing the list of watersheds and management areas where control measures are implemented or will be implemented during the permit term (C.11.a.iii.1.), the remaining requirements imposed by Provisions C.11.a. and b. are *not* new and do not constitute a new program or higher level of service.

i. Most of the requirements in Provisions C.11.a. and C.11.b. relating to the reduction of mercury are not new, except for the requirement to report on progress toward developing a list of the watersheds and management areas where mercury control measures are currently being implemented or will be implemented during the permit term (C.11.a.iii.1.), which is new.

The plain language of Provision C.11.a. says that permittees shall "implement mercury source and treatment control measures and pollution prevention strategies to reduce mercury loads throughout the [permit area][559] by doing all of the following:

- Identify the watersheds or portions of watersheds (management areas) in which mercury control measures are currently being implemented and those in which new control measures will be implemented during the permit term, as well as identify the control measures that are currently being implemented and those that will be implemented in each watershed and management area.[560]

[558] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.3., C.12.c.iii.3.).

[559] Exhibit A, Test Claim, page 486 (test claim permit, Provision C.11.a.i.).

[560] Exhibit A, Test Claim, page 486 (test claim permit, Provisions C.11.a.ii.1. and 2.).

- Submit a schedule for control measure implementation.[561]
- Implement mercury source and treatment control measures and pollution prevention strategies and quantify mercury load reductions achieved by using the accounting methods established according to Provision C.11.b.[562]
- By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where mercury control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[563]
- In the 2016 Annual Report, report the list of watersheds and management areas where mercury controls are currently being implemented or will be implemented during the permit term, the specific control measures that are currently being implemented and those that will be implemented in these watersheds and management areas, and an implementation schedule for these control measures.[564] This report shall also include:
    - The number, type, and locations and/or frequency (if applicable) of control measures;
    - The description, scope, and start date of pollution prevention measures;
    - For each structural control and non-structural BMP, interim implementation progress milestones (e.g., construction milestones for structural BMPs or other relevant milestones for non-structural BMPs), and a schedule for milestone achievement; and
    - Clear statements of the roles and responsibilities of each participating Permittee for implementation of pollution prevention or control measures identified in C.11.a.ii.2.[565]
- Beginning with the 2017 Annual Report and continuing in all Annual Reports, update all the information required by Provision C.11.a.iii.2. as necessary to account for new control measures implemented, but not described in the 2016 Annual Report.[566]

Provision C.11.b. requires permittees to develop and implement an assessment methodology and data collection program to quantify in a technically sound manner

[561] Exhibit A, Test Claim, page 486 (test claim permit, Provision C.11.a.ii.3.)

[562] Exhibit A, Test Claim, page 486 (test claim permit, Provision C.11.a.ii.4.).

[563] Exhibit A, Test Claim, page 486 (test claim permit, Provision C.11.a.iii.1.).

[564] Exhibit A, Test Claim, pages 486-487 (test claim permit, Provision C.11.a.iii.2.).

[565] Exhibit A, Test Claim, page 487 (test claim permit, Provision C.11.a.ii.2.a-d.).

[566] Exhibit A, Test Claim, page 487 (test claim permit, Provision C.11.a.iii.3.).

mercury loads reduced through implementation of pollution prevention, source control, and treatment control measures, including mercury source control, stormwater treatment, green infrastructure, and other measures. This assessment methodology shall be used to demonstrate progress towards achieving the load reductions required in this permit term and the program area wasteload allocations.[567] The Fact Sheet states that the reasonable and technically sound load reduction accounting system was based on information submitted by the permittees in their 2014 Integrated Monitoring Report.[568] The test claim permit therefore describes the activities required by this task as "documenting the method described in the Fact Sheet or any alternative methodology, updating and refining the accounting system to account for new information, justifying assumptions, analytical methods, sampling schemes and parameters used to quantify the load reduction for each type of control measure, and indicating what information will be collected and submitted to confirm the calculated load reduction for each control measure implemented."[569] Provision C.11.b. requires the following tasks:

- Adequately quantify the mercury load reductions achieved through implementing pollution prevention, source control, and treatment control efforts.[570]
- Submit the chosen assessment methodology and data collection program with the 2016 Annual Report for executive approval.[571]
- Beginning with the 2017 Annual Report, annually report the mercury loads reduced using either the default or an approved alternative assessment methodology, to demonstrate the cumulative mercury load reduced from each control measure implemented since the beginning of the permit term; and submit all supporting data and information necessary to substantiate the load reduction estimates, including appropriate reference to the control measure descriptions required under C.11.a.[572]
- Beginning with the 2018 Annual Report, submit any necessary refinements to the measurement and estimation methodologies to assess mercury load reductions in the subsequent permit term for Executive Officer approval.[573]

The Commission finds that most of these requirements are *not* new and, thus, do not constitute a new program or higher level of service, except for the requirement to provide a progress report on preparing the list of watersheds and management areas

[567] Exhibit A, Test Claim, page 487 (test claim permit, Provision C.11.b.i.).

[568] Exhibit A, Test Claim, page 638 (test claim permit, Fact Sheet).

[571] Exhibit A, Test Claim, page 488 (test claim permit, Provisions C.11.b.iii.1.).

[572] Exhibit A, Test Claim, page 488 (test claim permit, Provisions C.11.b.iii.2.).

[573] Exhibit A, Test Claim, page 488 (test claim permit, Provisions C.11.b.iii.3.).

where control measures are implemented or will be implemented during the permit term (C.11.a.iii.1.), which is new.

The requirements to select and implement control measures and mercury source and treatment control measures in selected watersheds in accordance with Provisions C.11.a.i. and C.11.a.ii.1., 2., and 4., are not new and do not impose a new program or higher level of service. As indicated above, the mercury TMDL became effective in February 2008, before the December 1, 2009 effective date of the prior permit.[574] TMDLs calculate the maximum amount of each constituent pollutant that the water body can assimilate and still meet water quality standards.[575] The TMDL and the wasteload allocations allocated to dischargers are required by federal law to be established at levels necessary to meet water quality standards.[576] And existing federal law requires permittees to meet water quality standards by implementing controls to reduce pollutants in urban runoff from commercial, residential, industrial, and construction land uses or activities, and to have the legal authority to control the discharges to their MS4.[577]

Moreover, meeting water quality standards for mercury is not new to the claimants; narrative criteria or objectives existed in the Basin Plan before the TMDLs were adopted.[578] The Basin Plan provided that surface waters shall not contain concentrations of chemical constituents in amounts that adversely affected any designated beneficial use.[579] The Basin Plan also had a water quality objective for

---

[574] Exhibit X (4), Order R2-2006-0052, Mercury TMDL, page 4; California Code of Regulations, title 23, section 3915; Exhibit A, Test Claim, page 207 (prior permit, Provision C.21.).

[575] United States Code, title 33, section 1313(d); Code of Federal Regulations, title 40, section 130.7(c).

[576] Code of Federal Regulations, title 40, section 130.2(h), 130.7(c)(1) ("TMDLs hall be established for all pollutants preventing or expected to prevent attainment of water quality standards"); *Communities for a Better Environment v. State Water Resources Control Bd.* (2003) 109 Cal.App.4th 1089, 1095-1096.

[577] United States Code, title 33, section 1342(p)(3)(B)(iii) (Permits for discharges from municipal storm sewers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods"); Code of Federal Regulations, title 40, section 122.26(d)(2)(i)(A-D) and (iv)(A-D).

[578] Exhibit X (4), Order R2-2006-0052, Mercury TMDL, pages 6, 10 (Before the adoption of the TMDL for mercury, the Basin Plan provided that surface waters shall not contain concentrations of chemical constituents in amounts that adversely affected any designated beneficial use. In 1998, the Regional Board adopted a 303(d) impaired water body list classifying all of San Francisco Bay as impaired due to mercury.)

[579] Exhibit X (4), Order R2-2006-0052, Mercury TMDL, page 6.

mercury in surface waters not to exceed a 4-day average of 0.025 ug/l, and a one-hour average of 2.1 ug/l.[580]

In addition, compliance with the wasteload allocations adopted in the mercury TMDL was required under the prior permit by performing the same activities as required by the test claim permit. The prior permit's discharge prohibitions and receiving water limitations in Provisions A and B required and prohibited the following:

- Permittees shall, within their respective jurisdictions, effectively prohibit the discharge of non-stormwater (materials other than stormwater) into, storm drain systems and watercourses.[581]
- It shall be prohibited to discharge rubbish, refuse, bark, sawdust, or other solid wastes into surface waters or at any place where they would contact or where they would be eventually transported to surface waters, including flood plain areas.[582]
- The discharge shall not cause conditions of nuisance or adversely affect the beneficial uses of the waters, including from "[s]ubstances present in concentrations or quantities that would cause deleterious effects on aquatic biota, wildlife, waterfowl, or that render of these unfit for human consumption."[583]
- The discharge shall not cause or contribute to a violation of any applicable water quality standard for receiving waters.[584]

The Basin Plan was amended to include the wasteload allocations adopted in the mercury TMDL.[585]

The prior permit, in Provision C.1. then required the permittees to "comply with Discharge Prohibitions A.1 and A.2 and Receiving Water Limitations B.1 and B.2 through the timely implementation of control measures *and* other actions specified in Provisions C.2 through C.15" of the prior permit.[586] The prior permit, in Provision C.8.e., also imposed monitoring requirements to ensure compliance with water quality standards, including pollutants of concern monitoring (including monitoring for mercury, a category 1 pollutant), to quantify annual loads or concentrations of pollutants of concern from tributaries to the Bay; quantify the decadal-scale loading or concentration trends of pollutants of concern from small tributaries to the Bay; and quantify the projected impacts of management actions (including control measures) on tributaries

[582] Exhibit A, Test Claim, page 91 (prior permit, Provision A.2.).

[583] Exhibit A, Test Claim, page 91 (prior permit, Provision B.1.).

[584] Exhibit A, Test Claim, page 91 (prior permit, Provision B.2.).

[585] California Code of Regulations, title 23, section 3915.

[586] Exhibit A, Test Claim, page 92 (Prior Permit, Provision C.1.), emphasis added.

and identifying where these management actions should be implemented to have the greatest beneficial impact.[587] Provision C.11. of the prior permit specifically required the permittees to develop and implement a monitoring program to quantify mercury loads and loads reduced through source control, treatment, and other management measures pursuant to Provision C.11.g.[588] These requirements are consistent with existing federal law, which requires the claimants to monitor compliance with the effluent limitations identified in an NPDES permit, implement best management practices to control the pollutants, and report monitoring results at least once per year, or within 24 hours for any noncompliance which may endanger health or the environment.[589]

Thus, the permittees were required by prior state and federal laws to select and implement control measures of their choosing to meet the water quality standards for mercury. These prior requirements also implement a 1999 precedential order from the State Water Resources Control Board requiring permits to achieve water quality standards in protected waters through the implementation of control measures.[590] Therefore, the claimants had an existing duty to comply with the water quality standards for mercury when the prior permit was adopted through the selection and implementation of control measures in their water bodies and, therefore, these requirements are not new.

---

[587] Exhibit A, Test Claim, pages 163-166 (prior permit, Provision C.8.e.).

[588] Exhibit A, Test Claim, page 182 (prior permit, Provision C.11.g.).

[589] United States Code, title 33, section 1342(p)(3)(B)(iii) requires that permits for discharges from municipal storm sewers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as . . . the State determines appropriate for the control of such pollutants." Emphasis added. See also, Code of Federal Regulations, title 40, sections 122.41 (conditions applicable to all permits, including monitoring and reporting requirements); section 122.44(i) (monitoring requirements to ensure compliance with permit limitations); section 122.48 (requirements for recording and reporting monitoring results); and Part 127 (electronic reporting).

[590] Exhibit A, Test Claim, page 234 (prior permit, Fact Sheet); Exhibit X (6), State Water Resources Control Board Order WQ 2015-0075, pages 11-12, which describes the Water Board's 1999 Order; see also *Building Industry Association of San Diego County v. State Water Resources Control Board* (2004) 124 Cal.App.4th 866, 880 (holding permit provisions requiring compliance with water quality standards are proper under federal law); *Natural Resources Defense Council, Inc. v. County of Los Angeles* (2013) 725 F.3d 1194, 1199, 1206-1207 (holding that if a permittee's monitoring data shows that the level of pollutants in federally protected water bodies exceeds those allowed under the permit, then, as a matter of permit construction, the monitoring data conclusively demonstrates that the County Defendants are not "in compliance" with the Permit conditions.).

Moreover, the requirements to select and implement control measures to reduce the discharge of mercury to protected waters in selected watersheds in accordance with the TMDL is not unique to government and does not provide a governmental service to the public and, therefore, does not impose a new program or higher level of service.[591] The TMDL for mercury also imposed wasteload allocations on private industrial dischargers, including Chevron, Conoco, Martinez Refining Company, Valero, C&H Sugar, requiring these dischargers to reduce their discharges to meet water quality standards for mercury by implementing "effective programs to control mercury sources and loading."[592] Thus, compliance with the mercury TMDL by implementing control measures is not uniquely imposed on government and does not provide a *governmental* service to the public, but applies equally to public and private entities that discharge to the Bay. In this respect, the TMDL requirements are no different from the alleged mandated activities in *County of Los Angeles v. Department of Industrial Relations*.[593] In that case, the County sought reimbursement for complying with earthquake and fire safety regulations applicable to elevators in public buildings.[594] The "County acknowledges that the elevator safety regulations apply to all elevators, not just those which are publicly owned."[595] The court concluded that therefore the regulations "do not impose a 'unique requirement' on local government, [and] they do not meet the second definition of 'program' established by [County of Los Angeles I]."[596] Similarly, in *City of Richmond*, state law exempted public safety employees from the requirement to pay death benefits to a deceased employee's survivors under workers compensation statutes.[597] After the state repealed the exemption for public safety employees, the city sought reimbursement for the payment of workers compensation death benefits, which had to be made in addition to a PERS death benefit.[598] The court denied reimbursement, finding that the payment of death benefits under the workers

compensation statutes was not unique to government. The court agreed with the Commission; "[t]hat [the test claim statute] affects only local government does not compel the conclusion that it imposes a unique requirement on local government."[599]

Therefore, the requirements to select and implement mercury source and treatment control measures in selected watersheds in accordance with Provisions C.11.a.i. and C.11.a.ii.1., 2., and 4., do not mandate a new program or higher level of service.

Provision C.11.a.ii.3. requires the permittees to submit a schedule of control measure implementation during the permit term. This requirement is not new. Federal law requires a proposed management program, which shall include a description of the structural and source control measure to control pollutants that are to be implemented during the life of the permit, an estimate of the expected resulting pollutant loads reduced, and a proposed schedule for implementing such controls.[600] Thus, it is not a new requirement to provide a schedule for control measures to be implemented during the permit term. Thus, Provisions C.11.a.ii.3. does not mandate a new program or higher level of service.

Provisions C.11.b.i. and ii. require permittees to develop and implement an assessment methodology and data collection program that will be used to quantify in a technically sound manner the mercury load reduced through the implementation of pollution prevention, source control, and treatment control measures, by either using the default methodology identified in the Fact Sheet (which is derived from 2014 Integrated Monitoring Report required by the prior permit), or modifying the program.[601] This is not a new requirement and does not mandate a new program or higher level of service. The prior permit required permittees to develop and implement a monitoring program to quantify their mercury loads and loads reduced through source control, treatment and other management measures.[602] Provision C.11.g.ii. of the prior permit specified this would be done by either: 1) quantifying through estimates the annual mercury load reduced through pollution prevention, source control, and treatment control efforts or other relevant efforts; 2) quantifying the mercury load as a rolling five-year annual average using data on flow and water column mercury concentrations; or 3) quantitatively demonstrating that the mercury concentration of suspended sediment that best represents sediment discharged with urban runoff is below the target of 0.2 mg mercury/kg dry weight. Permittees were required to report their chosen methods and a full description of the measurement and estimation methodology and rationale for the approach in their 2010 Annual Report; and report the results of their chosen monitoring/measurement approach concerning the loads assessment and estimate of

---

[600] Code of Federal Regulations title 40 section 122.26 (d)(2)(iv).

[601] Exhibit A, Test Claim, pages 487-488 (test claim permit, Provision C.11.b.i. and ii.).

[602] Exhibit A, Test Claim, page182 (prior permit, Provision C.11.g.i.).

loads reduced in the 2014 Integrated Monitoring Report.[603] The 2014 Integrated Monitoring Report was used as the basis for the default assessment methodology and data collection described in the Fact Sheet for Provision C.11.b. of the test claim permit.[604] Thus, using the existing methodology developed under the prior permit is not new and developing a new methodology is not required by the test claim permit, but a choice provided to the permittees. In addition, and as stated above, federal law requires a permittee's management program include an estimate of the expected resulting pollutant loads reduced.[605] Moreover, the mercury TMDL requires private dischargers to also monitor their discharges and document their mercury effluent concentrations, ongoing source control activities, and mercury loads avoided as a result, which is substantially the same as developing a data collection program, and thus the requirements are not unique to government or provide a governmental service to the public.[606] Therefore, requiring permittees to develop and implement an assessment methodology and data collection program in accordance with Provisions C.11.b.i. and ii. is not a new program or higher level of service, but was required for all dischargers by federal law and the TMDL, and the prior permit adopted for the local agency permittees, which implemented the mercury TMDL.

Moreover, the following reporting requirements imposed by Provisions C.11.b.iii.1.-3. are not new.

- Submit the chosen assessment methodology and data collection program with the 2016 Annual Report for executive approval.[607]
- Beginning with the 2017 Annual Report, annually report the mercury loads reduced using either the default or an approved alternative assessment methodology, to demonstrate the cumulative mercury load reduced from each control measure implemented since the beginning of the permit term; and submit all supporting data and information necessary to substantiate the load reduction estimates, including appropriate reference to the control measure descriptions required under C.11.a.[608]
- Beginning with the 2018 Annual Report, submit any necessary refinements to the measurement and estimation methodologies to assess mercury load reductions in the subsequent permit term for Executive Officer approval.[609]

[608] Exhibit A, Test Claim, page 488 (test claim permit, Provisions C.11.b.iii.2.).

[609] Exhibit A, Test Claim, page 488 (test claim permit, Provisions C.11.b.iii.3.).

Under federal law, a permittee, when obtaining an NPDES permit, is required to identify a proposed management program that includes measures to control pollutants during the life of the permit, an estimate of the expected pollutant loads reduced as a result of those measures, and a proposed schedule for implementing such controls.[610] Federal law then requires that an annual report be filed by the permittees by the anniversary date of the issuance of the permit and include the following information:

- The status of implementing the components of the stormwater management program that are established as permit conditions.
- Proposed changes to the stormwater management programs that are established as permit conditions. Such proposed changes shall be consistent with Code of Federal Regulations, title 40, 122.26(d)(2)(iii) (which requires a permittee to provide information, as specified, characterizing the quality and quantity of discharges covered in the permit application).
- Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit.
- A summary of data, including monitoring data, that is accumulated throughout the reporting year.
- Annual expenditures and budget for the year following each annual report.
- A summary describing the number and nature of enforcement actions, inspections, and public education programs.
- Identification of water quality improvements or degradation.[611]

As indicated above, the permittees were already required by the prior permit to use control measures to reduce the discharge of mercury and, thus, were required by federal law to report the status of that program, the mercury loads reduced, and any necessary refinements to the measurement and estimation methodologies chosen to assess mercury load reductions.[612] The prior permit also required the permittees, in Provision C.11.g.iii., to identify the monitoring and measurement approach the permittees chose to use in the 2010 annual report and to report the mercury loads assessment and loads reduced in the 2014 Integrated Monitoring Report.[613] Thus, none of the activities required by Provision C.11.b. are new.

In contrast, Provision C.11.a.iii.1. requires permittees to submit a report on their *progress towards developing* the list of where control measures will be implemented and the monitoring data and other information used to select them. This progress report answers a separate question than the information that is to be included in the 2016

---

[610] Code of Federal Regulations title 40 section 122.26 (d)(2)(iv).

[611] Code of Federal Regulations, title 40, section 122.42(c).

[612] Exhibit A, Test Claim, page 178 (prior permit, Provision C.11.).

[613] Exhibit A, Test Claim, pages 182-183 (prior permit, Provision C.11.g.iii.).

Annual Report under Provision C.11.a.iii.2., namely verifying that the permittee is working to prepare the list and is using data and other information likely to result in a satisfactorily completed list. It also has a separate and additional deadline from any other previously required reports of April 1, 2016. Therefore, the following is a new requirement within Provision C.11.a.iii.1.:

- By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where mercury control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[614]

ii. The new requirement imposed by Provision C.11.a.iii.1. to file a progress report with the Regional Board by April 1, 2016, is mandated by the state and imposes a new program or higher level of service within the meaning of article XIII B, section 6 of the California Constitution.

The California Supreme Court, in *Department of Finance v. Commission on State Mandates*, identified the following test to determine whether certain conditions imposed by an NPDES stormwater permit issued by the Los Angeles Regional Water Board were mandated by the state or the federal government:

> If federal law compels the state to impose, or itself imposes, a requirement, that requirement is a federal mandate. On the other hand, if federal law gives the state discretion whether to impose a particular implementing requirement, and the state exercises its discretion to impose the requirement by virtue of a "true choice," the requirement is not federally mandated.[615]

As indicated in the court's decision, this is the long-standing test identified in prior case law to determine if requirements imposed by state statute or executive order are mandated by the state or the federal government when the state is implementing federal law.[616]

---

[614] Exhibit A, Test Claim, page 486 (test claim permit, Provision C.11.a.iii.1.).

[615] *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 765.

[616] See *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 764-765, where the court explains the following prior decisions: *City of Sacramento v. State of California* (1990) 50 Cal.3d 51, which addressed local governments' reimbursement claims for the costs of extending unemployment insurance protection to their employees pursuant to a federal statute that induced the state's compliance with a carrot and stick; *County of Los Angeles v. Commission on State Mandates* (1995) 32 Cal.App.4th 805, addressing a state statute that required local governments to provide indigent criminal defendants with experts for the preparation of their defense in accordance with federal law; and *Hayes v. Commission on State Mandates* (1992) 11

The courts have also explained "except where a regional board finds the conditions are the only means by which the [federal] 'maximum extent practicable' standard can be met, the State exercises a true choice by determining what controls are necessary to meet the standard."[617] "That the . . . Regional Board found the permit requirements were 'necessary' to meet the standard establishes only that the . . . Regional Board exercised its discretion."[618]

Here, the mercury TMDL is required by federal law since the waterbodies were 303(d) listed as impaired because of mercury. Regional boards are then required by federal law to include effluent limits compliant with "all applicable water quality standards" and "consistent with the assumptions and requirements of any available wasteload allocation for the discharge" in NPDES permits.[619] The permits can also include such other provisions as the permitting agency determines to be appropriate for the control of pollutants.[620]

However, the specific new activity found in Provision C.11.a.iii.1. was for permittees to submit a separate report by April 1, 2016 on their progress towards developing a list of the watersheds and management areas where mercury control measures are currently being implemented and those in which new control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas. This progress report is in addition to the Annual Report, as demonstrated by the fact that permittees are required to submit the finished version of the list of watersheds and management areas later that same year in their 2016 Annual Report.[621] Federal law does not require NPDES stormwater permittees to submit an additional report on their progress in preparing the required information about where control measures are being implemented. Thus, the Regional Board exercised discretion when it required permittees to report by April 1, 2016 on progress towards developing the list of watersheds and management areas where mercury control measures are being implemented and those where control measures will be implemented, as well as the monitoring data and other information used to identify the areas.

Cal.App.4th 1564, which addressed state special education statutes implementing the federal Education of the Handicapped Act.

[618] *Department of Finance v. Commission on State Mandates* (2017) 18 Cal.App.5th 661, 682.

[619] Code of Federal Regulations, title 40, section 122.44(d)(1)(vii).

[620] United States Code, title 33, section 1342(p)(3)(B)(iii).

[621] See Exhibit A, Test Claim, page 487 (test claim permit, Provision C.11.a.iii.2.).

Moreover, the requirement of Provision C.11.a.iii.1. constitutes a new program or higher level of service. The requirement to submit a progress report is uniquely imposed on local agency permittees. The Regional Board has mandated that the permittees prepare this progress report and schedule as part of their BMPs to comply with the WLA assigned to MS4 permittees identified in the TMDL to achieve water quality standards for urban runoff and, thus, the requirement also provides a governmental service to the public.[622]

Accordingly, the Commission finds that Provision C.11.a.iii.1. mandates a new program or higher level of service by requiring permittees to perform the following activity:

- By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where mercury control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[623]

    f. Provisions C.12.a., C.12.d., and C.12.e., regarding control measures to achieve PCBs load reductions, impose some state-mandated new programs or higher levels of service to submit specific reports; prepare an implementation plan and schedule of future actions, and a reasonable assurance analysis showing control measures will be fully implemented in the future to achieve the PCBs TMDL wasteload allocations by 2030; and sample caulks and sealants in storm drains and roadway infrastructures. The remaining requirements are not new and do not mandate a new program or higher level of service.

Provision C.12. imposes requirements discussed below to achieve interim load reductions for PCBs during the term of the test claim permit, and to ultimately achieve the aggregate wasteload allocation of 1.6 kg/yr by March 2030, in accordance with the PCBs TMDL.[624]

i. Most of the requirements in Provision C.12.a. are not new and, thus, do not mandate a new program or higher level of service, except for some of the reporting requirements, which are new.

Provision C.12.a.i. requires permittees to "implement PCBs source and treatment control measures and pollution prevention strategies" to achieve the PCBs load reductions outlined in Table 12.1 throughout the permit area.[625] Table 12.1 identifies the following "PCBs Load Reductions Performance Criteria by County":

---

[622] See *Carmel Valley Fire Protection District v. State of California* (1987) 190 Cal.App.3d 521, 537-538.

[623] Exhibit A, Test Claim, page 486 (test claim permit, Provision C.11.a.iii.1.).

[624] Exhibit A, Test Claim, page 492 (test claim permit, Provision C.12.).

[625] Exhibit A, Test Claim, page 492 (test claim permit, Provision C.12.a.i.).

County	PCBs Load Reduction (g/yr) by June 30, 2018	PCBs Load Reduction (g/yr) by June 30, 2020
Alameda Permittees	160	940
Contra Costa Permittees	90	560
San Mateo Permittees	60	370
Santa Clara Permittees	160	940
Solano Permittees: Suisun City, Vallejo, Fairfield	30	190
Totals	**500**	**3000**[626]

Provision C.12.a.ii.4. explains that "For all Permittees combined, the county-specific average annual PCBs load reduction performance criteria shall total 0.5 kg/yr by June 30, 2018, and 3.0 kg/yr by June 30, 2020. The June 30, 2020, deadline shall be extended to December 31, 2020, if the Permittees provide documentation that control measures that will attain the load reduction will be implemented by December 31, 2020."[627]

Provision C.12.a.iv. also states that the permittees may meet the load reductions as a group, rather than by county, and can use an alternative method of distributing the county load reductions if they choose, but all permittees within a county shall use the same method of distributing the county load reductions.[628]

To implement this, the plain language of Provision C.12.a. requires the following:

- Identify the watersheds or portions of watersheds (management areas) in which PCBs control measures are currently being implemented and those in which new control measures will be implemented during the permit term, as well as identify the control measures that are currently being implemented and those that will be implemented in each watershed and management area.[629]

  The Fact Sheet identifies potential control measures including the removal, capping, and paving of contaminated sediment in newly developed or redeveloped areas; retrofits or other treatment controls, such as green infrastructure; cleanup of contaminated private properties; control measures to prevent discharge to storm drains of PCBs in building materials during

[626] Exhibit A, Test Claim, page 493 (test claim permit, Table 12.1.).

[627] Exhibit A, Test Claim, page 492 (test claim permit, Provision C.12.a.ii.4.).

[629] Exhibit A, Test Claim, page 492 (test claim permit, Provisions C.12.a.ii.1 and 2.).

demolition; and enhanced operation and maintenance control measures to reduce loads of mercury and PCBs, including street sweeping, drain inlet cleaning, pump station maintenance, and PCBs captured by full trash capture devices.[630]

- Submit a schedule for control measure implementation.[631]
- Implement sufficient control measures to achieve the permit-area-wide PCBs load reduction of 0.5 kg/year by June 30, 2018 and 3.0 kg/yr by June 30, 2020, or the county-specific load reduction performance criteria outlined in table 12.1.[632]
- By April 1, 2016, report progress towards developing a list of the watersheds and portions of watersheds (management areas) where PCBs control measures are currently being implemented and those in which PCBs control measures will be implemented during the permit term, including watersheds containing contaminated sites that were referred to the Water Board, as well as the monitoring data and other information used to select these watersheds and management areas.[633]
- In the 2016 Annual Report, report the list of watersheds and management areas where control measures are currently being implemented or will be implemented during the permit term, along with the specific control measures that are currently being implemented, and those that will be implemented in those watersheds and management areas and an implementation schedule for those control measures.[634] Include the following:
    - The number, type, and locations and/or frequency (if applicable) of control measures;
    - A cumulative listing of all potentially PCBs-contaminated sites permittees have discovered and referred to the Water Board to date, with a brief summary description of each site and where to obtain further information;
    - The description, scope, and start date of PCBs control measures;
    - For each structural control and non-structural BMP, interim implementation progress milestones (e.g. construction milestones for structural controls or other relevant implementation milestones for structural controls or non-structural BMPs) and a schedule for milestone achievement; and

[630] Exhibit A, Test Claim, pages 647-649 (test claim permit, Fact Sheet).

[631] Exhibit A, Test Claim, page 492 (test claim permit, Provision C.12.a.ii.3.)

[632] Exhibit A, Test Claim, page 492 (test claim permit, Provision C.12.a.ii.4.).

[633] Exhibit A, Test Claim, page 493 (test claim permit, Provision C.12.a.iii.1.).

[634] Exhibit A, Test Claim, pages 492-494 (test claim permit, Provision C.12.a.iii.2.).

- Clear statements of the roles and responsibilities of each participating permittee for implementation of pollution prevention or identified control measures.[635]

- Beginning with the 2017 Annual Report, update all information required in C.12.a.iii.2. as necessary to account for new control measures implemented but not described in the 2016 Annual Report.[636]

The Commission finds that the requirements to identify watersheds and implement PCBs source and treatment control measures and pollution prevention strategies to achieve PCBs load reductions in accordance with Provisions C.12.a.i., C.12.a.ii.1., C.12.a.ii.2., and C.12.a.ii.4. are not new and do not mandate a new program or higher level of service.

Before the adoption of the TMDL, the Basin Plan contained a narrative water quality objective stating that controllable water quality factors shall not cause a detrimental increase in toxic substances found in bottom sediments or aquatic life.[637] In addition, in May 2000, the CTR established numeric water quality criteria of 0.00017 ug/L total PCBs in water that apply to the San Francisco Bay.[638] The CTR is a water quality standard that applies to "'all waters' for 'all purposes and programs under the CWA.'"[639] However, all segments of the San Francisco Bay were not meeting the narrative and CTR water quality standards, were listed as impaired for PCBs, and were 303(d) listed in 1998.[640] Thus, the permittees had actual knowledge that PCBs loads had to be reduced in 1998.

The Regional Board adopted the PCBs TMDL on February 13, 2008; it was approved by the State Board on October 20, 2009; was approved by the Office of Administrative Law on March 1, 2010; and was approved by the U.S. EPA on March 29, 2010.[641] This was happening concurrently to drafting the prior permit, which became effective on December 1, 2009.[642]

[642] Exhibit A, Test Claim, page 207 (prior permit, Provision 21.).

TMDLs calculate the maximum amount of each constituent pollutant that the water body can assimilate and still meet water quality standards.[643] The TMDL and the wasteload allocations allocated to dischargers are required by federal law to be established at levels necessary to meet water quality standards.[644] Meeting water quality standards for these pollutants is not new to the claimants. Existing federal law requires permittees to meet water quality standards by implementing controls to reduce pollutants in urban runoff from commercial, residential, industrial, and construction land uses or activities, and to have the legal authority to control the discharges to their MS4.[645] In addition, and as explained above, narrative and numeric criteria or objectives existed in the Basin Plan and the CTR before the TMDLs were adopted. Moreover, the prior permit implemented the PCBs TMDL, stating that one of the goals was to "achieve Waste Load Allocations adopted under Total Maximum Daily Loads" and "to implement the urban runoff requirements of the PCBs TMDL and reduce PCBs loads to make substantial progress toward achieving the urban runoff PCBs load allocation."[646] Thus, compliance with the water quality standards and the wasteload allocations adopted in the PCBs TMDL was required under the prior permit and, as explained below, the prior permit imposed the same activities as required by the test claim permit.

In addition, the prior permit required the permittees to identify watersheds and implement PCBs source and treatment control measures and pollution prevention strategies to achieve PCBs load reductions in accordance with the wasteload allocations set by the TMDL. The prior permit's discharge prohibitions and receiving water limitations in Provisions A and B prohibited discharges that cause or contribute to a violation of any applicable water quality standard for receiving waters,[647] including those for PCBs, and also required the following:

---

[643] United States Code, title 33, section 1313(d); Code of Federal Regulations, title 40, section 130.7(c).

[644] Code of Federal Regulations, title 40, section 130.2(h), 130.7(c)(1) ("TMDLs shall be established for all pollutants preventing or expected to prevent attainment of water quality standards"); *Communities for a Better Environment v. State Water Resources Control Bd.* (2003) 109 Cal.App.4th 1089, 1095-1096.

[645] United States Code, title 33, section 1342(p)(3)(B)(iii) (Permits for discharges from municipal storm sewers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods"); Code of Federal Regulations, title 40, section 122.26(d)(2)(i)(A-D) and (iv)(A-D).

[646] Exhibit A, Test Claim, pages 185, 220 (prior permit, Provision C.12. and Fact Sheet); see also "The C.12 provisions are consistent with the regulatory approach and implementation plan of the San Francisco Bay PCBs TMDL adopted by the Water Board." (Exhibit A, Test Claim, page 299 (prior permit, Fact Sheet).)

[647] Exhibit A, Test Claim, page 91 (prior permit, Provision B.2.).

- Permittees shall, within their respective jurisdictions, effectively prohibit the discharge of non-stormwater (materials other than stormwater) into, storm drain systems and watercourses.[648]
- It shall be prohibited to discharge rubbish, refuse, bark, sawdust, or other solid wastes into surface waters or at any place where they would contact or where they would be eventually transported to surface waters, including flood plain areas.[649]
- The discharge shall not cause conditions of nuisance or adversely affect the beneficial uses of the waters, including from "[s]ubstances present in concentrations or quantities that would cause deleterious effects on aquatic biota, wildlife, waterfowl, or that render of these unfit for human consumption."[650]

The prior permit, in Provision C.1., then required the permittees to "comply with Discharge Prohibitions A.1 and A.2 and Receiving Water Limitations B.1 and B.2 through the timely implementation of control measures *and* other actions specified in Provisions C.2 through C.15" of the prior permit.[651] The Fact Sheet for the prior permit explains the "State Water Resources Control Board ("State Water Board") Order WQ 1999-05, is a precedential order requiring that municipal stormwater permits achieve water quality standards and water quality standard based discharge prohibitions through the implementation of control measures, by which Permittees' compliance with the permit can be determined" and that the "Water Board Order specifically requires that Provision C.1 include language that Permittees shall comply with water quality standards based discharge prohibitions and receiving water limitations through timely implementation of control measures and other actions to reduce pollutants in the discharges."[652] Thus, pursuant to the plain language of Provision C.1., the permittees were required by the prior permit to implement control measures of their choosing *and* the specific control actions specified in Provision C.12. to meet the water quality standards for PCBs.

The prior permit also imposed monitoring requirements to ensure compliance with water quality standards, including pollutants of concern monitoring in Provision C.8.e. (including monitoring for PCBs, a category 1 pollutant), to quantify annual loads or concentrations of pollutants of concern from tributaries to the Bay; quantify the decadal-scale loading or concentration trends of pollutants of concern from small tributaries to the Bay; and quantify the projected impacts of management actions (including control measures) on tributaries and identifying where these management actions should be

---

[648] Exhibit A, Test Claim, page 91 (prior permit, Provision A.1.).

[649] Exhibit A, Test Claim, page 91 (prior permit, Provision A.2.).

[650] Exhibit A, Test Claim, page 91 (prior permit, Provision B.1.).

[651] Exhibit A, Test Claim, page 92 (prior permit, Provision C.1.), emphasis added.

[652] Exhibit A, Test Claim, page 234 (prior permit, Fact Sheet).

implemented to have the greatest beneficial impact.[653] Provision C.12.g. of the prior permit required the permittees to develop and implement a monitoring program to quantify PCBs loads and loads reduced through source control, treatment, and other management measures implemented with the pilot projects, and directs the reader to "see C.11.g for details," which addresses the same requirement under the prior permit for mercury.[654] Provision C.11.g. of the prior permit required compliance by either: 1) quantifying through estimates the annual loads reduced through pollution prevention, source control, and treatment control efforts or other relevant efforts; 2) quantifying the load as a rolling five-year annual average using data on flow and water column mercury concentrations; or 3) quantitatively demonstrating that the concentration of suspended sediment that best represents sediment discharged with urban runoff is below the target. Permittees were required to report their chosen methods and a full description of the measurement and estimation methodology and rationale for the approach in their 2010 Annual Report; and report the results of their chosen monitoring/measurement approach concerning the loads assessment and estimate of loads reduced in the 2014 Integrated Monitoring Report.[655] Since the prior permit treated Provisions C.11.g. and C.12.g. for mercury and PCBs consistently, the specific requirements for reporting under C.11.g. also apply to Provision C.12.g. of the prior permit. These requirements are consistent with existing federal law, which requires the claimants to monitor compliance with the effluent limitations identified in an NPDES permit, implement best management practices to control the pollutants, and report monitoring results at least once per year, or within 24 hours for any noncompliance which may endanger health or the environment.[656]

Thus, the claimants had an existing duty to comply with the water quality standards for PCBs under the prior permit by identifying watersheds and implementing control measures of their choosing to reduce the discharge of PCBs in accordance with the PCBs TMDL to meet water quality standards. Though Provision C.12.a.ii.4. of the test claim permit sets a specific requirement that these control measures attain aggregate, region-wide PCBs load reductions totaling 0.5 kg/yr by June 30, 2018 and 3 kg/year by

---

[653] Exhibit A, Test Claim, pages 163-166 (prior permit, Provision C.8.e.).

[654] Exhibit A, Test Claim, page 190 (prior permit, Provision C.12.g.).

[655] Exhibit A, Test Claim, pages 182-183 (prior permit, Provision C.11.g.iii.).

[656] United States Code, title 33, section 1342(p)(3)(B)(iii) requires that permits for discharges from municipal storm sewers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as . . . the State determines appropriate for the control of such pollutants." Emphasis added. See also, Code of Federal Regulations, title 40, sections 122.41 (conditions applicable to all permits, including monitoring and reporting requirements); section 122.44(i) (monitoring requirements to ensure compliance with permit limitations); section 122.48 (requirements for recording and reporting monitoring results); and Part 127 (electronic reporting).

June 30, 2020, these interim deadlines are consistent with the resolution adopting the PCBs TMDL, as stated in the opening paragraph of Provision C.12., which set an aggregate, region-wide wasteload allocation for permittees of 1.6 kg/year to be achieved by 2030.[657]

Moreover, the requirements to select and implement control measures to reduce the discharge of PCBs to protected waters in selected watersheds in accordance with the TMDL is not unique to government and does not provide a governmental service to the public and, therefore, does not impose a new program or higher level of service.[658] The TMDL for PCBs also imposed wasteload allocations on private industrial dischargers, including Chevron, Conoco, and C&H Sugar, requiring these dischargers to reduce their discharges to meet water quality standards for PCBs by implementing "best management practices to maintain optimum treatment performance for solids removal and the identification and management of controllable sources.[659] Thus, compliance with the PCBs TMDL by implementing control measures is not uniquely imposed on government and does not provide a *governmental* service to the public, but applies equally to public and private entities that discharge to the Bay and are assigned a wasteload allocation. In this respect, the TMDL requirements are no different from the alleged mandated activities in *County of Los Angeles v. Department of Industrial Relations*.[660] In that case, the County sought reimbursement for complying with earthquake and fire safety regulations applicable to elevators in public buildings.[661] The "County acknowledges that the elevator safety regulations apply to all elevators, not just those which are publicly owned."[662] The court concluded that therefore the regulations "do not impose a 'unique requirement' on local government, [and] they do not meet the second definition of 'program' established by [County of Los Angeles I]."[663] Similarly, in *City of Richmond*, state law exempted public safety employees from the requirement to pay death benefits to a deceased employee's survivors under workers compensation

---

[657] Exhibit A, Test Claim, page 492 (test claim permit, Provision C.12.).

[658] *County of Los Angeles v. State of California* (1987) 43 Cal.3d 46, 56; *Carmel Valley Fire Protection Dist. v. State of California* (1987) 190 Cal.App.3d 521, 537; *Department of Finance v. Commission on State Mandates* (2021) 59 Cal.App.5th 546, 557.

[661] *County of Los Angeles v. Department of Industrial Relations* (1989) 214 Cal.App.3d 1538, 1545.

[662] *County of Los Angeles v. Department of Industrial Relations* (1989) 214 Cal.App.3d 1538, 1545.

[663] *County of Los Angeles v. Department of Industrial Relations* (1989) 214 Cal.App.3d 1538, 1545.

statutes.[664] After the state repealed the exemption for public safety employees, the city sought reimbursement for the payment of workers compensation death benefits, which had to be made in addition to a PERS death benefit.[665] The court denied reimbursement, finding that the payment of death benefits under the workers compensation statutes was not unique to government. The court agreed with the Commission; "[t]hat [the test claim statute] affects only local government does not compel the conclusion that it imposes a unique requirement on local government."[666]

Therefore, the requirements in Provisions C.12.a.i., C.12.a.ii.1., C.12.a.ii.2., and C.12.a.ii.4., are not new and do not mandate a new program or higher level of service.

Provision C.12.a.ii.3. requires the permittees to submit a schedule of control measure implementation during the permit term.[667] This requirement is not new. Federal law requires a proposed management program, which shall include a description of the structural and source control measure to control pollutants that are to be implemented during the life of the permit, an estimate of the expected resulting pollutant loads reduced, and a proposed schedule for implementing such controls.[668] Accordingly, it is not a new requirement to provide a schedule for control measures to be implemented during the permit term. Thus, Provision C.12.a.ii.3. does not mandate a new program or higher level of service.

In addition, some of the reporting requirements in Provision C.12.a.iii. are not new and do not mandate a new program or higher level of service. Provision C.12.a.iii. requires the permittees to include the following information in their 2016 Annual Report:

- A list of watersheds and management areas where control measures are currently being implemented or will be implemented during the term of the permit.
- A list of specific control measures currently being implemented and those that will be implemented, along with an implementation schedule.
- The number, type, and locations or frequency of control measures.
- A cumulative listing of all potentially PCB-contaminated sites permittees have discovered and referred to the Water Board to date, with a brief summary description of each site and where to obtain further information.
- The description, scope, and start date, of PCBs control measures.

[666] *City of Richmond v. Commission on State Mandates* (1998) 64 Cal.App.4th 1190, 1197.

[667] Exhibit A, Test Claim, page 492 (test claim permit, Provision C.12.a.ii.3.).

[668] Code of Federal Regulations title 40 section 122.26 (d)(2)(iv).

- For each structural control and non-structural BMP, interim implementation progress milestones (e.g., construction milestones for structural controls or other relevant implementation milestones for structural controls and non-structural BMPs) and a schedule for milestone achievement.
- Clear statements of the roles and responsibilities of each participating permittee for implementation of pollution prevention or control measures.[669]

Provision C.12.a.iii.3. then requires, beginning with the 2017 Annual Report and continuing in all Annual Reports, the permittees to update the above information as necessary to account for new control measures implemented but not described in the 2016 Annual Report.[670]

Under federal law, in order to obtain an NPDES permit, a permittee is required to identify a proposed management program that includes measures to control pollutants during the life of the permit, an estimate of the expected pollutant loads reduced as a result of those measures, and a proposed schedule for implementing such controls.[671] Federal law then requires that an annual report be filed by the permittees by the anniversary date of the issuance of the permit and include the following information:

- The status of implementing the components of the stormwater management program that are established as permit conditions.
- Proposed changes to the stormwater management programs that are established as permit conditions. Such proposed changes shall be consistent with Code of Federal Regulations, title 40, 122.26(d)(2)(iii) [which requires a permittee to provide information, as specified, characterizing the quality and quantity of discharges covered in the permit application].
- Revisions, if necessary, to the assessment of controls and the fiscal analysis reported in the permit.
- A summary of data, including monitoring data, that is accumulated throughout the reporting year.
- Annual expenditures and budget for the year following each annual report.
- A summary describing the number and nature of enforcement actions, inspections, and public education programs.
- Identification of water quality improvements or degradation.[672]

In addition, and as stated above, the permittees had to report their measurement and estimation methodology for the reduction of PCBs and the rationale for their approach in

---

[669] Exhibit A, Test Claim, pages 493-494 (test claim permit, Provision C.12.a.iii.2.).

[670] Exhibit A, Test Claim, page 494 (test claim permit, Provision C.12.a.iii.3.).

[671] Code of Federal Regulations title 40 section 122.26 (d)(2)(iv).

[672] Code of Federal Regulations, title 40, section 122.42(c).

the 2010 Annual Report; and report the results of their chosen monitoring/measurement approach concerning the loads assessment and estimate of loads reduced in the 2014 Integrated Monitoring Report. Thus, reporting the following information required by Provision C.12.a.ii.2. of the test claim permit is not new:

- A list of watersheds and management areas where control measures are currently being implemented or will be implemented during the term of the permit.
- A list of specific control measures currently being implemented and those that will be implemented, along with an implementation schedule.
- The number, type, and locations or frequency of control measures.
- The description, scope, and start date, of PCBs control measures.

Moreover, the requirement to update the above information beginning with the 2017 Annual Report to account for new control measures implemented but not described in the 2016 Annual Report, as required by Provision C.12.a.iii.3., is not new but is required by the existing federal requirement to annually report "revisions, if necessary, to the assessment of controls."[673]

However, prior law did not require the permittees to report the following new information in the 2016 Annual Report, in accordance with Provision C.12.a.iii.2.:

- A cumulative listing of all potentially PCB-contaminated sites permittees have discovered and referred to the Water Board to date, with a brief summary description of each site and where to obtain further information.
- For each structural control and non-structural BMP, interim implementation progress milestones (e.g., construction milestones for structural controls or other relevant implementation milestones for structural controls and non-structural BMPs) and a schedule for milestone achievement.
- Clear statements of the roles and responsibilities of each participating permittee for implementation of pollution prevention or control measures.[674]

In addition, while reporting where control measures are being implemented or will be implemented during the permit term is not new and required by federal law, Provision C.12.a.iii.1. requires permittees to report on their progress towards developing the list of where control measures will be implemented and the monitoring data and other information used to identify them by April 1, 2016. This answers a separate question from the information to be included in the 2016 Annual Report, namely verifying that the permittee is working on preparing the list in compliance with the permit terms and is using data that will likely result in a satisfactorily completed list. This report also has a deadline of April 1, 2016, separate and in addition to the annual reports already required, further demonstrating it is a new requirement.

---

[673] Code of Federal Regulations, title 40, section 122.42(c).

[674] Exhibit A, Test Claim, pages 493-494 (test claim permit, Provision C.12.a.iii.2.).

Therefore, the following are new requirements imposed by Provisions C.12.a.iii.1. and C.12.a.iii.2.:

- By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where PCBs control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[675]
- In the 2016 Annual Report, include the following information:
    - A cumulative listing of all potentially PCB-contaminated sites permittees have discovered and referred to the Water Board to date, with a brief summary description of each site and where to obtain further information.
    - For each structural control and non-structural BMP, interim implementation progress milestones (e.g., construction milestones for structural controls or other relevant implementation milestones for structural controls and non-structural BMPs) and a schedule for milestone achievement.
    - Clear statements of the roles and responsibilities of each participating permittee for implementation of pollution prevention or control measures for PCBs.[676]

ii. The required activities for Provision C.12.d., which require an implementation plan and schedule of future actions, and a reasonable assurance analysis for attaining the PCBs TMDL wasteload allocation by 2030, are new requirements.

Provision C.12.d. says that "Permittees shall prepare a plan and schedule for PCBs control measure implementation and reasonable assurance analysis demonstrating that sufficient control measures will be implemented to attain the PCBs TMDL wasteload allocations by 2030," and submit the plan and schedule in the 2020 Annual Report.[677] To implement this, the plain language in section C.12.d. requires the following:

- Prepare a PCBs control measures implementation plan, which must identify all technically and economically feasible PCBs control measures to be implemented (including green infrastructure projects).[678]

[675] Exhibit A, Test Claim, page 492 (test claim permit, Provisions C.12.a.ii.1. and C.12.a.iii.1.).

[676] Exhibit A, Test Claim, pages 493-494 (test claim permit, Provision C.12.a.iii.2.).

[677] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.).

[678] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.1.).

- Include a schedule for PCBs control measure implementation according to which these technically and economically feasible PCBs control measures will be fully implemented by 2030.[679]
- Provide an evaluation and quantification of the PCBs load reduction of such measures as well as an evaluation of costs, control measure efficiency and significant environmental impacts resulting from their implementation.[680]
- Prepare a reasonable assurance analysis demonstrating that sufficient control measures will be implemented to attain the PCBs TMDL wasteload allocations by 2030.[681]
- Submit the plan and schedule required by Provision C.12.d. in the 2020 Annual Report.[682]

The Fact Sheet explains that achievement of the allocations for stormwater runoff in 20 years pursuant to the PCBs TMDL will be challenging and the long-term plan and schedule required by Provision C.12.d. will help lay the foundation for an implementation timeframe that is longer than stated in the TMDL:

> The PCBs TMDL anticipated the challenge of achieving the urban runoff load reductions required to meet the TMDL allocations within the twenty-year implementation time frame. The TMDL implementation plan states that
>
> *"... achievement of the allocations for stormwater runoff, which is projected to take 20 years, will be challenging. Consequently, the Water Board will consider modifying the schedule for achievement of the load allocations for stormwater runoff provided that dischargers have complied with all applicable permit requirements and accomplished all of the following:*
>
> *• A diligent effort has been made to quantify PCBs loads and the sources of PCBs in the discharge;*
>
> *• Documentation has been prepared that demonstrates that all technically and economically feasible and cost-effective control measures recognized by the Water Board have been fully implemented, and evaluates and quantifies the PCBs load reduction of such measures;*
>
> *• A demonstration has been made that achievement of the allocation will require more than the remaining 10 years originally envisioned; and*

[679] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.2.).

[680] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.3.).

[681] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.i.).

[682] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.iii.).

> • *A plan has been prepared that includes a schedule for evaluating the effectiveness and feasibility of additional control measures and implementing additional controls as appropriate.*"
>
> Provision C.12.d provides the opportunity for Permittees to describe the full suite of actions that will be required to achieve the TMDL along with realistic timelines for this achievement. The load reductions for PCBs are difficult and time-consuming to achieve because of the distribution of sources in the landscape; challenges associated with finding and reducing these existing sources; and unpredictability related to demolition of PCBs containing structures. Further, some part of the expected PCB load reduction will come from long-term implementation of control strategies (like green infrastructure) that extend beyond the current implementation timeframe of the TMDL. The long-term plan and schedule required by this provision will help lay the foundation for an implementation timeframe that is longer than that stated in the TMDL.[683]

The Commission finds that the requirements imposed by Provision C.12.d. are new. Federal law requires a proposed management program for the permit term, which describes structural and source control measures to be implemented and a schedule for implementation, and further requires the assessment of the loads reduced and a fiscal analysis of the necessary capital and operational and maintenance expenditures and the source of funds to carry out the program.[684] However these federal requirements are specifically looking at the controls to be implemented during the permit term, while the requirements in Provision C.12.d. are looking all the way out to 2030.

Although permittees were required by the prior permit to attain the wasteload allocation set out in the PCBs TMDL,[685] there was no requirement for the permittees to create a control measures implementation plan and a reasonable assurance analysis laying out which control measures they intend to implement in order to achieve the wasteload allocations of the TMDL by 2030 and a schedule of when these control measures will be fully implemented in the future to achieve compliance by 2030. Nor was there a prior requirement to provide evaluations and quantifications of the load reductions these control measures will achieve in the future to 2030, or to evaluate their costs, efficiency and significant environmental impacts. Thus, the requirements in Provision C.12.d. are new.

[683] Exhibit A, Test Claim, page 653 (test claim permit, Fact Sheet).

[684] Code of Federal Regulations, title 40, section122.26 (d)(2)(iv)-(vi).

[685] Exhibit A, Test Claim, page 185 (prior permit, Provision C.12.).

iii. The activities required for Provision C.12.e., which require collecting and analyzing samples of caulks and sealants used in storm drains and roadway infrastructure, are new.

Provision C.12.e. requires permittees to evaluate the presence of PCBs in caulks and sealants used in storm drains or roadway infrastructure in public rights-of-way.[686] This section requires permittees to do the following:

- Collect at least 20 composite samples from throughout the permit-area of the caulks and sealants used in storm drains or roadway infrastructure in public rights-of-way.[687]
- Analyze the samples taken for PCBs in such a way that is able to detect a minimum PCB concentration of 200 parts per billion.[688]
- Report on the results of this investigation, including all data gathered, no later than the 2018 Annual Report.[689]

Under section C.12.b. of the prior permit, the permittees were required to develop a sampling and analysis plan to evaluate PCBs at construction sites that involve demolition activities, including research on when, where, and which materials potentially contain PCBs. The permittees were required to implement the plan at a minimum of ten sites throughout the combined permittees' jurisdictional areas, and then develop and select BMPs to pilot test at five sites to reduce or prevent the discharge of PCBs during demolition and remodeling, and submit various reports including their results in the 2014 Integrated Monitoring Report.[690] The Fact Sheet to the prior permit indicates that Provision C.12.b. addressed PCBs that were used in a variety of building materials "like caulk and adhesives" and, thus, the "pilot tests and reporting results will help determine if control measures for PCBs from these sources should be implemented in a more widespread fashion in the next permit term" as follows:

> PCBs are used in a variety of building materials like caulks and adhesives. PCBs contained in such materials can be liberated and transported in runoff during and after demolition and renovation activities. At this point, it is not known how extensive this type of PCB contamination is in the region. Therefore, the expectation for this permit term is that Permittees conduct pilot studies (Provision C.12.b) that includes evaluation of the presence of PCBs in such materials, sampling and analysis, and BMP development to prevent PCBs in these materials from being released into the environment during demolition and renovation. Conducting these pilot

[686] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.).

[687] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[688] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[689] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.iii.).

[690] Exhibit A, Test Claim, pages 185-186 (prior permit, Provision C.12.b.).

tests and reporting results will help determine if control measures for PCBs from these sources should be implemented in a more widespread fashion in the next permit term.[691]

Provision C.12.c. of the prior permit also required the permittees to identify five drainage areas that contain high levels of PCBs and investigate and abate on-land locations with elevated PCB concentrations, including public rights-of-way and stormwater conveyances, with accumulated sediments. To comply, the permittees had to identify potential source areas, validate the existence of elevated PCB concentrations through "surface soil/sediment sampling and analysis," and determine whether runoff from such locations is likely to convey soils and sediments with PCBs to municipal stormwater conveyances and conduct abatement program in portions of drainages under their jurisdiction.[692]

Thus, the permittees were aware of the PCB issues with caulk and sealants under the prior permit and were required to investigate and abate five drainage areas with elevated PCB concentrations in sediment, including in public rights-of-way and storm drains.

The requirements in Provision C.12.e. of the test claim permit are new, however. There was no prior requirement to sample caulks and sealants used *in storm drains or roadway infrastructure in public rights-of-way*. The Fact Sheet notes this requirement was added because the Washington Department of Ecology discovered that caulks and sealants containing PCBs were used inside the City of Tacoma's storm drains during a repair back in the 1970's.[693] "There is reason to believe that such use was not isolated to one location," and given that limited sampling of Bay Area structures built between 1950 and 1980 found PCBs contaminations at levels similar to those built in other parts of North America and Europe, it is plausible that a similar problem might be found in Permittee's storm drains.[694]

Accordingly, the requirements in Provision C.12.e. are new.

iv. The new requirements imposed in Provisions C.12.a.iii.1., C.12.a.iii.2., C.12.d., and C.12.e. to comply with the PCBs TMDL constitute state-mandated new programs or higher levels of service within the meaning of article XIII B, section 6 of the California Constitution.

As discussed above, the following activities required by Provisions C.12.a.iii.1.-2., C.12.d., and C.12.e., with respect to the PCBs TMDL, are new:

1. PCBs Reporting (Provisions C.12.a.iii.1. and C.12.a.iii.2.):

---

[691] Exhibit A, Test Claim, pages 300-301 (prior permit, Fact Sheet).

[692] Exhibit A, Test Claim, pages 186-187 (prior permit, Provision C.12.c.).

[693] Exhibit A. Test Claim, page 653 (test claim permit, Fact Sheet, Provision C.12.e.).

[694] Exhibit A, Test Claim, pages 645, 653, (test claim permit, Fact Sheet, Finding C.12.-10, Provision C.12.e.).

- By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where PCBs control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[695]
- In the 2016 Annual Report, include the following information:
    - A cumulative listing of all potentially PCB-contaminated sites permittees have discovered and referred to the Water Board to date, with a brief summary description of each site and where to obtain further information.
    - For each structural control and non-structural BMP, interim implementation progress milestones (e.g., construction milestones for structural controls or other relevant implementation milestones for structural controls and non-structural BMPs) and a schedule for milestone achievement.
    - Clear statements of the roles and responsibilities of each participating permittee for implementation of pollution prevention or control measures for PCBs.[696]

2. Prepare PCBs control measures implementation plan, schedule, and reasonable assurance analysis to achieve the PCBs TMDL wasteload allocations by 2030 (Provision C.12.d.):
    - Prepare a PCBs control measures implementation plan, which must identify all technically and economically feasible PCBs control measures to be implemented (including green infrastructure projects).[697]
    - Include a schedule for PCBs control measure implementation according to which these technically and economically feasible PCBs control measures will be fully implemented by 2030.[698]
    - Provide an evaluation and quantification of the PCBs load reduction of such measures as well as an evaluation of costs, control measure efficiency and significant environmental impacts resulting from their implementation.[699]

[695] Exhibit A, Test Claim, page 492 (test claim permit, Provisions C.12.a.ii.1. and C.12.a.iii.1.).

[696] Exhibit A, Test Claim, pages 493-494 (test claim permit, Provision C.12.a.iii.2.).

[697] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.1.).

[698] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.2.).

[699] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.3.).

- Prepare a reasonable assurance analysis demonstrating that sufficient control measures will be implemented to attain the PCBs TMDL wasteload allocations by 2030.[700]
- Submit the plan and schedule required by Provision C.12.d. in the 2020 Annual Report.[701]

3. Evaluate the presence of PCBs in caulks/sealants in storm drain or roadway infrastructure in public rights-of-way (Provision C.12.e.):
   - Collect at least 20 samples from throughout the permit-area of the caulks and sealants used in storm drains or roadway infrastructure in public rights-of-way.[702]
   - Analyze the samples taken for PCBs in such a way that is able to detect a minimum PCB concentration of 200 parts per billion.[703]
   - Report on the results of this investigation, including all data gathered, no later than the 2018 Annual Report.[704]

The Commission finds these new requirements are mandated by the state.

The California Supreme Court, in *Department of Finance v. Commission on State Mandates*, identified the following test to determine whether certain conditions imposed by an NPDES stormwater permit issued by the Los Angeles Regional Water Board were mandated by the state or the federal government:

> If federal law compels the state to impose, or itself imposes, a requirement, that requirement is a federal mandate. On the other hand, if federal law gives the state discretion whether to impose a particular implementing requirement, and the state exercises its discretion to impose the requirement by virtue of a "true choice," the requirement is not federally mandated.[705]

As indicated in the court's decision, this is the long-standing test identified in prior case law to determine if requirements imposed by state statute or executive order are mandated by the state or the federal government when the state is implementing federal law.[706]

[703] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[704] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.iii.).

[705] *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 765.

[706] See *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 764-765, where the court explains the following prior decisions: *City of Sacramento v.*

The courts have also explained "except where a regional board finds the conditions are the only means by which the [federal] 'maximum extent practicable' standard can be met, the State exercises a true choice by determining what controls are necessary to meet the standard."[707] "That the . . . Regional Board found the permit requirements were 'necessary' to meet the standard establishes only that the . . . Regional Board exercised its discretion."[708]

Here, the PCBs TMDL is required by federal law since the waterbodies were 303(d) listed as impaired because of PCBs.[709] Regional Boards are then required by federal law to include effluent limits "consistent with the assumptions and requirements of any available wasteload allocation for the discharge" in NPDES permits.[710] The permits can also include such other provisions as the permitting agency determines to be appropriate for the control of pollutants.[711]

The Regional Board determined that these new requirements were appropriate for the control of PCBs and, as explained in the sections above, these activities are not required by federal law. Thus, the Regional Board exercised a true choice when imposing these requirements, making them mandated by the state.

Moreover, the new state-mandated requirements to implement the PCBs TMDL impose a new program or higher level of service since carry they out the governmental function of providing services to the public, or to implement a state policy, impose unique requirements on local governments and do not apply generally to all residents and entities in the state.[712] Although the TMDL imposes requirements to reduce the discharge of PCB on both public and private dischargers, the new requirements

---

State of California (1990) 50 Cal.3d 51, which addressed local governments' reimbursement claims for the costs of extending unemployment insurance protection to their employees pursuant to a federal statute that induced the state's compliance with a carrot and stick; *County of Los Angeles v. Commission on State Mandates* (1995) 32 Cal.App.4th 805, addressing a state statute that required local governments to provide indigent criminal defendants with experts for the preparation of their defense in accordance with federal law; and *Hayes v. Commission on State Mandates* (1992) 11 Cal.App.4th 1564, which addressed state special education statutes implementing the federal Education of the Handicapped Act.

[707] *Department of Finance v. Commission on State Mandates* (2017) 18 Cal.App.5th 661, 682 citing to *Department of Finance v. Commission on State Mandates* (2016) 1 Cal.5th 749, 768, emphasis added.

[708] *Department of Finance v. Commission on State Mandates* (2017) 18 Cal.App.5th 661, 682.

[709] Exhibit X (5), Order R2-2008-0012, PCBs TMDL, page 1 (Finding 3).

[710] Code of Federal Regulations, title 40, section 122.44(d)(1)(vii).

[711] United States Code, title 33, section 1342(p)(3)(B)(iii).

[712] *County of Los Angeles v. State of California* (1987) 43 Cal.3d 46, 56.

imposed by Provisions C.12.a.iii.1.-2., C.12.d., and C.12.e. to submit specific reports, prepare an implementation plan and schedule of future actions and a reasonable assurance analysis showing control measures will be fully implemented in the future to achieve the PCBs TMDL wasteload allocations by 2030, and to sample caulks and sealants in storm drains and roadway infrastructures, are uniquely imposed on the local agency permittees and do not apply generally to all dischargers.

Moreover, the new requirements carry out the governmental function of providing services to the public.[713] The waters in the San Francisco Bay were impaired for PCBs, which threaten the health of humans, as described above. The purpose of these new requirements is to reduce the discharge of PCBs in urban runoff to the receiving waters, to lay the foundation for an implementation timeframe so that urban runoff dischargers will be able to comply with the final wasteload allocations by 2030, and to identify potential sources of PCBs in storm drains and roadways controlled by local government so that these potential sources of PCB discharges can be controlled.[714]

Accordingly, the Commission finds that the new requirements imposed by Provisions C.12.a.iii.1.-2., C.12.d., and C.12.e. mandate a new program or higher level of service.

C. Pursuant to Government Code 17556(d), There Are No Costs Mandated by the State When the Claimants Have the Authority to Impose Fees Sufficient to Pay for the New State-Mandated Requirements.

As indicated above, the following activities constitute state-mandated new programs or higher levels of service:

1. Green Infrastructure Plan (Provision C.3.j.i.-iv.):
   a. Green Infrastructure Plan (Provision C.3.j.i.)
      - Prepare a framework or workplan describing specific tasks and timeframes for development for its Green Infrastructure Plan, to be approved by the Permittee's governing body, mayor, city manager, or county manager by June 30, 2017. This framework or workplan shall include a statement of purpose, tasks, and timeframe needed to complete all requirements in Provision C.3.j.i.2. (discussed below).[715]
      - Prepare a Green Infrastructure Plan, subject to Executive Officer approval, that contains all the following:
        - A mechanism (such as SFEI's Green PlanIT tool) to prioritize and map areas for potential and planned projects, both public and private, on a drainage-area specific basis, for implementation by 2020, by 2030, and by

[713] *County of Los Angeles v. State of California* (1987) 43 Cal.3d 46, 56; *Department of Finance v. Commission on State Mandates* (2021) 59 Cal.App.5th 546, 629-630.

[714] Exhibit A, Test Claim, pages 647, 652-653, (test claim permit, Fact Sheet, Provisions C.12.a., C.12.d., and C.12.e.).

[715] Exhibit A, Test Claim, page 423 (test claim permit, Provision C.3.j.i.1.).

2040, that includes criteria for prioritization and outputs that can be incorporated into the Permittees' long-term planning and capital improvement processes.

- Outcomes from the above-described mechanism, including but not limited to, the prioritization criteria, maps, lists, and all other information, as appropriate. Individual project-specific reviews do not need to be submitted with the Plan, but shall be made available for review upon request.
- Targets for the amount of impervious surface from public and private projects within the Permittee's jurisdiction to be retrofitted by 2020, by 2030, and by 2040.
- A process for tracking and mapping completed projects, public and private, and making the information publicly available online (I.E., SFEI's Green PlanIT tool).
- General guidelines for overall streetscape and project design and construction so that projects have a unified complete design that implements the range of functions associated with the project.
- Standard specifications, and as appropriate, typical design details and related information necessary for the Permittee to implement Green Infrastructure Projects in its jurisdiction, which shall be sufficient to address the different street and project types within a Permittee's jurisdiction, as defined by land use and transportation characteristics.
- Requirements that projects be designed to meet the treatment and hydromodification sizing requirements outline in Provisions C.3.c. and C.3.d. For projects that are not subject to these requirements according to Provision C.3.b.ii. (non-regulated projects), Permittees may collectively propose a single approach for how to proceed when project constraints preclude fully meeting the sizing requirements, which can include options for addressing specific issues or scenarios.
- A summary of planning documents the permittee has updated or otherwise modified to incorporate Green Infrastructure requirements (General Plans, Specific Plans, Complete Street Plans, Active Transportation Plans, Storm Drain Master Plans, Pavement Work Plans, Urban Forestry Plans, Flood Control/Management Plans, and any other plans that may impact the future alignment, configuration or design of impervious surfaces within the Permittee's jurisdiction). These modifications are to be completed by no later than the end of the permit term.
- A workplan identifying how the Permittee will ensure that Green Infrastructure and low impact development are appropriately included in future plans.

- A workplan to complete prioritized projects identified as part of an Alternative Compliance Program or Early Implementation as outlined in Provision C.3.e. or C.3.j.ii.
- An evaluation of prioritized project funding options including, but not limited to: Alternative Compliance funds; grant monies, including transportation project grants from federal, State, and local agencies; existing Permittee resources; new tax or other levies; and other sources of funds.[716]

- Adopt policies, ordinances, and/or other appropriate legal mechanisms to ensure implementation of the Green Infrastructure Plan in accordance with the requirements of this provision.[717]
- Conduct outreach and education in accordance with the following:
  - Conduct public outreach on the requirements of this provision, including outreach coordinated with adoption or revision of standard specifications and planning documents, and with the initiation and planning of infrastructure projects. Such outreach shall include general outreach and targeted outreach to and training for professionals involved in infrastructure planning and design.
  - Train appropriate staff, including planning, engineering, public works maintenance, finance, fire/life safety, and management staff on the requirements of this provision and methods of implementation.
  - Educate appropriate Permittee elected officials (e.g., mayors, city council members, county supervisors, district board members) on the requirements of this provision and methods of implementation.[718]
- Each permittee shall report on its planning progress as follows:
  - Submit documentation in the 2017 Annual Report that its framework or workplan for development of its Green Infrastructure Plan was approved by its governing body, mayor, city manager, or county manager by June 30, 2017.
  - Submit its completed Green Infrastructure Plan with the 2019 Annual Report.
  - Submit documentation of its legal mechanisms to ensure implementation of its Green Infrastructure Plan with the 2019 Annual Report.

[716] Exhibit A, Test Claim, pages 423-425 (test claim permit, Provision C.3.j.i.2.).

[717] Exhibit A, Test Claim, page 425 (test claim permit, Provision C.3.j.i.3.).

[718] Exhibit A, Test Claim, pages 425-426 (test claim permit, Provision C.3.j.i.4.).

- Submit a summary of its outreach and education efforts in each Annual Report.[719]

b. Early Implementation – List of Green Infrastructure Projects (Provision C.3.j.ii.):

- *Except for a permittee's own public project (which does not mandate a new program or higher level of service)*, prepare and maintain a list of Green Infrastructure Projects, public and private, that are already planned for implementation during the permit term and infrastructure projects planned for implementation during the permit term that have potential for Green Infrastructure measures.[720]
- *Except for a permittee's own public project (which does not mandate a new program or higher level of service)*, submit the list with each Annual Report and a summary of planning or implementation status for each public Green Infrastructure Project and each private Green Infrastructure Project that is not also a Regulated Project as defined in Provision C.3.b.ii. Include a summary of how each public infrastructure project with Green Infrastructure potential will include Green Infrastructure measures to the maximum extent practicable during the permit term. For any public infrastructure project where implementation of Green Infrastructure measures is not practicable, submit a brief description of the project and the reasons Green Infrastructure measures were impracticable to implement.[721]

c. Participation in Processes to Promote Green Infrastructure (Provision C.3.j.iii.):

- Either individually or collectively, track processes, assemble and submit information, and provide informational materials and presentations as needed to assist relevant regional, State, and federal agencies to plan, design, and fund incorporation of Green Infrastructure measures into local infrastructure projects, including transportation projects. Issues to be addressed include coordinating the timing of funding from different sources, changes to standard designs and design criteria, ranking and prioritizing projects for funding, and implementation of cooperative in-lieu programs.[722]
- In each Annual Report, report on the goals and outcomes during the reporting year of work undertaken to participate in processes to promote Green Infrastructure.[723]

[719] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.i.5.).

[720] Exhibit A, Test Claim, page 426 (test claim permit, Provision C.3.j.ii.1.).

[721] Exhibit A, Test Claim, page 426 (test claim permit, section C.3.j.ii.2.).

[722] Exhibit A, Test Claim, page 426 (test claim permit, section C.3.j.iii.1.).

[723] Exhibit A, Test Claim, page 427 (test claim permit, section C.3.j.iii.2.).

- In the 2019 Annual Report, submit a plan and schedule for new and ongoing efforts to participate in processes to promote Green Infrastructure.[724]

d. Tracking and Reporting Progress (Provision C.3.j.iv.):

- Either individually or collectively, develop and implement regionally-consistent methods to track and report implementation of Green Infrastructure measures including treated area and connected and disconnected impervious area on both public and private parcels within their jurisdictions. The methods shall also address tracking needed to provide reasonable assurance that wasteload allocations for TMDLs, including the San Francisco Bay PCBs and mercury TMDLs, and reductions for trash, are being met.[725]
- In each Annual Report, report progress on development and implementation of the tracking methods.[726]
- In the 2019 Annual Report, submit the tracking methods and report implementation of Green Infrastructure measures including treated area, and connected and disconnected impervious area on both public and private parcels within their jurisdictions.[727]

2. Reasonable Assurance Analysis (Provisions C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., and C.12.c.iii.1.-3.):

- Prepare a reasonable assurance analysis of future mercury and PCBs load reductions by doing the following:
  - Quantify the relationship between areal extent of Green Infrastructure implementation and mercury and PCBs load reductions, taking into consideration the scale of contamination of the treated area as well as the pollutant removal effectiveness of likely green infrastructure strategies.[728]
  - Estimate the amount and characteristics of land area that will be treated through Green Infrastructure by 2020, 2030, and 2040.[729]

[724] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.3.j.iii.3.).

[725] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.3.j.iv.1.).

[726] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.2.j.iv.2.).

[727] Exhibit A, Test Claim, page 427 (test claim permit, Provision C.2.j.iv.3.).

[728] Exhibit A, Test Claim, pages 489, 497 (test claim permit, Provisions C.11.c.ii.2.a., C.12.c.ii.2.a.).

[729] Exhibit A, Test Claim, pages 489, 497 (test claim permit, Provisions C.11.c.ii.2.b., C.12.c.ii.2.b.).

- Estimate the amount of mercury/PCBs load reductions that will result from Green Infrastructure implementation by 2020, 2030, and 2040.[730]
- Quantitatively demonstrate that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/yr will be realized by 2040 through implementation of Green Infrastructure Projects.[731]
- Ensure that the calculation methods, models, model inputs, and modeling assumptions used to fulfill provisions C.11.c.ii.2.a.-d. and C.12.c.ii.2.a.-d. above have been validated through a peer review process.[732]

- Submit in the 2018 Annual Report as part of the reporting required for Provisions C.11.b.iii.2. and C.12.b.iii.3., the quantitative relationship between Green Infrastructure implementation and mercury and PCBs load reductions. This submittal shall include all data used and a full description of the models and model inputs relied on to establish this relationship.[733]
- Submit in the 2020 Annual Report an estimate of the amount and characteristics of land area that will be treated through Green Infrastructure implementation by 2020, 2030, and 2040. This submittal shall include all data used and a full description of the models and model inputs relied on to generate this estimate.[734]
- Submit in the 2020 Annual Report a reasonable assurance analysis to demonstrate quantitatively that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/yr will be realized by 2040 through the implementation of Green Infrastructure Projects. This submittal shall include all data used and a full description of models and model inputs relied on to make the demonstration and documentation of peer review of the reasonable assurance analysis.[735]

[735] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.iii.3., C.12.c.iii.3.).

3. Progress Report on List of Watersheds and Management Areas Where Mercury Control Measures are or will be Implemented (Provision C.11.a.iii.1.):

    - By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where mercury control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[736]

4. PCBs Reporting (Provisions C.12.a.iii.1. and C.12.a.iii.2.):

    - By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where PCBs control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[737]
    - In the 2016 Annual Report, include the following information:
        - A cumulative listing of all potentially PCB-contaminated sites permittees have discovered and referred to the Water Board to date, with a brief summary description of each site and where to obtain further information.
        - For each structural control and non-structural BMP, interim implementation progress milestones (e.g., construction milestones for structural controls or other relevant implementation milestones for structural controls and non-structural BMPs) and a schedule for milestone achievement.
        - Clear statements of the roles and responsibilities of each participating permittee for implementation of pollution prevention or control measures for PCBs.[738]

5. Prepare PCBs control measures implementation plan, schedule, and reasonable assurance analysis to achieve the PCBs TMDL wasteload allocations by 2030 (Provision C.12.d.):

    - Prepare a PCBs control measures implementation plan, which must identify all technically and economically feasible PCBs control measures to be implemented (including green infrastructure projects).[739]

---

[736] Exhibit A, Test Claim, page 486 (test claim permit, Provision C.11.a.iii.1.).

[737] Exhibit A, Test Claim, page 492 (test claim permit, Provisions C.12.a.ii.1. and C.12.a.iii.1.).

[738] Exhibit A, Test Claim, pages 493-494 (test claim permit, Provision C.12.a.iii.2.).

[739] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.1.).

- Include a schedule for PCBs control measure implementation according to which these technically and economically feasible PCBs control measures will be fully implemented by 2030.[740]
- Provide an evaluation and quantification of the PCBs load reduction of such measures as well as an evaluation of costs, control measure efficiency and significant environmental impacts resulting from their implementation.[741]
- Prepare a reasonable assurance analysis demonstrating that sufficient control measures will be implemented to attain the PCBs TMDL wasteload allocations by 2030.[742]
- Submit the plan and schedule required by Provision C.12.d. in the 2020 Annual Report.[743]

6. Evaluate the presence of PCBs in caulks/sealants in storm drain or roadway infrastructure in public rights-of-way (Provision C.12.e.):
    - Collect at least 20 samples from throughout the permit-area of the caulks and sealants used in storm drains or roadway infrastructure in public rights-of-way.[744]
    - Analyze the samples taken for PCBs in such a way that is able to detect a minimum PCB concentration of 200 parts per billion.[745]
    - Report on the results of this investigation, including all data gathered, no later than the 2018 Annual Report.[746]

The last issue in determining whether reimbursement is required under article XIII B, section 6 is whether these new mandated activities result in increased costs mandated by the state. Government Code section 17514 defines "costs mandated by the state" as any increased costs that a local agency or school district incurs as a result of any statute or executive order that mandates a new program or higher level of service. Government Code section 17564(a) further requires that no claim shall be made nor shall any payment be made unless the claim exceeds $1,000. Increased costs

[740] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.2.).

[741] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.3.).

[742] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.i.).

[743] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.iii.).

[744] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[745] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[746] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.iii.).

mandated by the state requires a showing of "increased actual expenditures of limited tax proceeds that are counted against the local government's spending limit."[747]

In addition, a finding of costs mandated by the state means that none of the exceptions in Government Code section 17556 apply to deny the claim. As relevant here, Government Code section 17556(d) states that the Commission shall not find costs mandated by the state when:

> The local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service. This subdivision applies regardless of whether the authority to levy charges, fees, or assessments was enacted or adopted prior to or after the date on which the statute or executive order was enacted or issued.

The claimant contends that the activities result in increased costs mandated by the state within the meaning of article XIII B, section 6 and Government Code section 17514. The identified costs the claimant alleges it spent in fiscal years 2014-2015, 2015-2016, and 2016-2017 implementing mandated activities in the test claim permit total $9,454,799.39, of which $3,718,706.52 came from projects it began during the prior permit term before this test claim permit's effective date.[748] It further asserts that future projects needed to complete all the requirements in the test claim permit are expected to cost $72,600,000 total, plus $145,000 per year for annual maintenance costs. The claimant made a statewide costs estimate for fiscal year 2016-2017 of costs totaling $18,135,921.[749]

The claimant acknowledged that it received some funding for installing full trash capture systems and green streets projects through grants from the EPA and the Proposition 84 State Water Grant Program, but insists that it is unlikely that it will be able to avail itself of any future grant opportunities because all other available grants are highly competitive and have steep fund matching requirements.[750] The claimant also acknowledged that it funds some of its activities through its Clean Water Fund, which is obtained through revenue on property tax assessments, and a solid waste franchise surcharge, as well as several other City revenue sources that are restricted to roadway projects, of which green street projects qualify.[751]

[748] Exhibit A, Test Claim 16-TC-03, filed June 30, 2017, page 47 (Declaration of Thomas Ruark, City Engineer, City of Union City).

[749] Exhibit A, Test Claim 16-TC-03, filed June 30, 2017, page 31 (Written Narrative).

[750] Exhibit A, Test Claim 16-TC-03, filed June 30, 2017, pages 23, 34 (Written Narrative).

[751] Exhibit A, Test Claim 16-TC-03, filed June 30, 2017, page 34 (Written Narrative).

The Regional Board asserts that these funding sources, as well as others used by other municipalities under the test claim permit, demonstrate that claimants can fund these programs without using their tax revenue. Examples of how other municipalities have done this include: increased stormwater fees; "excess litter fees" on identified types of high trash-generating businesses; encouraging property owners to participate in a Business Improvement District or Community Benefits District where the property owners vote to pay assessments for maintenance and beautification projects within a district; partnerships with Caltrans; vehicle registration fees; federal, state and local grants; Measure A and J grants; gas tax; and development impact fees.[752]

As explained below, the Commission finds that the new state-mandated activities result in costs mandated by the state for some of the activities based on the following findings:

1. There is substantial evidence in the record that permittees incurred costs exceeding $1,000 and used proceeds of taxes to comply with the test claim permit.
2. Pursuant to Government Code section 17556(d), permittees have regulatory fee authority sufficient as a matter of law to fund the new state-mandated activities related to developing and implementing the Green Infrastructure Plan (Provision C.3.j.i.-iv.), and thus, there are no costs mandated by the state for these activities.
3. The Permittees have constitutional and statutory authority to charge property-related fees for the reasonable assurance analysis of future mercury and PCBs load reductions (C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., and C.12.c.iii.1.-3.); required mercury progress report on list of watersheds and management areas where control measures are or will be implemented (C.11.a.iii.); PCBs reporting (C.12.a.iii.1. and 2.); PCBs control measures implementation plan (C.12.d.); and PCBs caulk and sealant testing (C.12.e.). However, from January 1, 2016 (the beginning date of the potential period of reimbursement) to December 31, 2017, these fees are subject to the voter approval requirement in article XIII D, section 6(c), and therefore fee authority is not sufficient as a matter of law.[753] Under these limited circumstances, Government Code section 17556(d) does not apply, and there are costs mandated by the state.[754] Any fee revenues received must be identified as offsetting revenue. In addition, reimbursement for this mandate

[752] Exhibit C, Regional Board's Late Comments on the Test Claim, pages 10-12.

[753] See *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98 Cal.App.4th 1351, and *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 579-581.

[754] *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 579-581; Government Code sections 57350 and 57351 (SB 231, eff. January 1, 2018, which overturned *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98 Cal.App.4th 1351; *Paradise Irrigation District v. Commission on State Mandates* (2019) 33 Cal.App.5th 174, 195.

from any source, including but not limited to, service fees collected, federal funds, other state funds, and other funds that are not a claimant's local proceeds of taxes shall be identified and deducted from this claim.

On or after January 1, 2018, there are no costs mandated by the state to comply with these activities because the claimants have constitutional and statutory authority to charge property-related fees for these costs subject only to the voter protest provisions of article XIII D, which is sufficient as a matter of law to cover the costs of the mandated activities within the meaning of Government Code section 17556(d).[755]

Based on *Paradise Irrigation District* case and the Legislature's enactment of Government Code sections 57350 and 57351 (which overturned *Howard Jarvis Taxpayers Association v. City of Salinas* (2002) 98 Cal.App.4th 1351), there are no costs mandated by the state on or after January 1, 2018, to comply with these activities, because claimants have constitutional and statutory authority to charge property-related fees for these costs subject only to the voter protest provisions of article XIII D, which is sufficient as a matter of law to cover the costs of the mandated activities within the meaning of Government Code section 17556(d).

1. There Is Substantial Evidence in the Record that Permittees Incurred Increased Costs and Used Proceeds of Taxes to Comply with the Test Claim Permit.

a. The reimbursement requirement in article XIII B, section 6 was included because of the tax and spend limitations in articles XIII A and XIII B and is triggered only when the state forces the expenditure of local proceeds of taxes; section 6 was not intended to reach beyond taxation or to protect nontax sources.

In 1978, the voters adopted Proposition 13, which added article XIII A to the California Constitution. Article XIII A reduced the authority of local government to impose property taxes by providing "the maximum amount of any ad valorem tax on real property shall not exceed one percent (1%) of the full cash value of such property," and the one percent (1%) tax was to be collected by counties and "apportioned according to law to the districts within the counties…"[756] In addition to limiting the property tax, section 4 also restricts a local government's ability to impose special taxes by requiring a two-thirds approval by the voters.[757]

Article XIII B was adopted by the voters as Proposition 4, less than 18 months after the addition of article XIII A to the state Constitution, and was billed as "the next logical step

[757] California Constitution, article XIII A, section 4 (effective June 7, 1978).

to Proposition 13."[758] While article XIII A is aimed at controlling ad valorem property taxes and the imposition of new special taxes, "the thrust of article XIII B is toward placing certain limitations on the growth of appropriations at both the state and local government level; in particular, article XIII B places limits on the authorization to expend the 'proceeds of taxes.'"[759] "Proceeds of taxes," in turn, includes "all tax revenues," as well as proceeds from "regulatory licenses, user charges, and user fees to the extent those proceeds exceed the costs reasonably borne by that entity in providing the regulation, product, or service," and proceeds from the investment of tax revenues.[760] And, with respect to local governments, the section reiterates that "proceeds of taxes" includes state subventions other than mandate reimbursement, and, with respect to the State's spending limit, excludes such state subventions.[761] Article XIII B does not restrict the growth in appropriations financed from nontax sources, such as "user fees based on reasonable costs."[762] And appropriations subject to limitation do not include "[a]ppropriations for debt service."[763]

Proposition 4 also added article XIII B, section 6, which was specifically "designed to protect the tax revenues of local governments from state mandates that would require the expenditure of such revenues."[764] The California Supreme Court, in *County of Fresno v. State of California*,[765] explained:

> Section 6 was included in article XIII B in recognition that article XIII A of the Constitution severely restricted the taxing powers of local governments. (See *County of Los Angeles I, supra*, 43 Cal.3d at p. 61.) The provision was intended to preclude the state from shifting financial responsibility for carrying out governmental functions onto local entities that were ill equipped to handle the task. (*Ibid*.; see *Lucia Mar Unified School Dist. v. Honig* (1988) 44 Cal.3d 830, 836, fn. 6.) Specifically, it was

> designed to protect the tax revenues of local governments from state mandates that would require expenditure of such revenues. Thus, although its language broadly declares that the "state shall provide a subvention of funds to reimburse ... local government for the costs [of a state-mandated new] program or higher level of service," read in its textual and historical context section 6 of article XIII B requires subvention only when the costs in question can be recovered *solely from tax revenues*.[766]

The California Supreme Court concluded articles XIII A and XIII B work "in tandem," for the purpose of precluding "the state from shifting financial responsibility for carrying out governmental functions to local agencies, which are 'ill equipped' to assume increased financial responsibilities *because of the taxing and spending limitations that articles XIII A and XIII B impose.*"[767] Accordingly, reimbursement under article XIII B, section 6 is only required when a mandated new program or higher level of service forces local government to incur "increased actual expenditures of limited tax proceeds that are counted against the local government's spending limit."[768]

b. <u>There is substantial evidence in the record that the claimants incurred increased costs exceeding $1,000 and used their local "proceeds of taxes" to comply with the new state-mandated activities.</u>

Consistent with these constitutional principles, reimbursement under article XIII B, section 6 is only required if the claimants show, with substantial evidence in the record,[769] they have incurred increased costs mandated by the state within the meaning of Government Code section 17514. When alleged mandated activities do not compel the increased expenditure of local "proceeds of taxes," reimbursement under section 6 is not required.[770] Government Code section 17514 defines "costs mandated by the state" as any increased costs a local agency or school district incurs as a result of any

statute or executive order that mandates a new program or higher level of service. Government Code section 17564(a) further requires that no claim shall be made nor shall any payment be made unless the claim exceeds $1,000.

The claimant filed declarations showing it has incurred shared costs and individual direct costs exceeding the $1,000 threshold to comply with the test claim permit.[771] For example, for its costs to implement the Green Infrastructure Plan and mercury and PCBs controls, the claimant filed a declaration by Union City's City Engineer, Thomas Ruark, stating that the city has budgeted $15,000 to retain a consultant that will assist in preparing "some of the tasks listed in the Framework for Green Infrastructure Plan Development."[772] Ruark also declared that the claimant paid $106,466 in fiscal years 2015-2016 and 2016-2017 to the Alameda County Clean Water Program (ACCWP) in support of compliance actions, of which he asserted $2,124 in fiscal year 2015-2016 went towards Green Infrastructure Plan development, and $5,377 in fiscal year 2016-2017 went towards Green Infrastructure Plan development and GIS development and support required by provisions C.3., C.11., and C.12.[773] These numbers were confirmed by James Scanlin of the ACCWP in his own declaration.[774] Ruark also identified some of the initial costs for staff time reviewing agendas and attending meetings for working groups that addressed requirements in C.3.j., C.11., and C.12., totaling $2,587.14.[775]

However, reimbursement is not required to the extent the claimants receive fee revenue and used that revenue to pay for the state-mandated activities, or used any other revenues, including but not limited to grant funding, assessment revenue, and federal funds, that are not the claimants' proceeds of taxes. When state-mandated activities do not compel the increased expenditure of local "proceeds of taxes," reimbursement under section 6 is not required.[776]

The declarations state that although the claimant has partially funded its costs through grants and the claimant's Clean Water Fund, it is unlikely to be able to receive future grants, and the Clean Water Fund is already largely consumed by existing stormwater mandate costs and is funded through property tax assessments and a solid waste surcharge, neither of which the claimant has authority to increase under Proposition 218.[777]

The Regional Board's late comments argue that besides sewer fees, they can also levy regulatory fees for the mercury, PCBs, and green infrastructure provisions by collecting fees from developers.[778] Permittees are not required to use taxes to pay for the costs of the program, because they can levy fees, such as inspection fees, permitting fees, or for new storm drain connections on new development.[779] Besides the grants the claimant acknowledged in its declarations, other permittees have found other ways to fund program compliance, such as forming Business Improvement Districts or Community Benefit Districts, which vote to pay additional assessments to fund maintenance and beautification projects within the district, or by partnering with Caltrans on specific projects.[780]

There is also evidence in the administrative records for both this Test Claim and its predecessor that at least some permittees have adopted stormwater fees to cover costs to comply with their NPDES permits, such as Alameda County, the cities of Alameda and San Jose, and the Vallejo Sanitation and Flood Control District.[781]

There is no evidence in the record, however, that the claimant used fee or grant revenue for all of the mandated activities here. The State has not filed any evidence rebutting the claimant's assertion that proceeds of taxes were used to pay for the new state mandated activities.

Accordingly, there is substantial evidence in the record that the claimant incurred increased costs exceeding $1,000 and used its proceeds of taxes to comply with the test claim permit. The analysis must continue, however, to determine whether the exceptions in Government Code section 17556 apply.

2. Pursuant to Government Code Section 17556(d), Permittees Have Authority to Impose Regulatory Fees on Development Sufficient as a Matter of Law to Fund the New State-Mandated Activities Related to Developing and Implementing the Green Infrastructure Plan Requirements (Provision C.3.j.i.-iv.), and thus, There Are No Costs Mandated by the State for These Activities. Permittees also Have Authority to Impose Property-Related Stormwater Fees Sufficient as a Matter of Law to Fund the Remaining New State-Mandated Activities Imposed by Provisions C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., C.12.c.iii.1.-3., C.11.a.iii.1., C.12.a.iii.1.-2., C.12.d., and C.12.e., Beginning January 1, 2018, and, thus, There Are No Costs Mandated by the State for Those Activities Beginning January 1, 2018.

Government Code section 17556(d) provides that the Commission "shall not find costs mandated by the state, as defined in Section 17514" if the Commission finds that "the local agency or school district has the authority to levy service charges, fees, or assessments sufficient to pay for the mandated program or increased level of service."

The claimant argues that although it has a Clean Water Fund that is funded by property tax assessments and a solid waste franchise surcharge, most of this fund is already consumed by existing stormwater compliance costs, and it has no authority to increase these sources without seeking voter approval.[782]

The Regional Board's late comments argue that permittees have the ability to craft regulatory development fees capable of covering the costs associated with implementing any mandated mercury, PCBs, and green infrastructure provisions.[783]

There is no question that local agencies have the authority to charge fees for stormwater programs. Cities and counties have authority under the California Constitution to make and enforce ordinances and resolutions to protect and ensure the general welfare within their jurisdiction, which is commonly referred to as the "police power."[784] That authority includes the power to impose fees or charges that are directed toward a particular activity or industrial or commercial sector, known as "regulatory fees;" fees or charges based on services or benefits received from government, known as "user fees;" fees or charges imposed as a condition of development of real property, known as "development fees;" and fees or charges (or assessments) levied on all property owners within the jurisdiction, which after Proposition 218 are commonly described as "property-related fees or assessments." In addition, a number of provisions of the Government Code provide express authority to

[782] Exhibit A, Test Claim, page 34 (Written Narrative).

impose or increase regulatory fees,[785] fees for development of real property,[786] and property-based assessments, fees and charges.[787] Each of these fees or charges is subject to differing limitations pursuant to Propositions 218 and 26.[788]

The analysis below will address those limitations separately, because only property-related fees and assessments are subject to the notice, hearing, and majority approval or protest provisions of articles XIII D.

"Regulatory," "development," and "user" fees or charges are not subject to voter approval or majority protest. Broadly, these categories of fees are those that are targeted toward certain activities or sectors of industrial or commercial activity, or certain benefits received from the government or burdens created by the activity or the entity, rather than imposed on all property owners as an incident of property ownership.[789] Such fees may be adopted as an ordinance or resolution in the context of the legislative body's normal business,[790] subject only to the limitations of article XIII C, section 1(e), which, largely turn on establishing the relationship between the revenues raised and the uses to which they are put, and the amount charged and the benefits received or burdens created by the payor.[791]

As explained below, the courts have held that there are no costs mandated by the state pursuant to Government Code section 17556(d) when local government has the authority to charge regulatory fees pursuant to article XIII C or property-related fees that

---

[785] See, for example, Government Code section 37101 ("The legislative body may license, for revenue and regulation, and fix the license tax upon, every kind of lawful business transacted in the city.").

[786] Government Code section 66001 provides for development fees under the Mitigation Fee Act requiring local entity to identify the purpose of the fee and the uses to which revenues will be put, to determine a reasonable relationship between the fee's use and the type of project or projects on which the fee is imposed.

[787] See, for example, Health and Safety Code section 5471 (fees for storm drainage maintenance and operation); Government Code sections 38902 (providing for sewer standby charges); 53750 et seq. (Proposition 218 Omnibus Implementation Act, describing procedures for adoption of assessments, fees and charges); 53751 (as amended in 2017, providing that fees for sewer services includes storm sewers).

Boss* (1948) 83 Cal.App.2d 445, 450 ("If revenue is the primary purpose and regulation is merely incidental the imposition is a tax; while if regulation is the primary purpose the mere fact that incidentally a revenue is also obtained does not make the imposition a tax").

[791] California Constitution, article XIII C, section 1(e).

are subject only to the voter protest provisions of article XIII D, section 6 of the California Constitution.

a. Case law establishes that the exception to the subvention requirement found in Government Code section 17556(d) is a legal inquiry, not a practical one.

The California Supreme Court upheld the constitutionality of Government Code section 17556(d) in County of Fresno.[792] The court, in holding that the term "costs" in article XIII B, section 6, excludes expenses recoverable from sources other than taxes, stated:

> Section 6 was included in article XIII B in recognition that article XIII A of the Constitution severely restricted the taxing powers of local governments. (See *County of Los Angeles I, supra*, 43 Cal.3d at p. 61.) The provision was intended to preclude the state from shifting financial responsibility for carrying out governmental functions onto local entities that were ill equipped to handle the task. (*Ibid.*; see *Lucia Mar Unified School Dist. v. Honig* (1988) 44 Cal.3d 830, 836, fn. 6 [244 Cal.Rptr. 677, 750 P.2d 318].) Specifically, it was designed to protect the tax revenues of local governments from state mandates that would require expenditure of such revenues. Thus, although its language broadly declares that the "state shall provide a subvention of funds to reimburse ... local government for the costs [of a state-mandated new] program or higher level of service," read in its textual and historical context section 6 of article XIII B requires subvention only when the costs in question can be recovered solely from tax revenues.[793]

Following the logic of *County of Fresno*, the Third District Court of Appeal in *Connell v. Superior Court* held that the Santa Margarita Water District, and other similarly situated districts, had statutory authority to raise rates on water, notwithstanding argument and evidence that the amount by which the district would be forced to raise its rates would render the water unmarketable.[794] The district acknowledged the existence of fee authority, but argued it was not "sufficient," within the meaning of section 17556(d).[795] The court held that "[t]he Districts in effect ask us to construe 'authority,' as used in the statute, as a practical ability in light of surrounding economic circumstances. However, this construction cannot be reconciled with the plain language of [section 17556(d)] and would create a vague standard not capable of reasonable adjudication."[796] The court

concluded: "Thus, the economic evidence presented by SMWD to the Board was irrelevant and injected improper factual questions into the inquiry."[797]

More recently, the Third District Court of Appeal endorsed and followed *Connell* in *Paradise Irrigation District*: "[w]e also reject the Water and Irrigation Districts' claim that, as a matter of practical reality, the majority protest procedure allows water customers to defeat the Districts' authority to levy fees."[798] Instead, the court held, "[w]e adhere to our holding in *Connell* that the inquiry into fee authority constitutes an issue of law rather than a question of fact."[799] Further, the 2021 decision of the Second District Court of Appeal in *Department of Finance v. Commission on State Mandates* found that "[e]ven if we assume that drafting or enforcing a law that imposes fees to pay for inspections would be difficult, the issue is whether the local governments have the authority to impose such a fee, not how easy it would be to do so."[800] And, the 2022 decision of the Third District Court of Appeal in *Department of Finance v. Commission on State Mandates* found that "The sole issue before us is whether permittees have 'the authority, i.e., the right or power, to levy fees sufficient to cover the costs of the state-mandated program' . . . The inquiry is an issue of law, not a question of fact."[801]

Accordingly, the rule from these cases is that where the claimant has "authority, i.e., the right or power, to levy fees sufficient to cover the costs" of a state mandated program, reimbursement is not required, notwithstanding other factors that may make the exercise of that authority impractical, undesirable, or difficult.[802]

b. Permittees have authority to impose regulatory fees on development sufficient as a matter of law to fund the new state-mandated activities related to developing and implementing the Green Infrastructure Plan (Section C.3.j.i.-iv.), which are sufficient as a matter of law to cover the costs of the activities within the meaning of Government Code section 17556(d) and thus, there are no costs mandated by the state for these activities.

i. Permittees have constitutional and statutory authority to impose regulatory fees, which are exempt from the definition of "tax" under article XIII C of the California Constitution as long as the fees meet a threshold of reasonableness and proportionality.

Article XI, section 7 of the California Constitution provides: "A county or city may make and enforce within its limits all local, police, sanitary, and other ordinances and regulations not in conflict with general laws."[803] Interpreting this provision, and its predecessor, the courts have held that a local legislative body with police power "has a wide discretion" and its laws or ordinances "are invested with a strong presumption of validity."[804] The courts have held that "the power to impose valid regulatory fees does not depend on legislatively authorized taxing power but exists pursuant to the direct grant of police power under article XI, section 7, of the California Constitution."[805] Accordingly, ordinances or laws regulating legitimate businesses or other activities within a city or county, as well as regulating the development and use of real property, have generally been upheld.[806] In addition, "[t]he services for which a regulatory fee may be charged include those that are "'incident to the issuance of [a] license or permit, investigation, inspection, administration, maintenance of a system of supervision and

[803] California Constitution, article XI, section 7.

[805] *Mills v. County of Trinity* (1980) 108 Cal.App.3d 656, 662 (in which a taxpayer challenged a county ordinance that imposed new and increased fees for county services in processing subdivision, zoning, and other land-use applications that had been adopted without a two-thirds affirmative vote of the county electors).

[806] See *Ex parte Junqua* (1909) 10 Cal.App. 602 (police power "embraces the right to regulate any class of business, the operation of which, unless regulated, may, in the judgment of the appropriate local authority, interfere with the rights of others…."); *Sullivan v. City of Los Angeles Dept. of Building & Safety* (1953) 116 Cal.App.2d 807 (recognizing broad power to regulate not only nuisances but things or activities that may become nuisances or injurious to public health); *California Building Industry Assn. v. City of San Jose* (2015) 61 Cal.4th 435 (recognizing broad authority of municipality to regulate land use).

enforcement.'"[807] The courts also hold that water pollution prevention is a valid exercise of government police power.[808]

Moreover, as noted above, a number of provisions of the Government Code provide express authority to impose or increase regulatory fees,[809] and fees for development of real property,[810] and property-based assessments, fees, and charges.[811]

Thus, there is no dispute that the claimants have authority, both statutory and constitutional (recognized in case law), to impose fees, including regulatory and development fees.[812] The issue in dispute is how far that authority goes and whether Propositions 218 and 26 impose procedural and substantive restrictions that so weaken that authority as to render it insufficient within the meaning of Government Code section 17556(d).

As discussed above, Proposition 13 of 1978 added article XIII A to the California Constitution, with the intent to limit local governments' power to impose or increase taxes.[813] Proposition 13 generally limited the rate of any ad valorem tax on real property to one percent; limited increases in the assessed value of real property to two percent annually absent a change in ownership; and required that any changes in state taxes enacted to increase revenues and special taxes imposed by local government

[809] See, for example, Government Code section 37101 ("The legislative body may license, for revenue and regulation, and fix the license tax upon, every kind of lawful business transacted in the city").

[810] Government Code section 66001 provides for development fees under the Mitigation Fee Act requiring local entity to identify the purpose of the fee and the uses to which revenues will be put, to determine a reasonable relationship between the fee's use and the type of project or projects on which the fee is imposed.

[811] See, for example, Government Code sections 38902 (providing for sewer standby charges); 53750 et seq. (Proposition 218 Omnibus Implementation Act, describing procedures for adoption of assessments, fees and charges); 53751 (as amended in 2017, providing that fees for sewer services includes storm sewers).

[812] See also, *Ayers v. City Council of City of Los Angeles* (1949) 34 Cal.2d 31 (Upholding conditions imposed by the City on subdivision development, in the absence of any clear restriction or limitation on the City's police power); *Associated Home Builders etc. Inc. v. City of Walnut Creek* (1971) 4 Cal.3d 633 (upholding state statute and local ordinance requiring dedication or in-lieu fees for parks and recreation as a condition of subdividing for residential building).

[813] See, e.g., *County of Fresno v. State of California* (1991) 53 Cal.3d 482.

must be approved by a two-thirds vote of the electors.[814] Proposition 13, however, did not define "special taxes"; a series of judicial decisions tried to define the difference between fees and taxes, and in so doing, diminished Proposition 13's import by allowing local governments to generate revenue without a two-thirds vote.[815]

In 1996, Proposition 218 added article XIII C to ensure and reiterate voter approval requirements for general and special taxes, because it was not clear whether Proposition 62, which enacted statutory provisions to ensure that all new local taxes be approved by a vote of the local electorate, bound charter jurisdictions.[816] As added by Proposition 218, article XIII C defined all taxes as general or special, and provided that special districts have no power to impose general taxes; and for any other local government, general taxes require approval by a majority of local voters, and special taxes require a two-thirds majority voter approval.[817]

Interpreting the newly-reiterated limitation on local taxes, the California Supreme Court in *Sinclair Paint* held that a statute permitting the Department of Health Services to levy fees on manufacturers and other persons contributing to environmental lead contamination, in order to support a program of evaluation and screening of children, imposed bona fide regulatory fees, and not, as alleged by plaintiffs, a special tax that would require voter approval under articles XIII A and XIII C.[818] The Court noted with approval San Diego Gas & Electric, in which the air district was permitted to recover costs of its operations, which are not reasonably identifiable with specific industrial polluters, against all monitored polluters according to an emissions-based formula, and those fees were not held to constitute a special tax.[819] The Court cited with approval the court of appeal's finding that "[a] reasonable way to achieve Proposition 13's goal of tax relief is to shift the costs of controlling stationary sources of pollution from the tax-paying public to the pollution-causing industries themselves…"[820] The Court thus held: "In our view, the shifting of costs of providing evaluation, screening, and medically necessary follow-up services for potential child victims of lead poisoning from the public

to those persons deemed responsible for that poisoning is likewise a reasonable police power decision."[821]

In 2010, the voters approved Proposition 26, partly in response to *Sinclair Paint*.[822] Proposition 26 sought to broaden the definition of "tax," and accordingly narrow the courts' construction of permissible non-tax fees. However, Proposition 26 largely codifies the analysis of *Sinclair Paint*, in its articulation of the various types of fees and charges that are *not* deemed "taxes."[823] Thus, while Proposition 13 led a series of increasing restrictions on the imposition of new taxes, after *Sinclair Paint* and Propositions 218 and 26, local governments have the power, subject to varying limitations, to impose or increase (1) general taxes (with voter approval);[824] (2) special taxes (with two-thirds voter approval);[825] and (3) levies, charges, or exactions that are not "taxes," pursuant to the exceptions stated in article XIII C, section 1(e), which include:

> (1) A charge imposed for a specific benefit conferred or privilege granted directly to the payor that is not provided to those not charged, and which does not exceed the reasonable costs to the local government of conferring the benefit or granting the privilege.
>
> (2) A charge imposed for a specific government service or product provided directly to the payor that is not provided to those not charged, and which does not exceed the reasonable costs to the local government of providing the service or product.
>
> (3) A charge imposed for the reasonable regulatory costs to a local government for issuing licenses and permits, performing investigations, inspections, and audits, enforcing agricultural marketing orders, and the administrative enforcement and adjudication thereof.
>
> (4) A charge imposed for entrance to or use of local government property, or the purchase, rental, or lease of local government property.
>
> (5) A fine, penalty, or other monetary charge imposed by the judicial branch of government or a local government, as a result of a violation of law.

[824] California Constitution, article XIII C, section 2.

[825] California Constitution, article XIII C, section 2.

(6) A charge imposed as a condition of property development.

(7) Assessments and property-related fees imposed in accordance with the provisions of Article XIII D.

The local government bears the burden of proving by a preponderance of the evidence that a levy, charge, or other exaction is not a tax, that the amount is no more than necessary to cover the reasonable costs of the governmental activity, and that the manner in which those costs are allocated to a payor bear a fair or reasonable relationship to the payor's burdens on, or benefits received from, the governmental activity.[826]

The plain language of article XIII C, section 1(e) thus describes certain categories of fees or exactions that are not taxes, including fees or charges for a benefit conferred or privilege granted,[827] and fees or charges for a government service or product provided to the payor and not others.[828] Both of these could be described as "user" fees, or otherwise described as fees for a government service or benefit. In addition, section 1(e) provides for regulatory fees (including those for inspections),[829] development fees,[830] and assessments or property-related fees or charges adopted in accordance with article XIII D.[831] In each case, the local government bears the burden to establish that the fee or charge is not a tax, including that "the amount is no more than necessary to cover the reasonable costs of the governmental activity, and that the manner in which those costs are allocated to a payor bear a fair or reasonable relationship to the payor's burdens on, or benefits received from, the governmental activity."[832]

However, while the limitations of article XIII C, section 1(e) may be newly expressed in the Constitution (i.e., added in 2010 by Proposition 26), the concepts that regulatory fees must be reasonably related to a legitimate public purpose, and in some way proportional to the activity being regulated, are not at all new. The California Supreme Court described the history of such fees in *United Water Conservation Dist*., saying, "the language of Proposition 26 is drawn in large part from pre-Proposition 26 case law distinguishing between taxes subject to the requirements of article XIII A, on the one hand, and regulatory and other fees, on the other."[833] The Court also noted: "*Sinclair*

[833] *City of San Buenaventura v. United Water Conservation Dist.* (2017) 3 Cal.5th 1191, 1210, footnote 7 citing *Jacks v. City of Santa Barbara* (2017) 3 Cal.5th 248, 262 and footnote 5.

Paint, from which the relevant article XIII C requirements are derived, made clear that the aggregate cost inquiry and the allocation inquiry are two separate steps in the analysis."[834] Accordingly, the Court upheld the court of appeal's finding that the conservation charges did not exceed the reasonable cost of the regulatory activity in the aggregate,[835] but presumed "each requirement to have independent effect,"[836] and remanded the matter for consideration of the latter issue.

Similarly, in *San Diego County Water Authority*, the First District Court of Appeal upheld non-property-related rates charged for conveying water from the Colorado River based on a two-part test.[837] The rates were held to satisfy both the express requirements of article XIII C, section 1(e)(2): "a specific service (use of the conveyance system) directly to the payor (a member agency) that is not provided to those not charged and which does not exceed the reasonable costs…of providing the service"; and the more general test of *Sinclair Paint*: "[the volumetric rates] bear a fair and reasonable relationship to the benefits it receives from its use of the conveyance system."[838]

Notably, developer fees have been interpreted somewhat more loosely with respect to this proportionality test. Broad categories of fees have been found to be allowable development fees, such as fees to recover the local agency's costs of advance planning services (i.e., the cost to prepare general and specific plans that are applicable to the project being developed). The plain language of article XIII C, section 1(e)(6) conspicuously omits any language relating to the reasonable costs or burdens of development, although the general caveat at the end of section 1(e) presumably still applies: "that the amount is no more than necessary to cover the reasonable costs of the governmental activity, and that the manner in which those costs are allocated to a payor bear a fair or reasonable relationship to the payor's burdens on, or benefits received from, the governmental activity."[839] However, the court in *616 Croft Ave., LLC* suggests that as long as a development fee is "reasonably related to the broad general welfare purposes for which the ordinance was enacted,"[840] the courts will not inquire into the reasonableness of the fee as applied to a particular payor:

[839] California Constitution, article XIII C, section 1(e).

[840] *616 Croft Ave., LLC v. City of West Hollywood* (2016) 3 Cal.App.5th 621, 631.

> [A]lthough the fee must be reasonable, the inquiry is not about the reasonableness of the individual calculation of fees related to Croft's development's impact on affordable housing. The inquiry is whether the fee schedule itself is reasonably related to the overall availability of affordable housing in West Hollywood.[841]

The court relied in part on article XIII D, section 1, which states that "[n]othing in this article or Article XIII C shall be construed to…[a]ffect exiting laws relating to the imposition of fees as a condition of property development."[842] Other courts have also confirmed the constitutionality of development fees, finding that there must be a "logical nexus" between the impacts of development and the use of the fee exacted from the developer to mitigate those impacts, and that the fee must be roughly proportionate to the impacts from the development.[843]

Accordingly, there is no reason to believe that article XIII C imposes any greater limitation on local governments' authority under their police power to impose reasonable regulatory fees and other fees than existed under prior law. Article XIII C makes clear that the burden is on the local government to establish that the levy is not a tax, that the fee is reasonably related to the costs to government in the aggregate, and that the fee charged to the payors is reasonably related to the benefits received or burdens created by such payors as a part of the rate setting process.[844] It is not the burden of the state to make this showing on behalf of local government.

Based on the foregoing, the Commission finds that article XIII C of the California Constitution does not render local government's authority to impose fees insufficient as a matter of law within the meaning of Government Code section 17556.

[844] California Constitution, article XIII C, section 1(e).

ii. Permittees have regulatory fee authority for the new state-mandated requirements related to developing and implementing the Green Infrastructure Plan (Provision C.3.j.i.-iv.), and thus, there are no costs mandated by the state pursuant to Government Code section 17556(d) for this Provision. Permittees do not have regulatory fee authority for the other Provisions found to impose new state-mandated requirements.

The Regional Board contends that the claimants have regulatory fee authority within the meaning of Government Code section 17556(d) sufficient to cover the costs of all the new state-mandated activities by charging fees to developers and, thus, there are no costs mandated by the state.[845] The Regional Board argues that regulatory fees could be collected from developers for the costs associated with implementing mercury, PCBs, and green infrastructure provisions, stating:

> The permittees are capable of crafting fees to cover the trash, mercury, PCB and green infrastructure provisions. The Supreme Court has validated the adoption of regulatory fees, providing they are not levied for unrelated revenue purposes. It is reasonable to collect fees from developers for the costs associated with implementing the mercury, PCBs and green infrastructure provisions. Similarly, the costs of full trash capture can be allocated to businesses responsible for generating high trash areas. Asking these entities to bear the costs directly related to their activities "is comparable in character to similar police power measures imposing fees to defray the actual or anticipated adverse effects of various business operations." Permittees' police power is "broad enough to include mandatory remedial measures to mitigate the *past, present or future* adverse impact of the fee payer's operations" in situations, like those present here, where there is a causal connection or nexus between the adverse effects and the fee payer's activities.[846]

As explained below, the Commission agrees that the permittees have the authority to impose regulatory fees on developers sufficient as a matter of law to cover the costs to comply with Provision C.3.j.i.-iv. and, thus, there are no costs mandated by the state for the requirements in Provision C.3.j.i.-iv. However, regulatory fees imposed on developers for the remaining new state-mandated activities would not satisfy constitutional requirements because there is no evidence in the law or record that the remaining activities were intended to provide a specific benefit or privilege only to developers.

The sole issue for determining whether Government Code section 17556(d) applies is whether the claimants have the "authority, i.e., the right or power, to levy fees sufficient to cover the costs" of a state mandated program, notwithstanding other factors that may

[846] Exhibit C, Regional Board's Late Comments on the Test Claim, page 7, citations omitted, emphasis in original.

make the exercise of that authority or the collection of those fees impractical or difficult.[847] And, as explained above, the claimants have the authority under their police powers to impose regulatory fees on development, which must meet the requirements of article XIII C, section 1(e) (Proposition 26).

The Green Infrastructure Plan requirements imposed by Provision C.3.j.i.-iv. provide general guidelines for overall streetscape and project design and construction; standard specifications and typical design details and related information necessary to incorporate Green Infrastructure into development projects; require any Green Infrastructure projects not subject to the treatment and hydromodification sizing requirements already imposed on Regulated Projects to meet those standards; and summarize planning documents that have been updated or modified to include green infrastructure elements.[848] It also requires permittees to conduct public outreach to educate professionals involved in the planning and design of Green Infrastructure Projects on these standards and specifications, to develop and implement methods for tracking and reporting implementation of green infrastructure measures, and to report on the implementation of green infrastructure measures.[849] In other words, the Green Infrastructure Plan provides guidance to project developers on how to effectively incorporate Green Infrastructure into a project's design for Regulated Projects and any other projects intended to incorporate Green Infrastructure elements that do not qualify as a Regulated Project. Although the Green Infrastructure Plan as a whole provides a public good by encouraging the use of Green Infrastructure to reduce pollutant loads, project developers receive a direct benefit from the information it provides on how to incorporate those elements into their projects.

The activities required to develop and implement a Green Infrastructure Plan pursuant to Provision C.3.j.i.-iv., which would then be applicable to development projects seeking permittees' approval, would fall within the category of a constitutionally-allowable regulatory development fee. In 2022, the Third District Court of Appeal issued its decision in *Department of Finance (Discharge of Stormwater Runoff)* and found that the permittees had regulatory fee authority under their police powers to pay for the requirements imposed by the San Diego Regional Water Quality Control Board to develop and implement a hydromodification management plan and LID requirements for use on priority development projects, as incidental expenses of regulating development.[850] Similar to the test claim permit here, the court explained that the priority development projects addressed in the permit are certain new developments

that increase pollutants in stormwater and in discharges from MS4s, including certain residential, commercial, and industrial uses along with parking lots and roads that add impervious surfaces or are built on hillsides or in environmentally sensitive areas.[851] The permit required the claimants to develop and implement a hydromodification management plan to mitigate increases in runoff discharge rates and durations from priority development projects, and add LID requirements to their local Standard Urban Storm Water Mitigation Plans.[852] The County and cities argued that the costs of creating the plans could not be recovered through regulatory fees, and thus voter approval would be required, since the amount of the fee would exceed the reasonable costs of providing the services for which it is charged, and the amount of the fee would not bear a reasonable relationship to the burdens created by the feepayers' activities or operations, primarily because the costs were incurred before any priority development project was proposed.[853] The County and cities further argued that they could not legally levy a fee to recover the cost of preparing the plans because those planning actions benefit the public at large and, thus, would constitute a tax.[854] The court disagreed and found that local government has fee authority sufficient as a matter of law to cover the costs of the hydromodification management plan and LID requirements within the meaning of Government Code section 17556(d) and, thus, there were no costs mandated by the state for these activities based on the following findings:

- Creating the hydromodification management plans and the LID requirements "constitute costs incident to the development permit which permittees will issue to priority development projects and the administration of permittees' pollution abatement program. Setting the fee will not require mathematical precision. Permittees' legislative bodies need only consider probabilities according to the best honest viewpoint of [their] informed officials to set the amount of the fee."[855]
- There was no evidence that the permittees could not levy a fee that would bear a reasonable relationship to the burdens created by future priority development. "A regulatory fee does not become a tax simply because the fee may be disproportionate to the service rendered to individual payors . . . The question of proportionality is not measured on an individual basis. Rather, it is measured

collectively, considering all rate payors." The fee just has to be related to the overall cost of the governmental regulation.[856]

- The court rejected the claimants' argument that they could not legally levy a fee to recover the cost of preparing the plans because those planning actions benefit the public at large, relying on *Newhall County Water Dist. v. Castaic Lake Water Agency* (2016) 243 Cal.App.4th 1430, 1451. Proposition 26 states a levy is not a tax where, among other uses, it is imposed "for a specific government service provided directly to the payor that is not provided to those not charged ...."[857] However, the court found that the service provided directly to developers of priority development projects was the preparation, implementation, and approval of water pollution mitigations applicable only to their projects. Unlike in *Newhall*, that service was not provided to anyone else, and only affected priority project developers charged for the service. The service would not be provided to those not charged.[858]

In addition, the Mitigation Fee Act, Government Code section 66000 et seq., also authorizes local agencies to impose development fees if certain requirements are met. As defined by the Act, a development fee is:

> . . . a monetary exaction other than a tax or special assessment, whether established for a broad class of projects by legislation of general applicability or imposed on a specific project on an ad hoc basis, that is charged by a local agency to the applicant in connection with approval of a development project for the purpose of defraying all or a portion of the cost of public facilities related to the development project, but does not include . . . fees for processing applications for governmental regulatory actions or approvals[.][859]

"[A] fee does not become a 'development fee' simply because it is made in connection with a development project. Rather, approval of the development project must be conditioned on payment of the fee."[860] A development fee under the Act is one that is

Commission on State Mandates* (2021) 59 Cal.App.5th 546, 569, where the court held that article XIII D prohibits MS4 permittees from charging property owners for the cost of providing trash receptacles at public transit locations in part because service was made available to the public at large.

[858] *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 592-593.

[859] Government Code section 66000(b).

[860] *California Building Industry Assn. v. San Joaquin Valley Air Pollution Control Dist.* (2009) 178 Cal.App.4th 120, 130.

imposed to "defray[] all or a portion of the cost of public facilities related to the development project."[861] "'Public facilities' [broadly] includes public improvements, public services, and community amenities," and, thus, is not limited to capital outlay costs.[862] The local agency shall determine how there is a reasonable relationship between the amount of the fee and the cost of the public facility or portion of the public facility attributable to the development on which the fee is imposed.[863] Pollution prevention or abatement provides a public service,[864] which falls within the Act's definition of a public facility.

The courts have also explained that the scope of a regulatory fee is somewhat flexible: a regulatory fee is valid as long as it relates to the overall purpose of the regulatory governmental action.[865] The Third District Court of Appeal in *California Assn. of Prof. Scientists v. Department of Fish & Game (Professional Scientists)* has identified the following general rules:

> General principles have emerged. Fees charged for the associated costs of regulatory activities are not special taxes under an article XIII A, section 4 analysis if the " ' "fees do not exceed the reasonable cost of providing services necessary to the activity for which the fee is charged and [they] are not levied for unrelated revenue purposes." ' " (Citation omitted.) "A regulatory fee may be imposed under the police power when the fee constitutes an amount necessary to carry out the purposes and provisions of the regulation." (Citation omitted.) "Such costs ... include all those incident to the issuance of the license or permit, investigation, inspection, administration, maintenance of a system of supervision and enforcement." (Citation omitted.) Regulatory fees are valid despite the absence of any perceived "benefit" accruing to the fee payers. (Citation omitted.) Legislators "need only apply sound judgment and consider 'probabilities according to the best honest viewpoint of informed officials' in determining the amount of the regulatory fee." (Citation omitted).[866]

As indicated by the court in *Professional Scientists*, regulatory fees can include all those costs "incident to the issuance of the license or permit, investigation, inspection,

[865] *California Farm Bureau Federation v. State Water Resources Control Board* (2011) 51 Cal.4th 421, 438, citing *California Assn. of Prof. Scientists v. Department of Fish & Game* (2000) 79 Cal.App.4th 935, 945.

[866] *California Assn. of Prof. Scientists v. Department of Fish & Game* (2000) 79 Cal.App.4th 935, 945.

administration, maintenance of a system of supervision and enforcement."[867] In *United Business Commission v. City of San Diego*, the court explained that regulatory fees include "all the incidental consequences that may be likely to subject the public to cost in consequence of the business licensed" and that the following incidental costs are properly included in a regulatory fee: "inspection of hazards, travel time, office supplies, telephone expenses, overhead, and clerk's time"[868]

Here, Green Infrastructure Program Plan development, early implementation of Green Infrastructure Projects, participating in processes to promote Green Infrastructure, and tracking and reporting progress pursuant to Provision C.3.j.i.-iv. are "incident to the development permit[s] which permittees will issue to priority development projects and the administration of permittees' pollution abatement program."[869] The required activities all relate to the development and implementation of a plan which facilitates incorporating Green Infrastructure elements into development projects, which project developers benefit from directly. The proposed fee would be imposed as a condition for approving new real property development and redevelopment and based on the developer's application for government approval to proceed with the development. The fees would not be levied for an unrelated revenue purpose, can be fairly allocated among the fee payers, and the service is not provided to those not charged.[870] Such fees are not taxes under Proposition 26 when they are charges imposed as a condition of property development.[871]

In addition, there is no evidence in the record indicating that the claimants cannot levy a fee that will bear a reasonable relationship to the burdens created by future Green Infrastructure development. A regulatory fee does not become a tax simply because the fee may be disproportionate to the service rendered to individual payors.[872] The question of proportionality is not measured on an individual basis. Rather, it is

measured collectively, considering all rate payors.[873] Thus, permissible fees must be related to the overall cost of the governmental regulation. They need not be finely calibrated to the precise benefit each individual fee payor might derive, or the precise burden each payer may create. What a fee cannot do is exceed the reasonable cost of regulation with the generated surplus used for general revenue collection. "An excessive fee that is used to generate general revenue becomes a tax."[874] And "No one is suggesting [that the claimants] levy fees that exceed their costs."[875]

Based on this authority, the claimants in this case have regulatory and developer fee authority under their police powers and the Mitigation Fee Act sufficient as a matter of law to cover the costs of the new state-mandated requirements related to the Green Infrastructure Plan (Section C.3.j.i.-iv.), pursuant to Government Code section 17556(d), and thus, there are no costs mandated by the state for these requirements.

In contrast, the Regional Board has not explained how the permittees have authority to impose fees on developers for the remaining mandated activities. The remaining provisions: 1) required permittees to prepare a reasonable assurance analysis of future mercury and PCBs load reductions (C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., and C.12.c.iii.1.-3.); 2) required a mercury progress report on the list of watersheds where mercury control measures are or will be implemented (C.11.a.iii.); 3) required PCBs reporting (C.12.a.iii.1. and 2.); 4) required a PCBs control measures implementation plan (C.12.d.); and 5) required permittees to perform PCBs caulk and sealant testing (C.12.e.). These activities relate to identifying where mercury and PCBs are currently present in the environment, a plan identifying control measures that are or will be implemented during the permit term, and creating plans and analysis for how those loads will be reduced in the future.[876] Unlike developing and implementing the Green Infrastructure Plan, which provides a direct benefit to developers by providing guidance on how to incorporate green infrastructure into their projects and requires compliance with the Green Infrastructure Plan requirements to obtain a building permit, the remaining new mandated activities primarily benefit the public at large by providing information that shows compliance with the TMDLs and how best to comply with the water quality standards for these pollutants in the future. The TMDLs showed that mercury and PCBs needed to be controlled and reduced because of the threat to the health of humans who consume fish, the impairment to sport fishing, and the preservation of endangered species, and the sources of these pollutants extend beyond

[876] Exhibit A, Test Claim, pages 486-487 (test claim permit, Provision C.11.a.iii.), 489-490 (test claim permit, Provisions C.11.c.ii.2. and C.11.c.iii.1.-3.), 493-494 (test claim permit, Provisions C.12.a.iii.1. and 2.), 497 (test claim permit, Provisions C.12.c.ii.2. and C.12.c.iii.1.-3.), and 498 (test claim permit, Provisions C.12.d. and C.12.e.).

development.[877] As mentioned, for a regulatory fee to be constitutional, there must be a "logical nexus" between the impacts of development and the use of the fee exacted from the developer to mitigate those impacts, and that the fee must be roughly proportionate to the impacts from the development.[878] As indicated in Proposition 26, a charge must be imposed for a specific benefit conferred or privilege granted directly to the payor that is not provided to those not charged.[879] There is no evidence in the law or record that the Regional Board intended that providing a reasonable assurance analysis of future mercury and PCBs load reductions by 2040; reporting on preparing a list of watersheds where mercury control measures are or will be implemented; preparing a PCBs report; preparing a PCBs control measure implementation plan; and testing caulk and sealants in existing storm drain infrastructure and public rights-of-way for PCBs, would provide any specific benefit to a developer.

Accordingly, while the claimants in this case have regulatory fee authority under their police powers and the Mitigation Fee Act sufficient as a matter of law to cover the costs of the new state-mandated requirements related to the Green Infrastructure Plan (Section C.3.j.i.-iv.), pursuant to Government Code section 17556(d), they do not have regulatory fee authority for any of the other new activities found to be mandated by the state.

[879] California Constitution, article XIII C, section 1(e).

c. The permittees have constitutional and statutory authority to impose property-related stormwater fees for the reasonable assurance analysis of future mercury and PCBs load reductions (C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2, and C.12.c.iii.1.-3.); required progress report on list of watersheds where mercury control measures are or will be implemented (C.11.a.iii.); PCBs reporting (C.12.a.iii.1. and 2.); PCBs control measures implementation plan (C.12.d.); and PCBs caulk and sealant testing (C.12.e.). However, from January 1, 2016, through December 31, 2017, voter approval of these fees is required and the courts have found that when voter approval is required, Government Code section 17556(d) does not apply and there are costs mandated by the state. Beginning January 1, 2018, when property-related stormwater fees are subject only to the voter protest provisions of article XIII D, Section 6 of the California Constitution, Government Code section 17556(d) applies, there are no costs mandated by the State, and reimbursement is denied.

The claimants also have authority pursuant to their constitutional police powers[880] and other statutory authority[881] to impose property-related fees for the new state mandated activities.[882] "[P]revention of water pollution is a legitimate governmental objective, in furtherance of which the police power may be exercised."[883]

As discussed above, some permittees have adopted and imposed property-related fees to cover their costs to comply with the stormwater permits.[884]

As described below, however, stormwater property-related fees are subject to certain substantive and procedural requirements of Proposition 218, or article XIII D of the California Constitution. The claimant contends that it has no authority to increase its existing Clean Water Fund without seeking voter approval under proposition 218.[885]

It is true that property-related fees are subject to the procedural requirements of article XIII D, which until January 1, 2018, required voter approval before new or increased

fees could be charged. The courts have held when voter approval of a fee is required by article XIII D, Government Code section 17556(d) does not apply and there are costs mandated by the state for new state-mandated requirements.[886]

Effective January 1, 2018, SB 231 defined "sewer" to include stormwater as an exception to the voter approval requirement in article XIII D, which makes only the voter protest provisions of article XIII D apply to property-related stormwater fees. The courts have held Government Code section 17556(d) applies to deny a claim for state mandate reimbursement when the fee authority is subject to voter protests under article XIII D, section 6(a).[887]

These issues are analyzed below.

i. The substantive and procedural requirements of articles XIII C and XIII D for property-related fees and SB 231.

Proposition 218, approved by voters in 1996, added articles XIII C and XIII D to the California Constitution and "is one of a series of voter initiatives restricting the ability of state and local governments to impose taxes and fees."[888] Article XIII C concerns voter approval for many types of local taxes other than property taxes. Article XIII D addresses property-based taxes and fees.[889] Specifically, article XIII D of the California Constitution "imposes certain substantive and procedural restrictions on taxes, assessments, fees, and charges 'assessed by any agency upon any parcel of property or upon any person as an incident of property ownership.'"[890] For example, assessments and property-related fees are subject to notice and hearing requirements, and must meet a threshold of proportionality with respect to the amount of the exaction and the purposes to which it is put. Section 4, addressing assessments, provides:

> An agency which proposes to levy an assessment shall identify all parcels which will have a special benefit conferred upon them and upon which an assessment will be imposed. The proportionate special benefit derived by each identified parcel shall be determined in relationship to the entirety of the capital cost of a public improvement, the maintenance and operation expenses of a public improvement, or the cost of the property related service being provided. No assessment shall be imposed on any parcel which exceeds the reasonable cost of the proportional special benefit conferred on that parcel. Only special benefits are assessable, and an

[890] *City of San Buenaventura v. United Water Conservation Dist.* (2017) 3 Cal.5th 1191, 1200 citing California Constitution, article XIII D, section 3.

> agency shall separate the general benefits from the special benefits conferred on a parcel. Parcels within a district that are owned or used by any agency, the State of California or the United States shall not be exempt from assessment unless the agency can demonstrate by clear and convincing evidence that those publicly owned parcels in fact receive no special benefit.[891]

Once the amount of the proposed assessment is identified, notice must be mailed to the record owner of each parcel, stating the amount chargeable to the entire district, to the parcel itself, the reason for the assessment and the basis of the calculation, and the date, time and location of the public hearing on the proposed assessment. The notice must be in the form of a ballot, and at the public hearing the agency "shall consider all protests…and tabulate the ballots." If the majority of the returned ballots oppose the assessment, the agency "shall not impose" the assessment.

Similarly, section 6 provides for a proportionality requirement with respect to property-related fees and charges and imposes the following substantive requirements:

> A fee or charge shall not be extended, imposed, or increased by any agency unless it meets all of the following requirements:
>
> (1) Revenues derived from the fee or charge shall not exceed the funds required to provide the property related service.
>
> (2) Revenues derived from the fee or charge shall not be used for any purpose other than that for which the fee or charge was imposed.
>
> (3) The amount of a fee or charge imposed upon any parcel or person as an incident of property ownership shall not exceed the proportional cost of the service attributable to the parcel.
>
> (4) No fee or charge may be imposed for a service unless that service is actually used by, or immediately available to, the owner of the property in question. Fees or charges based on potential or future use of a service are not permitted. Standby charges, whether characterized as charges or assessments, shall be classified as assessments and shall not be imposed without compliance with Section 4.
>
> (5) No fee or charge may be imposed for general governmental services including, but not limited to, police, fire, ambulance or library services, where the service is available to the public at large in substantially the same manner as it is to property owners. Reliance by an agency on any parcel map, including, but not limited to, an assessor's parcel map, may be considered a significant factor in determining whether a fee or charge is imposed as an incident of property ownership for purposes of this article. In any legal action contesting the validity of a fee or charge, the

[891] California Constitution, article XIII D, section 4(a).

> burden shall be on the agency to demonstrate compliance with this article.[892]

And section 6 provides for notice and a public hearing similarly to section 4; but, unlike section 4, section 6 does not expressly require the notice to inform parcel owners of their right to protest the proposed fee, nor is the notice required to be in the form of a ballot to be returned.[893]

Section 6(c) also provides that *voter approval* is required for property-related fees and charges *other than* for water, sewer, and refuse collection services.[894] This section is discussed further below, but for charges for water, sewer, and refuse collection services, voter approval is not required to impose or increase fees. The fees may be adopted, and are subject only to the voter protest provisions of article XIII D.

In 2010, the voters approved Proposition 26 to amend article XIII C, section 1 of the California Constitution to define a "tax" subject to the voters' approval as "any levy, charge, or exaction of any kind imposed by a local government, *except*" as stated.[895] An exception to the definition of a tax includes "Assessments and property-related fees imposed in accordance with the provisions of Article XIII D."[896] Thus, as long as local government complies with the substantive and procedural requirements of article XIII D (added by Proposition 218), then the revenues received are not considered proceeds of taxes, but revenue from "nontax" property-related fees and assessments. Article XIII C also makes clear that the burden is on local government to establish that the levy is not a tax, that the fee is reasonably related to the costs to government in the aggregate, and that the fee charged to the payors is reasonably related to the benefits received or burdens created by such payors as a part of the rate setting process.[897]

Many of the limitations stated in Proposition 218 and article XIII D are not new, as most special assessment acts under prior law required notice and a public hearing, and many such acts also provided for majority protest of affected parcel owners to defeat a proposed assessment.[898] Despite the existence of such limitations before Proposition

[898] *County of Placer v. Corin* (1980) 113 Cal.App.3d 443, 454, footnote 9.

218, the court in *County of Placer v. Corin* held assessments were sufficiently distinct from taxes as to be outside the scope of articles XIII A and XIII B.[899]

After Proposition 218 came the cases of *Apartment Ass'n of Los Angeles County*, *Richmond*, and *Bighorn-Desert View*.[900] In each of these cases, the Court narrowly construed the procedural and substantive limitations of article XIII D. In *Apartment Ass'n*, the Court rejected a challenge under article XIII D, section 6 to the city's ordinance imposing fees on residential rental properties, finding the fees were not "imposed by an agency upon a parcel or upon a person as an incident of *property ownership*…"[901] The Court held Proposition 218 imposes restrictions on taxes, assessments, fees, and charges only "when they burden landowners as *landowners*."[902] The residential rental fee ordinance at issue "imposes a fee on its subjects by virtue of their ownership of a business - i.e., because they are landlords," and, thus, the fee was not subject to the requirements of article XIII D.[903]

In *Richmond*, the District imposed a "capacity charge" on applicants for new water service connections, and thus could not prospectively identify the parcels to which the charge would apply; i.e., it could not have complied with the procedural requirements of notice and hearing under article XIII D, section 4. The Court held the impossibility of compliance with section 4 was one reason to find that the capacity charge was not an assessment, within the meaning of article XIII D.[904] The Court also found the charge was to be imposed on applicants for new service, rather than users receiving service through existing connections, and that distinction is consistent with the overall intent of Proposition 218, to promote taxpayer consent.[905] Accordingly, the Court concluded: "Because these fees are imposed only on the self-selected group of water service applicants, and not on real property that the District has identified or is able to identify, and because neither fee can ever become a charge on the property itself, we conclude

that neither fee is subject to the restrictions that article XIII D imposes on property assessments and property-related fees."[906]

In *Bighorn-Desert View*, the Court rejected a local initiative designed to impose a voter approval requirement on all future rate increases for water service,[907] finding article XIII D, section 6's express exemption from voter approval for sewer, water, and refuse collection "would appear to embody the electorate's intent as to when voter-approval should be required, or not required."[908] The Court concluded:

> [U]nder section 3 of California Constitution article XIII C, local voters by initiative may reduce a public agency's water rate and other delivery charges, but…[article XIII C, section 3] does not authorize an initiative to impose a requirement of voter preapproval for future rate increases or new charges for water delivery. In other words, by exercising the initiative power voters may decrease a public water agency's fees and charges for water service, but the agency's governing board may then raise other fees or impose new fees without prior approval. Although this power-sharing arrangement has the potential for conflict, we must presume that both sides will act reasonably and in good faith, and that the political process will eventually lead to compromises that are mutually acceptable and both financially and legally sound. (See *DeVita v. County of Napa, supra,* 9 Cal.4th at pp. 792–793, 38 Cal.Rptr.2d 699, 889 P.2d 1019 ["We should not presume ... that the electorate will fail to do the legally proper thing."].) We presume local voters will give appropriate consideration and deference to a governing board's judgments about the rate structure needed to ensure a public water agency's fiscal solvency, and we assume the board, whose members are elected (see Stats.1969, ch. 1175, § 5, p. 2274, 72B West's Ann. Wat.-Appen., supra, ch. 112, p. 190), will give appropriate consideration and deference to the voters' expressed wishes for affordable water service. The notice and hearing requirements of subdivision (a) of section 6 of California Constitution article XIII D will facilitate communications between a public water agency's board and its customers, and the substantive restrictions on property-related charges in subdivision (b) of the same section should allay customers' concerns that the agency's water delivery charges are excessive.[909]

The Sixth District Court of Appeal in *Howard Jarvis Taxpayers' Ass'n v. City of Salinas* (2002) 98 Cal.App.4th 1351(*City of Salinas*) held "sewer," for purposes of the voter

---

approval exemption in article XIII D, does not include storm sewers or storm drains.[910] *City of Salinas* involved a challenge to a "storm drainage fee" imposed by the City of Salinas to fund its efforts "to reduce or eliminate pollutants contained in storm water, which was channeled into a drainage system separate from the sanitary and industrial waste systems," as required by the CWA.[911] The fee was imposed on owners of developed parcels of property, and the amount "was to be calculated according to the degree to which the property contributed to runoff to the City's drainage facilities. That contribution, in turn, would be measured by the amount of the 'impervious area' on that parcel."[912] Taxpayers challenged the imposition of the fee, arguing it was subject to voter approval under Proposition 218. The City argued the fee was exempt from the voter approval requirements because it was for "sewer" or "water" services under article XIII D, section 6(c). The court disagreed, and construed the term "sewer" narrowly, holding "sewer" referred solely to "sanitary sewerage" (i.e., the system that carries "putrescible waste" from residences and businesses), and did not encompass a sewer system designed to carry only stormwater.[913] It also held the term "water services" meant "the supply of water for personal, household, and commercial use, not a system or program that monitors storm water for pollutants, carries it away, and discharges it into the nearby creeks, river, and ocean."[914]

Thus, under the *City of Salinas* case, a local agency's charges on developed parcels to fund stormwater management were property-related fees not covered by Proposition 218's exemption for "sewer" or "water" services. Therefore, for local agencies to impose new or increased stormwater fees on property owners, an election and majority vote of the affected property owners or two-thirds of the electorate in the area was first required to affirmatively approve those fees.

That holding has since been the subject of legislation. In 2017, the Legislature enacted SB 231, which amended Government Code sections 53750 and 53751 to expressly overrule the 2002 *City of Salinas* case.[915] Government Code section 53750(k) defines the term "sewer" for purposes of article XIII D as including systems that "facilitate sewage collection, treatment, or disposition for . . . drainage purposes, including . . . drains, conduits, outlets for . . . storm waters, and any and all other works, property, or structures necessary or convenient for the collection or disposal of . . . storm waters."

[915] Government Code sections 53750; 53751 (amended, Stats. 2017, ch. 536 (SB 231)).

Government Code section 53751 explains why the Legislature thinks the *City of Salinas* case is wrong:

> The court in *Howard Jarvis Taxpayers Ass'n v. City of Salinas* (2002) 98 Cal.App.4th 1351 failed to follow long-standing principles of statutory construction by disregarding the plain meaning of the term "sewer." Courts have long held that statutory construction rules apply to initiative measures, including in cases that apply specifically to Proposition 218 (see *People v. Bustamante* (1997) 57 Cal.App.4th 693; *Keller v. Chowchilla Water Dist.* (2000) 80 Cal.App.4th 1006). When construing statutes, courts look first to the words of the statute, which should be given their usual, ordinary, and commonsense meaning (*People v. Mejia* (2012) 211 Cal.App.4th 586, 611). The purpose of utilizing the plain meaning of statutory language is to spare the courts the necessity of trying to divine the voters' intent by resorting to secondary or subjective indicators. The court in *Howard Jarvis Taxpayers Ass'n v. City of Salinas* (2002) 98 Cal.App.4th 1351 asserted its belief as to what most voters thought when voting for Proposition 218, but did not cite the voter pamphlet or other accepted sources for determining legislative intent. Instead, the court substituted its own judgment for the judgment of voters.[916]

ii. Local government permittees have the authority to impose property-related fees for the new state-mandated requirements, which meet the substantive requirements of article XIII D, section 6(b).

The claimant contends that it has no legal authority to impose fees against residents for the new requirements.[917] Its rebuttal comments also claim that SB 231 has no effect on this test claim because it became effective in 2018, and thus has no effect on the availability of fee authority during the years the test claim permit went into effect that are the basis for the Commission's approval of the test claim.[918]

The Commission disagrees with these contentions.

In the 2021 *Department of Finance* case, the Second District Court of Appeal determined that an NPDES permit condition requiring the local governments to install and maintain trash receptacles at public transit stops owned by other public entities required subvention under article XIII B, section 6 because the local agencies did not have sufficient authority to levy fees for the requirement.[919] The court held the local governments did not have authority to install equipment on another public entity's

---

[916] Government Code section 53751(f).

[917] Exhibit A, Test Claim, page 34 (Written Narrative).

[918] Exhibit D, Claimant's Rebuttal Comments, page 3.

property and then charge that entity for installation and ongoing maintenance.[920] The State then contended the local governments could impose a fee on private property owners. However, the court determined not only that the State had not shown the fee would meet article XIII D's substantive requirements for property-related fees, but common sense dictated the vast majority of persons who would use and benefit from trash receptacles at transit stops are not the owners of adjacent properties but rather pedestrians, transit riders, and other members of the general public, as follows.

> The state agencies have not satisfied their burden. Not only have the state agencies failed to cite to the record or authority to support the point that a fee imposed on property owners adjacent to transit stops could satisfy the substantive constitutional requirements, but common sense dictates that the vast majority of persons who would use and benefit from trash receptacles at transit stops are not the owners of adjacent properties but rather pedestrians, transit riders, and other members of the general public; any benefit to property owners in the vicinity of bus stops would be incidental. Even if the state agencies could establish that the need for the trash receptacles is in part attributable to adjacent property owners and that the property owners would use the trash receptacles (see Cal. Const., art. XIII D, § 6, subd. (b)(3)-(4)), the placement of the receptacles at public transit stops makes the "service available to the public at large in substantially the same manner as it is to property owners" (id., art. XIII D, § 6, subd. (b)(3)). The state agencies, therefore, failed to establish that the local governments could impose on property owners adjacent to transit stops a fee that could satisfy these constitutional requirements.[921]

In 2022, the Third District Court of Appeal revisited the 2021 case and the substantive requirements in article XIII D, section 6(b) regarding property-related fees to cover the costs of street sweeping required by the NPDES permit as part of the receiving water limitations and discharge prohibitions to keep pollutants out of local waters.[922] The State acknowledged the general rule that the party claiming the applicability of an exception bears the burden of demonstrating that it applies. However, the State argued that this typical approach should not apply to the burden of showing fee authority under Government Code section 17556(d). The State argued "the inherent flexibility in permittees' police power means permittees may develop fees in any number of ways. Also, local governments like permittees have significantly more expertise and experience than the State agencies before us in designing, implementing, and

defending local government fees. The State asserts that permittees' expertise means they should bear the burden on this point."[923] The court agreed, and held as follows:

> We agree the State has the burden of establishing that permittees have fee authority, but that burden does not require the State also to prove permittees as a matter of law and fact are able to promulgate a fee that satisfies article XIII D's substantive requirements. The sole issue before us is whether permittees have "the authority, i.e., the right or power, to levy fees sufficient to cover the costs of the state-mandated program." (*Connell v. Superior Court* (1997) 59 Cal.App.4th 382, 401, 69 Cal.Rptr.2d 231.) The inquiry is an issue of law, not a question of fact. (*Ibid.*)[924]

The court further held that requiring the State to show affirmatively how permittees can create a fee that meets the substantive requirements where no fee yet exists requires the State to effectively engage in the rulemaking process itself and asks the State to do more than establish permittees have the lawful authority to enact a fee, which is the sole issue under Government Code section 17556(d).[925] The court held that unless there is a showing that a fee cannot meet the substantive requirements of article XIII D, section 6(b) as a matter of law or undisputed fact (as was the case in the 2021 *Department of Finance* case), then the finding that a fee would meet the substantive requirements is implicit in the determination that permittees have the right or power to levy a fee. The court stated the following:

> Although the court of appeal in *Los Angeles Mandates II* [i.e., the 2021 *Department of Finance* case] stated the state bore the burden to show that a fee for public trash receptacles could satisfy the substantive requirements, and that the state did not satisfy its burden, the court actually ruled that the local governments could not establish a fee that could meet the substantive requirements as a matter of law or undisputed

---

[923] *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 584.

[924] *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 584-585.

[925] *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 585. This finding is consistent with provisions in articles XIII C and XIII D, which state the burden is on the local agency to demonstrate compliance with the substantive rules when a fee exists and is legally challenged. Article XIII D, section 6(b), states that "In any legal action contesting the validity of a fee or charge, the burden shall be on the agency to demonstrate compliance with this article;" and article XIII C, section 1(e), states, "The local government bears the burden of proving by a preponderance of the evidence that a levy, charge, or other exaction is not a tax, that the amount is no more than necessary to cover the reasonable costs of the governmental activity, and that the manner in which those costs are allocated to a payor bear a fair or reasonable relationship to the payor's burdens on, or benefits received from, the governmental activity."

> fact. (*Los Angeles Mandates II, supra*, 59 Cal.App.5th at pp. 568-569, 273 Cal.Rptr.3d 619 ["common sense dictates" that fee would not meet requirements].) To require the State to show affirmatively how permittees can create a fee that meets the substantive requirements where no fee yet exists requires the State effectively to engage in the rulemaking process itself. That asks the State to do more than establish permittees have the lawful authority to enact a fee, which is the sole issue. To the extent *Los Angeles Mandates II* requires the State to prove more, we respectively disagree with its interpretation.[926]

Similarly here, there is no showing as a matter of law or fact that a fee cannot meet the substantive requirements of article XIII D, section 6(b). Although the claimant is correct that SB 231 became effective after the test claim went into effect, that only affects whether the permittees have fee authority for the entire permit term, not whether they have fee authority at all. The remaining mandate issues here regarding mercury and PCBs control measures address waters within the regulatory control of the permittees. Like street sweeping in the 2022 *Department of Finance* case, all of the new requirements are required by the permit to protect the beneficial uses of the local waters enjoyed by property owners in the San Francisco region and to prevent pollutants from causing or contributing to a violation of water quality standards.[927]

As indicated above, the courts have found that local government has the authority (i.e., the right and the power) to levy property-related fees for stormwater services under their police powers.[928] And the California Stormwater Quality Association (CASQA) has provided information to local agencies on how they can properly develop property-related stormwater fees under section XIII D of the California Constitution, including elements incorporated into a stormwater fee for various types of parcels to cover the cost of reducing stormwater pollutant loading and public education.[929] CASQA describes the typical apportionment of costs for stormwater services as follows:

> Proposition 218 requires that property-related fees "shall not exceed the proportional cost of the service attributable to the parcel."
>
> Therefore, it is essential to develop an apportionment of costs that best reflects the stormwater services provided by the municipality.

[927] Exhibit A, Test Claim, page 385 (test claim permit, Provision C.1.).

[928] *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 561.

[929] Exhibit X (13), CASQA, *Fee Study and Ordinance,* https://www.casqa.org/resources/funding-resources/creating-stormwater-utility/fee-study-and-ordinance (accessed on November 23, 2022).

> Across the U.S., most stormwater fee structures are based on the amount of impervious surface on a parcel, which is proportional to the amount of rainwater that runs off a parcel. This is a straight forward method, although impervious surface data may be difficult or expensive to obtain. Rate-setting consultants have experience working around this issue with sampling and statistical approaches, which can satisfy the Proposition 218 "proportionality" test.
>
> The majority of stormwater rate structures utilize an equivalent residential unit (ERU) as a basis for fees. ERUs estimate the average or median characteristics for a residential property. For stormwater, land use, impervious surface cover, or total size are possible metrics. Once established based on a sample of properties, each parcel in a municipality can be assigned an individual number of ERUs, which is multiplied by the base residential rate to establish the individual fee. With the ERUs assigned and totaled, the revenue requirement is divided by the total number or ERUs to establish the base residential rate.
>
> Most municipalities are bound to an NPDES permit requiring them to reduce stormwater pollutant loading as well as other objectives such as green infrastructure development and public education. These elements could be incorporated into the stormwater fees for various types of parcels.
>
> It is worth noting that Proposition 218's strict requirements on a fair apportionment method means that a municipality should create a thorough administrative record of how the rate and studies upon which it relies would need to be clearly referenced.[930]

Moreover, as noted in the Decision on the prior Test Claim in this series, several permittees have already adopted property-related fees to pay for similar requirements imposed by the NPDES permit, including fees for stormwater pollution and control.[931]

Accordingly, the Commission finds that local government permittees have the authority to impose property-related fees for the new state-mandated requirements, which meet the substantive requirements of article XIII D, section 6(b).

[931] Commission on State Mandates, Test Claim Decision on *California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2009-0074*, 10-TC-02, 10-TC-03, 10-TC-05, adopted January 24, 2025, pages 361-362.

iii. The courts have held Government Code section 17556(d) does not apply to deny a claim when voter approval of the property-related stormwater fee is required under article XIII D (Proposition 218). However, Government Code section 17556(d) applies to deny a claim when the voter protest provisions of article XIII D (Proposition 218) apply.

The court in *Paradise Irrigation District* (a challenge to the Commission's Decision in *Water Conservation*, 10-TC-12/12-TC-01) held, in the context of water services, the voter protest requirements of Proposition 218 do not divest local agencies of their authority to impose fees sufficient as a matter of law pursuant to Government Code section 17556(d) and, thus, when even when the voter protest provisions apply, there are no costs mandated by the state.[932] In *Paradise Irrigation District,* the Third District Court of Appeal observed:

> This case takes up where *Connell* left off, namely with the question of whether the passage of Proposition 218 undermined water and irrigation districts' authority to levy fees so that they are entitled to subvention for state-mandated regulations requiring water infrastructure upgrades. The Water and Irrigation Districts do not argue this court wrongly decided *Connell, supra*, 59 Cal.App.4th 382, 69 Cal.Rptr.2d, but only that the rule of decision was superseded by Proposition 218. Consequently, we proceed to examine the effect of Proposition 218 on the continuing applicability of *Connell*.[933]

Ultimately the court preserved and followed the rule of *Connell*, finding, based in large part on a discussion of *Bighorn-Desert View*, "Proposition 218 implemented a powersharing arrangement that does not constitute a revocation of the Water and Irrigation Districts' fee authority."[934] The court held, "[c]onsistent with the California Supreme Court's reasoning in *Bighorn*, we presume local voters will give appropriate consideration and deference to state mandated requirements relating to water conservation measures required by statute."[935] In addition, the court held "[w]e also reject the Water and Irrigation Districts' claim that, as a matter of practical reality, the majority protest procedure allows water customers to defeat the Districts' authority to

[933] *Paradise Irrigation District v. Commission on State Mandates* (2019) 33 Cal.App.5th 174, 189.

[934] *Paradise Irrigation District v. Commission on State Mandates* (2019) 33 Cal.App.5th 174, 194-195.

[935] *Paradise Irrigation District v. Commission on State Mandates* (2019) 33 Cal.App.5th 174, 194.

levy fees."[936] However, the court said, "[w]e adhere to our holding in *Connell* that the inquiry into fee authority constitutes an issue of law rather than a question of fact."[937] The court found water service fees, being expressly exempt from the voter approval provisions of article XIII D, section 6(c), therefore do not require voter preapproval, as would new taxes.[938] In addition, the court followed and relied upon *Bighorn-Desert View*'s analysis of a power-sharing relationship between local agencies and their constituents, including the presumption "local voters will give appropriate consideration and deference to a governing board's judgments about the rate structure needed to ensure a public water agency's fiscal solvency…" and the notice and hearing requirements of article XIII D, section 6(a) "will facilitate communications between a public water agency's board and its customers, and the substantive restrictions on property-related charges in subdivision (b) of the same section should allay customers' concerns that the agency's water delivery charges are excessive."[939] Accordingly, the court found that power-sharing arrangement "does not undermine the fee authority that the districts have," and the majority protest procedure of article XIII D, section 6(a) "does not divest the Water and Irrigation Districts of their authority to levy fees."[940] The court noted statutory protest procedures already existed, and "the possibility of a protest under article XIII D, section 6 does not eviscerate the Water and Irrigation Districts' ability to raise fees to comply with the Water Conservation Act."[941] Thus, the court found Government Code section 17556(d) still applies to deny a claim when the fee authority is subject to voter protest under article XIII D, section 6(a).

Finally, the Third District Court of Appeal addressed the voter approval issue in *Department of Finance v. Commission on State Mandates* (*Discharge of Stormwater Runoff*) and found that Government Code section 17556(d) does not apply when voter approval is required and, thus, there are costs mandated by the state for new

[941] *Paradise Irrigation District v. Commission on State Mandates* (2019) 33 Cal.App.5th 174, 194.

requirements mandated by a stormwater permit issued by the San Diego Regional Water Quality Control Board.[942] The court's reasoning is as follows:

> The State contends the reasoning in *Paradise Irrigation Dist.* applies equally here where article XIII D requires the voters to preapprove fees. It argues that as with the voter protest procedure, under article XIII D permittees' governing bodies and the voters who elected those officials share power to impose fees. The governing bodies propose the fee, and the voters must approve it. The "fact that San Diego property owners could theoretically withhold approval—just as a majority of the governing body could theoretically withhold approval to impose a fee—does not 'eviscerate' San Diego's police power; that power exists regardless of what the property owners, or the governing body, might decide about any given fee."
>
> The State's argument does not recognize a key distinction we made in *Paradise Irrigation Dist.:* water service fees were not subject to voter approval. We contrasted article XIII D's protest procedure with the voter approval requirement imposed by Proposition 218 on new taxes. Under article XIII C, no local government may impose or increase any general or special tax "unless and until that tax is submitted to the electorate and approved" by a majority of the voters for a general tax and by a two-thirds vote for a special tax. (Cal. Const., art. XIII C, § 2, subds. (b), (d).) Under article XIII D, however, water service fees do not require the consent of the voters. (Cal. Const., art. XIII D, § 6, subd. (c).) (*Paradise Irrigation Dist., supra,* 33 Cal.App.5th at p. 192, 244 Cal.Rptr.3d 769.) The implication is the voter approval requirement would deprive the districts of fee authority.
>
> Since the fees in *Paradise Irrigation Dist.* were not subject to voter approval, the protest procedure created a power sharing arrangement like that in *Bighorn* which did not deprive the districts of their fee authority. In *Bighorn*, the power-sharing arrangement existed because voters could possibly bring an initiative or referendum to reduce charges, but the validity of the fee was not contingent on the voters preapproving it. In *Paradise Irrigation Dist.*, the power-sharing arrangement existed because voters could possibly protest the water fee, but the validity of the fee was not contingent on voters preapproving the fee. The water fee was valid unless the voters successfully protested, an event the trial court in *Paradise Irrigation Dist.* correctly described as a "speculative and uncertain threat." (*Paradise Irrigation Dist., supra*, 33 Cal.App.5th at p. 184, 244 Cal.Rptr.3d 769.)

[942] *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 581.

Here, a fee for stormwater drainage services is not valid unless and until the voters approve it. For property-related fees, article XIII D limits permittees' police power to proposing the fee. Like article XIII C's limitation on local governments' taxing authority, article XIII D provides that "[e]xcept for fees or charges for sewer, water, and refuse collection services, no property related fee or charge shall be imposed or increased unless and until that fee or charge is submitted and approved by a majority vote of the property owners of the property subject to the fee or charge or, at the option of the agency, by a two-thirds vote of the electorate residing in the affected area." (Cal. Const., art. XIII D, § 6, subd. (c).) The State's argument ignores the actual limitation article XIII D imposes on permittees' police power. Permittees expressly have no authority to levy a property-related fee unless and until the voters approve it. There is no power sharing arrangement.

This limitation is crucial to our analysis. The voter approval requirement is a primary reason Section 6 exists and requires subvention. As stated earlier, the purpose of Section 6 "is to preclude the state from shifting financial responsibility for carrying out governmental functions to local agencies, which are 'ill equipped' to assume increased financial responsibilities because of the taxing and spending limitations that articles XIII A and XIII B impose." (*County of San Diego v. State of California* (1997) 15 Cal.4th 68, 81, 61 Cal.Rptr.2d 134, 931 P.2d 312.) And what are those limitations? Voter approval requirements, to name some.

Articles XIII A and XIII B "work in tandem, together restricting California governments' power both to levy and to spend for public purposes." (*City of Sacramento, supra*, 50 Cal.3d at p. 59, fn. 1, 266 Cal.Rptr. 139, 785 P.2d 522.) Article XIII A prevents local governments from levying special taxes without approval by two-thirds of the voters. (Cal. Const., art. XIII A, § 4.) It also prevents local governments from levying an ad valorem tax on real and personal property. (Cal. Const., art. XIII A, § 1.) Article XIII B, adopted as the "next logical step" to article XIII A, limits the growth of appropriations made from the proceeds of taxes. (Cal. Const., art. XIII B, §§ 1, 2, 8; *City Council v. South* (1983) 146 Cal.App.3d 320, 333-334, 194 Cal.Rptr. 110.) And, as stated above, article XIII C extends the voter approval requirement to local government general taxes. (Cal. Const., art. XIII C, § 2, subd. (b).)

Subvention is required under Section 6 because these limits on local governments' taxing and spending authority, especially the voter approval requirements, deprive local governments of the authority to enact taxes to pay for new state mandates. They do not create a power-sharing arrangement with voters. They limit local government's authority to proposing a tax only, a level of authority that does not guarantee resources to pay for a new mandate. Section 6 provides them with those resources.

> Article XIII D's voter approval requirement for property-related fees operates to the same effect. Unlike the owner protest procedure at issue in Paradise Irrigation Dist., the voter approval requirement does not create a power sharing arrangement. It limits a local government's authority to proposing a fee only; again, a level of authority that does not guarantee resources to pay for a state mandate. Section 6 thus requires subvention because of Article XIII D's voter approval requirement. Contrary to the State's argument, *Paradise Irrigation Dist*. does not compel a different result.[943]

The Commission is required by law to follow the 2022 *Department of Finance* case and find that Government Code section 17556(d) does not apply to deny a claim when voter approval of the fee is required under article XIII D (Proposition 218).[944] However, pursuant to the decision in *Paradise Irrigation District*, Government Code section 17556(d) applies to deny a claim when the voter protest provisions of article XIII D (Proposition 218) apply.

iv. From January 1, 2016, through December 31, 2017, voter approval of stormwater fees is required pursuant to the decision in the City of Salinas and, thus, Government Code section 17556(d) does not apply and there are costs mandated by the state for new state-mandated requirements. Beginning January 1, 2018, when property-related fees are subject only to the voter protest provisions of article XIII D, section 6 of the California Constitution, then Government Code section 17667(d) applies, and there are no costs mandated by the state.

As indicated above, the court in *City of Salinas* held a local agency's charges on developed parcels to fund stormwater management were property-related fees that were not covered by Proposition 218's exemption for "sewer" or "water" services. Therefore, for local agencies to impose new or increased stormwater fees on property owners, an election and majority vote of the affected property owners or two thirds of the electorate in the area was first required to affirmatively approve those fees.[945] When voter approval of fees are required, then Government Code section 17556(d) does not apply and there are costs mandated by the state.[946]

---

[943] *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 579-581.

[944] *Auto Equity Sales, Inc. v. Superior Court of Santa Clara County* (1962) 57 Cal.2d 450, 455 ("Under the doctrine of *stare decisis*, all tribunals exercising inferior jurisdiction are required to follow decisions of courts exercising superior jurisdiction.").

[945] *Howard Jarvis Taxpayers' Ass'n v. City of Salinas* (2002) 98 Cal.App.4th 1351, 1358-1359.

[946] *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535, 579-581.

However, Government Code sections 53750 and 53751 superseded the holding in *City of Salinas* and defined "sewer" to include stormwater sewers subject only to the voter protest provisions of article XIII D.[947] These provisions became effective January 1, 2018.

The Commission is required to presume statutes are constitutional. Article III, section 3.5 of the California Constitution prohibits administrative agencies, such as the Commission, from refusing to enforce a statute or from declaring a statute unconstitutional. Article III, section 3.5 states, in relevant part, the following:

> An administrative agency, including an administrative agency created by the Constitution or an initiative statute, has no power:
>
> (a) To declare a statute unenforceable, or refuse to enforce a statute, on the basis of being unconstitutional unless an appellate court has made a determination that such statute is unconstitutional;
>
> (b) To declare a statute unconstitutional;

The Commission also finds, pursuant to the decision of the Third District Court of Appeal, Government Code sections 53750 and 53751, absent a clear and unequivocal statement to the contrary, operate prospectively beginning January 1, 2018.[948]

Accordingly, the claimants do not have fee authority sufficient as a matter of law to cover the costs of the new state-mandated activities from December 1, 2009, through December 31, 2017, when voter approval of stormwater fees is required, and there are costs mandated by the state during that time. However, reimbursement is not required to the extent the claimants received fee revenue and used that revenue to pay for the state-mandated activities, or used any other revenues, including but not limited to grant funding, assessment revenue, and federal funds, that are *not* the claimants' proceeds of taxes.[949]

Pursuant to Government Code sections 53750 and 53751 and the decision in *Paradise Irrigation District*, there are no costs mandated by the state beginning January 1, 2018.

V. Conclusion

Based on the foregoing analysis, the Commission partially approves this Test Claim and finds that the test claim permit imposes a reimbursable state-mandated program from January 1, 2016 through December 31, 2017, only, for the following activities:

1. Reasonable Assurance Analysis (Provisions C.11.c.ii.2., C.11.c.iii.1.-3., C.12.c.ii.2., and C.12.c.iii.1.-3.):
    - Prepare a reasonable assurance analysis of future mercury and PCBs load reductions by doing the following:
        - Quantify the relationship between areal extent of Green Infrastructure implementation and mercury and PCBs load reductions, taking into consideration the scale of contamination of the treated area as well as the pollutant removal effectiveness of likely green infrastructure strategies.[950]
        - Estimate the amount and characteristics of land area that will be treated through Green Infrastructure by 2020, 2030, and 2040.[951]
        - Estimate the amount of mercury/PCBs load reductions that will result from Green Infrastructure implementation by 2020, 2030, and 2040.[952]
        - Quantitatively demonstrate that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/yr will be realized by 2040 through implementation of Green Infrastructure Projects.[953]
        - Ensure that the calculation methods, models, model inputs, and modeling assumptions used to fulfill provisions C.11.c.ii.2.a.-d. and C.12.c.ii.2.a.-d. above have been validated through a peer review process.[954]
    - Submit in the 2018 Annual Report as part of the reporting required for Provisions C.11.b.iii.2. and C.12.b.iii.3., the quantitative relationship between Green Infrastructure implementation and mercury and PCBs load reductions.

[954] Exhibit A, Test Claim, pages 490, 497 (test claim permit, Provisions C.11.c.ii.2.e., C.12.c.ii.2.e.).

This submittal shall include all data used and a full description of the models and model inputs relied on to establish this relationship.[955]

- Submit in the 2020 Annual Report an estimate of the amount and characteristics of land area that will be treated through Green Infrastructure implementation by 2020, 2030, and 2040. This submittal shall include all data used and a full description of the models and model inputs relied on to generate this estimate.[956]
- Submit in the 2020 Annual Report a reasonable assurance analysis to demonstrate quantitatively that mercury load reductions of at least 10 kg/yr and PCBs load reductions of at least 3 kg/yr will be realized by 2040 through the implementation of Green Infrastructure Projects. This submittal shall include all data used and a full description of models and model inputs relied on to make the demonstration and documentation of peer review of the reasonable assurance analysis.[957]

2. Progress Report on List of Watersheds and Management Areas Where Mercury Control Measures are or will be Implemented (Provision C.11.a.iii.1.).
    - By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where mercury control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[958]
3. PCBs Reporting (Provisions C.12.a.iii.1. and C.12.a.iii.2.):
    - By April 1, 2016, report on progress towards developing a list of the watersheds and portions of watersheds (management areas) where PCBs control measures are currently being implemented, and those in which control measures will be implemented during the permit term, as well as the monitoring data and other information used to select these watersheds and management areas.[959]
    - In the 2016 Annual Report, include the following information:

---

[959] Exhibit A, Test Claim, page 492 (test claim permit, Provision C.12.a.iii.1.).

- A cumulative listing of all potentially PCB-contaminated sites permittees have discovered and referred to the Water Board to date, with a brief summary description of each site and where to obtain further information.
- For each structural control and non-structural BMP, interim implementation progress milestones (e.g., construction milestones for structural controls or other relevant implementation milestones for structural controls and non-structural BMPs) and a schedule for milestone achievement.
- Clear statements of the roles and responsibilities of each participating permittee for implementation of pollution prevention or control measures for PCBs.[960]

4. Prepare PCBs control measures implementation plan, schedule, and reasonable assurance analysis to achieve the PCBs TMDL wasteload allocations by 2030 (Provision C.12.d.):
    - Prepare a PCBs control measures implementation plan, which must identify all technically and economically feasible PCBs control measures to be implemented (including green infrastructure projects).[961]
    - Include a schedule for PCBs control measure implementation according to which these technically and economically feasible PCBs control measures will be fully implemented by 2030.[962]
    - Provide an evaluation and quantification of the PCBs load reduction of such measures as well as an evaluation of costs, control measure efficiency and significant environmental impacts resulting from their implementation.[963]
    - Prepare a reasonable assurance analysis demonstrating that sufficient control measures will be implemented to attain the PCBs TMDL wasteload allocations by 2030.[964]
    - Submit the plan and schedule required by Provision C.12.d. in the 2020 Annual Report.[965]
5. Evaluate the presence of PCBs in caulks/sealants in storm drain or roadway infrastructure in public rights-of-way (Provision C.12.e.):

[960] Exhibit A, Test Claim, pages 493-494 (test claim permit, Provision C.12.a.iii.2.).

[961] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.1.).

[962] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.2.).

[963] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.ii.3.).

[964] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.i.).

[965] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.d.iii.).

- Collect at least 20 samples from throughout the permit-area of the caulks and sealants used in storm drains or roadway infrastructure in public rights-of-way.[966]
- Analyze the samples taken for PCBs in such a way that is able to detect a minimum PCB concentration of 200 parts per billion.[967]
- Report on the results of this investigation, including all data gathered, no later than the 2018 Annual Report.[968]

Reimbursement for these activities is denied beginning January 1, 2018, because the claimants have fee authority sufficient as a matter of law to cover the costs of these activities pursuant to Government Code section 17556(d) and, thus, there are no costs mandated by the state.

In addition, reimbursement for these mandated activities from any source, including but not limited to, state and federal funds, any service charge, fees, or assessments to offset all or part of the costs of this program, and any other funds that are not the claimant's proceeds of taxes that are used to pay for the mandated activities, shall be identified and deducted from any claim submitted for reimbursement.

All other sections, activities, and costs pled in the Test Claim are denied.

[966] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[967] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.ii.).

[968] Exhibit A, Test Claim, page 498 (test claim permit, Provision C.12.e.iii.).

DECLARATION OF SERVICE BY EMAIL

I, the undersigned, declare as follows:

I am a resident of the County of Sacramento and I am over the age of 18 years, and not a party to the within action. My place of employment is 980 Ninth Street, Suite 300, Sacramento, California 95814.

On December 23, 2025, I served the:

- **Current Mailing List dated December 19, 2025**
- **Draft Proposed Decision, Schedule for Comments, and Notice of Hearing issued December 23, 2025**

  California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049, 16-TC-03
  California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049, Provisions C.3.j, C.8., C.10.a., C.10.b., C.11.a., C.11.b., C.11.c., C.12.a., C.12.c., C.12.d., and C.12.e, Adopted on November 19, 2015 and Effective on January 1, 2016
  Union City, Claimant

by making it available on the Commission's website and providing notice of how to locate it to the email addresses provided on the attached mailing list.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct, and that this declaration was executed on December 23, 2025 at Sacramento, California.

COMMISSION ON STATE MANDATES

Mailing List

Last Updated: 12/19/25

Claim Number: 16-TC-03

Matter: California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049

Claimant: City of Union City

TO ALL PARTIES, INTERESTED PARTIES, AND INTERESTED PERSONS:

Each commission mailing list is continuously updated as requests are received to include or remove any party or person on the mailing list. A current mailing list is provided with commission correspondence, and a copy of the current mailing list is available upon request at any time. Except as provided otherwise by commission rule, when a party or interested party files any written material with the commission concerning a claim, it shall simultaneously serve a copy of the written material on the parties and interested parties to the claim identified on the mailing list provided by the commission. (Cal. Code Regs., tit. 2, § 1181.3.)

Re: Comments on Draft Proposed Decision, Test Claim 16-TC-03 (Municipal Regional Stormwater Permit, Order No. R2-2015-0049)

Dear Ms. Gmur:

Our office represents the Alameda Countywide Clean Water Program and its members as well as claimant Union City, who have incurred costs related to the San Francisco Bay Regional Water Quality Control Board's municipal regional stormwater permit, Order No. R2-2015-0049, which is the second municipal regional permit ("MRP 2") that regulates the discharge of stormwater runoff from the municipal separate storm sewer systems ("MS4s") within the jurisdiction of Bay Area regional stormwater programs.

We submit this letter in response to the Draft Proposed Decision ("DPD") issued by Commission staff on December 23, 2025, in connection with Test Claim 16-TC-03. Union City submitted this test claim with the Commission on State Mandates asserting that the Second Municipal Regional Stormwater Permit ("MRP 2"), Order No. R2-2015-0049, imposed new state-mandated programs and higher levels of service triggering the constitutional duty of reimbursement under Article XIII B, Section 6 of the California Constitution. Commission staff recommended denial of most of Union City's claims in the DPD. Union City respectfully objects to that recommendation and submits the following comments.

The Municipal Claimants object to and disagree with the portions of the Proposed Decision that improperly seek to address an issue that is not currently before the

Commission— the possible impact of Senate Bill 231 ("SB 231"). The Municipal Claimants contend that the Commission's analysis regarding SB 231 is inconsistent with *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535 and City of Salinas (2002) 98 Cal.App.4th 1351. Although it is irrelevant to this proceeding and should not be addressed at all by the Commission here, the Municipal Claimants reserve all rights regarding the applicability of SB 231 and its constitutionality. The Municipal Claimants believe that even if SB 231 were applicable, which it is not, the appropriate approach for the Commission to take regarding SB 231 would be to wait until a court of competent jurisdiction resolves the constitutionality of SB 231 in the context of an actual fee enacted under its provisions. Since SB 231 is irrelevant here, the Commission should just delete all references to it in the Proposed Decision.

We also object to and disagree with the following:

- The DPD concluded that implementation of the Green Infrastructure Plan (MRP 2 § C.3.j) through early public projects was not a mandate imposed by the state through legal or practical compulsion. (DPD at pp. 104–105.) We disagree. The public projects required under § 3.j were not voluntary; the permit's regulatory framework rendered compliance legally and practically compulsory, leaving permittees no genuine choice but to undertake these projects.
- The DPD held that the green infrastructure requirements to achieve TMDLs (§§ C.11.c and C.12.c) are not new because similar provisions existed in the prior permit, including as part of the receiving water limitations. (DPD at p. 115.) However, the U.S. Supreme Court has since invalidated the use of receiving water limitations under federal law in *San Francisco v. EPA*, 145 S. Ct. 704 (2025), undermining the Commission's rationale. Similarly, the trash provisions (§§ C.10.a and C.10.b) are also new contrary to the DPD characterization of them as continuations of prior permit obligations (DPD at pp. 69–77).
- The Commission incorrectly determined that the green infrastructure and trash requirements are federally mandated. Under *Department of Finance v. Commission on State Mandates* (2017) 18 Cal.App.5th 661, when federal law leaves states discretion in determining specific implementing requirements, as here, the state's exercise of that discretion creates a reimbursable state mandate.

In addition to the foregoing, we also hereby incorporate our comments from May 29, 2018 as they relate to the denials in the DPD. Nothing in this submission shall be construed as a waiver of any argument, claim, or right available to Union City with respect to the test claim or any related proceedings

Regards,

DUANE MORRIS LLP

State Water Resources Control Board

Exhibit G

Commission on State Mandates
Filed Date
07/13/2026

July 13, 2026

VIA DROP BOX

Juliana F. Gmur
Executive Director
Commission on State Mandates
980 9th Street, Suite 300
Sacramento, CA 95814

COMMENTS OF THE STATE WATER RESOURCES CONTROL BOARD AND CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD, SAN FRANCISCO BAY REGION ON THE DRAFT PROPOSED DECISION
California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049, Provisions C.3.j, C.10.a, C.10.b, C.11.a, C11.b, C.11.c, C.12.a, C.12.d, and C.12.e, Adopted November 19, 2015, and Effective on January 1, 2016, City of Union City, Claimant, 16-TC-03

Dear Ms. Gmur:

The State Water Resources Control Board (State Water Board) and California Regional Water Quality Control Board, San Francisco Bay Region (San Francisco Bay Water Board) (together, Water Boards) have reviewed the Draft Proposed Decision for Test Claim 16-TC-03 issued by the Commission on State Mandates (Commission) on December 23, 2025. The Water Boards appreciate the thorough analysis of Commission staff. We generally concur with the conclusions that would deny reimbursement for challenged provisions in San Francisco Bay Water Board Order R2-2015-0049 but do not agree with the conclusions that some of the challenged provisions constitute reimbursable state-mandated new programs or higher levels of service. We maintain the arguments in our comments on the test claim with respect to the latter.[1] The Water Boards submit the following comments on permittees' fee authority.

The Draft Proposed Decision discusses local agency constitutional and statutory authorities to raise fees, including what courts have found to constitute sufficient fee authority as a legal matter within the meaning of Government Code section 17556, subdivision (d).[2] The Water Boards agree with the Draft Proposed Decision's conclusion

[1] See San Francisco Bay Water Board Response to Union City Test Claim 16-TC-03 (Order R2-2015-0049), Jan. 31, 2018.
[2] Draft Proposed Decision, pp. 170–206.

that permittees have sufficient regulatory fee authority related to the Green Infrastructure Plan requirements and sufficient fee authority based on *Paradise Irrigation District* (2019) 33 Cal.App.5th 174 and the Legislature's enactment of Government Code sections 57350 and 57351 for costs incurred beginning January 1, 2018. Notwithstanding *Department of Finance v. Commission on State Mandates* (2022) 85 Cal.App.5th 535 (*2022 Department of Finance*), the Water Boards maintain that the rationale in *Paradise Irrigation District* applies to voter approval requirements and permittees have sufficient fee authority for all costs.

The Water Boards disagree with the holding in the *2022 Department of Finance* decision and the conclusion in the Draft Proposed Decision that permittees lack fee authority for costs incurred *prior* to 2018 due to Proposition 218's voter approval provisions.[3] The Water Boards maintain that permittees had sufficient fee authority as a legal matter under Government Code section 17556(d) for the entire test claim period and are not entitled to reimbursement for any costs. California courts have consistently held that fee authority is purely a question of legal authorization.[4] "[F]actual considerations of practicality" do not defeat a local agency's fee authority.[5] Even where Proposition 218 requires voter approval for fees to pay for specific state mandates, the permittees still have fee authority, and expenditures for mandates are not reimbursable.

In *Paradise Irrigation, supra,* the court of appeal considered whether the majority protest procedure added by Proposition 218 deprived local agencies of authority to impose fees for water service.[6] California Constitution, Article XIII D, section 6(a), requires a local agency to identify parcels subject to a new fee, calculate the fee amount, and provide notice to affected property owners.[7] If a majority of the property owners submit written protests against the fee, the fee may not be imposed.[8]

The *Paradise Irrigation* court held that the "majority protest procedures are properly construed as a power-sharing arrangement between the districts and their customers, rather than a deprivation of fee authority."[9] The court explained that, when considering how voter powers affect the ability of local governments to impose fees, courts "presume local voters will give appropriate consideration and deference to state mandated requirements . . . ."[10] "Although this power-sharing arrangement has the potential for conflict, we must presume that both sides will act reasonably and in good

[3] Draft Proposed Decision, pp. 201–206.

[4] *Connell v. Superior Court* (1997) 59 Cal.App.4th 382, 401 [holding that the focus under Government Code section 17556 is whether a local agency has "authority, i.e., the right or power, to levy fees sufficient to cover the costs"]; *Clovis Unified School Dist. v. Chiang* (2010) 188 Cal.App.4th 794, 812.

[5] *Paradise Irrigation Dist. v. Commission on State Mandates* (2019) 33 Cal.App.5th 174, 195.

[6] *Id.* at p. 182.

[7] Cal. Const., art. XIII D, § 6, subd. (a), par. (1).

[8] Cal. Const., art. XIII D, § 6, subd. (a), par. (2).

[9] *Paradise Irrigation*, *supra,* 33 Cal.App.5th at p. 182.

[10] *Id.* at p. 194, citing *Bighorn-Desert View Water Agency v. Verjil* (2006) 39 Cal.4th 205, 220.

faith."[11] Further, the fact that, "as a matter of practical reality, the majority protest procedure allows water customers to defeat the District's authority to levy fees" was not dispositive; "the inquiry into fee authority constitutes an issue of law rather than a question of fact."[12]

The *Paradise Irrigation* court did not consider whether a local agency has fee authority as a legal matter where fees or assessments are subject to voter approval requirements. However, the court's reasoning should apply with equal force where Proposition 218 requires pre-approval by a majority vote of the affected property owners (or, alternatively, by a two-thirds vote of the electorate). That the governing body of a municipality (e.g., County Board of Supervisors or City Council) and the affected property owners who elected that body share power to impose fees does not mean claimants are deprived of fee authority under Government Code section 17556. And the fact that property owners in claimants' local jurisdictions could theoretically withhold approval—just as a majority of the governing body could theoretically withhold approval to impose a fee—does not undermine claimants' police power; that power exists regardless of what the property owners, or the governing body, might decide about any given fee.

In *2022 Department of Finance*, the State Water Board and the San Diego Water Board argued that the court should extend the reasoning in *Paradise Irrigation* to Proposition 218 pre-approval requirements. The Third District Court of Appeal did not agree.[13] Other districts are not bound by the Third District Court of Appeal's decision and could decide differently,[14] as could the California Supreme Court. As such, the Water Boards maintain their arguments on this issue.

I declare under penalty of perjury that the foregoing is true and correct to the best of my personal knowledge, information, or belief.

Sincerely,

Teresita J. Sablan
Attorney IV

Exhibit H

Commission on State Mandates
Filed Date
07/13/2026

July 13, 2026

Juliana Gmur
Executive Director
Commission on State Mandates
980 Ninth Street, Suite 300
Sacramento, CA 95814

Comments on draft proposed decision for California Regional Water Quality Control Board, San Francisco Bay Region, Order No. R2-2015-0049, Test Claim 16-TC-03

Dear Director Gmur,

The Department of Finance (Finance) has completed its review of the proposed decision by the Commission on State Mandates (Commission) for the above referenced Test Claim. Finance appreciates the careful consideration and effort by staff and concurs with those parts of the proposed decision that deny reimbursement. Further, Finance concurs with and joins in comments submitted or to be submitted by the State Water Resources Control Board (State Water Board) and California Regional Water Quality Control Board, San Francisco Bay Region (San Francisco Bay Water Board) (collectively, Water Boards) on the proposed decision. Finance provides the comments below concerning fee authority.

Finance agrees with the draft proposed decision's conclusion that permittees have sufficient regulatory fee authority related to the Green Infrastructure Plan requirements and sufficient fee authority based on *Paradise Irrigation District v. Commission on State Mandates* (2019) 33 Cal.App.5th 174 (Paradise Irrigation District) and enactment of Government Code sections 57350 and 57351 for costs incurred beginning January 1, 2018.

To the extent the Commission determines there are any state mandated costs prior to January 1, 2018, Finance contends the claimant has the necessary fee authority and is not entitled to any reimbursement. Specifically, Finance contends that claimant had sufficient fee authority pursuant to Government Code section 17556(d) and Proposition 26 for the entire test claim period and subsequently is not entitled to reimbursement for any costs. Proposition 26 addresses voter approval requirements and it specifically excludes assessment and property related fees imposed in accordance with Proposition 218. As such, under Proposition 26, so long as they are imposed in accordance with Proposition 218, the claimant is not prohibited by Proposition 26 from

levying fees or assessments without voter approval. The fee authority negates the need for any reimbursement by the state for those costs claimed by the claimant.

If you have any questions regarding this letter, please contact Kenny Louie, Chief Counsel at (916) 322-0971.

Sincerely,

KENNY LOUIE
Chief Counsel

DECLARATION OF SERVICE BY EMAIL

I, the undersigned, declare as follows:

I am a resident of the County of Sacramento and I am over the age of 18 years, and not a party to the within action. My place of employment is 980 Ninth Street, Suite 300, Sacramento, California 95814.

On July 14, 2026, I served the:

Stormwater Phase II Final Rule

Exhibit I

Illicit Discharge Detection and Elimination Minimum Control Measure

Stormwater Phase II Final Rule Fact Sheet Series

Overview

1.0 – Stormwater Phase II Final Rule: An Overview

Small MS4 Program

2.0 – Small MS4 Stormwater Program Overview

2.1 – Who's Covered? Designation and Waivers of Regulated Small MS4s

2.2 – Urbanized Areas: Definition and Description

Minimum Control Measures

2.3 – Public Education and Outreach

2.4 – Public Participation/ Involvement

2.5 – Illicit Discharge Detection and Elimination

2.6 – Construction Site Runoff Control

2.7 – Post-Construction Runoff Control

2.8 – Pollution Prevention/Good Housekeeping

2.9 – Permitting and Reporting: The Process and Requirements

2.10 – Federal and State-Operated MS4s: Program Implementation

Construction Program

3.0 – Construction Program Overview

3.1 – Construction Rainfall Erosivity Waiver

Industrial "No Exposure"

4.0 – Conditional No Exposure Exclusion for Industrial Activity

This fact sheet profiles the Illicit Discharge Detection and Elimination minimum control measure, one of six measures the operator of a Phase II regulated small municipal separate storm sewer system (MS4) is required to include in its stormwater management program to meet the conditions of its National Pollutant Discharge Elimination System (NPDES) permit. This fact sheet outlines the Phase II Final Rule requirements and offers some general guidance on how to satisfy them. It is important to keep in mind that the small MS4 operator has a great deal of flexibility in choosing exactly how to satisfy the minimum control measure requirements.

What Is An "Illicit Discharge"?

Federal regulations define an illicit discharge as "...any discharge to an MS4 that is not composed entirely of stormwater..." with some exceptions. These exceptions include discharges from NPDES-permitted industrial sources and discharges from fire-fighting activities. Illicit discharges (see Table 1) are considered "illicit" because MS4s are not designed to accept, process, or discharge such non-stormwater wastes.

Table 1

Sources of Illicit Discharges
Sanitary wastewater
Effluent from septic tanks
Car wash wastewaters
Improper oil disposal
Radiator flushing disposal
Laundry wastewaters
Spills from roadway accidents
Improper disposal of auto and household toxics

Why Are Illicit Discharge Detection and Elimination Efforts Necessary?

Discharges from MS4s often include wastes and wastewater from non-stormwater sources. A study conducted in 1987 in Sacramento, California, found that almost one-half of the water discharged from a local MS4 was not directly attributable to precipitation runoff. A significant portion of these dry weather flows were from illicit and/or inappropriate discharges and connections to the MS4.

Illicit discharges enter the system through either direct connections (e.g., wastewater piping either mistakenly or deliberately connected to the storm drains) or indirect connections (e.g., infiltration into the MS4 from cracked sanitary systems, spills collected by drain outlets, or paint or used oil dumped directly into a drain). The result is untreated discharges that contribute high levels of pollutants, including heavy metals, toxics, oil and grease, solvents, nutrients, viruses, and bacteria to receiving waterbodies. Pollutant levels from these illicit discharges have been shown in EPA studies to be high enough to significantly degrade receiving water quality and threaten aquatic, wildlife, and human health.

What Is Required?

Recognizing the adverse effects illicit discharges can have on receiving waters, the Phase II Final Rule requires an operator of a regulated small MS4 to develop, implement and enforce an illicit discharge detection and elimination program. This program must include the following:

- ❑ A storm sewer system map, showing the location of all outfalls and the names and location of all waters of the United States that receive discharges from those outfalls;
- ❑ Through an ordinance, or other regulatory mechanism, a prohibition (to the extent allowable under State, Tribal, or local law) on non-stormwater discharges into the MS4, and appropriate enforcement procedures and actions;
- ❑ A plan to detect and address non-stormwater discharges, including illegal dumping, into the MS4;
- ❑ The education of public employees, businesses, and the general public about the hazards associated with illegal discharges and improper disposal of waste; and
- ❑ The determination of appropriate best management practices (BMPs) and measurable goals for this minimum control measure. Some program implementation approaches, BMPs (i.e., the program actions/activities), and measurable goals are suggested below.

Does This Measure Need to Address All Illicit Discharges?

No. The illicit discharge detection and elimination program does not need to address the following categories of non-stormwater discharges or flows unless the operator of the regulated small MS4 identifies them as significant contributors of pollutants to its MS4:

- ❑ Water line flushing;
- ❑ Landscape irrigation;
- ❑ Diverted stream flows;
- ❑ Rising ground waters;
- ❑ Uncontaminated ground water infiltration;
- ❑ Uncontaminated pumped ground water;
- ❑ Discharges from potable water sources;
- ❑ Foundation drains;
- ❑ Air conditioning condensation;
- ❑ Irrigation water;
- ❑ Springs;
- ❑ Water from crawl space pumps;
- ❑ Footing drains;
- ❑ Lawn watering;
- ❑ Individual residential car washing;
- ❑ Flows from riparian habitats and wetlands;
- ❑ Dechlorinated swimming pool discharges; and
- ❑ Street wash water.

What Are Some Guidelines for Developing and Implementing This Measure?

The objective of the illicit discharge detection and elimination minimum control measure is to have regulated small MS4 operators gain a thorough awareness of their systems. This awareness allows them to determine the types and sources of illicit discharges entering their system; and establish the legal, technical, and educational means needed to eliminate these discharges. Permittees could meet these objectives in a variety of ways depending on their individual needs and abilities, but some general guidance for each requirement is provided below.

The Map

The storm sewer system map is meant to demonstrate a basic awareness of the intake and discharge areas of the system. It is needed to help determine the extent of discharged dry weather flows, the possible sources of the dry weather flows, and the particular waterbodies these flows may be affecting. An existing map, such as a topographical map, on which the location of major pipes and outfalls can be clearly presented demonstrates such awareness.

EPA recommends collecting all existing information on outfall locations (e.g., review city records, drainage maps, storm drain maps), and then conducting field surveys to verify locations. It probably will be necessary to walk (i.e., wade through small receiving waters or use a boat for larger waters) the streambanks and shorelines for visual observation. More than one trip may be needed to locate all outfalls.

Legal Prohibition and Enforcement

EPA recognizes that some permittees may have limited authority under State, Tribal or local law to establish and enforce an ordinance or other regulatory mechanism prohibiting illicit discharges. In such a case, the permittee is encouraged to obtain the necessary authority, if possible.

The Plan

The plan to detect and address illicit discharges is the central component of this minimum control measure. The plan is dependant upon several factors, including the permittee's available resources, size of staff, and degree and character of its illicit discharges. As guidance only, the four steps of a recommended plan are outlined below:

❶ **Locate Problem Areas**

EPA recommends that priority areas be identified for detailed screening of the system based on the likelihood of illicit connections (e.g., areas with older sanitary sewer lines). Methods that can locate problem areas include: visual screening; water sampling from manholes and outfalls during dry weather; the use of infrared and thermal photography, cross-training field staff to detect illicit discharges, and public complaints.

❷ **Find the Source**

Once a problem area or discharge is found, additional efforts usually are necessary to determine the source of the problem. Methods that can find the source of the illicit discharge include: dye-testing buildings in problem areas; dye- or smoke-testing buildings at the time of sale; tracing the discharge upstream in the storm sewer; employing a certification program that shows that buildings have been checked for illicit connections; implementing an inspection program of existing septic systems; and using video to inspect the storm sewers.

❸ **Remove/Correct Illicit Connections**

Once the source is identified, the offending discharger should be notified and directed to correct the problem. Education efforts and working with the discharger can be effective in resolving the problem before taking legal action.

❹ **Document Actions Taken**

As a final step, all actions taken under the plan should be documented. This illustrates that progress is being made to eliminate illicit connections and discharges. Documented actions should be included in annual reports and include information such as: the number of outfalls screened; any complaints received and corrected; the number of discharges and quantities of flow eliminated; and the number of dye or smoke tests conducted.

Educational Outreach

The Center for Watershed Protection and Robert Pitt (2004) researched the most cost-effective and efficient techniques that can be employed to identify and correct inappropriate discharges. Data from Montgomery County, Maryland, was analyzed and it was determined that staff identify and correct about six inappropriate discharges per year as a result of regular screening. By contrast, over 185 inappropriate discharges are corrected each year in Montgomery County as a direct result of citizen complaints and calls to a storm water compliant hotline. Public education and labeling of outfalls and other storm drain infrastructure is an important element of establishing a successful citizen hotline. Outreach to public employees, businesses, property owners, the general public, and elected officials regarding ways to detect and eliminate illicit discharges is an integral part of this minimum measure.

Suggested educational outreach efforts include:

- Developing ***informative brochures, and guidances*** for specific audiences (e.g., carpet cleaning businesses) and school curricula;
- Designing a program to ***publicize and facilitate public reporting*** of illicit discharges;
- ***Coordinating volunteers*** for locating, and visually inspecting, outfalls or to stencil storm drains; and
- Initiating ***recycling programs*** for commonly dumped wastes, such as motor oil, antifreeze, and pesticides.

What Are Appropriate Measurable Goals?

Measurable goals, which are required for each minimum control measure, are intended to gauge permit compliance and program effectiveness. The measurable goals, as well as the BMPs, should reflect the needs and characteristics of the operator and the area served by its small MS4. Furthermore, they should be chosen using an integrated approach that fully addresses the requirements and intent of the minimum control measure.

EPA has developed a Measurable Goals Guidance for Phase II MS4s that is designed to help program managers comply with the requirement to develop measurable goals. The guidance presents an approach for MS4 operators to develop measurable goals as part of their stormwater management plan. For example, an MS4 could establish a measurable goal of responding to all complaints received by the citizen complaint hotline within 24 hours to minimize water quality impacts or recurrent dumping. A complaint tracking system could be used to log response and enforcement activity.

The educational outreach measurable goals for this minimum control measure could be combined with the measurable goals for the Public Education and Outreach minimum control measure (see Fact Sheet 2.3).

CHAPTER 1: INTRODUCTION

1.1 THE SAN FRANCISCO BAY REGION

The San Francisco Bay Region (Region) is 4,603 square miles, roughly the size of the State of Connecticut, and characterized by its dominant feature, 1,100 square miles of the 1,600 square mile San Francisco Bay Estuary (Estuary), the largest estuary on the west coast of the United States, where fresh waters from California's Central Valley mix with the saline waters of the Pacific Ocean. The Region also includes coastal portions of Marin and San Mateo counties, from Tomales Bay in the north to Pescadero and Butano Creeks in the south.

The Estuary conveys the waters of the Sacramento and San Joaquin rivers into the Pacific Ocean. Located on the central coast of California (Figure 1-1), the Bay system functions as the only drainage outlet for waters of the Central Valley. It also marks natural topographic separation between the northern and southern coastal mountain ranges. The Region's waterways, wetlands, and bays form the centerpiece of the United States' fourth-largest metropolitan region, including all or major portions of Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, Solano, and Sonoma counties.

Because of its highly dynamic and complex environmental conditions, the Bay system supports an extraordinarily diverse and productive ecosystem. Within each section of the Bay lie deepwater areas that are adjacent to large expanses of very shallow water. Salinity levels range from hypersaline to fresh water, and water temperature varies throughout the Bay system. These factors greatly increase the number of species that can live in the Estuary and enhance its biological stability.

The Bay system's deepwater channels, tidelands, marshlands, freshwater streams, and rivers provide a wide variety of habitats that have become increasingly vital to the survival of several plant and animal species as other estuaries are reduced in size or lost to development. These areas sustain rich communities of crabs, clams, fish, birds, and other aquatic life and serve both as important wintering sites for migrating waterfowl and as spawning areas for anadromous fish.

1.2 THE BAY SYSTEM'S SURFACE WATER & GROUNDWATER

The Sacramento and San Joaquin rivers, which enter the Bay system through the Delta at the eastern end of Suisun Bay, contribute almost all the freshwater inflow to the Bay. Many small rivers and streams also convey fresh water to the Bay system. The rate and timing of these freshwater flows are among the most important factors influencing physical, chemical, and biological conditions in the Estuary. Much of the freshwater inflow, however, is trapped upstream by the dams, canals, and reservoirs of California's water diversion projects, which provide vital water to industries, farms, homes, and businesses throughout the state. This freshwater diversion has sparked statewide controversy over possible adverse effects on the Estuary's water quality, fisheries, and ecosystem.

Flows in the Region are highly seasonal, with more than 90 percent of the annual runoff occurring during the winter rainy season between October and April. Many streams go dry during the middle or late summer. For example, the Napa River, which is least affected by

upstream regulation, clearly shows the seasonal nature of runoff. Only 4-1/2 percent of this river's average annual runoff occurs during the summer months.

Groundwater is an important component of the hydrologic system in the Region. Groundwater provides excellent natural storage, distribution, and treatment systems. Groundwater also supplies high quality water for drinking, irrigation, and industrial processing and service. As an important source of freshwater replenishment, groundwater may also discharge to surface streams, wetlands, and San Francisco Bay.

A variety of historical and ongoing industrial, urban, and agricultural activities and their associated discharges degrade groundwater quality, including industrial and agricultural chemical spills, underground and above-ground tank and sump leaks, landfill leachate, septic tank failures, and chemical seepage via shallow drainage wells and abandoned wells. In addition, saltwater intrusion directly attributed to over- pumping has degraded the purity of some groundwater aquifers.

These adverse impacts on groundwater quality often have long-term effects that are costly to remediate. Consequently, as additional discharges are identified, source removal, pollution containment, and cleanup must be undertaken as quickly as possible. Activities that may potentially pollute groundwater must be managed to ensure that groundwater quality is protected.

1.3 PROTECTING SAN FRANCISCO BAY: THE WATER BOARD

Because of its unique characteristics, the San Francisco Bay estuarine system merits special protection. The adverse effects of waste discharges must be controlled. Extensive upstream water diversions must be limited, and their effects mitigated. To address these and other water issues, the California Legislature established the State Water Resources Control Board (State Water Board) and the nine Regional Water Quality Control Boards (Regional Water Boards) in 1949. Operating under the provisions of the California Water Code (Water Code), their unique relationship couples state-level coordination and regional familiarity with local needs and conditions. Their joint actions constitute a comprehensive program for managing water quality in California, as well as for effective state administration of federal water pollution control laws.

The State Water Board administers water rights, water pollution control, and water quality functions for the state as part of the California Environmental Protection Agency (Cal/EPA). It provides policy guidance and budgetary authority to the Regional Water Boards, which conduct planning, permitting, and enforcement activities. The State Water Board shares authority for implementation of the federal Clean Water Act and the state Porter-Cologne Act with the Regional Water Boards.

The San Francisco Bay Regional Water Quality Control Board (Water Board) regulates surface water and groundwater quality in the Region. The area under the Water Board's jurisdiction comprises all of the San Francisco Bay segments extending to the mouth of the Sacramento-San Joaquin Delta (Winter Island near Pittsburg).

California's governor appoints the nine-member Water Board, whose members serve for four-year terms. Water Board members must reside or maintain a place of business within the Region and must be associated with or have special knowledge of specific activities related to water quality control. Members of the Water Board serve without pay and conduct their business at regular meetings and frequent public hearings where public participation is encouraged.

The Water Board's overall mission is to protect surface waters and groundwater in the Region. The Water Board carries out its mission by:

- Addressing Region-wide water quality concerns through the creation and triennial update of a Water Quality Control Plan (Basin Plan);
- Preparing new or revised policies addressing Region-wide water quality concerns;
- Adopting, monitoring compliance with, and enforcing waste discharge requirements and National Pollutant Discharge Elimination System (NPDES) permits;
- Providing recommendations to the State Water Board on financial assistance programs, proposals for water diversion, budget development, and other statewide programs and policies;
- Coordinating with other public agencies that are concerned with water quality control; and
- Informing and involving the public on water quality issues.

1.4 WATER QUALITY CONTROL PLAN

By law, the Water Board is required to develop, adopt (after public hearing), and implement a Basin Plan for the Region. The Basin Plan is the master policy document that contains descriptions of the legal, technical, and programmatic bases of water quality regulation in the Region. The plan must include:

- A statement of beneficial water uses that the Water Board will protect;
- The water quality objectives needed to protect the designated beneficial water uses; and
- The strategies and time schedules for achieving the water quality objectives.

The Water Board first adopted a plan for waters inland from the Golden Gate in 1968. After several revisions, the first comprehensive Basin Plan for the Region was adopted by the Water Board and approved by the State Water Board in April 1975. Subsequently, major revisions were adopted in 1982, 1986, 1992, 1995, 2002, and 2004. Each proposed amendment to the Basin Plan is subject to an extensive public review process. The Water Board must then adopt the amendment, which is then subject to approval by the State Water Board. In most cases, the Office of Administrative Law and the U.S. Environmental Protection Agency (U.S. EPA) must approve the amendment as well.

The basin planning process drives the Water Board's effort to manage water quality. The Basin Plan provides a definitive program of actions designed to preserve and enhance water quality and to protect beneficial uses in a manner that will result in maximum benefit to the people of California. The Basin Plan fulfills the following needs:

- The U.S. EPA requires such a plan in order to allocate federal grants to cities and districts for construction of wastewater treatment facilities.
- The Basin Plan provides a basis for establishing priorities as to how both state and federal grants are disbursed for constructing and upgrading wastewater treatment facilities.
- The Basin Plan fulfills the requirements of the Porter-Cologne Act that call for water quality control plans in California.
- The Basin Plan, by defining the resources, services, and qualities of aquatic ecosystems to be maintained, provides a basis for the Water Board to establish or revise waste discharge requirements and for the State Water Board to establish or revise water rights permits.
- The Basin Plan establishes conditions (discharge prohibitions) that must be met at all times.
- The Basin Plan establishes or indicates water quality standards applicable to waters of the Region, as required by the federal Clean Water Act.
- The Basin Plan establishes water quality attainment strategies, including total maximum daily loads (TMDLs) required by the Clean Water Act, for pollutants and water bodies where water quality standards are not currently met.

The intent of this comprehensive planning effort is to provide positive and firm direction for future water quality control. However, adequate provision must be made for changing conditions and technology. The Water Board will review the Basin Plan at least once every three years. Unlike traditional plans, which often become obsolete within a few years after their preparation, the Basin Plan is updated as deemed necessary to maintain pace with technological, hydrological, political, and physical changes in the Region.

This Basin Plan contains water quality regulations adopted by the Water Board, and approved by the State Water Board, the Office of Administrative Law, and U.S. EPA. It also contains statewide regulations adopted by the State Water Board and other state agencies that refer to activities regulated by the Water Board. For the most recent list of statewide regulations applicable in the Region, please refer to the State Water Board's "Compendium of Current, Statewide Applicable Water Quality Regulations." Federal laws and regulations also specify water quality standards and are available at U.S. EPA's website.

1.5 WATERSHED MANAGEMENT PLANNING

In 1995, the Water Board initiated a watershed management approach to regulating water quality, expanding its primary focus from point sources of pollution to include more diffuse sources such as urban and agricultural runoff. A five-year statewide Strategic Plan was completed in 2001 and guides the water resource protection efforts by the State and Regional Water Boards. A key component of the Strategic Plan is the Watershed Management Initiative (WMI).

A watershed is the area of land drained by a stream or river system. It is where water precipitates and collects, extending from ridges down to the topographic low points where the water drains into a river, bay, ocean, or other water body. A watershed includes surface water bodies (e.g., streams, rivers, lakes, reservoirs, wetlands, and estuaries), groundwater (e.g., aquifers and

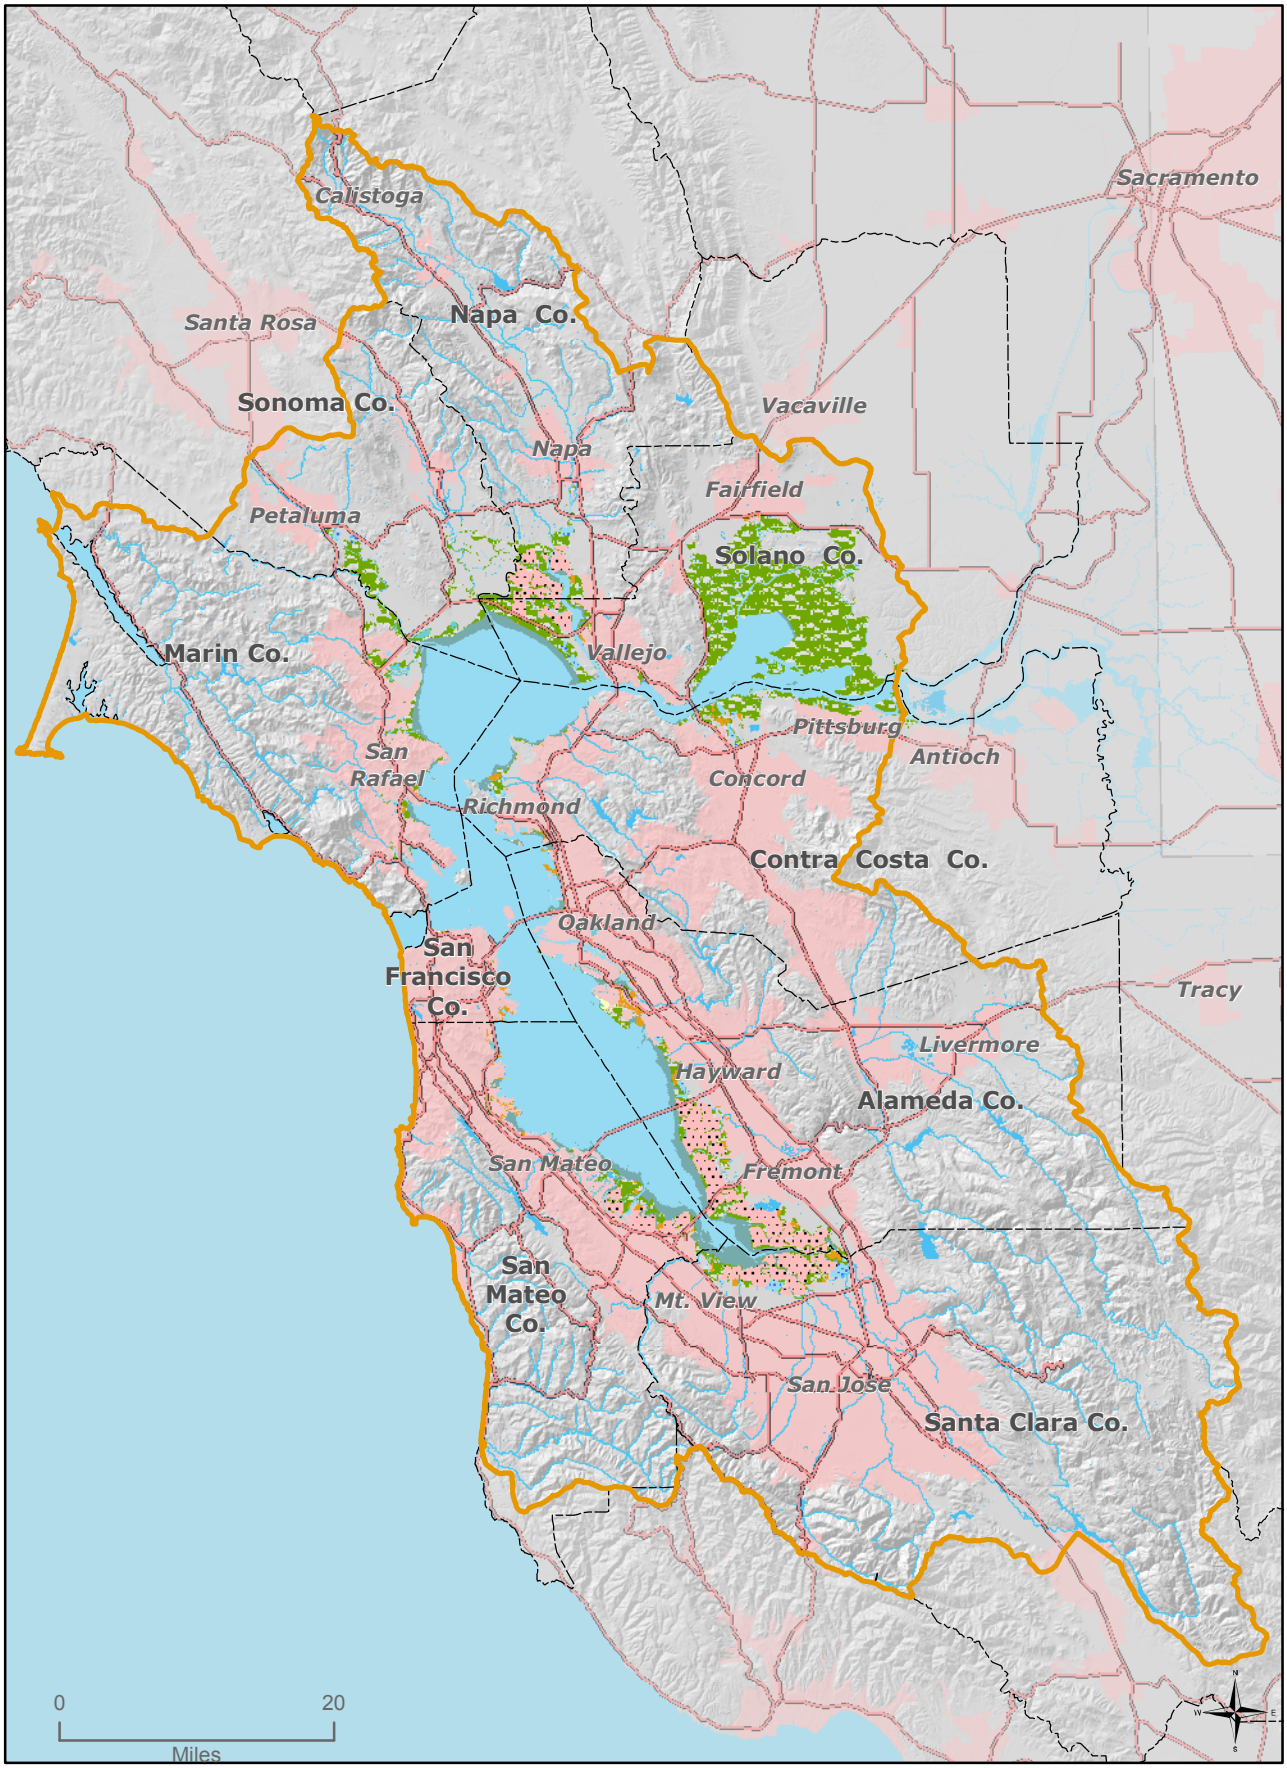
groundwater basins) and the surrounding landscape. Watershed management is a strategy for protecting water quality in all water bodies by looking at all components that make up a watershed area, including the natural environment, water supply, land uses and their effects on drainage, wastewater collection and discharges, and the ways humans interact with the water bodies.

In the Water Board's watershed management approach to water quality protection, water resource problems are identified and prioritized primarily on the basis of water quality within individual watersheds (i.e., the geographic drainage areas and groundwater basins used for management purposes). Unique solutions are developed for each watershed that consider all local conditions and pollution sources and rely on the input and involvement of local stakeholders. Major features of a watershed management approach are: targeting priority problems based on water quality information and monitoring, promoting stakeholder involvement in prioritization and management decisions, developing integrated solutions that make use of the expertise and authority of multiple agencies and organizations, and measuring success through monitoring and other collected data. The approach culminates in the creation and implementation of "watershed action plans."

The water quality of many water bodies continues to be degraded from pollutants discharged from diffuse sources, referred to as nonpoint sources, and from the cumulative impacts of multiple point sources such as drainage from urban areas, known as urban runoff. This degradation persists despite successful pollutant reduction efforts in the regulation of municipal and industrial wastewater point source discharges through the NPDES program. Watershed management represents a shift from the approach that focuses on regulation of point sources to a more regional approach that acknowledges environmental impacts from all activities, and prioritizes regulation of these activities with input from local stakeholders.

Watersheds transcend political, social, and economic boundaries. It is important to engage all affected stakeholders in designing and implementing goals for the watershed to protect water quality. Groups formed to create watershed action plans may include representatives from all levels of government, public interest groups, industry, academic institutions, private landowners, concerned citizens and others. Tasks in a watershed action plan could include a wide range of actions, such as improving coordination between regulatory and permitting agencies, increasing citizen participation in watershed planning activities, improving public education on water quality and protection issues, and enforcing current regulations on a more consistent and prioritized basis.

1.6 THE SAN FRANCISCO ESTUARY PROJECT



The Water Board has been an active participant in the San Francisco Estuary Project (Estuary Project), a cooperative program aimed at promoting effective, environmentally sound management of the San Francisco Bay Estuary while protecting and restoring its natural resources. In 1993, the Estuary Project reached its goal of developing a Comprehensive Conservation and Management Plan (CCMP). The CCMP addresses five critical concerns identified by the Estuary Project's broad-based advisory committees: decline of biological resources; increased pollutants; freshwater diversion and altered flow regime; dredging and waterway modification; and intensified land use.

Implementation of the CCMP's over 140 recommended actions has been ongoing since the early 1990s. The Water Board serves as lead state agency, undertaking responsibility for ensuring that CCMP actions are carried out. The Estuary Project's Public Involvement and Education Program, which seeks to inform and involve the public in Estuary issues, is currently housed at the Water Board office.

THIS PAGE LEFT INTENTIONALLY BLANK

CHAPTER 2: BENEFICIAL USES

State policy for water quality control in California is directed toward achieving the highest water quality consistent with maximum benefit to the people of the state. Aquatic ecosystems and underground aquifers provide many different benefits to the people of the state. The beneficial uses described in detail in this chapter define the resources, services, and qualities of these aquatic systems that are the ultimate goals of protecting and achieving high water quality. The Regional Board is charged with protecting all these uses from pollution and nuisance that may occur as a result of waste discharges in the region. Beneficial uses of surface waters, groundwaters, marshes, and mudflats presented here serve as a basis for establishing water quality objectives and discharge prohibitions to attain this goal.

2.1 DEFINITIONS OF BENEFICIAL USES

The following definitions (in italic) for beneficial uses are applicable throughout the entire state. A brief description of the most important water quality requirements for each beneficial use follows each definition (in alphabetical order by abbreviation).

2.1.1 AGRICULTURAL SUPPLY (AGR)

Uses of water for farming, horticulture, or ranching, including, but not limited to, irrigation, stock watering, or support of vegetation for range grazing.

The criteria discussed under municipal and domestic water supply (MUN) also effectively protect farmstead uses. To establish water quality criteria for livestock water supply, the Regional Board must consider the relationship of water to the total diet, including water freely drunk, moisture content of feed, and interactions between irrigation water quality and feed quality. The University of California Cooperative Extension has developed threshold and limiting concentrations for livestock and irrigation water. Continued irrigation often leads to one or more of four types of hazards related to water quality and the nature of soils and crops. These hazards are (1) soluble salt accumulations, (2) chemical changes in the soil, (3) toxicity to crops, and (4) potential disease transmission to humans through reclaimed water use. Irrigation water classification systems, arable soil classification systems, and public health criteria related to reuse of wastewater have been developed with consideration given to these hazards.

2.1.2 AREAS OF SPECIAL BIOLOGICAL SIGNIFICANCE (ASBS)

Areas designated by the State Water Board.

These include marine life refuges, ecological reserves, and designated areas where the preservation and enhancement of natural resources requires special protection. In these areas, alteration of natural water quality is undesirable. The areas that have been designated as ASBS in this Region are Bird Rock, Point Reyes Headland Reserve and Extension, Double Point, Duxbury Reef Reserve and Extension, Farallon Islands, and James V. Fitzgerald Marine Reserve, depicted in Figure 2-1. The 2001 California Ocean Plan (see Chapter 5) prohibits waste discharges into, and requires wastes to be discharged at a sufficient distance from, these areas to assure maintenance

of natural water quality conditions. These areas have been designated as a subset of State Water Quality Protection Areas as per the Public Resources Code.

2.1.3 COLD FRESHWATER HABITAT (COLD)

Uses of water that support cold water ecosystems, including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.

Cold freshwater habitats generally support trout and may support the anadromous salmon and steelhead fisheries as well. Cold water habitats are commonly well-oxygenated. Life within these waters is relatively intolerant to environmental stresses. Often, soft waters feed cold water habitats. These waters render fish more susceptible to toxic metals, such as copper, because of their lower buffering capacity.

2.1.4 OCEAN, COMMERCIAL, AND SPORT FISHING (COMM)

Uses of water for commercial or recreational collection of fish, shellfish, or other organisms in oceans, bays, and estuaries, including, but not limited to, uses involving organisms intended for human consumption or bait purposes.

To maintain ocean fishing, the aquatic life habitats where fish reproduce and seek their food must be protected. Habitat protection is under descriptions of other beneficial uses.

2.1.5 ESTUARINE HABITAT (EST)

Uses of water that support estuarine ecosystems, including, but not limited to, preservation or enhancement of estuarine habitats, vegetation, fish, shellfish, or wildlife (e.g., estuarine mammals, waterfowl, shorebirds), and the propagation, sustenance, and migration of estuarine organisms.

Estuarine habitat provides an essential and unique habitat that serves to acclimate anadromous fishes (salmon, striped bass) migrating into fresh or marine water conditions. The protection of estuarine habitat is contingent upon (1) the maintenance of adequate Delta outflow to provide mixing and salinity control; and (2) provisions to protect wildlife habitat associated with marshlands and the Bay periphery (i.e., prevention of fill activities). Estuarine habitat is generally associated with moderate seasonal fluctuations in dissolved oxygen, pH, and temperatur and with a wide range in turbidity.

2.1.6 FRESHWATER REPLENISHMENT (FRESH)

Uses of water for natural or artificial maintenance of surface water quantity or quality.

2.1.7 GROUNDWATER RECHARGE (GWR)

Uses of water for natural or artificial recharge of groundwater for purposes of future extraction, maintenance of water quality, or halting saltwater intrusion into freshwater aquifers.

The requirements for groundwater recharge operations generally reflect the future use to be made of the water stored underground. In some cases, recharge operations may be conducted to prevent seawater intrusion. In these cases, the quality of recharged waters may not directly affect quality at the wellfield being protected. Recharge operations are often limited by excessive suspended sediment or turbidity that can clog the surface of recharge pits, basins, or wells.

Under the state Antidegradation Policy, the quality of some of the waters of the state is higher than established by adopted policies. It is the intent of this policy to maintain that existing higher quality to the maximum extent possible.

Requirements for groundwater recharge, therefore, shall impose the Best Available Technology (BAT) or Best Management Practices (BMPs) for control of the discharge as necessary to assure the highest quality consistent with maximum benefit to the people of the state. Additionally, it must be recognized that groundwater recharge occurs naturally in many areas from streams and reservoirs. This recharge may have little impact on the quality of groundwaters under normal circumstances, but it may act to transport pollutants from the recharging water body to the groundwater. Therefore, groundwater recharge must be considered when requirements are established.

2.1.8 INDUSTRIAL SERVICE SUPPLY (IND)

Uses of water for industrial activities that do not depend primarily on water quality, including, but not limited to, mining, cooling water supply, hydraulic conveyance, gravel washing, fire protection, and oil well repressurization.

Most industrial service supplies have essentially no water quality limitations except for gross constraints, such as freedom from unusual debris.

2.1.9 MARINE HABITAT (MAR)

Uses of water that support marine ecosystems, including, but not limited to, preservation or enhancement of marine habitats, vegetation such as kelp, fish, shellfish, or wildlife (e.g., marine mammals, shorebirds).

In many cases, the protection of marine habitat will be accomplished by measures that protect wildlife habitat generally, but more stringent criteria may be necessary for waterfowl marshes and other habitats, such as those for shellfish and marine fishes. Some marine habitats, such as important intertidal zones and kelp beds, may require special protection.

2.1.10 FISH MIGRATION (MIGR)

Uses of water that support habitats necessary for migration, acclimatization between fresh water and salt water, and protection of aquatic organisms that are temporary inhabitants of waters within the region.

The water quality provisions acceptable to cold water fish generally protect anadromous fish as well. However, particular attention must be paid to maintaining zones of passage. Any barrier to migration or free movement of migratory fish is harmful. Natural tidal movement in estuaries

and unimpeded river flows are necessary to sustain migratory fish and their offspring. A water quality barrier, whether thermal, physical, or chemical, can destroy the integrity of the migration route and lead to the rapid decline of dependent fisheries.

Water quality may vary through a zone of passage as a result of natural or human- induced activities. Fresh water entering estuaries may float on the surface of the denser salt water or hug one shore as a result of density differences related to water temperature, salinity, or suspended matter.

2.1.11 MUNICIPAL AND DOMESTIC SUPPLY (MUN)

Uses of water for community, military, or individual water supply systems, including, but not limited to, drinking water supply.

The principal issues involving municipal water supply quality are (1) protection of public health; (2) aesthetic acceptability of the water; and (3) the economic impacts associated with treatment- or quality-related damages.

The health aspects broadly relate to: direct disease transmission, such as the possibility of contracting typhoid fever or cholera from contaminated water; toxic effects, such as links between nitrate and methemoglobinemia (blue babies); and increased susceptibility to disease, such as links between halogenated organic compounds and cancer.

Aesthetic acceptance varies widely depending on the nature of the supply source to which people have become accustomed. However, the parameters of general concern are excessive hardness, unpleasant odor or taste, turbidity, and color. In each case, treatment can improve acceptability although its cost may not be economically justified when alternative water supply sources of suitable quality are available.

Published water quality objectives give limits for known health-related constituents and most properties affecting public acceptance. These objectives for drinking water include the U.S. Environmental Protection Agency Drinking Water Standards and the California State Department of Health Services criteria.

2.1.12 NAVIGATION (NAV)

Uses of water for shipping, travel, or other transportation by private, military, or commercial vessels.

2.1.13 INDUSTRIAL PROCESS SUPPLY (PROC)

Uses of water for industrial activities that depend primarily on water quality.

Water quality requirements differ widely for the many industrial processes in use today. So many specific industrial processes exist with differing water quality requirements that no meaningful criteria can be established generally for quality of raw water supplies. Fortunately, this is not a serious shortcoming, since current water treatment technology can create desired product waters tailored for specific uses.

2.1.14 PRESERVATION OF RARE AND ENDANGERED SPECIES (RARE)

Uses of waters that support habitats necessary for the survival and successful maintenance of plant or animal species established under state and/or federal law as rare, threatened, or endangered.

The water quality criteria to be achieved that would encourage development and protection of rare and endangered species should be the same as those for protection of fish and wildlife habitats generally. However, where rare or endangered species exist, special control requirements may be necessary to assure attainment and maintenance of particular quality criteria, which may vary slightly with the environmental needs of each particular species. Criteria for species using areas of special biological significance should likewise be derived from the general criteria for the habitat types involved, with special management diligence given where required.

2.1.15 WATER CONTACT RECREATION (REC1)

Uses of water for recreational activities involving body contact with water where ingestion of water is reasonably possible. These uses include, but are not limited to, swimming, wading, water-skiing, skin and scuba diving, surfing, whitewater activities, fishing, and uses of natural hot springs.

Water contact implies a risk of waterborne disease transmission and involves human health; accordingly, criteria required to protect this use are more stringent than those for more casual water-oriented recreation.

Excessive algal growth has reduced the value of shoreline recreation areas in some cases, particularly for swimming. Where algal growths exist in nuisance proportions, particularly bluegreen algae, all recreational water uses, including fishing, tend to suffer.

One criterion to protect the aesthetic quality of waters used for recreation from excessive algal growth is based on chlorophyll a.

2.1.16 NONCONTACT WATER RECREATION (REC2)

Uses of water for recreational activities involving proximity to water, but not normally involving contact with water where water ingestion is reasonably possible. These uses include, but are not limited to, picnicking, sunbathing, hiking, beachcombing, camping, boating, tide pool and marine life study, hunting, sightseeing, or aesthetic enjoyment in conjunction with the above activities.

Water quality considerations relevant to noncontact water recreation, such as hiking, camping, or boating, and those activities related to tide pool or other nature studies require protection of habitats and aesthetic features. In some cases, preservation of a natural wilderness condition is justified, particularly when nature study is a major dedicated use.

One criterion to protect the aesthetic quality of waters used for recreation from excessive algal growth is based on chlorophyll a.

2.1.17 SHELLFISH HARVESTING (SHELL)

Uses of water that support habitats suitable for the collection of crustaceans and filter-feeding shellfish (e.g., clams, oysters, and mussels) for human consumption, commercial, or sport purposes.

Shellfish harvesting areas require protection and management to preserve the resource and protect public health. The potential for disease transmission and direct poisoning of humans is of considerable concern in shellfish regulation. The bacteriological criteria for the open ocean, bays, and estuarine waters where shellfish cultivation and harvesting occur should conform with the standards described in the National Shellfish Sanitation Program, Manual of Operation.

Toxic metals can accumulate in shellfish. Mercury and cadmium are two metals known to have caused extremely disabling effects in humans who consumed shellfish that concentrated these elements from industrial waste discharges. Other elements, radioactive isotopes, and certain toxins produced by particular plankton species also concentrate in shellfish tissue. Documented cases of paralytic shellfish poisoning are not uncommon in California.

2.1.18 FISH SPAWNING (SPWN)

Uses of water that support high quality aquatic habitats suitable for reproduction and early development of fish.

Dissolved oxygen levels in spawning areas should ideally approach saturation levels. Free movement of water is essential to maintain well-oxygenated conditions around eggs deposited in sediments. Water temperature, size distribution and organic content of sediments, water depth, and current velocity are also important determinants of spawning area adequacy.

2.1.19 WARM FRESHWATER HABITAT (WARM)

Uses of water that support warm water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.

The warm freshwater habitats supporting bass, bluegill, perch, and other panfish are generally lakes and reservoirs, although some minor streams will serve this purpose where stream flow is sufficient to sustain the fishery. The habitat is also important to a variety of nonfish species, such as frogs, crayfish, and insects, which provide food for fish and small mammals. This habitat is less sensitive to environmental changes, but more diverse than the cold freshwater habitat, and natural fluctuations in temperature, dissolved oxygen, pH, and turbidity are usually greater.

2.1.20 WILDLIFE HABITAT (WILD)

Uses of waters that support wildlife habitats, including, but not limited to, the preservation and enhancement of vegetation and prey species used by wildlife, such as waterfowl.

The two most important types of wildlife habitat are riparian and wetland habitats. These habitats can be threatened by development, erosion, andsedimentation, as well as by poor water quality.

The water quality requirements of wildlife pertain to the water directly ingested, the aquatic habitat itself, and the effect of water quality on the production of food materials. Waterfowl habitat is particularly sensitive to changes in water quality. Dissolved oxygen, pH, alkalinity, salinity, turbidity, settleable matter, oil, toxicants, and specific disease organisms are water quality characteristics particularly important to waterfowl habitat. Dissolved oxygen is needed in waterfowl habitats to suppress development of botulism organisms; botulism has killed millions of waterfowl. It is particularly important to maintain adequate circulation and aerobic conditions in shallow fringe areas of ponds or reservoirs where botulism has caused problems.

2.2 PRESENT AND POTENTIAL BENEFICIAL USES

2.2.1 SURFACE WATERS

Surface waters in the Region consist of non-tidal wetlands, rivers, streams, and lakes (collectively described as inland surface waters), estuarine wetlands known as baylands, estuarine waters, and coastal waters. In this Region, estuarine waters consist of the Bay system including intertidal, tidal, and subtidal habitats from the Golden Gate to the Region's boundary near Pittsburg and the lower portions of streams that are affected by tidal hydrology, such as the Napa and Petaluma rivers in the north and Coyote and San Francisquito creeks in the south.

Inland surface waters support or could support most of the beneficial uses described above. The specific beneficial uses for inland streams include municipal and domestic supply (MUN), agricultural supply (AGR), industrial process supply (PRO), groundwater recharge (GWR), water contact recreation (REC1), noncontact water recreation (REC2), wildlife habitat (WILD), cold freshwater habitat (COLD), warm freshwater habitat (WARM), fish migration (MIGR), and fish spawning (SPWN). The San Francisco Bay Estuary supports estuarine habitat (EST), industrial service supply (IND), and navigation (NAV) in addition to all of the uses supported by streams.

Coastal waters' beneficial uses include water contact recreation (REC1); noncontact water recreation (REC2); industrial service supply (IND); navigation (NAV); marine habitat (MAR); shellfish harvesting (SHELL); ocean, commercial and sport fishing (COMM); and preservation of rare and endangered species (RARE). In addition, the California coastline within the Region is endowed with exceptional scenic beauty.

Beneficial uses of each significant water body have been identified and are organized according to the seven major hydrologic units within the Region (Figure 2-2). Table 2-1 contains the beneficial uses for water bodies that have been designated in the Region. The maps locating each water body (Figures 2-3 through 2-9) were produced using a geographical information system (GIS) at the Water Board. The maps use the hydrologic basin information compiled by the California Interagency Watershed map, with supplemental information from the Oakland Museum of California Creek and Watershed Map series, the Contra Costa County Watershed Atlas, and the San Francisco Estuary Institute EcoAtlas. More detailed representations of each location can be created using this GIS version.

The beneficial uses of any specifically identified water body generally apply to all its tributaries. In some cases a beneficial use may not be applicable to the entire body of water, such as navigation in Richardson Bay or shellfish harvesting in the Pacific Ocean. In these cases, the

Water Board's judgment regarding water quality control measures necessary to protect beneficial uses will be applied.

2.2.2 GROUNDWATER

Groundwater is defined as subsurface water that occurs beneath the water table in soils and geologic formations that are fully saturated. Where groundwater occurs in a saturated geologic unit that contains sufficient permeable thickness to yield significant quantities of water to wells and springs, it can be defined as an aquifer. A groundwater basin is defined as a hydrogeologic unit containing one large aquifer or several connected and interrelated aquifers.

Water-bearing geologic units occur within groundwater basins in the Region that do not meet the definition of an aquifer. For instance, there are shallow, low permeability zones throughout the Region that have extremely low water yields. Groundwater may also occur outside of currently identified basins. Therefore, for basin planning purposes, the term "groundwater" includes all subsurface waters, whether or not these waters meet the classic definition of an aquifer or occur within identified groundwater basins.

The California Department of Water Resources (DWR) evaluated the characteristics of groundwater basins in the Region and throughout the state and summarized the results in California's Groundwater, Bulletin 118 (2003). Of special importance to the Region are the 28 groundwater basins and seven sub-basins classified by DWR that produce, or potentially could produce, significant amounts of groundwater (Figures 2-10 and 2-10A-D). The Water Board maintains a GIS for all water bodies in the Region and has the capacity to present information on each basin at a much higher level of resolution than is depicted in Figures 2-10A-D.

Existing and potential beneficial uses applicable to groundwater in the Region include municipal and domestic water supply (MUN), industrial water supply (IND), industrial process supply (PRO), agricultural water supply (AGR), groundwater recharge (GWR), and freshwater replenishment to surface waters (FRESH). Table 2-2 lists the 28 identified groundwater basins and seven sub-basins located in the Region and their existing and potential beneficial uses.

Unless otherwise designated by the Water Board, all groundwater is considered suitable, or potentially suitable, for municipal or domestic water supply (MUN). In making any exceptions, the Water Board will consider the criteria referenced in State Water Board Resolution No. 88-63 and Water Board Resolution No. 89-39, "Sources of Drinking Water," where:

- The total dissolved solids exceed 3,000 milligrams per liter (mg/L) (5,000 microSiemens per centimeter, μS/cm, electrical conductivity), and it is not reasonably expected by the Water Board that the groundwater could supply a public water system; or
- There is contamination, either by natural processes or by human activity (unrelated to a specific pollution incident), that cannot reasonably be treated for domestic use using either Best Management Practices (BMPs) or best economically achievable treatment practices; or
- The water source does not provide sufficient water to supply a single well capable of producing an average, sustained yield of 200 gallons per day; or

- The aquifer is regulated as a geothermal energy-producing source or has been exempted administratively pursuant to 40 Code of Federal Regulations (CFR) Part 146.4 for the purpose of underground injection of fluids associated with the production of hydrocarbon or geothermal energy, provided that these fluids do not constitute a hazardous waste under 40 CFR Part 261.3.

2.2.3 WETLANDS

Federal administrative law (e.g., 40 CFR Part 122.2, revised December 22, 1993) defines wetlands as waters of the United States. National waters include waters of the State of California, defined by the Porter-Cologne Act as "any water, surface or underground, including saline waters, within the boundaries of the State" (California Water Code §13050[e]). Wetland water quality control is therefore clearly within the jurisdiction of the State Water Board and Regional Water Boards.

Wetlands are further defined in 40 CFR 122.2 as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."

The Water Board recognizes that wetlands frequently include areas commonly referred to as saltwater marshes, freshwater marshes, open or closed brackish water marshes, mudflats, sandflats, unvegetated seasonally ponded areas, vegetated shallows, sloughs, wet meadows, playa lakes, natural ponds, vernal pools, diked baylands, seasonal wetlands, floodplains, and riparian woodlands.

Mudflats make up one of the largest and most important habitat types in the Estuary. Snails, clams, worms, and other animals convert the rich organic matter in the mud bottom to food for fish, crabs, and birds.

Mudflats generally support a variety of edible shellfish, and many species of fish rely heavily on the mudflats during at least a part of their life cycle. Additionally, San Francisco Bay mudflats are one of the most important habitats on the coast of California for millions of migrating shorebirds.

Another important characteristic of the Estuary is the fresh, brackish, and salt water marshes around the Bay's margins. These highly complex communities are recognized as vital components of the Bay system's ecology. Most marshes around the Bay have been destroyed through filling and development. The protection, preservation, and restoration of the remaining marsh communities are essential for maintaining the ecological integrity of the Estuary.

Identifying wetlands may be complicated by such factors as the seasonality of rainfall in the Region. Therefore, in identifying wetlands considered waters of the United States, the Water Board will consider such indicators as hydrology, hydrophytic plants, and/or hydric soils for the purpose of mapping and inventorying wetlands. The Water Board will, in general, rely on the federal manual for wetland delineation in the Region when issuing Clean Water Act Section 401 water quality certifications (U.S. Army Corps of Engineers (Corps) Wetlands Delineation Manual, 1987). In the rare cases where the U.S. EPA and Corps guidelines disagree on the boundaries for federal juridictional wetlands, the Water Board will rely on the wetlands delineation made by the

U.S. EPA or the California Department of Fish and Game (CDFG). For the purpose of mapping and inventorying wetlands, the Water Board will rely on the protocols and naming conventions of the National Wetlands Inventory (NWI) prepared by the U.S. Fish and Wildlife Service (USFWS).

Many individual wetlands provide multiple benefits depending on the wetland type and location. There are many potential beneficial uses of wetlands, including Wildlife Habitat (WILD); Preservation of Rare and Endangered Species (RARE); Shellfish Harvesting (SHELL); Water Contact Recreation (REC1); Noncontact Water Recreation (REC2); Ocean, Commercial, and Sport Fishing (COMM); Marine Habitat (MAR); Fish Migration (MIGR); Fish Spawning (SPAWN); and Estuarine Habitat (EST). Some of these general beneficial uses can be further described in terms of their component wetland function. For example, many wetlands that provide groundwater recharge (GWR) also provide flood control, pollution control, erosion control, and stream baseflow.

Table 2-3 shows how beneficial uses are associated with different wetland types. Table 2-3 lists and specifies beneficial uses for 34 significant wetland areas within the Region; generalized locations of these wetlands are shown in Figure 2-11. It should be noted that most of the wetlands listed in Table 2-3 are saltwater marshes, and that the list is not comprehensive.

The Water Board has participated in completing the Baylands Ecosystem Habitat Goals Report (1999) and the Baylands Ecosystem Species and Community Profiles (2000), which were written by scientists and managers in the Region in order to recommend sound wetland restoration strategies. Other efforts around the Bay to locate wetland sites include San Francisco Estuary Institute's (SFEI) EcoAtlas Baylands Maps (Baylands Maps) and Bay Area Wetlands Project Tracker (Wetlands Tracker), and the Wetland Tracker managed by the San Francisco Bay Joint Venture. Because of the large number of small and non-contiguous wetlands, it is not practical to delineate and specify beneficial uses of every wetland area. Therefore, beneficial uses may be determined site specifically, as needed. Chapter 4 of this Plan contains additional information on the process used to determine beneficial uses for specific wetland sites.

CHAPTER 3: WATER QUALITY OBJECTIVES

The overall goals of water quality regulation are to protect and maintain thriving aquatic ecosystems and the resources those systems provide to society and to accomplish these in an economically and socially sound manner. California's regulatory framework uses water quality objectives both to define appropriate levels of environmental quality and to control activities that can adversely affect aquatic systems.

3.1 WATER QUALITY OBJECTIVES

There are two types of objectives: narrative and numerical. Narrative objectives present general descriptions of water quality that must be attained through pollutant control measures and watershed management. They also serve as the basis for the development of detailed numerical objectives.

Historically, numerical objectives were developed primarily to limit the adverse effect of pollutants in the water column. Two decades of regulatory experience and extensive research in environmental science have demonstrated that beneficial uses are not fully protected unless pollutant levels in all parts of the aquatic system are also monitored and controlled. The Regional Board is actively working towards an integrated set of objectives, including numerical sediment objectives, that will ensure the protection of all current and potential beneficial uses.

Numerical objectives typically describe pollutant concentrations, physical/chemical conditions of the water itself, and the toxicity of the water to aquatic organisms. These objectives are designed to represent the maximum amount of pollutants that can remain in the water column without causing any adverse effect on organisms using the aquatic system as habitat, on people consuming those organisms or water, and on other current or potential beneficial uses (as described in Chapter 2).

The technical bases of the region's water quality objectives include extensive biological, chemical, and physical partitioning information reported in the scientific literature, national water quality criteria, studies conducted by other agencies, and information gained from local environmental and discharge monitoring (as described in Chapter 6). The Regional Board recognizes that limited information exists in some cases, making it difficult to establish definitive numerical objectives, but the Regional Board believes its conservative approach to setting objectives has been proper. In addition to the technical review, the overall feasibility of reaching objectives in terms of technological, institutional, economic, and administrative factors is considered at many different stages of objective derivation and implementation of the water quality control plan.

Together, the narrative and numerical objectives define the level of water quality that shall be maintained within the region. In instances where water quality is better than that prescribed by the objectives, the state Antidegradation Policy applies (State Board Resolution 68-16: Statement of Policy With Respect to Maintaining High Quality of Waters in California). This policy is aimed at protecting relatively uncontaminated aquatic systems where they exist and preventing further degradation. The state’s Antidegradation Policy is consistent with the federal Antidegradation Policy, as interpreted by the State Water Resources Control Board in State Board Order No. 86-17.

When uncontrollable water quality factors result in the degradation of water quality beyond the levels or limits established herein as water quality objectives, the Regional Board will conduct a case-by-case analysis of the benefits and costs of preventing further degradation. In cases where this analysis indicates that beneficial uses will be adversely impacted by allowing further degradation, then the Regional Board will not allow controllable water quality factors to cause any further degradation of water quality. Controllable water quality factors are those actions, conditions, or circumstances resulting from human activities that may influence the quality of the waters of the state and that may be reasonably controlled.

The Regional Board establishes and enforces waste discharge requirements for point and nonpoint source of pollutants at levels necessary to meet numerical and narrative water quality objectives. In setting waste discharge requirements, the Regional Board will consider, among other things, the potential impact on beneficial uses within the area of influence of the discharge, the existing quality of receiving waters, and the appropriate water quality objectives.

In general, the objectives are intended to govern the concentration of pollutant constituents in the main water mass. The same objectives cannot be applied at or immediately adjacent to submerged effluent discharge structures. Zones of initial dilution within which higher concentrations can be tolerated will be allowed for such discharges.

For a submerged buoyant discharge, characteristic of most municipal and industrial wastes that are released from submerged outfalls, the momentum of the discharge and its initial buoyancy act together to produce turbulent mixing. Initial dilution in this case is completed when the diluting wastewater ceases to rise in the water column and first begins to spread horizontally.

For shallow water submerged discharges, surface discharges, and nonbuoyant discharges, characteristic of cooling water wastes and some individual discharges, turbulent mixing results primarily from the momentum of discharge. Initial dilution, in these cases, is considered to be completed when the momentum-induced velocity of the discharge ceases to produce significant mixing of the waste, or the diluting plume reaches a fixed distance from the discharge to be specified by the Regional Board, whichever results in the lower estimate for initial dilution.

Compliance with water quality objectives may be prohibitively expensive or technically impossible in some cases. The Regional Board will consider modification of specific water quality objectives as long as the discharger can demonstrate that the alternate objective will protect existing beneficial uses, is scientifically defensible, and is consistent with the state Antidegradation Policy. This exception clause properly indicates that the Regional Board will conservatively compare benefits and costs in these cases because of the difficulty in quantifying beneficial uses.

These water quality objectives are considered necessary to protect the present and potential beneficial uses described in Chapter 2 of this Plan and to protect existing high quality waters of the state. These objectives will be achieved primarily through establishing and enforcing waste discharge requirements and by implementing this water quality control plan.

3.2 OBJECTIVES FOR OCEAN WATERS

The provisions of the State Board's "Water Quality Control Plan for Ocean Waters of California" (Ocean Plan) and "Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California" (Thermal Plan) and any revision to them will apply to ocean waters. These plans describe objectives and effluent limitations for ocean waters.

3.3 OBJECTIVES FOR SURFACE WATERS

The following objectives apply to all surface waters within the region, except the Pacific Ocean.

3.3.1 BACTERIA

Table 3-1 provides a summary of the bacterial water quality objectives and identifies the sources of those objectives. Table 3-2 summarizes U.S. EPA's water quality criteria for water contact recreation based on the frequency of use a particular area receives. These criteria will be used to differentiate between pollution sources or to supplement objectives for water contact recreation.

3.3.2 BIOACCUMULATION

Many pollutants can accumulate on particles, in sediment, or bioaccumulate in fish and other aquatic organisms. Controllable water quality factors shall not cause a detrimental increase in concentrations of toxic substances found in bottom sediments or aquatic life. Effects on aquatic organisms, wildlife, and human health will be considered.

3.3.3 BIOSTIMULATORY SUBSTANCES

Waters shall not contain biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses. Changes in chlorophyll a and associated phytoplankton communities follow complex dynamics that are sometimes associated with a discharge of biostimulatory substances. Irregular and extreme levels of chlorophyll a or phytoplankton blooms may indicate exceedance of this objective and require investigation.

3.3.4 COLOR

Waters shall be free of coloration that causes nuisance or adversely affects beneficial uses.

3.3.5 DISSOLVED OXYGEN

For all tidal waters, the following objectives shall apply:

In the Bay:

Downstream of Carquinez Bridge	5.0 mg/l minimum
Upstream of Carquinez Bridge	7.0 mg/l minimum

For nontidal waters, the following objectives shall apply:

Waters designated as:

Cold water habitat	7.0 mg/l minimum
Warm water habitat	5.0 mg/l minimum

The median dissolved oxygen concentration for any three consecutive months shall not be less than 80 percent of the dissolved oxygen content at saturation.

Dissolved oxygen is a general index of the state of the health of receiving waters. Although minimum concentrations of 5 mg/l and 7 mg/l are frequently used as objectives to protect fish life, higher concentrations are generally desirable to protect sensitive aquatic forms. In areas unaffected by waste discharges, a level of about 85 percent of oxygen saturation exists. A three-month median objective of 80 percent of oxygen saturation allows for some degradation from this level, but still requires a consistently high oxygen content in the receiving water.

3.3.6 FLOATING MATERIAL

Waters shall not contain floating material, including solids, liquids, foams, and scum, in concentrations that cause nuisance or adversely affect beneficial uses.

3.3.7 OIL AND GREASE

Waters shall not contain oils, greases, waxes, or other materials in concentrations that result in a visible film or coating on the surface of the water or on objects in the water, that cause nuisance, or that otherwise adversely affect beneficial uses.

3.3.8 POPULATION AND COMMUNITY ECOLOGY

All waters shall be maintained free of toxic substances in concentrations that are lethal to or that produce significant alterations in population or community ecology or receiving water biota. In addition, the health and life history characteristics of aquatic organisms in waters affected by controllable water quality factors shall not differ significantly from those for the same waters in areas unaffected by controllable water quality factors.

3.3.9 pH

The pH shall not be depressed below 6.5 nor raised above 8.5. This encompasses the pH range usually found in waters within the basin. Controllable water quality factors shall not cause changes greater than 0.5 units in normal ambient pH levels.

3.3.10 RADIOACTIVITY

Radionuclides shall not be present in concentrations that result in the accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life. Waters designated for use as domestic or municipal supply shall not contain concentrations of radionuclides in excess of the limits specified in Table 4 of Section 64443 (Radioactivity) of Title 22 of the California Code of Regulations (CCR), which is incorporated by reference into this Plan. This incorporation is prospective, including future changes to the incorporated provisions as the changes take effect (see Table 3-5).

3.3.11 SALINITY

Controllable water quality factors shall not increase the total dissolved solids or salinity of waters of the state so as to adversely affect beneficial uses, particularly fish migration and estuarine habitat.

3.3.12 SEDIMENT

The suspended sediment load and suspended sediment discharge rate of surface waters shall not be altered in such a manner as to cause nuisance or adversely affect beneficial uses.

Controllable water quality factors shall not cause a detrimental increase in the concentrations of toxic pollutants in sediments or aquatic life.

3.3.13 SETTLEABLE MATERIAL

Waters shall not contain substances in concentrations that result in the deposition of material that cause nuisance or adversely affect beneficial uses.

3.3.14 SUSPENDED MATERIAL

Waters shall not contain suspended material in concentrations that cause nuisance or adversely affect beneficial uses.

3.3.15 SULFIDE

All water shall be free from dissolved sulfide concentrations above natural background levels. Sulfide occurs in Bay muds as a result of bacterial action on organic matter in an anaerobic environment.

Concentrations of only a few hundredths of a milligram per liter can cause a noticeable odor or be toxic to aquatic life. Violation of the sulfide objective will reflect violation of dissolved oxygen objectives as sulfides cannot exist to a significant degree in an oxygenated environment.

3.3.16 TASTES AND ODORS

Waters shall not contain taste- or odor-producing substances in concentrations that impart undesirable tastes or odors to fish flesh or other edible products of aquatic origin, that cause nuisance, or that adversely affect beneficial uses.

3.3.17 TEMPERATURE

Temperature objectives for enclosed bays and estuaries are as specified in the "Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays of California," including any revisions to the plan.

In addition, the following temperature objectives apply to surface waters:

- The natural receiving water temperature of inland surface waters shall not be altered unless it can be demonstrated to the satisfaction of the Regional Board that such alteration in temperature does not adversely affect beneficial uses.
- The temperature of any cold or warm freshwater habitat shall not be increased by more than 5°F (2.8°C) above natural receiving water temperature

3.3.18 TOXICITY

All waters shall be maintained free of toxic substances in concentrations that are lethal to or that produce other detrimental responses in aquatic organisms. Detrimental responses include, but are not limited to, decreased growth rate and decreased reproductive success of resident or indicator species. There shall be no acute toxicity in ambient waters. Acute toxicity is defined as a median of less than 90 percent survival, or less than 70 percent survival, 10 percent of the time, of test organisms in a 96-hour static or continuous flow test.

There shall be no chronic toxicity in ambient waters. Chronic toxicity is a detrimental biological effect on growth rate, reproduction, fertilization success, larval development, population abundance, community composition, or any other relevant measure of the health of an organism, population, or community.

Attainment of this objective will be determined by analyses of indicator organisms, species diversity, population density, growth anomalies, or toxicity tests (including those described in Chapter 4), or other methods selected by the Water Board. The Water Board will also consider other relevant information and numeric criteria and guidelines for toxic substances developed by other agencies as appropriate.

The health and life history characteristics of aquatic organisms in waters affected by controllable water quality factors shall not differ significantly from those for the same waters in areas unaffected by controllable water quality factors.

3.3.19 TURBIDITY

Waters shall be free of changes in turbidity that cause nuisance or adversely affect beneficial uses. Increases from normal background light penetration or turbidity relatable to waste discharge shall not be greater than 10 percent in areas where natural turbidity is greater than 50 NTU.

3.3.20 UN-IONIZED AMMONIA

The discharge of wastes shall not cause receiving waters to contain concentrations of un-ionized ammonia in excess of the following limits (in mg/l as N):

Annual Median	0.025
Maximum, Central Bay (as depicted in Figure 2-5) and upstream	0.16
Maximum, Lower Bay (as depicted in Figures 2-6 and 2-7):	0.4

The intent of this objective is to protect against the chronic toxic effects of ammonia in the receiving waters. An ammonia objective is needed for the following reasons:

- Ammonia (specifically un-ionized ammonia) is a demonstrated toxicant. Ammonia is generally accepted as one of the principle toxicants in municipal waste discharges. Some industries also discharge significant quantities of ammonia.
- Exceptions to the effluent toxicity limitations in Chapter 4 of the Plan allow for the discharge of ammonia in toxic amounts. In most instances, ammonia will be diluted or degraded to a nontoxic state fairly rapidly. However, this does not occur in all cases, the South Bay being a notable example. The ammonia limit is recommended in order to preclude any build up of ammonia in the receiving water.
- A more stringent maximum objective is desirable for the northern reach of the Bay for the protection of the migratory corridor running through Central Bay, San Pablo Bay, and upstream reaches.

3.3.21 OBJECTIVES FOR SPECIFIC CHEMICAL CONSTITUENTS

Surface waters shall not contain concentrations of chemical constituents in amounts that adversely affect any designated beneficial use. Water quality objectives for selected toxic pollutants for surface waters are given in Tables 3-3 and 3-4.

The Regional Board intends to work towards the derivation of site-specific objectives for the Bay-Delta estuarine system. Site-specific objectives to be considered by the Regional Board shall be developed in accordance with the provisions of the federal Clean Water Act, the State Water Code, State Board water quality control plans, and this Plan. These site-specific objectives will take into consideration factors such as all available scientific information and monitoring data and the latest U.S. EPA guidance, and local environmental conditions and impacts caused by bioaccumulation. Pending the adoption of site-specific objectives, the objectives in Tables 3-3 and 3-4 apply throughout the region. Site-specific objectives for copper and nickel, adopted for South San Francisco Bay south of the Dumbarton Bridge, are listed in Table 3-3A.

South San Francisco Bay south of the Dumbarton Bridge is a unique, water-quality-limited, hydrodynamic and biological environment that merits continued special attention by the Regional Board. Controlling urban and upland runoff sources is critical to the success of maintaining water quality in this portion of the Bay. Site-specific water quality objectives have been adopted for dissolved copper and nickel in this Bay segment. Site-specific objectives may be appropriate for other pollutants of concern, but this determination will be made on a case-by-case basis, and after it has been demonstrated that all other reasonable treatment, source control and pollution prevention measures have been exhausted. The Regional Board will determine whether revised water quality objectives and/or effluent limitations are appropriate based on sound technical information and scientific studies, stakeholder input, and the need for flexibility to address priority problems in the watershed.

3.3.22 CONSTITUENTS OF CONCERN FOR MUNICIPAL AND AGRICULTURAL WATER SUPPLIES

At a minimum, surface waters designated for use as domestic or municipal supply (MUN) shall not contain concentrations of constituents in excess of the maximum (MCLs) or secondary maximum contaminant levels (SMCLs) specified in the following provisions of Title 22, which are incorporated by reference into this plan: Table 64431-A (Inorganic Chemicals) of Section 64431, and Table 64433.2-A (Fluoride) of Section 64433.2, Table 64444-A (Organic Chemicals) of Section 64444, and Table 64449-A (SMCLs-Consumer Acceptance Limits) and 64449-B (SMCLs-Ranges) of Section 64449. This incorporation-by-reference is prospective, including future changes to the incorporated provisions as the changes take effect. Table 3-5 contains water quality objectives for municipal supply, including the MCLs contained in various sections of Title 22 as of the adoption of this plan.

At a minimum, surface waters designated for use as agricultural supply (AGR) shall not contain concentrations of constituents in excess of the levels specified in Table 3-6.

3.4 OBJECTIVES FOR GROUNDWATER

Groundwater objectives consist primarily of narrative objectives combined with a limited number of numerical objectives. Additionally, the Water Board will establish basin- and/or site-specific numerical groundwater objectives as necessary. For example, the Water Board has groundwater basin-specific objectives for the Alameda Creek watershed above Niles to include the Livermore-Amador Valley as shown in Table 3-7.

The maintenance of existing high quality of groundwater (i.e., "background") is the primary groundwater objective.

In addition, at a minimum, groundwater shall not contain concentrations of bacteria, chemical constituents, radioactivity, or substances producing taste and odor in excess of the objectives described below unless naturally occurring background concentrations are greater. Under existing law, the Water Board regulates waste discharges to land that could affect water quality, including both groundwater and surface water quality. Waste discharges that reach groundwater are regulated to protect both groundwater and any surface water in continuity with groundwater. Waste discharges that affect groundwater that is in continuity with surface water cannot cause violations of any applicable surface water standards.

3.4.1 BACTERIA

In groundwater with a beneficial use of municipal and domestic supply, the median of the most probable number of coliform organisms over any seven-day period shall be less than 1.1 most probable number per 100 milliliters (MPN/100 mL) (based on multiple tube fermentation technique; equivalent test results based on other analytical techniques as specified in the National Primary Drinking Water Regulation, 40 CFR, Part 141.21 (f), revised June 10, 1992, are acceptable).

3.4.2 ORGANIC AND INORGANIC CHEMICAL CONSTITUENTS

All groundwater shall be maintained free of organic and inorganic chemical constituents in concentrations that adversely affect beneficial uses. To evaluate compliance with water quality objectives, the Water Board will consider all relevant and scientifically valid evidence, including relevant and scientifically valid numerical criteria and guidelines developed and/or published by other agencies and organizations (e.g., U.S. Environmental Protection Agency (U.S. EPA), the State Water Board, California Department of Health Services (DHS), U.S. Food and Drug Administration, National Academy of Sciences, California Environmental Protection Agency's (Cal/EPA) Office of Environmental Health Hazard Assessment (OEHHA), U.S. Agency for Toxic Substances and Disease Registry, Cal/EPA Department of Toxic Substances Control (DTSC), and other appropriate organizations.)

At a minimum, groundwater designated for use as domestic or municipal supply (MUN) shall not contain concentrations of constituents in excess of the maximum (MCLs) or secondary maximum contaminant levels (SMCLs) specified in the following provisions of Title 22, which are incorporated by reference into this plan: Tables 64431-A (Inorganic Chemicals) of Section 64431, Table 64433.2-A (Fluoride) of Section 64433.2, and Table 64444-A (Organic Chemicals) of Section 64444. This incorporation-by-reference is prospective, including future changes to the incorporated provisions as the changes take effect. (See Table 3-5.)

Groundwater with a beneficial use of agricultural supply shall not contain concentrations of chemical constituents in amounts that adversely affect such beneficial use. In determining compliance with this objective, the Water Board will consider as evidence relevant and scientifically valid water quality goals from sources such as the Food and Agricultural Organizations of the United Nations; University of California Cooperative Extension, Committee of Experts; and McKee and Wolf's "Water Quality Criteria," as well as other relevant and scientifically valid evidence. At a minimum, groundwater designated for use as agricultural supply (AGR) shall not contain concentrations of constituents in excess of the levels specified in Table 3-6.

Groundwater with a beneficial use of freshwater replenishment shall not contain concentrations of chemicals in amounts that will adversely affect the beneficial use of the receiving surface water.

Groundwater with a beneficial use of industrial service supply or industrial process supply shall not contain pollutant levels that impair current or potential industrial uses.

3.4.3 RADIOACTIVITY

At a minimum, groundwater designated for use as domestic or municipal supply (MUN) shall not contain concentrations of radionuclides in excess of the MCLs specified in Table 4 (Radioactivity) of Section 64443 of Title 22, which is incorporated by reference into this plan. This incorporation-by-reference is prospective, including future changes to the incorporated provisions as the changes take effect. (See Table 3-5.)

3.4.4 TASTE AND ODOR

Groundwater designated for use as domestic or municipal supply (MUN) shall not contain taste- or odor-producing substances in concentrations that cause a nuisance or adversely affect beneficial uses. At a minimum, groundwater designated for use as domestic or municipal supply shall not contain concentrations in excess of the SMCLs specified in Tables 64449-A (Secondary MCLs-Consumer Acceptance Limits) and 64449-B (Secondary MCLs-Ranges) of Section 64449 of Title 22, which is incorporated by reference into this plan. This incorporation-by-reference is prospective, including future changes to the incorporated provisions as the changes take effect. (See Table 3-5.)

3.5 OBJECTIVES FOR THE DELTA

The objectives contained in the State Water Board's 1995 "Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary" and any revisions thereto shall apply to the waters of the Sacramento-San Joaquin Delta and adjacent waters as specified in that plan.

3.6 OBJECTIVES FOR ALAMEDA CREEK WATERSHED

The water quality objectives contained in Table 3-7 apply to the surface and groundwaters of the Alameda Creek watershed above Niles.

Wastewater discharges that cause the surface water limits in Table 3-7 to be exceeded may be allowed if they are part of an overall waterwastewater resource operational program developed by those agencies affected and approved by the Water Board.

Table 3-5: Water Quality Objectives for Municipal Supply

Table 3-6: Water Quality Objectives for Agricultural Supply

Table 3-7: Water Quality Objectives for the Alameda Creek Watershed above Niles

Table 3-1: Water Quality Objectives for Coliform Bacteria[a]

Beneficial Use	Fecal Coliform (MPN/100ml)	Total Coliform (MPN/100ml
Water Contact Recreation	geometric mean < 200 90th percentile < 400	median < 240 no sample > 10,000
Shellfish Harvesting[b]	median < 14 90th percentile < 43	median < 70 90th percentile < 230[c]
Non-contact Water Recreation[d]	mean < 2000 90th percentile < 4000	
Municipal Supply:		
- Surface Water[e]	geometric mean < 20	geometric mean < 100
- Groundwater		< 1.1[f]

NOTES:

a. Based on a minimum of five consecutive samples equally spaced over a 30-day period.

b. Source: National Shellfish Sanitation Program.

c. Based on a five-tube decimal dilution test or 300 MPN/100 ml when a three-tube decimal dilution test is used.

d. Source: Report of the Committee on Water Quality Criteria, National Technical Advisory Committee, 1968.

e. Source: DOHS recommendation.

f. Based on multiple tube fermentation technique; equivalent test results based on other analytical techniques, as specified in the National Primary Drinking Water Regulation, 40 CFR, Part 141.21(f), revised June 10, 1992, are acceptable.

Table 3-2: U.S. EPA Bacteriological Criteria for Water Contact Recreation[1,2]
(in colonies per 100 ML)

	Fresh Water		Salt Water
	Enterococci	**E. Coli**	**Enterococci**
Steady State (all areas)	33	126	35
Maximum at:			
- designated beach	61	235	104
- moderately used area	89	298	124
- lightly used area	108	406	276
- infrequently used area	151	576	500

NOTES:

1. The criteria were published in the Federal Register, Vol. 51, No. 45 / Friday, March 7, 1986 / 8012-8016. The Criteria are based on:
(a) Cabelli, V.J. 1983. Health Effects Criteria for Marine Recreational Waters. U.S. EPA, EPA 600/1-80-031, Cincinnati, Ohio, and
(b) Dufour, A.P. 1984. Health Effects Criteria for Fresh Recreational Waters. U.S. EPA, EPA 600/1-84-004, Cincinnati Ohio.

2. The U.S. EPA criteria apply to water contact recreation only. The criteria provide for a level of production based on the frequency of usage of a given water contact recreation area. The criteria may be employed in special studies within this region to differentiate between pollution sources or to supplement the current coliform objectives for water contact recreation.

Table 3-3: Marine[a] Water Quality Objectives for Toxic Pollutants for Surface Waters (all values in ug/l)

Compound	4-day Average	1-hr Average	24-hr Average
Arsenic[b, c, d]	36	69	
Cadmium[b, c, d]	9.3	42	
Chromium VI[b, c, d, e]	50	1100	
Copper[c, d, f]			
Cyanide[g]			
Lead[b, c, d]	8.1	210	
Mercury[h]	0.025	2.1	
Nickel[b, c, d]	8.2	74	
Selenium[i]			
Silver[b, c, d]		1.9	
Tributyltin[j]			
Zinc[b, c, d]	81	90	
PAHs[k]			15

NOTES:

a. Marine waters are those in which the salinity is equal to or greater than 10 parts per thousand 95% of the time, as set forth in Chapter 4 of the Basin Plan. Unless a site-specific objective has been adopted, these objectives shall apply to all marine waters except for the South Bay south of Dumbarton Bridge, where the California Toxics Rule (CTR) applies. For waters in which the salinity is between 1 and 10 parts per thousand, the applicable objectives are the more stringent of the freshwater (Table 3-4) or marine objectives.

b. Source: 40 CFR Part 131.38 (California Toxics Rule or CTR), May 18, 2000.

c. These objectives for metals are expressed in terms of the dissolved fraction of the metal in the water column.

d. According to the CTR, these objectives are expressed as a function of the water-effect ratio (WER), which is a measure of the toxicity of a pollutant in site water divided by the same measure of the toxicity of the same pollutant in laboratory dilution water. The 1-hr. and 4-day objectives = table value X WER. The table values assume a WER equal to one.

e. This objective may be met as total chromium.

f. Water quality objectives for copper were promulgated by the CTR and may be updated by U.S. EPA without amending the Basin Plan. Note: at the time of writing, the values are 3.1 ug/l (4-day average) and 4.8 ug/l (1-hr. average). The most recent version of the CTR should be consulted before applying these values.

g. Cyanide criteria were promulgated in the National Toxics Rule (NTR). The NTR criteria specifically apply to San Francisco Bay upstream to and including Suisun Bay and Sacramento-San Joaquin Delta. Note: at the time of writing, the values are 1.0 ug/l (4-day average) and 1.0 ug/l (1-hr. average).

h. Source: U.S. EPA Ambient Water Quality Criteria for Mercury (1984).

i. Selenium criteria were promulgated for all San Francisco Bay/Delta waters in the National Toxics Rule (NTR). The NTR criteria specifically apply to San Francisco Bay upstream to and including Suisun Bay and Sacramento-San Joaquin Delta. Note: at the time of writing, the values are 5.0 ug/l (4-day average) and 20 ug/l (1-hr. average).

j. Tributyltin is a compound used as an antifouling ingredient in marine paints and toxic to aquatic life in low concentrations. U.S. EPA has published draft criteria for protection of aquatic life (Federal Register: December 27, 2002, Vol. 67, No. 249, Page 79090-79091). These criteria are cited for advisory purposes. The draft criteria may be revised.

k. The 24-hour average aquatic life protection objective for total PAHs is retained from the 1995 Basin Plan. Source: U.S. EPA 1980.

Table 3-3A: Water Quality Objectives for Copper and Nickel in Lower South San Francisco Bay

Compound	4-day Average (CCC)[1]	1-hr Average (CMC)[2]	Extent of Applicability
Copper	6.9	10.8	Marine and Estuarine Waters Contiguous to SF Bay, South of Dumbarton Bridge
Nickel	11.9	62.4[*]	Marine and Estuarine Waters Contiguous to SF Bay, South of Dumbarton Bridge

[*] Handbook of WQS, 2nd ed. 1994 in Section 3.7.6 states that the CMC = Final AcuteValue/2; 62.4 is the Final Acute Value (resident species database)/2; so the site-specific CMC is lower than the California Toxics Rule value because we are using the resident species database instead of the National Species Database.

[1] Criteria Continuous Concentration

[2] Criteria Maximum Concentration

Table 3-4: Freshwater[a] Water Quality Objectives for Toxic Pollutants for Surface Waters (all values in ug/l)

COMPOUND	4-DAY AVERAGE	1-HR AVERAGE
Arsenic[b, c, d]	150	340
Cadmium[d]	e	e
Chromium III[c, f]		
Chromium VI[b, c, d, g]	11	16
Copper[b, c, d]	9.0[h]	13[h]
Cyanide[i]		
Lead[b, c, d]	2.5[j]	65[j]
Mercury[k]	0.025	2.4
Nickel[b, c, d]	52[l]	470[l]
Selenium[m]		
Silver[b, c, d]		3.4[n]
Tributyltin[o]		
Zinc[b, c, d]	120[p]	120[p]

NOTES:

a. Freshwaters are those in which the salinity is equal to or less than 1 part per thousand 95% of the time, as set forth in Chapter 4 of the Basin Plan. Unless a site-specific objective has been adopted, these objectives shall apply to all freshwaters except for the South Bay south of Dumbarton Bridge, where the California Toxics Rule (CTR) applies. For waters in which the salinity is between 1 and 10 parts per thousand, the applicable objectives are the more stringent of the marine (Table 3-3) and freshwater objectives.

b. Source: 40 CFR Part 131.38 (California Toxics Rule or CTR), May 18, 2000.

c. These objectives for metals are expressed in terms of the dissolved fraction of the metal in the water column.

d. These objectives are expressed as a function of the water-effect ratio (WER), which is a measure of the toxicity of a pollutant in site water divided by the same measure of the toxicity of the same pollutant in laboratory dilution water. The 1-hr. and 4-day objectives = table value X WER. The table values assume a WER equal to one.

e. The objectives for cadmium and other noted metals are expressed by formulas where H = ln (hardness) as CaCO3 in mg/l: The four-day average objective for cadmium is $e^{(0.7852\ H\ -\ 3.490)}$. This is 1.1 µg/l at a hardness of 100 mg/l as $CaCO_3$. The one-hour average objective for cadmium is $e^{(1.128\ H\ -\ 3.828)}$. This is 3.9 µg/l at a hardness of 100 mg/l as $CaCO_3$.

f. Chromium III criteria were promulgated in the National Toxics Rule (NTR). The NTR criteria specifically apply to San Francisco Bay upstream to and including Suisun Bay and Sacramento-San Joaquin Delta. Note: at the time of writing, the values are 180 ug/l (4-day average) and 550

ug/l (1-hr. average). The objectives for chromium III are based on hardness. The values in this footnote assume a hardness of 100 mg/l $CaCO_3$. At other hardnesses, the objectives must be calculated using the following formulas where H = ln (hardness): The 4-day average objective for chromium III is $-0.860 \times e^{(0.8190H+1.561)}$. The 1-hour average for chromium III is $0.316 \times e^{(0.8190 H+3.688)}$.

g. This objective may be met as total chromium.

h. The objectives for copper are based on hardness. The table values assume a hardness of 100 mg/l $CaCO_3$. At other hardnesses, the objectives must be calculated using the following formulas where H = ln (hardness): The 4-day average objective for copper is $0.960 \times e^{(0.8545H-1.702)}$. The 1-hour average for copper is $0.960 \times e^{(0.9422H-1.700)}$.

i. Cyanide criteria were promulgated in the National Toxics Rule (NTR). The NTR criteria specifically apply to San Francisco Bay upstream to and including Suisun Bay and Sacramento-San Joaquin Delta. Note: at the time of writing, the values are 5.2 ug/l (4-day average) and 22 ug/l (1-hr. average).

j. The objectives for lead are based on hardness. The table values assume a hardness of 100 mg/l $CaCO_3$. At other hardnesses, the objectives must be calculated using the following formulas where H = ln (hardness): The 4-day average objective is $(1.46203 - 0.475712H) \times e^{(1.273H -4.705)}$. The 1-hour average for lead is $(1.46203 - 0.145712H) \times e^{(1.273H-1.460)}$.

k. Source: U.S. EPA Quality Criteria for Water 1986 (EPA 440/5-86-001), which established a mercury criterion of 0.012 ug/l. The Basin Plan set the objective at 0.025 based on considerations of the level of detection attainable at that time.

l. The objectives for nickel are based on hardness. The table values assume a hardness of 100 mg/l $CaCO_3$. At other hardnesses, the objectives must be calculated using the following formulas where H = ln (hardness): The 4-day average objective is $0.997 \times e^{(0.8460H + 0.0584)}$. The 1-hour average objective is $0.998 \times e^{(0.8460H + 2.255)}$.

m. Selenium criteria were promulgated for all San Francisco Bay/Delta waters in the National Toxics Rule (NTR). The NTR criteria specifically apply to San Francisco Bay upstream to and including Suisun Bay and Sacramento-San Joaquin Delta. Note: at the time of writing, the values are 5.0 ug/l (4-day average) and 20 ug/l (1-hr. average).

n. The objective for silver is based on hardness. The table value assumes a hardness of 100 mg/l $CaCO_3$. At other hardnesses, the objective must be calculated using the following formula where H = ln (hardness): The 1-hour average objective for silver is $0.85 \times e^{(1.72H - 6.52)}$. U.S. EPA has not developed a 4-day criterion.

o. Tributyltin is a compound used as an antifouling ingredient in marine paints and toxic to aquatic life in low concentrations. U.S. EPA has published draft criteria for protection of aquatic life (Federal Register: December 27, 2002, Vol. 67, No. 249, Page 79090-79091). These criteria are cited for advisory purposes. The draft criteria may be revised.

p. The objectives for zinc are based on hardness. The table values assume a hardness of 100 mg/l $CaCO_3$. At other hardnesses, the objectives must be calculated using the following formulas where H = ln (hardness): The 4-day average objective for zinc is $0.986 \times e^{(0.8473 H+0.884)}$. The 1-hour average for zinc is $0.978 \times e^{(0.8473 H+ 0.884)}$.

SURFACE WATER QUALITY OBJECTIVES (ALAMEDA CREEK AND TRIBUTARIES)

TDS:	250 mg/l (90 day-arithmetic mean)
	360 mg/l (90 day-90th percentile)
	500 mg/l (daily maximum)
Chlorides:	60 mg/l (90 day-arithmetic mean)
	100 mg/l (90 day-90th percentile)
	250 mg/l (daily maximum)

GROUNDWATER QUALITY OBJECTIVES

(Concentration not to be exceeded more than 10 percent of the time during one year.)

Central Basin

TDS:	Ambient or 500 mg/l, whichever is lower
Nitrate (NO_3):	45 mg/l

Fringe Subbasins

TDS:	Ambient or 1000 mg/l, whichever is lower
Nitrate (NO_3):	45 mg/l

Upland and Highland Areas

California domestic water quality standards set forth in California Code of Regulations, Title 22 and current county standards.

Ambient water quality conditions at a proposed project area will be determined by Zone 7 of the Alameda County Flood Control and Water Conservation District at the time the project is proposed, with the cost borne by the project proponents. Ambient conditions apply to the water-bearing zone with the highest quality water.

Waters designated for use as domestic or municipal water supply shall not contain concentrations of chemicals in excess of natural concentrations or the limits specified in California Code of Regulations, Title 22, Chapter 15, particularly Tables 64431-A and 64431-B of Section 64431, Table 64444-A of Section 64444, and Table 4 of Section 64443.

CHAPTER 4: IMPLEMENTATION PLANS

INTRODUCTION

The San Francisco Bay Regional Water Quality Control Board (Water Board)'s overall mission is to protect the beneficial uses supported by the quality of the San Francisco Bay Region (Region)'s surface water and groundwater. Together, the beneficial uses described in detail in Chapter 2 define the resources, services, and qualities of aquatic ecosystems that are the ultimate goals of protecting and achieving water quality. The objectives presented in Chapter 3 present a framework for determining whether water quality is indeed supporting these beneficial uses. This chapter describes in detail the Water Board's regulatory programs and specific plans of action for meeting water quality objectives and protecting beneficial uses.

The descriptions of specific actions to be taken by local public entities and industries to comply with the policies and objectives of this Water Quality Control Plan (Basin Plan) are intended for the guidance of local officials. The Water Board will consider any proposed alternative actions that are consistent with and achieve the policies and objectives of the Basin Plan.

This chapter describes the watershed management conceptual framework for water quality control in the Region and presents each of the individual regulatory programs that form part of this comprehensive approach. These programs are organized into general categories, including surface water protection and management, groundwater protection and management, wetland protection and management, and emerging program areas. Taken together, these programs constitute an integrated, comprehensive water quality control program that is protective, efficient, and flexible.

4.1 THE WATERSHED MANAGEMENT APPROACH

In 1995, the Water Board initiated a watershed management approach to regulating water quality, expanding its primary focus from point sources of pollution to include more diffuse sources such as urban and agricultural runoff. A five-year statewide Strategic Plan, initiated in 1995 and last updated in 2001, guides the water resource protection efforts of the State and Regional Water Boards. A key component of the Strategic Plan is the Watershed Management Initiative (WMI), which promotes a watershed management approach for water quality protection as discussed in Chapter 1.

The WMI is designed to integrate various surface water and groundwater regulatory programs while promoting cooperative, collaborative efforts within a watershed that are designed to improve water quality and protect the beneficial uses of the watershed's water bodies. The WMI is also designed to focus limited funding and resources on the highest priority water quality issues identified by the Water Board in consultation with local stakeholders. The Water Board's strategy for the WMI is contained in the report titled, "San Francisco Bay Regional Water Quality Control Board Watershed Management Initiative, Integrated Plan Chapter." This report is a regularly updated planning tool for identifying priorities to be funded by existing resources, as well as priority tasks that are currently not funded. For each update, activities are planned over the next one to two years, and in some cases, over the next five years. The report also contains descriptions of regional and watershed strategies, discusses how the Water Board is structured to implement the WMI, and how the Water Board is implementing a priority-setting process. The WMI builds upon the progress made to date by the Water Board's efforts, combined with local

watershed efforts led by other entities, and it also identifies tasks to be accomplished to fully implement the WMI. Examples of local implementation of the WMI are included in Section 4.1.3 Watershed Management in Countywide Programs and Individual Watersheds.

To implement the WMI in the Region, there are three levels of watershed management: 1) region-wide, 2) countywide, and 3) in sub-watersheds. This watershed management process is flexible and recognizes the existing institutional structures that can implement watershed management to protect water quality.

Some water quality issues are managed at the region-wide level. For example, the Water Board's water quality control program focuses in part on managing the influx of toxic pollutants to the Estuary's aquatic system, described in Section 4.1.2 Toxic Pollutant Management in the San Francisco Estuary System. The goal of this program element is to limit the total amount of pollutants in the entire system to ensure protection of beneficial uses. In cases where evidence suggests beneficial uses are not protected due to specific pollutants in the system, the program described in Section 4.1.1 Water Quality Attainment Strategies Including Total Maximum Daily Loads is initiated.

Other water quality issues are managed at the countywide level. The Region includes portions of nine counties, which all include shoreline on the Bay, permitted discharges to the Bay, and watershed drainage to the Bay. These institutions are therefore well suited to organize and/or participate in a watershed management approach at the countywide level, forming stakeholder groups that include municipalities, other organizations, and members of the public. Examples are discussed in Section 4.1.3 Watershed Management in Countywide Programs and Individual Watersheds. For example, several urban runoff management programs are organized at this countywide level.

Sub-watershed level watershed management occurs within the county-wide framework, as a result of priority setting that is strongly influenced by local input.

4.1.1 WATER QUALITY ATTAINMENT STRATEGIES INCLUDING TOTAL MAXIMUM DAILY LOADS

The Water Board intends to establish Water Quality Attainment Strategies (WQAS) including Total Maximum Daily Loads (TMDLs) where necessary and appropriate to ensure attainment and maintenance of water quality standards. WQAS and TMDLs for the Region are described in Chapter 7. Section 303(d) of the federal Clean Water Act requires states to identify water bodies that are not attaining water quality standards, and to establish TMDLs for pollutants causing the impairment (non-attainment of water quality standards) of listed water bodies. As such, TMDLs are the pollutant load levels necessary to attain the applicable water quality standards. A complete TMDL refers to the process and elements associated with establishing a TMDL that include, but are not limited to, problem statement, numeric target(s), source analysis, linkage analysis, wasteload and load allocations, implementation plan, and monitoring plan.

WQAS are development and implementation actions associated with implementing (attaining) water quality standards. Complete TMDLs are WQAS, but WQAS are not limited to 303(d)-list pollutants. For example, they may be developed for pollutants for which threat of impairment

provides cause for pollution prevention actions and related activities. WQAS may contain, but not necessarily include, all or some of the complete TMDL elements.

The Water Board will establish WQAS including TMDLs at the level (the Estuary, smaller segments within the Estuary, or individual watersheds) deemed most appropriate in terms of effectiveness and efficiency relative to the applicable water quality standard, types and locations of pollutant sources, and type and scale of implementation actions.

4.1.2 TOXIC POLLUTANT MANAGEMENT IN THE ESTUARY

The Water Board's water quality programs began decades ago with a focus on controlling the discharge of point sources of pollution such as municipal sewage and industrial wastewater. Since then, highly effective waste treatment systems have been built, essentially eliminating what had been major water quality problems associated with high nutrient and organic loading. In addition, the overall influx of toxic pollutants from point sources has significantly declined as a result of these efforts. Still, certain toxic pollutants remain a great concern.

The focus of efforts to attain water quality goals has expanded accordingly. Further reductions in point source pollutant loadings are being attained through complex, innovative programs often involving numerous public agencies and private organizations. Loading from diffuse sources, such as urban and agricultural runoff, had until recently, continued largely unchecked. These sources are now generally considered to be the largest source of pollutants to aquatic systems. Water Board programs aim to reduce this diffuse pollutant loading.

4.1.2.1 NUMERIC WATER QUALITY OBJECTIVES: WASTELOAD ALLOCATIONS

The numerical objectives presented in Chapter 3 define maximum levels of individual pollutants allowed in the waters of the region. These objectives are based on extensive technical information that relates concentrations of pollutants in water to adverse effects on beneficial uses.

Assuring that pollutant concentrations throughout the whole Estuary system will meet objectives for each pollutant requires (a) information on the fate, transport, and distribution of that pollutant and (b) quantification of loading from all sources, including riverine inputs, urban and agricultural runoff, and point source discharges. When this information is available, the total amount of each pollutant that can enter the system without exceeding water quality objectives can be calculated. The maximum pollutant load can then be allocated among all sources, a process known as wasteload allocation. By considering pollutant influx from all sources, wasteload allocation supports the identification and implementation of the most effective and economically efficient means of achieving water quality objectives in the larger Estuary system.

There are three limitations to this approach. First, there are many pollutants of local concern for which objectives have not been developed and adopted. The objectives for specific toxic pollutants contained in Chapter 3 are reasonable for the purposes of interim regulation because they provide a minimum level of protection in the Estuary; however, additional objectives are necessary to fully implement the wasteload allocation approach. The Water Board will establish water quality objectives for selected pollutants as the necessary technical information becomes available and a framework for assessing economic factors is developed.

Second, the wasteload allocation approach only considers the impact of individual pollutants. Aquatic systems in the region contain mixtures of pollutants in a complex and variable water matrix. Implementation of the toxicity objective described in the following section addresses this issue.

Finally, substances that accumulate in sediment or organisms pose a more complicated problem for water quality control. The additional considerations necessary for these pollutants are described below.

4.1.2.2 TOXIC POLLUTANT ACCUMULATION: MASS-BASED STRATEGIES

Wasteload allocations based on the achievement of numeric water quality objectives will provide appropriate protection of beneficial uses for many toxic pollutants. For some pollutants, however, concentrations in water are not good indicators of their impairment of beneficial uses. Instead, wasteload allocations for such compounds are developed based on mass rather than concentration, and tissue and sediment concentrations. Typically, mass-based allocations require more extensive technical information on the fate and transport of pollutants in the system than those based on water alone.

The Water Board implements the narrative objectives regarding sediment accumulation and bioaccumulation in several ways. These are discussed in greater detail later in this chapter. In general, pollutants are identified and monitored in both discharges and the aquatic system. At a minimum, limits placed on point and nonpoint discharges take pollutant accumulation into consideration. Ultimately, the goal is to develop system-wide, mass-based wasteload allocations for appropriate substances.

4.1.2.3 SCIENTIFIC RESEARCH: ONGOING REFINEMENT OF PROGRAMS

The quantity of pollutants in the Estuary system is the result of many complex and interacting factors beyond the total amount discharged day-to-day. Levels of pollutants in water, sediments, and aquatic organisms are regularly assessed through the Regional Monitoring Program and other surveillance described in Chapter 6.

In addition, implementation of this Water Quality Control Plan involves research and investigation on processes controlling the fate, transport, and distribution of pollutants. In the past, the Water Board has supported research on Delta outflow and associated flushing, sediment movement, chemical transformations within the aquatic system, and biological effects associated with existing and projected pollutant levels.

Information resulting from ongoing scientific research and regular monitoring within the Estuary is continuously incorporated into each of the programs described in detail later in this chapter. In addition, the Water Board typically requires technical investigations in situations where water quality problems have been identified but not enough information is available to craft appropriate courses of action. As a result, programs are constantly evolving as better scientific information becomes available.

4.1.2.4 RIVERINE FLOWS, SYSTEM FLUSHING, AND POLLUTANT LOADING

4.1.2.4.1 DELTA OUTFLOW

In addition to pollution control measures, achieving water quality objectives and protecting the beneficial uses of the San Francisco Bay Estuary system (particularly fish migration and estuarine habitat) are depends on freshwater outflow from the Delta. Adequate freshwater inflow to the Bay system is necessary to control salinity, to provide mixing (particularly in the entrapment zone), to maintain proper temperature, and to flush out residual pollutants that cannot be eliminated by treatment or nonpoint source management. Except for local drainage and wastewater discharges, Delta outflow provides virtually all the freshwater inflow to San Francisco Bay. However, the availability of adequate Delta outflow to meet these needs is very uncertain because of the existing and potential upstream diversions of water and fluctuations in rainfall.

The State Board first addressed the issue of the Bay's inflow needs in the Water Quality Control Plan for the Sacramento-San Joaquin Delta and Suisun Marsh in the Water Rights Decision 1485, issued in August, 1978. In these documents, the State Board established maximum salinity standards (but no corresponding flow standards for the Delta) and required the two major water diverters to conduct research and determine:

- Outflow needs in San Francisco Bay, including the ecological benefits of unregulated outflows and salinity gradients established by them; and
- The need for winter flows for long-term protection of striped bass and other aquatic organisms in the Delta.

In 1993, estuarine scientists and managers associated with the San Francisco Estuary Project recommended development of salinity standards for different parts of the year to be used in conjunction with flow standards. Specifically, they indicate that average upstream positions of the near-bottom 2 0/00 isohaline would be an appropriate index for salinity standards.

Technical evidence developed during the Estuary Project process and the State Board Bay/Delta hearings will be used to help formulate future amendments to the Basin Plan.

4.1.2.4.2 SAN LUIS DRAIN

The San Luis Drain is a proposed method of funneling agricultural runoff from the San Joaquin Valley into the Delta.

Agricultural irrigation in the San Joaquin Valley leads to high salinity concentrations in the soil, which may be harmful to crops. To alleviate this condition, tile drains have been and are being installed to carry the saline water away from the fields. However, there have been adverse environmental effects associated with this wastewater.

In 1982, the U.S. Fish and Wildlife Service discovered selenium concentrations in fish from the San Luis Drain and Kesterson Reservoir to be as much as 100 times higher than background. It also found high mortalities and deformities among newborn coots, grebes, stilts, and ducks.

There was early concern about the potential for impacts on beneficial uses in the Estuary if the Drain were completed and discharged into the Delta. In response, the Water Board prohibited the proposed discharge in 1964, unless compelling evidence that the proposed discharge would not harm beneficial uses was submitted by proponents. In 1981, the Water Board requested that the State Board take the lead role in developing, revising, renewing, and enforcing waste discharge requirements for the Drain.

Unfortunately, the problem of agricultural drainage still exists. The San Joaquin Valley Drainage Program, another state and federal interagency program, has begun to investigate further the problems associated with the drainage of agricultural lands and to develop solutions.

4.1.3 WATERSHED MANAGEMENT COUNTYWIDE PROGRAMS AND INDIVIDUAL WATERSHEDS

Protection of beneficial uses associated with the Estuary also depends upon achieving water quality goals within each of the watersheds draining to the Bay. Successful wasteload allocations depend upon limiting pollutant influx from nonpoint as well as point sources. In turn, nonpoint source control is dependent on a wide range of factors, including physical factors such as the geology and hydrological characteristics of an area; existing natural resources such as vegetation along streambanks; and a wide range of human activities.

Watershed management planning in each countywide program or individual watershed involves a series of steps. First, a detailed assessment of current conditions, including identification of existing or potential problems, is conducted. Next, the process attempts to bring together all affected stakeholders and interested parties to determine how they would manage their watershed. Finally, specific actions are taken during implementation of the countywide or local watershed action plan.

The Water Board firmly believes that watershed planning and protection efforts will not be effective unless solutions are defined and implemented at the local level. The following sections present four examples of local watershed management planning activities supported by the Water Board.

4.1.3.1 THE NAPA RIVER WATERSHED

The Water Board has initiated county-level watershed management planning efforts. The first began in the Napa River Watershed where depressed oxygen levels, high coliform levels, and sedimentation due to erosion were recurring problems in segments of the Napa River.

The Water Board initiated the planning process by preparing a complete resource evaluation in cooperation with a wide range of local public and private entities. This evaluation encompassed traditional evaluations of natural resources and also included descriptions of existing management and regulatory frameworks, funding, and tax incentive programs to support the local planning process.

The Water Board is supporting local agency staff, public officials, agricultural landowners, urban residents of Napa County, and the Napa Resource Conservation District in their efforts to define watershed management goals and specific actions that will eventually allow those goals to be

met. In 1999, the Water Board issued waste discharge requirements (WDRs) for the Napa River Flood Control Project, which has set a national standard for innovative, community-based planning to ensure a "Living River" corridor along the Napa River that protects water quality, successfully integrating flood control, water quality, and habitat protection requirements.

4.1.3.2 THE SANTA CLARA BASIN WATERSHED MANAGEMENT INITIATIVE

In 1996, the Water Board and the U.S. EPA initiated a broad stakeholder effort to encourage local stewardship in the Santa Clara basin as part of the statewide WMI. The Santa Clara basin is defined as the San Francisco Bay south of the Dumbarton Bridge and the watersheds draining to that segment of the Bay. The Santa Clara Basin Watershed Management Initiative is a broad-based stakeholder group of 32 signatories from local, state and federal public agencies, business and trade associations, and civic and environmental groups and programs. The declared purpose of this WMI is "to develop and implement a comprehensive watershed management program - one that recognizes that healthy watersheds mean addressing water quality problems and quality of life issues for the people, animals and plants that live in the watershed." This WMI first established a mission statement, goals, planning objectives for development of a watershed action plan, implementation objectives, and a framework for conducting a watershed assessment. The most outstanding successes of this WMI have been in sustaining organizational continuity, providing a forum for stakeholder input on regulatory actions, and producing a variety of outreach materials for the general public to assist in natural resource protection. This WMI has continued to develop its foundation by producing watershed assessments (2002), and a watershed action plan (2003), and by further developing its priorities for implementation to protect and improve water quality (2005).

4.1.3.3 THE TOMALES BAY WATERSHED

The Tomales Bay watershed in western Marin County is one of the major estuaries on the west coast of the United States. It has a diverse ecosystem and several notable tributaries, including Lagunitas Creek, which has one of the few remaining viable coho salmon runs in central California. In December 1999, the local citizens and state, federal, and local agencies formed the Tomales Bay Watershed Council. The Council produced a Stewardship Plan for the Tomales Bay watershed to ensure that water quality in Tomales Bay and its tributary streams is sufficient to support natural resources and beneficial uses. The plan also includes recommendations to restore and protect the integrity of natural habitats and native plant communities, which contribute to improved water quality. The Water Board has actively participated on the Council, working with the other agencies and interested parties to coordinate monitoring and recommend funding for grant projects for a variety of pollution prevention and restoration projects within the watershed.

4.1.3.4 THE CONTRA COSTA WATERSHED FORUM

The Contra Costa Watershed Forum (CCWF) was established as a result of a countywide Creek and Watershed Symposium in 1999. The CCWF is an open committee of approximately 50 organizations, including federal, state, and local agencies; local governments; a professional watershed research organization; local non-profit environmental and education organizations; community volunteer groups; and private citizens. The CCWF staff are from the Contra Costa County Community Development Department. This diverse group of stakeholders is united by their concern for the watersheds of Contra Costa County. Through the coordinated activities of

the CCWF, local creek and watershed groups have been sustained, and the CCWF has received grant funding for creek surveys and mapping, biological water quality (benthic macroinvertebrate) monitoring, and production of the Watershed Atlas. The Watershed Atlas compiles information on geography, hydrology, demographics, impervious surface, drainage patterns and much other information pertinent to water quality protection and evaluation, including activities of local watershed groups and restoration projects. The Water Board supports the CCWF by attendance at meetings, management of grant-funded projects, and work with CCWF staff on setting watershed priorities. These efforts are leading to water quality improvements as the citizens of Contra Costa County become more directly involved in assessing, monitoring, restoring, and protecting their watersheds.

4.2 DISCHARGE PROHIBITIONS APPLICABLE THROUGHOUT THE REGION

To protect water quality of all aquatic systems throughout the region, the discharge prohibitions listed in Table 4-1 apply. The Water Board will not allow exceptions to these prohibitions, except where noted below.

Exceptions to Prohibitions 1, 2, and 3 will be considered where:

- An inordinate burden would be placed on the discharger relative to beneficial uses protected and an equivalent level of environmental protection can be achieved by alternate means, such as an alternative discharge site, a higher level of treatment, and/or improved treatment reliability; or
- A discharge is approved as part of a reclamation project; or
- It can be demonstrated that net environmental benefits will be derived as a result of the discharge; or
- A discharge is approved as part of a groundwater clean-up project, and in accordance with Resolution No. 88-160 "Regional Board Position on the Disposal of Extracted Groundwater from Groundwater Clean-up Projects," and it has been demonstrated that neither reclamation nor discharge to a POTW is technically and economically feasible, and the discharger has provided certification of the adequacy and reliability of treatment facilities and a plan that describes procedures for proper operation and maintenance of all treatment facilities. (The Water Board recognizes the resource value of extracted and treated groundwater and urges its utilization for the highest beneficial use for which applicable water quality standards can be achieved.)

In reviewing requests for exceptions, the Water Board will consider the reliability of the discharger's system in preventing inadequately treated wastewater from being discharged to the receiving water and the environmental consequences of such discharges.

Prohibitions 1 through 5 refer to particular characteristics of concern to beneficial uses. The Water Board may consider an exception to 4 provided that any proposed reclamation project demonstrates that beneficial uses will be protected. This broad language has been and will be interpreted by the Water Board on a case-by-case basis. It should be noted that the Water Board will consider all discharges of treated sewage and other discharges where the treatment process

is subject to upset to contain particular characteristics of concern unless the discharger can demonstrate that the discharge of inadequately treated waste will be reliably prevented.

4.2.1 SUMMARY

The detailed program descriptions presented in the remainder of this chapter are focused on protecting water quality in systems ranging from small creeks to the larger Estuary.

The section on point source control focuses primarily on protecting beneficial uses in each segment of the Estuary, as well as the whole system. The section on nonpoint source control focuses primarily on individual watersheds, but also on the contributions of runoff to the larger Bay system. The section on groundwater protection and management centers on groundwater basins within each watershed. The section on emerging program areas describes resources and issues that have increasingly become the focus of Water Board activity. Often, these areas require integrated and innovative approaches that are substantially different than those that exist in established programs.

4.3 POINT SOURCE CONTROL

Surface waters in the region consist of inland surface water (freshwater lakes, rivers, and streams), estuaries, enclosed bays, and ocean waters. Historical and ongoing wasteloads contributed to the surface water bodies in the region come from upstream discharges carried into the region via Delta outflow, direct input in the forms of point and nonpoint sources, and indirect input via groundwater seepage.

A point source usually refers to waste emanating from a single, identifiable location, while a nonpoint source usually refers to waste emanating from diffuse locations. While legally considered point sources, stormwater sewer systems are discussed under the nonpoint source control because waste entering the systems is generated from diffuse sources. This section describes control measures for point source discharges. The Water Board may control either type of discharge, but approaches may differ.

Wasteloads from point sources are those that are generally associated with pollutant discharges from an identifiable location to a specific receiving water body. Major types of point sources include:

- Treated municipal sewage discharged from Publicly Owned Treatment Works (POTWs), which often consist of a combination of domestic, industrial, and commercial waste streams;
- Treated industrial wastewater resulting from industrial operations, processing, cleaning, and cooling;
- Treated groundwater from clean-up of groundwater pollution sites; and,
- Other miscellaneous types of discharges, including certain non-point sources with a physically identifiable point of discharge.

4.4 WASTE DISCHARGE PERMITTING PROGRAM

Point source discharges to surface waters are generally controlled through waste discharge requirements issued under the federal National Pollutant Discharge Elimination System (NPDES) permits. Although the NPDES program was established by the federal Clean Water Act, the permits are prepared and enforced by the Water Boards per California's delegated authority for the act.

Issued in five-year terms, an NPDES permit usually contains components such as discharge prohibitions, effluent limitations, and necessary specifications and provisions to ensure proper treatment, storage, and disposal of the waste. The permit often contains a monitoring program that establishes monitoring stations at effluent outfall and receiving waters.

Under the state's Porter-Cologne Water Quality Control Act, any person discharging or proposing to discharge waste within the region (except discharges into a community sewer system) that could affect the quality of the waters of the state is required to file a Report Of Waste Discharge (ROWD). The Water Board reviews the nature of the proposed discharge and adopts Waste Discharge Requirements (WDRs) to protect the beneficial uses of waters of the state. Waste discharge requirements could be adopted for an individual discharge, or a specific type of discharges in the form of a general permit. The Water Board may waive the requirements for filing a ROWD or issuing WDRs for a specific discharge where such a waiver is not against the public interest. NPDES requirements may not be waived.

Acceptable control measures for point source discharges must ensure compliance with NPDES permit conditions, including the discharge prohibitions (Table 4-1) and the effluent limitations provided on the following pages. In addition, control measures must satisfy water quality objectives set forth in the Basin Plan unless the Water Board judges that related economic, environmental, or social considerations merit a modification after a public hearing process has been conducted. Control measures employed must be sufficiently flexible to accommodate future changes in technology, population growth, land development, and legal requirements.

4.5 EFFLUENT LIMITATIONS

4.5.1 TECHNOLOGY- AND WATER QUALITY-BASED LIMITATIONS

The federal Clean Water Act (CWA) requires that NPDES permits include technology-based and, where appropriate, water quality-based effluent limitations. Technology-based effluent limitations are promulgated performance standards based on secondary treatment or best practicable control technology. When technology-based limitations fail to attain or maintain acceptable water quality (as measured by water quality objectives) or comply with water quality control plans, additional or more stringent effluent limitations will be required in order to attain water quality objectives. The more stringent limitations are known as water quality-based limits.

Water quality-based effluent limitations will consist of narrative requirements and, where appropriate, numerical limits for the protection of the most sensitive beneficial uses of the receiving water. Establishing numeric limits takes into account the appropriate water quality objectives, background concentrations in the receiving water, and allowable dilution credit.

In many cases, numerical water quality objectives are not available for various types of beneficial uses or for various constituents of concern. In these cases, best professional judgment will be used in deriving numerical effluent limitations that will ensure attainment and maintenance of narrative water quality objectives.

4.5.2 SITE-SPECIFIC OBJECTIVES

In some cases, the Water Board may elect to develop and adopt site-specific water quality objectives. These objectives will be based on reflect site-specific conditions and comply with the Antidegradation Policy. This situation may arise when:

- It is determined that promulgated water quality standards or objectives are not protective of beneficial uses; or
- Site-specific conditions warrant less stringent effluent limits than those based on promulgated water quality standards or objectives, without compromising the beneficial uses of the receiving water.

In the above cases, the Water Board may consider developing and adopting site-specific water quality objectives for the constituent(s) of concern. These site-specific objectives will be developed to provide the same level of environmental protection as intended by national criteria, but will more accurately reflect local conditions. Such objectives are subject to approval by the State Board, Office of Administrative Law, and U.S. EPA.

There may be cases where the promulgated water quality standard or adopted objectives are practically not attainable in the receiving water due to existing high concentrations. In such circumstances, discharges shall not cause impairment of beneficial uses.

4.5.3 BEST PROFESSIONAL JUDGMENT

In developing and setting water quality-based effluent limitations for toxic pollutants, best professional judgment will involve consideration of many factors. Factors that may be considered include:

- Applicable and relevant federal laws, regulation, and guidance (specifically 40 CFR122 and 131, promulgated National Toxics Rules, U.S. EPA Water Quality Criteria, and technical guidance on water-quality based toxics control);
- State laws, regulations, policies, guidance, and Water Quality Control Plans;
- This Regional Water Quality Control Plan;
- Achievability by available technology or control strategies;
- Effectiveness of pollution prevention and source control measures; and
- Economic and social costs and benefits.

While the conditions surrounding a waste discharge may vary from case to case, all attempts will be made to ensure consistency among permits when exercising best professional judgment.

The effluent limitations described below have been established to help achieve the water quality objectives identified in Chapter 3.

Numerical effluent limitations identified in this section may not contain a complete list of pollutants that have a reasonable potential to cause an adverse impact on water quality. Inclusion of such pollutants of concern into the NPDES permit will be evaluated on a case-by-case basis.

The Water Board will consider establishing more stringent limitations as necessary to meet water quality objectives and protect beneficial uses in particularly sensitive areas. Similarly, the Water Board will consider establishing less stringent limitations, consistent with state and federal laws, for any discharge where it can be conclusively demonstrated through a comprehensive program approved by the Water Board that such limitations will not result in unacceptable adverse impacts on the beneficial uses of the receiving water. Such a comprehensive program must evaluate the impact of other, nearby discharges as well as the discharge itself.

The numerical limits identified in this section have been and will be applied on a gross rather than a net basis except for certain industrial waste discharges, which will be evaluated on a case-by-case basis.

4.5.4 DISCHARGES TO OCEAN WATERS

Within the context of this Basin Plan, ocean waters of the region are all territorial marine waters of the state west of the coastline, except enclosed bays.

All discharges to ocean waters must comply with the applicable quality requirements for waste discharges specified in the State Board's Ocean Plan and Thermal Plan.

4.5.5 DISCHARGES TO INLAND SURFACE WATERS, ENCLOSED BAYS, AND ESTUARIES

Within the context of this plan, enclosed bays are the indentations along the coast that enclose an area of marine water (such as Tomales Bay and Drake's Estero) including San Francisco Bay; estuaries extend from a bay to points upstream where there is no significant mixing or fresh water or sea water (this includes significant portions of the main San Francisco Bay and the portions of streams draining to the Bay where salt and freshwater mix); and inland surface waters are all other waterbodies within the region (freshwater rivers, streams, lakes, and reservoirs). As described in Chapter 3, effluent limits for discharge into any surface water body within the region is based on salinity. These are defined in the State Enclosed Bays and Estuaries Policy, 1974.

4.5.5.1 LIMITATIONS FOR CONVENTIONAL POLLUTANTS

Effluent limitations for conventional pollutants are contained in Table 4-2 for discharges to inland surface waters and enclosed bays and estuaries within the region.

4.5.5.2 LIMITATIONS FOR SELECTED TOXIC POLLUTANTS

Water quality-based effluent limitations for shallow water and deepwater dischargers shall be calculated according to the methodology in the “Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bay, and Estuaries of California (SIP).” and any amendments thereto.

The Water Board may adopt additional numerical standards for conservative constituents documented in discharges and/or documented to be of concern in receiving waters.

4.5.5.3 WHOLE EFFLUENT TOXICITY LIMITS AND CONTROL PROGRAM

The narrative water quality objective for toxicity (see Chapter 3) protects beneficial uses against mixtures of pollutants typically found in aquatic systems. This approach is used because numerical objectives for individual pollutants do not take mixtures into account and because numerical objectives exist for only a small fraction of potential pollutants of concern.

Effluent limits for acute toxicity are described below and were derived through the Effluent Toxicity Characterization Program (ETCP). A detailed description of the ETCP is presented later in this section. These limits define in specific terms how the Water Board assesses whether waters are "maintained free of toxic substances in concentrations that are lethal to or that produce other detrimental responses in aquatic organisms" (the narrative objective in Chapter 3) and maintains waters free of "toxic substances in toxic amounts" (Clean Water Act).

4.5.5.3.1 ACUTE TOXICITY

The acute toxicity effluent limitation states that the survival of organisms in effluent shall be a median value of not less than 90 percent survival, and a 90 percentile value of not less than 70 percent survival using tests as specified in Table 4-4 and Table 4-5.

Compliance with the acute toxicity limitation is evaluated by measuring survival of test fishes exposed to effluent for 96 hours. Each fish species represents a single sample. Dischargers are required to conduct flow-through effluent toxicity tests, except for those that discharge intermittently and discharge less than 1.0 million gallons per day (average dry weather flow). Such small, intermittent dischargers are required to perform static renewal bioassays.

All dischargers perform toxicity tests using fish species, according to protocols approved by the U.S. EPA or State Board or published by the American Society for Testing and Materials (ASTM) or American Public Health Association. Two fish species shall be tested concurrently. These shall be the most sensitive two species determined from concurrent screening(s) of three species: three-spine stickleback, rainbow trout, and fathead minnow. Tests completed within ten days of the initial test are considered concurrent. This three-species-screening requirement can be met using either flow-through or static renewal bioassays.

The Water Board may consider allowing compliance monitoring with only one (the most sensitive, if known) fish species, if the following condition is met: The discharger can document that the acute toxicity limitation, specified above, has not been exceeded during the previous three years, or that acute toxicity has been observed in only one of two fish species.

The Water Board may modify the flow-through bioassay requirements and the specific test species requirements on a case-by-case basis for discharges of once-through cooling water or excessively saline wastes, which make the implementation of these test requirements impractical. Such changes are not intended as a reduction in the acute toxicity limitation, but rather to account for the technical difficulties of performing the tests.

In addition, for deep water discharges subject to marine effluent limitations, dischargers are not to be considered out of compliance with the acute toxicity effluent limitation under the following circumstances: the discharger documents that the only cause of acute toxicity is ammonia which rapidly decays in the receiving water, and demonstrates that ammonia in the discharge does not impact water quality or beneficial uses.

4.5.5.3.2 CHRONIC TOXICITY

Chronic toxicity effluent limits are derived for individual dischargers based upon Best Professional Judgement. Some of the factors that may be considered in the development of these limits include: allowing credit for dilution comparable to those allowed for numeric chemical-specific objectives, effluent variability, and intent to protect against consistent chronic toxicity and severe episodic toxic events.

Chronic toxicity limitations are contained in the permits of all dischargers that have completed or are currently participating in the Effluent Toxicity Characterization Program (ETCP). This includes all municipal facilities with pre-treatment programs, all major industrial facilities, and selected treated groundwater dischargers.

Monitoring requirements for chronic toxicity, such as test species, effluent sampling procedures, dilution series, monitoring frequency, dilution waters and reference toxicant testing requirements, are specified in NPDES permits on a case-by-case basis. Monitoring requirements will be based on Effluent Toxicity Characterization Program data. Test species and protocols will be selected from those listed in Table 4-5.

Dischargers with chronic toxicity limits in their permits monitoring quarterly or less frequently are required to accelerate the frequency to monthly (or as otherwise specified by the Executive Officer) when conditions such as those listed in Table 4-6 occur.

4.5.5.3.3 TOXICITY IDENTIFICATION/REDUCTION EVALUATION (TIE/TRE)

Permits shall require that if consistent toxicity is exhibited, then a chronic toxicity identification evaluation (TIE) and toxicity reduction evaluation (TRE) shall be conducted. Specific language in permits requires the development of workplans for implementing TIEs. TIEs will be initiated within 30 days of detection of persistent toxicity. The purpose of a TIE is to identify the chemical or combination of chemicals causing the observed toxicity. Every reasonable effort using currently available TIE methodologies shall be employed by the discharger. The Water Board recognizes that identification of causes of chronic toxicity may not be successful in all cases.

The purposes of a TRE are to identify the source(s) of the toxic constituents and evaluate alternative strategies for reducing or eliminating their discharge. The TRE shall include all reasonable steps to reduce toxicity to the required level. In addition, the Water Board will review chronic toxicity test results to assess acute toxicity and consider the need for an acute TIE.

Following completion of the TRE, if consistent toxicity is still exhibited in a discharge, then the discharger shall pursue all feasible waste minimization measures at a level that is acceptable to the Water Board. The discharger must document that the acceptable level of participation is maintained by submitting reports on a specified schedule to the Water Board.

A Toxicity Reduction Evaluation may again be required in situations where chronic toxicity still exists and new techniques for identifying and reducing toxicity become available. Alternatively, the cause of effluent toxicity may change, so that existing techniques will enable identification and reduction of toxicity.

Consideration of any enforcement action by the Water Board for violation of the effluent limitation will be based in part on the discharger's actions in identifying and reducing sources of persistent toxicity.

4.5.5.3.4 EFFLUENT TOXICITY CHARACTERIZATION PROGRAM

The Effluent Toxicity Characterization Program was initiated in 1986 with the goal of developing and implementing toxicity limits for each discharger based on actual characteristics of both receiving waters and waste streams. The Water Board initiated the program as a means of implementing the narrative objective prohibiting toxic effects in receiving water.

The first two phases of the program focused on developing methods for monitoring effluent toxicity (known as effluent characterization) and deriving the appropriate series of tests to ensure that each effluent and its immediate receiving waters are not toxic to aquatic organisms.

Information from these phases is used to determine whether the narrative objectives are being met in each segment of the Bay and will support the development of site-specific water quality objectives and wasteload allocations.

As the program progresses, the Water Board may: (a) Modify existing effluent limits; (b) Specify different test organisms and methods for determining compliance with toxicity effluent limits; and/or (3) Require a toxicity reduction evaluation (TRE) to determine the cost-effectiveness of controlling toxicity or reducing concentrations of specific pollutants.

This program is being implemented within the existing framework of the NPDES permitting program for municipal and industrial facilities.

The purposes of effluent characterization are to:

- Define effluent variability so that the most appropriate compliance monitoring program can be put in place for each discharge and so that adequate information can be developed to determine if treatment processes or source control modifications are necessary to comply with effluent limits;
- Define the sensitivity of different test species to different effluents so that appropriate acute toxicity effluent limits can be defined and to identify the most sensitive of a group of test organisms used for compliance monitoring; and
- Define the chronic toxicity of the effluent to different test species such that the most sensitive organism of a standard set can be defined and either used for compliance monitoring or used for development of application factors to be applied to the acute toxicity effluent limit.

Two rounds of effluent characterization have been completed by dischargers selected on the basis of the nature, volume, and location of discharge. The first round started characterization in 1988; the second round in 1991. The Water Board adopted guidance documents for each round of characterization, with modifications made to the second round from knowledge gained during the first. Status reports were issued in July, 1989, March, 1990, and July, 1991. A summary report is scheduled upon completion of the second round in 1995. The need for a third round of characterization will be evaluated at that time.

Thus far, no one test species has consistently been the most sensitive to all discharges. This strongly supports the current approach of requiring screening using several test species. Also, acute toxicity has been observed at several sites using the expanded range of test species.

Although these sites can meet existing limits with test species currently used to determine compliance (fathead minnow, trout, and stickleback), they cannot meet the limits based on more sensitive species now available.

Detailed technical guidelines for conducting toxicity tests and analyzing resulting data were compiled in "Modified Guidelines: Effluent Toxicity Characterization Program," San Francisco Bay Regional Water Quality Control Board, 1991, Resolution No. 91-083, after experience gained during the first round. This document is incorporated by reference into this plan.

4.6 CALCULATION OF WATER QUALITY-BASED EFFLUENT LIMITATIONS

4.6.1 DILUTION RATIOS

The allocation of dilution ratio depends on whether a discharge is classified as a deep water or a shallow water discharge. In order to be classified as a deep water discharge, waste must be discharged through an outfall with a diffuser and must receive a minimum initial dilution of 10:1, with generally much greater dilution. All other dischargers are classified as shallow water discharges.

4.6.1.1 DEEP WATER DISCHARGES

While it is recognized that the actual initial dilution of many deep water discharges is greater than ten, the Water Board has taken a conservative approach to calculating effluent limitations for the following reasons. First, there is concern over the effects of the cumulative mass loadings of toxic pollutants from the numerous discharges into San Francisco Bay. Limiting the allocation of dilution credits is one means of limiting mass loadings. Second, recent Water Board studies have detected toxicity in ambient waters throughout the Bay system based on laboratory toxicity tests. This calls for a cautious approach in allowing the discharge of toxic substances. Third, studies indicate that bioaccumulation of pollutants in San Francisco Bay biota is of concern to wildlife and human health. Fourth, it is difficult to either measure or predict actual dilution in the San Francisco Bay estuarine environment. In the Estuary, the direction of waste transport varies over the course of the tidal cycle, so it is difficult to determine the fraction of new water versus recirculated water mixing with the discharge. U.S. EPA has developed several models of initial dilution for discharge plumes, but none take into account transport due to tidal currents.

The Water Board will consider inclusion of an effluent limitation greater than that calculated from water quality objectives when the increase in concentration is caused by implementation of significant water reclamation or water reuse programs at the facility; the increase in the effluent limitation does not result in an increase in the mass loading; and water quality objectives will not be exceeded outside the zone of initial dilution.

4.6.1.2 SHALLOW WATER DISCHARGES

Shallow water dischargers are subject to a discharge prohibition (Table 4-1, No. 1), which is intended to protect beneficial uses in areas that receive very limited, if any, dilution. When an exception to the prohibition is granted, it is generally not appropriate to allocate dilution credits for purposes of calculating effluent limitations, because these shallow aquatic environments are often biologically sensitive or critical habitats.

However, dilution credit may be granted on a discharger-by-discharger and pollutant-by-pollutant basis based on provisions of the "Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bay, and Estuaries of California (SIP)." In making this determination, the Water Board will grant dilution credit on a pollutant-by-pollutant basis if the discharger demonstrates that an aggressive pretreatment and source control program is in place, including the following:

- Completion of a source identification study;
- Development and implementation of a source reduction plan; and
- Commitment of resources to fully implement the source control and reduction plan.

Any dilution credit granted must be consistent with the antibacksliding policy and may be granted only after very rigorous scrutiny of source control efforts and receiving water data. When dilution is granted, permits shall include provisions requiring continuing efforts at source control, targeting the substances to which the exceptions apply.

For certain low volume, short duration, or one-time discharges, the requirements of pretreatment and source control programs may not be practical. The Water Board may choose to waive such requirements for pollutants in low volume discharges determined to have no significant adverse impact on water quality.

In addition, the Water Board will consider the discharger's demonstration of compliance with water quality objectives, in accordance with the SIP. This demonstration shall address the following issues:

(a) A demonstration that the proposed effluent limitation will result in compliance with water quality objectives, including the narrative chronic toxicity objective, in the receiving water. Water quality objectives used in this demonstration are to be based on ambient salinity and hardness (for fresh waters) at the time of sampling. In addition, demonstration of compliance is to be based on the averaging period associated with each objective. Compliance with both acute and chronic chemical-specific water quality objectives shall be demonstrated. If freshwater objectives apply in the receiving waters (i.e., salinity is less than 5 parts per thousand), compliance with saltwater objectives shall also be demonstrated at the

nearest point in the receiving waters where salinity reaches 5 parts per thousand. Such a demonstration shall be based on ambient monitoring at a frequency equal to that typically required for effluent monitoring for a period of time defined in the study plan;

(b) An evaluation of worst-case conditions (in terms of tidal cycle, currents, or instream flows, as appropriate) through monitoring and/or modeling to demonstrate that water quality objectives will continue to be met, taking into account the averaging period associated with each objective; and

(c) An evaluation of the effects of mass loading resulting from allowing higher concentrations of pollutants in the discharge, in particular, the potential for accumulation of pollutants in aquatic life or sediments to levels that would impair aquatic life or threaten human health. This evaluation may include sampling of sediment and biota in the vicinity of the discharge to determine the accumulation of pollutants resulting from the current levels of discharge.

A study plan for conducting this work must be submitted to the Water Board for approval by the Executive Officer. Results of the study or studies addressing these three points shall be submitted to the Water Board. Effluent limitations based on either concentration or mass loading shall be developed for consideration by the Water Board based on study results and any other available information. The goal in setting effluent limitations shall be to ensure that water quality objectives are met in the receiving water and that mass loadings are limited to a level that provides protection of beneficial uses. In no case shall effluent limitations impair the basis upon which exception to the prohibition against discharge to shallow water was granted. Continued ambient monitoring shall also be required to ensure that water quality objectives are met.

4.6.2 FRESH WATER VS. MARINE WATER

Due to the unique estuarine environment that exists in the region, the salinity characteristics (i.e., freshwater vs. marine water) of the receiving water shall be considered in establishing water quality objectives. Freshwater effluent limitations shall apply to discharges to waters both outside the zone of tidal influence and with salinities equal to or less than 1 part per thousand at least 95 percent of the time in a normal water year. Marine effluent limitations shall apply to discharges to waters with salinities equal to or greater than 10 parts per thousand at least 95 percent of the time, except for discharges to the Pacific Ocean, which are covered by the California Ocean Plan. For discharges to waters with salinities in between these two categories, defined as estuarine, effluent limitations shall be the lower of the marine or freshwater effluent limitation, based on ambient hardness, for each substance. The use of alternative marine or freshwater criteria may be approved if scientifically defensible information and data demonstrate that on a site-specific basis the biology of the water body is dominated by freshwater aquatic life; or conversely, the biology of the water body is dominated by marine aquatic life.

4.6.3 BACKGROUND CONCENTRATIONS

When dilution credit is granted, the background concentration of the substance is taken into account in calculating effluent limitations so that the dilution provided by mixing with receiving waters is not overestimated. Ambient background concentration means the concentration of a substance, in the vicinity of a discharge, which is not influenced by the discharge. For the San

Francisco Estuary, it is difficult to identify a location that is not influenced by a discharge. Furthermore, background concentrations should vary within the Estuary due to changing geochemistry of the waters as they travel downstream. However, in order to simplify the calculation of effluent limitations, it is desirable to use one background concentration throughout the region.

The determination of ambient background concentration, for purposes of establishing NPDES effluent limitations for toxic pollutants, will be done in accordance with the provisions of the SIP, and amendments thereto.

4.7 IMPLEMENTATION OF EFFLUENT LIMITATIONS

In incorporating and implementing effluent limitations in NPDES permits, the following general guidance shall apply:

4.7.1. PERFORMANCE-BASED LIMITS

Where water quality objectives in the receiving water are being met, and an existing effluent limitation for a substance in a discharge is significantly lower than appropriate water quality-based limits, performance-based effluent limitations for that substance may be specified or the effluent limit revised. Any changes are subject to compliance with the state Antidegradation Policy. The performance-based effluent limitation may be either concentration- or mass-based, as appropriate.

4.7.2 SITE-SPECIFIC OBJECTIVE INCORPORATION

Once the Water Board has adopted a site-specific objective for any substance, effluent limitations shall be calculated from that objective in accordance with the methods described above.

4.7.3 AVERAGING PERIODS

For some substances there may be more than one effluent limitation with different averaging periods (e.g., daily average and 30-day average). In both cases, the effluent limitations shall apply to the mean concentration of all samples analyzed during the averaging period. If only one sample is taken during the averaging period, the effluent limitation applies to the concentration of that sample.

4.7.4 METHOD DETECTION LIMITS, PRACTICAL QUANTITATION LEVELS (PQL), AND LIMITS OF QUANTIFICATION (LOQ)

Method Detection Limits are defined in Title 40, Code of Federal Regulations, Part 136, Appendix B (revised June 30, 1986).

Practical Quantitation Level is the lowest concentration of a substance within plus or minus 20 percent of the true concentration by 75 percent of the analytical laboratories testing in a performance evaluation study. If performance data are not available, the PQL is the MDL x 5 for carcinogens and the MDL x 10 for noncarcinogens.

Limits of Quantification are ten standard deviations greater than the average measured blank values used in developing the MDL.

These terms and concepts are useful when pollutant concentrations in waters are relatively low. However, these will be taken into account in determining compliance with, rather than in the calculation of, effluent limitations.

4.7.5 SELECTION OF PARAMETERS

Effluent limits are not necessary for substances that do not pose any risk to beneficial uses or are shown not to be present in discharge. However, a discharger must demonstrate to the satisfaction of the Water Board that particular substances do not cause, or have the reasonable potential to cause or contribute to an excursion above numerical and narrative objectives. Dischargers must also demonstrate that pollutants of concern are (a) not in the waste stream, and (b) no change has occurred that may cause release of pollutants. This certification shall be supported, at a minimum, by monitoring results for such pollutants and process and treatment descriptions that demonstrate these substances are not expected to be present in the waste stream. At a minimum, this monitoring and certification is required prior to issuance and reissuance of WDRs.

The Water Board may choose to not require periodic monitoring and certification for pollutants in low volume discharges determined to have no significant adverse impact on water quality.

4.7.6 COMPLIANCE SCHEDULES

As new objectives or standards are adopted, permits will be revised accordingly. Revised permits will distinguish between effluent limitations that are met by current performance, and effluent limitations not currently attained. Immediate compliance will be required for effluent limitations that are met by current performance.

The Water Board may consider dischargers' proposals for longer compliance schedules for newly adopted objectives or standards as NPDES permit conditions for particular substances, where revised effluent limitations are not currently being met and where justified. The primary goal in setting compliance schedules is to promote the completion of source control and waste minimization measures, including water reclamation.

Justification for compliance schedules will include, at a minimum, all of the following:

(a) Submission of results of a diligent effort to quantify pollutant levels in the discharge and the sources of the pollutant in the waste stream;

(b) Documentation of source control efforts currently underway or completed, including compliance with the Pollution Prevention program described in the Basin Plan;

(c) A proposed schedule for additional source control measures or waste treatment; and

(d) A demonstration that the proposed schedule is as short as possible.

Implementation of source control measures to reduce pollutant loadings to the maximum extent practicable shall be completed as soon as possible, but in no event later than four years after new objectives or standards take effect. Implementation of any additional measures that may be required to comply with effluent limitations shall be completed as soon as possible, but in no event later than ten years after new objectives or standards take effect. The issuance of the permit containing a compliance schedule should not result in a violation of any applicable requirement of the federal Clean Water Act or the California Water Code, including any applicable Clean Water Act statutory deadlines.

4.8 STORMWATER DISCHARGES

As discussed in a later section titled "Urban Runoff Management," the Water Board has initiated a program that regulates certain municipal, industrial, and construction stormwater discharges through NPDES permits. Since both the sources of pollutants in stormwater discharges and the points of discharge are diffuse, and the methods of reducing pollutants in stormwater discharges are in the development stage, water quality-based numerical effluent limitations are not feasible at this time. Instead, stormwater permits will include requirements to prevent or reduce discharges of pollutants that cause or contribute to violations of water quality objectives. Compliance with these requirements is expected to be achieved through implementation of control measures or best management practices identified in dischargers' stormwater management plans or stormwater pollution prevention plans. Instead, stormwater permits will include requirements to prevent or reduce discharges of pollutants that cause or contribute to violations of water quality objectives for receiving waters. Compliance with these requirements is expected to be achieved through implementation of control measures or best management practices identified in dischargers' stormwater management plans or stormwater pollution prevention plans.

The Water Board is taking a phased approach towards attainment of water quality objectives in waters that receive stormwater discharges from urban areas and certain industrial and construction activities. The Water Board will first require entities subject to NPDES permits for stormwater discharges to complete implementation of technically and economically feasible control measures to reduce pollutants in stormwater to the maximum extent practicable. For industrial facilities, such control measures include those representing the best available technology that is economically achievable.

NPDES permits for stormwater discharges will require completion of technically and economically feasible control measures as soon as possible. Specific schedules for implementing control measures may, at the discretion of the Water Board, be included in permits (to the extent that such schedules are authorized by state or federal laws) either by reference to a stormwater management plan or by permit conditions. In no event will these schedules extend beyond the term of the permit.

If this first phase does not result in attainment of water quality objectives, the Water Board will consider permit conditions which may require implementation of additional control measures. In such circumstances, the Water Board may consider dischargers' proposed schedules for identification and implementation of additional control measures designed to attain water

quality objectives. Such schedules shall be as short as practicable and will only be considered for inclusion in permits when a discharger has demonstrated the following:

(a) A diligent effort to quantify pollutant levels and the sources of the pollutant in stormwater discharges; and

(b) Documentation of completion of implementation of all technically and economically reasonable control measures.

4.9 WET WEATHER OVERFLOWS

During periods of heavy rainfall, large pulses of water enter sewerage systems. When these pulses exceed the collection, treatment, or disposal capacity of a sewerage system, overflows occur. This is especially problematic for sewer systems that combine both sanitary sewage and stormwater (Combined Sewer Systems or CSS), such as the City and County of San Francisco's system (discussed under the municipal discharger section). All other municipalities in the region operate two distinct sewer systems. Wet weather is also problematic for separate systems because more water infiltrates the pipes leading to treatment plants. This problem is commonly referred to as inflow/infiltration (I/I). In either case, pulses of water during wet weather may cause untreated or partially treated wastewater to be discharged directly to surface water bodies.

Wet weather overflows of wastewater affect three types of beneficial uses: water contact recreation, non-contact water recreation, and shellfish harvesting. The water quality characteristics that can adversely affect these beneficial uses are pathogens, oxygen-demanding pollutants, suspended and settleable solids, nutrients, toxics, and floatable matter.

4.9.1 FEDERAL COMBINED SEWER OVERFLOW CONTROL POLICY

On April 11, 1994, the U.S. EPA adopted the Combined Sewer Overflow (CSO) Control Policy (50FR 18688). This policy establishes a consistent national approach for controlling discharges from CSOs to the nation’s water. Using the NPDES permit program, the policy initiates a two-phased process with higher priority given to more environmentally sensitive areas. During the first phase, the permittee is required to implement the following 9 Minimum Controls. These constitute the technology-based requirements of the Clean Water Act as applied to combined sewer facilities (best conventional treatment (BCT) and best available treatment (BAT)). These minimum controls can reduce CSOs and their effects on receiving water quality:

(1) Conduct proper operation and regular maintenance programs for the CSS and the CSO outfalls;

(2) Maximize use of the collection system for storage;

(3) Review and modify pretreatment programs to ensure that CSO impacts are minimized;

(4) Maximize flow to the POTW for treatment;

(5) Prohibit CSOs during dry weather;

(6) Control solids and floatable materials in CSOs;

(7) Develop and implement pollution prevention programs that focus on contaminant reduction activities;

(8) Notify the public; and

(9) Monitor to effectively characterize CSO impacts and the efficacy of CSO controls.

Compliance with the minimum controls shall be as soon as practicable, but no later than January 1, 1997. The permittee is also required to initiate development of a long-term control plan to select CSO controls, based on consideration of the permittee's financial capability.

The second phase of the process involves implementation of the long-term control plan developed in the first phase. Such implementation must provide for the attainment of water quality objectives and may result in additional site-specific technology-based controls, as well as water quality-based performance standards that are established based on best professional judgement. While numeric water quality-based effluent limits are not readily established due to unpredictability of a storm event and the general lack of data, the CSO Control Policy requires immediate compliance with water quality standards expressed in the form of a narrative limitation.

The Water Board intends to implement the federal CSO Control Policy for the combined sewer overflows from the City and County of San Francisco. The City and County of San Francisco has substantially completed implementation of the long-term CSO control plan (and is thereby exempted requirements to prepare a long-term control plan).

Additionally, the following is the Water Board's recommended approach to control the seasonal degradation of water quality that results from all wet weather overflows of wastewater, including POTWs with either combined and separate sewer systems, and industrial wastewater facilities. The overflow from San Francisco's combined sewer system is addressed by the CSO Control Policy described above.

4.9.2 CONCEPTUAL APPROACH

The recommended approach to controlling wet weather overflows of wastewater that contains particular characteristics of concern to beneficial uses is a combination of designated alternative levels of maintenance (i.e., combination of treatment levels and beneficial use protection categories) and guidance for the design of overflow discharge structures. The Water Board is not endorsing any specific control measures, but is presenting a conceptual framework that allows for the evaluation of costs and benefits. This framework can be used as guidance in adopting specific control measures. As with all of its programs, the Water Board will implement this conceptual approach consistent with the national goal of "...water quality which provides for the protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water."

Maintenance and associated treatment and overflow requirements are detailed in Table 4-8. The following requirements should be met for all overflows:

(a) Outfalls achieve an initial dilution of 10:1;

(b) Overflows receive treatment to remove large visible floatable material and to protect the outfall system; and

(c) Overflow locations be removed from dead-end sloughs and channels, and from close proximity to beaches and marinas.

Exceptions to (a) and (c) will be considered where an inordinate burden would be placed on the discharger relative to beneficial uses protected, and when an equivalent level of environmental protection can be achieved by alternative means, such as an alternative discharge site, a higher level of treatment, and/or improved treatment reliability.

The conceptual approach described above will be used by the Water Board in evaluating wet weather discharge conditions where polluted stormwater or process wastewater bypasses any treatment unit or units that are used in the normal treatment of the waste stream. Evaluation of such discharges must include identification of:

- Actual capacities of the collection system, each treatment unit, and the disposal system;
- Flow return period probabilities for the specific facility location;
- Cost of providing complete storage or treatment capacity and disposal capacity for flow return periods of 1, 5, and 20 years;
- Quality of the polluted stormwater and process wastewater for flow return periods of 1, 5, and 20, years; and
- Beneficial uses that may be affected by such discharges.

4.9.3 SURFACE IMPOUNDMENT OVERFLOW PROTECTION

In providing protection of waste management units against wet weather overflows, Chapter 15 requires that surface impoundments must have sufficient freeboard to accommodate seasonal precipitation and precipitation conditions specified for each class of waste management unit. Those specified precipitation conditions are probable maximum precipitation for Class I units; and the 1000-year, 24-hour precipitation for Class II units.

To guarantee the protection of water quality, the Water Board will interpret seasonal precipitation to be the 100-year return period wet season for Class I units and the 10-year return period wet season for Class II units. The sources to be used for determining the applicable precipitation for a given return period and location are California Department of Water Resources Bulletin No. 195 (or any update by the Department), local water agency publications, or other sources approved by the Executive Officer.

4.10 DISCHARGE OF TREATED GROUNDWATER

Cleanup of groundwater pollution sites often includes groundwater extraction, and thus creates the need for proper disposal of treated groundwater. The majority of the groundwater pollution cases in the Region involve surface spills, pipeline breaks, or leakages from tanks, vaults, sumps, surface impoundments, or landfills. Toxic pollutants commonly found in groundwater range from solvents (including volatile organic compounds [VOCs] and semi-volatile organic compounds [SVOCs]), petroleum hydrocarbons, heavy metals, or a combination of these pollutants. In many cases, the treated groundwater is discharged to surface waters via storm drains. These direct discharges would normally require an exception to the prohibitions against discharge into shallow or non-tidal waters.

To address this issue, the Water Board adopted Resolution No. 88-160 (see Chapter 5 Plans and Policies). The Resolution urges dischargers of groundwater extracted from cleanup projects to recycle (reclaim) their effluent. When recycling is not technically and/or economically feasible, discharges must be piped to a publicly-owned treament works (POTW). Furthermore, as required in State Water Board Resolution 89-21 (see Chapter 5 Plans and Policies), the Water Board recognizes the resource value of the extracted and treated groundwater and urges its utilization for the highest beneficial use for which applicable water quality standards can be achieved.

The Water Board will consider granting an exception to the discharge prohibitions only if (a) it has been demonstrated that neither recycling nor discharge to a POTW is technically or economically feasible, and (b) beneficial uses of the receiving water are not adversely affected. Such an exception is based on the Water Board's recognition that discharges allowed under the exception are an integral part of a program to cleanup polluted groundwater and thereby produce an environmental benefit.

Dischargers shall demonstrate that their groundwater extraction and treatment systems and associated operation, maintenance, and monitoring plans constitute acceptable programs for minimizing the discharge of toxic substances and for complying with effluent limitations deemed necessary for protection of the beneficial uses of receiving waters.

Applications for National Pollutant Discharge Elimination System (NPDES) permits to discharge treated groundwater directly to surface waters will be evaluated on a case-by-case basis. In some cases, the applicant may qualify for the requirements of a general NPDES permit for discharge of treated groundwater. The Water Board has adopted general NPDES permits for the following two types of groundwater cleanup projects:

(a) Groundwater polluted by fuel leaks and other related wastes at service stations and similar sites (NPDES General Waste Discharge Requirements for Discharge or Reuse of Extracted and Treated Groundwater Resulting from the Cleanup of Groundwater Polluted by Fuel Leaks and Other Related Wastes at Service Stations and Similar Sites, NPDES No. CAG912002); and

(b) Groundwater polluted by VOCs (NPDES General Waste Discharge Requirements for Discharge and Reuse of Extracted and Treated Groundwater Resulting from the Cleanup of Groundwater Polluted by Volatile Organic Compounds, NPDES No. CAG912003).

These general permits are intended to streamline a common regulatory process and are not available for groundwater discharges with constituents other than fuels and VOCs. The Water Board may renew, revise, or rescind the permits if deemed appropriate. The general permits specify effulent limitations for discharges to surface water bodies, establish self-monitoring requirements, and identify trigger levels for non-routine constituents that are used to determine if additional effluent sampling and treatability studies are needed. Updates to these two general permits are considered every five years.

4.11 MUNICIPAL FACILITIES (POTWs)

Table 4-9 is a list of municipal wastewater treatment facilities (excluding wet weather facilities) within the Region that discharge directly into surface waters. Figure 4-1 shows where these facilities are located in the region. Under normal operational conditions, these POTWs provide a minimum of secondary treatment. In addition, with more than thirty percent of the total flow receives advanced treatment.

Brief discussions of the issues specific to the City and County of San Francisco, South Bay dischargers, the Fairfield-Suisun Sewer District, the Livermore-Amador Valley, and the East Bay Municipal Utilities District are presented below.

4.11.1 CITY AND COUNTY OF SAN FRANCISCO

The City and County of San Francisco collects the wastewater in a combined sewer system. That is, the domestic sewage, industrial wastewater, and stormwater runoff are all collected in the same pipes (combined sewer). Such system is subject to overloading during severe storms. Most other communities in California have a separated sewer system: one set of pipes for domestic sewage and industrial wastes and another set for stormwater.

San Francisco is near completion of the primary components of its wastewater facilities master plan. This construction program began in 1974 with the publication of the Master Plan Environmental Impact Statement and Report. The integrated wastewater control system established by the master plan has been designed to provide control and treatment for both dry weather sewage and wet weather storm flows. All dry weather flows currently receive secondary level treatment. At program completion in 1996, all wet weather flows including stormwater runoff will be captured and will receive a specified level of treatment depending on the size of the storm. Pollutant removal from stormwater will be approximately 60 percent system-wide (measured as reduction in total suspended solids).

San Francisco is one of the first municipalities in the nation to complete a comprehensive control program for a combined sewer system. The expenditures for completing the wastewater master plan is about $1.45 billion.

The Southeast Water Pollution Control Plant is a major component of San Francisco's wastewater treatment system. The plant provides secondary level treatment for all dry weather domestic and industrial wastewater from the Bayside drainage area in San Francisco (approximately 75 percent of the total citywide flow). The Oceanside plant provides similar treatment on the Westside. The storage/transports around the periphery of the city store combined sewage for treatment after the storms subside. Additionally, northeast zone storm flows receive treatment at the Northpoint wet weather treatment plant.

4.11.2 SOUTH BAY MUNICIPAL DISCHARGERS (SAN JOSE/SANTA CLARA, PALO ALTO, AND SUNNYVALE)

The South Bay municipal dischargers consist of three sewage treatment facilities: the San Jose/Santa Clara Water Pollution Control Plant (WPCP), the Palo Alto Regional Water Quality Control Plant, and the Sunnyvale WPCP. These three plants serve all of the urban communities of Santa Clara County located in the Region. The South Bay municipal dischargers, as shown in Figure 4-1, presently discharge effluent receiving tertiary treatment (secondary plus nitrification, filtration, and disinfection) to shallow sloughs contiguous with the Bay, south of the Dumbarton Bridge.

The existing discharge locations for the Lower South SF Bay municipal wastewater dischargers are contrary to Basin Plan policy concerning discharge prohibitions (listed in Table 4-1). Exceptions to the first three of these prohibitions are discussed in Section 4.2 Discharge Prohibitions Applicable Throughout the Region.

State Water Board Order WQ 90-5 (1990) found that a net environmental benefit exception to these prohibitions could not be made for the three South Bay municipal discharges. However, the Order found that a finding of equivalent protection can be made if water quality based concentration limits for metals and revised mass loading limits for metals are placed in the dischargers' NPDES permits, if Sunnyvale and San Jose/Santa Clara continue avian botulism control programs, and if San Jose/Santa Clara implements mitigation for loss and degradation of endangered species habitat. Order WQ 90-5 also included provisions that would prevent increases in flows that would adversely impact endangered species habitats. In subsequent NPDES permit reissuances and Water Board resolutions from 1993 through 2003, the South Bay municipal dischargers met the three conditions required to support a finding of equivalent protection. The three conditions for granting the discharge prohibition must be confirmed at each NPDES permit reissuance.

4.11.3 FAIRFIELD-SUISUN SEWER DISTRICT (FSSD)

The FSSD's tertiary wastewater treatment plant has a dry weather treatment capacity of 17.5 million gallons per day (mgd), a wet weather capacity of 40 mgd, and 45 million gallons of off-line storage capacity. The District is currently treating 13 mgd (1993 dry weather data) from a service population of about 111,000. In order to comply with the Water Board's prohibition against dry weather discharges to the Suisun Marsh, FSSD operates a reclamation project in cooperation with the Solano Irrigation District. However, due to various contractual, legal and economic constraints, only about 40 percent of the treatment plant's annual effluent flow is reclaimed for agricultural irrigation. The remainder is discharged to Boynton Slough in Suisun Marsh.

The Water Board required FSSD to conduct an investigation to evaluate the discharge's impact on water quality conditions and beneficial uses of the receiving waters. This investigation was completed in 1987 and found that the discharge has some measurable local effects on water quality in Boynton Slough, but that beneficial uses are not impaired by the discharge. The study concluded that, overall and on a year-round basis, the discharge affords a net environmental benefit to Boynton Slough and the Suisun Marsh.

Given the findings of this study, the plant's high degree of operational redundancy and emergency storage capacity, and continued efforts by FSSD to maximize the use of reclaimed water, the Water Board has granted FSSD an exception to the Basin Plan prohibition. The Water Board allows, through the NPDES permit issued to FSSD, that portion of FSSD's tertiary effluent which cannot be reclaimed to be discharged to Boynton Slough on a year-round basis.

4.11.4 LIVERMORE-AMADOR VALLEY

The primary Water Board concern in the Livermore-Amador Valley (Valley) is the increase in salt loading that has occurred in the Valley's main groundwater basin. It is projected that with natural saline sources and and historical basin management practices, and with minimal water recycling, there will be a net salt loading increase from an average of 4,000 tons per year to 6,000 tons per year, resulting in a 10 milligram per liter (mg/L) per year increase in total dissolved solids (TDS) in groundwater. As a result, it has become increasingly important to develop and implement an integrated water/wastewater resource operational plan to protect the water quality and beneficial uses of the groundwater basin.

To achieve this goal, the Water Board supports local water management efforts to concurrently improve the salt balance in the main basin, to increase the local water supply, and to reduce the need for wastewater export through recycled water irrigation and groundwater recharge and other basin management practices.

4.11.4.1 SALT MANAGEMENT IN THE LIVERMORE-AMADOR VALLEY

The Livermore-Amador Valley groundwater basin is located in the middle of the Livermore-Amador Valley in eastern Alameda County and is primarily a closed groundwater basin within the Alameda Creek Watershed with multiple groundwater sub-basins of variable water quality. The Main Basin (that portion underlying the Cities of Livermore and Pleasanton) has the highest water quality, supplies most of the municipal wells in the area, and is used to store and distribute high quality imported water.

Alameda Creek and its tributaries recharge the Valley's groundwater basin and serve as channels to convey water released from the South Bay Aqueduct (SBA) to the main basin and the Niles Cone groundwater basin for artificial recharge. During dry weather, creek flow consists primarily of SBA release water.

The Alameda County Flood Control and Water Conservation District, locally known as the Zone 7 Water Agency (Zone 7), is the potable water wholesaler for most of the Valley and operates facilities to import and treat surface water from the State Water Project, groundwater wells, and distribution pipelines. Zone 7 serves as the overall water quality management planning agency

for the Livermore-Amador watershed and is responsible for managing the Valley's surface water and groundwater resources for the Valley's drinking water supply.

Dublin-San Ramon Services District (DSRSD) distributes potable water and treats wastewater in the western portion of the Valley, including parts of Contra Costa County. The City of Livermore distributes potable water to about one-fourth of Livermore and treats wastewater from the city and the adjacent national laboratories, Lawrence Livermore and Sandia National Laboratories.

The City of Livermore and DSRSD are member agencies of the Livermore-Amador Valley Water Management Agency (LAVWMA). Since 1980, wastewater has been exported from the Valley via LAVWMA-operated facilities that connect to the East Bay Dischargers Authority's (EBDA) interceptor in San Leandro. These waters are ultimately discharged through the EBDA outfall into south San Francisco Bay west of the Oakland Airport.

The current surface water quality objectives for the Alameda Creek Watershed above Niles (Table 3-7) were adopted in 1975. They were based on historic SBA water quality primarily to prevent degradation by wastewater discharges of imported SBA water being conveyed and used for groundwater recharge during dry weather periods. Wastewater discharges were terminated in 1980.

4.11.4.2 WATER RECYCLING AND VALLEY WATER - WASTEWATER MANAGEMENT

The water and wastewater agencies of the Valley have studied water recycling as an alternative to import of new water supplies and export of wastewater since the early 1970 (see Section 4.16 Water Recycling).

Zone 7, DSRSD and the City of Livermore's interests in water recycling have increased over the years due to droughts, continuing scarcity of new water supplies, institutional barriers to increasing wastewater export capacity from the Valley, and increasing public acceptance of water recycling throughout California. Technological advances and reduced costs of demineralization also now make groundwater recharge with demineralized recycled water a technically viable tool to help manage salt concentrations in the Valley.

Valley-wide water recycling is consistent with the Water Board's policy on recycled water, which states in part that disposal of wastewater to inland, estuarine, or coastal waters is not considered a permanent wastewater disposal solution where the potential exists for conservation and water recycling (see Section 4.16 Water Recycling). As directed by California Water Code (Water Code) Sections 13511 and 13512, the Water Board strongly supports the use of recycled water to supplement existing surface water and groundwater supplies and will work with agencies to facilitate development of water recycling facilities.

The Valley water and wastewater agencies jointly sponsored the "Livermore-Amador Valley Water Recycling Study" (May 1992) that includes a comprehensive investigation of water recycling options. The study documented the Valley's hydrogeology. It also identified and analyzed potential projects throughout the Valley, including irrigation with non-demineralized effluent, groundwater recharge with demineralized effluent, and export of brine. The report

included a discussion of how water recycling could be implemented in conformance with Water Board requirements and Zone 7 policies and still manage salt loading on a Valley-wide scale.

The report also detailed a strategy for developing a water recycling program incrementally, beginning with small demonstration projects to gain experience and public acceptance and building up to large-scale projects that could contribute substantially to water supply and wastewater disposal needs in future years.

The 1992 study documented that between 19,000 and 38,000 acre-feet per year of recycled water could be beneficially reused within the Valley via irrigation and groundwater recharge. Well-established technologies and procedures exist for accomplishing such uses and could be in full compliance with Water Board requirements and the Department of Health Services's (DHS) Title 22 CCR requirements. The long-operating Orange County Water District Water Factory 21 project has served as a model for many recycled water groundwater recharge facilities.

4.11.4.3 VALLEY-WIDE SALT MANAGEMENT PLAN

As recommended in the 1992 study, the agencies jointly applied for a Master Water Reuse Permit (Master Permit) to cover proposed water recycling activities throughout the Valley. The Water Board issued the Master Permit in 1993 (Order No. 93-159). The permit specifies the various technical reports that were required to be submitted for review and approval by the Executive Officer before projects could commence operation. In this manner, the Master Permit fully addresses the regulatory requirements that projects must comply with, while facilitating the approval process.

The permit allows small-scale irrigation projects to be developed by the cooperating agencies. Before large-scale recycling projects could be approved, a long-range Valley-wide Salt Management Plan (SMP) was required to be developed and implemented. The Master Permit required further characterization of basin hydrogeology, refinement of salt balance calculations, selection of TDS policy targets and examination of alternative ways to offset natural and recycled sources of salt loadings. The SMP would need to address the water quality objectives for the Alameda Creek Watershed, which state that wastewater disposal/reuse projects be part of an "overall water-wastewater resource operational program developed by the agencies affected and approved by the Water Board."

Zone 7, in partnership with a technical advisory group composed of local water retailers and a Zone 7 citizens committee, prepared the SMP as required by the Master Permit. The development of the SMP occurred through a lengthy public process (1994 to 1999) and resulted in Water Board approval in 2004. Over the years, the scope of the SMP broadened beyond that outlined in the Master Permit to one more resembling a comprehensive watershed and water resources management plan.

The purpose of the SMP is to identify and document the long-term strategy for managing salt and mineral water quality in the Valley's groundwater basin. The primary strategy is to increase conjunctive use combined with groundwater demineralization in the western portion of the service area to fully offset current and future sources of salt loading to the Valley's Main Basin. This strategy was designed to also maintain and improve delivered water quality and to facilitate

increased use of recycled water using Zone 7 facilities to offset the associated increase in salt loading. Other strategies were identified and may be implemented through Zone 7's monthly Water Operations Plans using an adaptive management process.

4.11.4.4 GENERAL WATER REUSE PERMIT

The City of Livermore and DSRSD were approved for the General Water Reuse Requirements for Municipal Wastewater and Water Agencies, (General Water Reuse Permit, see Section 4.16 Water Recycling), to administer their current and future recycled water projects involving landscape and/or agricultural irrigation recycling water projects. The General Water Reuse Permit, which delegates the administration of domestic wastewater reuse to water recycling agencies and water agencies, replaces the Master Permit for surface irrigation projects. The General Water Reuse Permit issued to the City of Livermore and DSRSD incorporates the requirements of the approved SMP. The Master Permit will remain on record, and, if needed, will be revised to address any future groundwater recharge projects that may be planned by the two agencies.

Groundwater recharge or conveyance via ephemeral streams is an essential component of the proposed Valley-wide, year-round water recycling and groundwater quality management program. However, projects subject to NPDES requirements are not authorized under the Master Permit. The Master Permit identifies the technical reports necessary to support a future NPDES permit application. The Water Board will consider issuing a separate NPDES permit to the permittees following receipt of a complete NPDES application.

4.11.4.5 WATER BOARD SUPPORT FOR WATER QUALITY MANAGEMENT STRATEGIES PROTECTING THE LIVERMORE-AMADOR VALLEY GROUNDWATER BASINS

The Water Board supports the concept that water recycling is an essential component for planning the Valley's future water supply. Water recycling is particularly important in areas like this, that are dependent on imported water.

As demonstrated by its 2004 approval, the Water Board supports the Salt Management Plan developed by the cooperating agencies in the Valley to facilitate increased use of recycled water to offset salt loading.

The Water Board supports the export of concentrate from the demineralization of groundwater via the LAVWMA and EBDA pipelines when implemented as part of the Salt Management Plan and is protective of beneficial uses of the San Francisco Bay.

The Water Board supports the concept of transport and groundwater recharge through the Valley's ephemeral streams. Recharge of the groundwater basin may be accomplished with imported water, as is done now, or combined with high-quality recycled water under a future groundwater-recharge NPDES permit or WDRs. The year-round, dependable recycled water resource may also be appropriate for streamflow augmentation to enhance beneficial uses of the Valley's ephemeral streams.

4.11.5 EAST BAY MUNICIPAL UTILITY DISTRICT (EBMUD) AND LOCAL AGENCIES

The sewer systems of the seven local agencies in the East Bay communities (Alameda, Albany, Berkeley, Emeryville, Oakland, Piedmont, and Stege Sanitary District) have had a serious problem with infiltration/inflow (I/I) during the wet weather season. During major storms, the community's sewers receive up to 20 times more flow than in dry weather. As a result, the communities' sewers overflowed to streets, local watercourses, and the Bay, creating a risk to public health and impairing water. The seven local agencies discharging sanitary sewage deliver sewage to EBMUD's facilities, and thus, EBMUD's interceptors and treatment facilities also subject to overflows during storm events.

The Water Board approved a regional approach -- a combination of community collection system improvements and EBMUD capacity improvements - for correcting wet weather overflows. Following the Basin Plan, EBMUD and the agencies established the following priorities to correct this problem:

- Substantially reduce or eliminate community sewer overflows with high public health risks;
- Substantially reduce or eliminate other community sewer overflows; and
- Eliminate or mitigate interceptor overflows.

In 1985, the East Bay communities completed a multi-year infiltration/inflow (I/I) study, which proposed a $300 million (1985 dollars) comprehensive sewer rehabilitation and relief line program known as the East Bay Infiltration/Inflow Correction Program (ICP), it required 20 years to implement. In a 1986 enforcement order, the Water Board accepted the proposed approach and directed the ICP Program to focus on high public health problems.

In 1986, all agencies submitted Compliance Plans in response to the cease-and-desist orders issued by the Water Board. These plans set forth the design and implementation requirements of each agency's I/I Correction Program.

EBMUD's and the collection system agencies' programs are designed to handle wastewater and I/I flows for up to a 5-year wet weather event. For rainfall events that have a return frequency greater than 5 years, overflows from the sanitary collection and treatment systems may occur. This approach is consistent with the Basin Plan wet weather overflow requirements (Maintenance Level C) adopted for the I/I Correction and the Wet Weather Facilities Program.

The communities have made good progress implementing their ICP eliminating about 60 percent of the high public public health risk overflows. They have also gained a better understanding of how to implement their ICP. This experience has revealed that some of the original planning assumptions underestimated sewer rehabilitation and replacement costs. As a result, the communities revised their programs and the Cities of Alameda, Albany, Berkeley, Oakland, and Piedmont requested extensions to their compliance schedules by 5 to 10 years. In 1993, the Water Board amended its enforcement order giving extensions to some communities' compliance schedules. The amended enforcement order also contains revised compliance reporting requirements.

As part of the regional approach, EBMUD's contribution is a $145 million (1985 dollars) Wet Weather Program, designed to increase treatment capacity to match the communities' flows. The Wet Weather Program includes an expansion of the main wastewater treatment plant, new storage basins, four new remote wet weather treatment plants, new and ungraded pumping stations, and 7.5 miles of new interceptors. This program will increase EBMUD's peak transport and treatment capacity, without which community sewers would continue to overflow. It will also provide treatment for wet weather discharges and meet or exceed Basin Plan requirements.

As of 1995, EBMUD has completed the expansion of the main wastewater treatment plant, all interceptor improvements, construction of the main plant storage basin, and construction of the two principal wet weather treatment facilities (Oakport and Point Isabel). The work remaining includes two pump station improvements, a storage basin, and two wet weather treatment plants. The Wet Weather Program is scheduled for completion in 1998.

4.12 INDUSTRIAL FACILITIES

This section discusses industrial waste discharges to surface waters under the NPDES program. Other industrial waste disposal practices are discussed in a later section entitled "Hazardous and Nonhazardous Waste Disposal" under Groundwater Protection and Management.

The Water Board has permitted over 320 industrial discharges in the region. They can be separated into two general types: process-related wastewaters and groundwater from cleanup activities. There are about 50 discharges of process wastewater; of these, 15 are classified as major discharges and the rest are mostly small discharges of non-contact cooling water and/or runoff. About 270 of the 320 discharges consist solely of treated groundwater from remediation activities at solvent and/or fuel contamination sites. These are minor in flow relative to the major discharges, and are discussed in more detail in an earlier section entitled "Discharge of Treated Groundwater." Additionally, there are over 1,500 industrial facilities discharging only stormwater runoff. The regulation of these discharges is discussed in a later section entitled: "Urban Runoff Management."

The 15 major discharges are the most significant individual sources of pollutant loadings from industrial discharges. They are identified and described in Table 4-11, and their locations are shown in Figure 4-2. These industries have all installed treatment facilities that can be considered to provide "best available treatment economically achievable" (BAT), and are in compliance with available BAT standards promulgated by the U.S. EPA for each industrial classification.

The Water Board's goal for regulation of industrial discharges is to continue to move beyond treatment technology-based standards to water quality-based standards. With this shift, the industries are challenged to improve existing or develop new treatment and control technologies to achieve higher levels of protection of receiving waters' beneficial uses.

The effect of the Water Board's regulation has been to drastically reduce the pollutant loadings from industrial sources. But with the focus shifting to water quality-based standards, concerns still do exist in certain areas. For example, a major concern is discharge of selenium from oil refineries. Water quality data from the Regional Monitoring Program and other studies will be necessary to identify areas of most concern and help target future pollutant reduction efforts.

4.13 PRETREATMENT AND POLLUTION PREVENTION

The Waste Discharge Permitting Program described in Section 4.12 Industrial Facilities focuses on limiting pollutant discharge to the Bay from industrial and municipal treatment systems. In most situations, however, the overall effectiveness of treatment depends on the type and amount of pollutants that enter these POTWs or industrial treatment system. Some pollutants may cause upset to or interference with the operation of the treatment plant, sludge contamination, or harm to treatment plant workers and the public if discharged into sewer systems. In general, it is often more economical to reduce overall pollutant loading into treatment systems than to install complex and expensive technology at the plant. Both pretreatment and pollution prevention programs are key components of pollutant source control.

The goal of the pretreatment program is to protect treatment plants, worker health and safety, and the environment from the impact of discharges of certain toxic wastes (e.g., explosive and corrosive materials) into collection systems.

The pollution prevention program expands beyond the pretreatment program to include industrial, commercial, and residential sources. The goals of pollution prevention are to:

1. Reduce or eliminate the discharge of all pollutants that have been found to impact or threaten beneficial uses;

2. Focus on pollutant source reduction "upstream" of treatment plants, with an emphasis on material recycling, efficient use of chemicals, waste reduction, material and/or product substitution, and process modification; and

3. Support reduction of pollutant discharges into collection systems through water conservation, recycling, and reuse.

The combined efforts of the pretreatment and pollution prevention programs have influenced thousands of facilities in the Region to significantly reduce the amount of pollutants discharged to the Bay. Between 1986 and 1999, the loading of heavy metals discharged from 27 POTWs with pretreatment programs, were reduced by 59 percent, even though the total volume discharged from these 27 POTWs increased slightly over this period.

4.13.1 CALIFORNIA'S PRETREATMENT PROGRAM

Each POTW regulates the types of waste discharged into collection systems leading to its treatment plant. The U.S. EPA, for certain types of waste and industrial categories, sets general standards for discharge to POTWs. Each POTW receiving a large amount of industrial waste and/or with a design flow greater than 5 million gallons per day (MGD) is required to develop and implement a pretreatment program, including enforce its own local discharge limits. The goal is to both protect treatment plants and ensure that the POTW is in compliance with its own discharge permit.

The Water Board oversees the implementation of the California pretreatment program under the California Water Code and federal Clean Water Act, although U.S. EPA retains its oversight role

and is still actively involved in inspections and enforcement activities. POTW pretreatment programs must include components as specified in federal regulations and program descriptions incorporated into the NPDES permit for each POTW.

Specific monitoring and reporting requirements for the 27 POTWs in the Region with approved pretreatment programs are contained in the NPDES Permits for the POTWs. Major budgeted program tasks for the Water Board's oversight activities include pretreatment compliance inspections and audits; annual and semiannual report reviews; program modifications, particularly local limits revisions; and enforcement activities.

4.13.2 POLLUTION PREVENTION

The Water Board supports reducing toxic discharges through pollution prevention and expansion of the pretreatment program. This general approach to minimizing waste discharge is a necessary element in the implementation of the State Water Board's Mass Emission Strategy and will become increasingly important as alternative uses of wastewater are developed.

The Water Board's pollution prevention program is a two-tiered program that consists of a general and a targeted program. The first tier is a general program, requiring dischargers to focus on long-term pollution prevention and overall reduction of toxics entering collection systems. The general program is structured to allow dischargers to develop and direct pollution prevention efforts in its own service area. It also allows dischargers to reduce toxic pollutant loading to their plants and remain in compliance with their discharge permit.

The second tier is a targeted program aimed to ameliorate existing water quality problems. The goal of targeted programs is to reduce the total amount of a specific pollutant (or pollutants) discharged to specific water bodies. Targeted programs are required when numeric or narrative water quality objectives are exceeded and beneficial uses are impaired or threatened.

Both the general and targeted pollution prevention programs will take multimedia concerns into account by coordinating with other relevant regulatory programs related to air and land disposal (e.g., sludge or biosolids).

All POTWs with an approved pretreatment program and all major industrial dischargers are required to develop and implement a general pollution prevention program within their jurisdiction. Dischargers are required to develop and implement a targeted program under the circumstances described in Section 4.13.2.4 Targeted Pollution Prevention for POTWs.

Presently, dischargers with required pollution prevention programs submit mid-year progress reports and/or a comprehensive annual report, which discusses progress and accomplishments along with program changes, and future program goals, developments and effectiveness measures. With forthcoming data needs for watershed permits, reporting formats will be standardized to improve comparability between programs.

4.13.2.1 GENERAL POLLUTION PREVENTION PRIORITIES

The following are the Water Board's priorities for the pollution prevention program in the coming years:

Encourage continued region-wide leadership across all pollution prevention programs through cross-program and cross media coordination, watershed based problem solving, and adaptability to new concerns through collaboration and partnerships.
Develop strategies to measure effectiveness of pollution prevention efforts over the long and short term.
Recognize and promote excellence through pollution prevention awards to programs that demonstrate resourcefulness, effectiveness, innovation, wide outreach (business, residential, and educational), and that take action to promote region-wide solutions.

4.13.2.2 POLLUTION PREVENTION PROGRAM HISTORY

In 1988, the Water Board began requiring "source control" programs from the three South Bay POTWs. In 1992, the Water Board required the remaining POTWs with pretreatment programs to develop and implement Waste Minimization Programs. Specifically, this included targeted programs for POTWs to reduce pollutants that exceeded water quality criteria, general programs for the remaining POTWs, and waste minimization audits for select industrial facilities discharging directly to surface waters. In 1993, the "Waste Minimization Program" was changed to "Pollution Prevention Program."

The Water Board formed the Bay Area Pollution Prevention Group (BAPPG) in 1990 and continues to support its significant successes in reducing pollution through product and chemical bans, targeted initiatives to reduce heavy metals, and regional technology transfer, outreach, and resource sharing.

In 2000, the state legislature enacted Water Code Section 13263.3 on pollution prevention programs. Also in 2000, the Policy for Implementation of Toxic Standards from Inland Surface Waters, Enclosed Bays and Estuaries of California (State Implementation Plan, or SIP) became effective, which addresses pollutant minimization programs.

In 2003, the Water Board adopted Resolution No. R2-2003-0096 promoting collaboration between the Bay Area Clean Water Agencies (BACWA) and the Water Board. It established 11 guiding principles for developing tools and guidance for POTW pollution prevention programs to balance program flexibility and program effectiveness. The products developed from this effort include a guidance document for pollution prevention program managers seeking to improve outreach and effectiveness of their programs, "Pollution Prevention Guidance and Tools for POTWs" (April 2005).

4.13.2.3 GENERAL POLLUTION PREVENTION PROGRAMS FOR POTWs

The general program is designed to allow individual POTWs to develop and direct long-term pollution prevention efforts according to local needs and is more flexible than targeted programs. General programs should contain the following elements:

Pretreatment program review and enhancement should include a general review of opportunities for incorporating waste reduction goals into inspections, enforcement, and permitting (such as increased inspection, improved process flow measurements, etc.) In addition, previously unregulated types of industrial and commercial facilities that discharge pollutants of concern to the POTW should be identified. Each general program should include provisions for two additional categories of discharge that are not covered under the federal regulations (such as waste oil disposal, household products, car and truck washing operations, medical and dental facilities, etc.).

Prioritize the need for and conduct audits of industrial users. The criteria for prioritization should include discharge of pollutants of concern, volume of flow, industrial user compliance, and opportunities for waste reduction.

Periodic analysis of the waste discharge to determine which pollutants are currently problems and/or which pollutants may pose problems in the future.

Identify sources of all pollutants of concern.

Identify and implement tasks to reduce the sources of pollutants of concern.

Design and conduct public education programs aimed at changing public behavior through educating the public about a pollutant, its sources, its impact to beneficial uses, how it is released into the environment, and where appropriate, options for safer product use, substitution, and product disposal (e.g., household hazardous waste management). Such efforts include advertising outreach and household hazardous waste programs. Current regional successes include product bans and advertising campaigns in English, Spanish, and Chinese. Successful outreach results in changing behaviors that lead to changes in purchasing behavior, or the way a toxic product is used, recycled, or disposed.

Coordination with other programs involving recycling, reuse, and source reduction of toxic chemicals. This includes programs involving other media, such as air, hazardous waste, and land disposal. This might include developing programs for joint inspections and sharing in enforcement activities.

An effectiveness monitoring program specifically designed to measure the success or effectiveness of specific pollution prevention activities, as well as overall successes achieved in reducing toxic loads to the receiving watershed where possible, as well as to air, or land via sludge disposal. Such evaluations of program effectiveness are conducted on a regular basis.

4.13.2.4 TARGETED POLLUTION PREVENTION PROGRAMS FOR POTWs

The purpose of targeted pollution prevention programs is to reduce the total amount of specific toxic pollutants being discharged to POTWs. Targeted programs are more intensive versions of the general programs and are focused only on one or a select number of pollutants.

Specifically, targeted programs are required for POTWs when any of the following conditions exist:

a. When numeric or narrative water quality objectives are exceeded and beneficial uses are impaired or threatened;
b. Are required as part of a TMDL or site specific objective (SSO) implementation plan;
c. Are required under the SIP when there are effluent limit compliance problems; or
d. As authorized under the Water Code Section 13263.3.

The Water Board may, at its discretion, require dischargers to implement pollution prevention plans consistent with Water Code Section 13263.3 and the SIP.

In those areas of a watershed or the Estuary identified as exceding water quality objectives or having impaired beneficial uses, dischargers that are significant contributors to the water quality problem will be identified and will be required to participate in a targeted waste minimization (pollution prevention) program. In addition to general program elements, a targeted pollution prevention program involves quantifying the sources to the POTW of the targeted pollutants in question. It may also be necessary to conduct further monitoring of the targeted pollutants in the receiving water, sediment, and biota by identified dischargers to POTW systems and/or POTWs at and near their discharge locations in order to more precisely determine associated effects.

A targeted program must also initiate reductions in pollutant loading through a control strategy designed to achieve the goal of maintaining concentrations of reportable priority pollutants in the effluent at or below the effluent limit, focusing on the most effective and economic control measures first. These reductions may be achievable through focused public outreach, implementation of Best Management Practices (BMPs), technical information transfer regarding effective management techniques, or installation of appropriate technologies.

The targeted program shall include all elements of the general program, expanding where appropriate to maximize the reduction of the targeted pollutants.

Targeted programs may also require other options such as performance-based effluent concentration limits and mass limitations for the pollutants of concern, in order to attain water quality objectives in the receiving water body.

4.13.2.5 DIRECT INDUSTRIAL DISCHARGER POLLUTION PREVENTION PROGRAM

Industrial entities discharging directly to receiving waters instead of public sewer systems are also subject to similar pollution prevention requirements. Overall source reduction and recycling of hazardous wastes, including audits, planning, and reporting to the Department of Toxic Substance Control (DTSC) is required under the Hazardous Waste Source Reduction and Management Review Act of 1989 (Title 23, CCR, Ch 31). Rather than require separate pollution prevention programs, major dischargers were asked to submit copies of the required pollution prevention reports (those sections specifically addressing liquid waste and reduction of pollutants discharged to water) to the Water Board. These dischargers submitted initial plans for pollution prevention, including detailed descriptions of tasks and schedules, in 1992.

In the event that existing pollution prevention reports do not adequately address reduction of toxic pollutants in effluent, the Water Board will require additional information.

In cases where water quality problems exist or where beneficial uses are impaired or threatened by direct industrial dischargers, focused pollution prevention programs similar to POTW targeted programs will also be required. In cases where Water Board staff determines that independent audits, as opposed to audits conducted by the involved companies, the issue will be brought before the Water Board. The effort should result in the reduction or elimination of specific pollutants of concern.

4.14 URBAN RUNOFF MANAGEMENT

During periods of rain, water flushes sediment and pollutants from urbanized parts of the Estuary (Figure 4-3) into storm drain systems. These drains discharge directly to surface waters within the region, except in San Francisco where stormwater is mixed with sewage and directed to the treatment plant.

Urban runoff contributes significant quantities of total suspended solids, heavy metals, petroleum hydrocarbons, and other pollutants to the waters of the region. The impacts of pollutants in urban runoff on aquatic systems are many and varied. For example, small soil particles washed into streams can smother spawning grounds and marsh habitat. Lead and petroleum hydrocarbons washed off from roadways and parking lots may cause toxic responses in aquatic life and exemplify another kind of threat. The US EPA found levels of cadmium, copper, lead, and zinc in urban runoff exceeded freshwater acute aquatic life criteria in 9 to 50 percent of samples taken across the country. The chronic criteria for these metals, beryllium, cyanide, mercury, and silver were exceeded in at least 10 percent of the samples. In the San Francisco Bay Region, the Association of Bay Area Governments (ABAG) has found consistently high levels of hydrocarbons in urban runoff.

The Water Board's urban runoff management program focuses on reducing pollutant transport through stormwater drain systems into surface waters. In general, measures that will effectively limit storm drain pollutant discharge will also limit direct runoff of pollutants into creeks, streams, and lakes.

The program is structured around the municipalities and local agencies responsible for maintaining storm drain systems, and three classes of activities that are responsible for significant amounts of pollutant influx to those public storm drain systems: highways under the jurisdiction of the California Department of Transportation (Caltrans), industrial activities, and construction on areas larger than 5 acres.

Within each of these program areas, the Water Board's urban runoff management approach emphasizes general, long-term planning to avoid any increases in pollutant loading, and more structured, intensive approaches when existing water quality problems require immediate action.

A large part of the Water Board's work in managing urban runoff involves supporting local planning and investigation. The program includes:

- Organizing local ad hoc task forces within each hydrologic sub-region (see maps in Chapter 2) to facilitate investigations and design of appropriate control strategies. These task forces include representatives from local government, point source dischargers, local industries, the Water Board, and U.S. EPA.
- Developing cooperative investigation and control strategies utilizing the expertise and resources of point source dischargers in each of the receiving water segments.
- Supporting research by the San Francisco Estuary Institute, ABAG, U.S. EPA, and others entities to better define the impacts of urban runoff discharges.

- Participating on the State Water Board Stormwater Quality Task Force and the development and implementation of a statewide urban stormwater best management practices manual.
- Working with other agencies such as the Bay Area Air Quality Management District and the Metropolitan Transportation Commission to ensure that transportation related strategies and plans will reduce the impact on receiving waters from transportation system runoff discharges.

4.14.1 MANAGEMENT OF POLLUTANT DISCHARGE FROM STORM DRAINS

The Water Board's strategy for managing pollutants and sediment in urban runoff entering and being discharged public storm drain systems is two-tiered. All cities and counties are encouraged to develop and implement voluntary programs aimed at pollution prevention throughout the region (Baseline Control Program). Selected cites and counties, by virtue of the amount of pollutants being discharged from their storm drain system, impact of those discharges on receiving waters, or population, are required to develop pollution prevention programs and take steps to reduce runoff into drain systems (Comprehensive Control Program).

The first major step in addressing pollutant loading to public storm drains was to compile basic information on existing systems. A Board survey of local agencies owning or responsible for storm drain systems and flood control agencies had limited and often dated information on the storm drain systems that they own or manage. In addition, flow and water quality data for storm drain system discharge were virtually nonexistent. The survey also found that current management of storm drain systems is primarily focused on flood control, with storm drainage inlets, lines, and catch basins scheduled for cleaning annually or on an as-needed basis for flood prevention purposes.

4.14.1.1 BASELINE CONTROL PROGRAM

All local agencies, including special districts, in the cities and counties in the region (see Table 4-11) that own or have maintenance responsibility for storm drain systems should develop and implement a baseline control program.

The goal of the baseline control programs is to prevent any increase in pollutants entering these systems. To a large extent, this goal can be achieved by including consideration of pollutant runoff into storm drain systems in the course of local planning efforts and encouraging "good practice" techniques.

Components of baseline control programs should include: review and update of operation and maintenance programs for storm drain systems; development and adoption of ordinances or other planning procedures (such as CEQA review) to avoid and control pollutant and sediment loading to runoff as part of the normal design and construction of new and significant redevelopment (both during construction and after construction is completed); and education measures to inform the public, commercial entities, and industries on the proper use and disposal of materials and waste and correct practices of urban runoff control. Baseline control programs should also include surveillance, monitoring, and enforcement activities to ensure and document implementation.

Similarly, flood control agencies should consider the impact of their projects on receiving waters. Flood management projects, facilities, or operations should be designed, operated, and maintained to reduce the amount of pollutants in stormwater discharges as well as achieving flood control objectives.

The Water Board will support and encourage the development and implementation of baseline control programs in cooperation with cities and counties. Board staff may provide technical guidance and support, facilitate ad-hoc working groups including people with expertise and experience in POTW pollution prevention programs and local hazardous waste management, and participate in development of model ordinances.

The programs should be coordinated with POTW and industrial pollution prevention programs and local hazardous materials management programs.

In addition, the Water Board will focus its surveillance, monitoring, and enforcement activities on and review Environmental Impact Reports on new development and significant redevelopment and focus its surveillance, monitoring, and enforcement activities to support implementation of effective baseline control programs. The effectiveness of a municipality's baseline control program will also be considered when issuing NPDES permits for construction activities pursuant to the Water Board's Construction Activity Control Program.

The Water Board requires the local agencies, special districts, and municipalities listed in Table 4-11 to submit annual reports (pursuant to Section 13225(c) of the California Water Code) describing their baseline control programs. These reports are due on September 1 of each year and should describe:

- Operation and maintenance activities associated with the storm drain system;
- Master planning procedures and documentation of activities associated with control;
- A list of all new development and significant redevelopment projects with documentation that urban runoff control measures have been required and are being implemented;
- Documentation of educational measures;
- Documentation of surveillance, monitoring, and enforcement activities; and
- A qualitative evaluation of program effectiveness, including, but not limited to, program accomplishments, funds expended, staff hours utilized, an overall evaluation, and plans for the upcoming year.

To the extent that voluntary implementation of baseline control programs is not realized, the Water Board will act, where necessary, to require individual local agencies to investigate specific runoff discharges, quantify pollutant loads, and identify and implement control strategies for pollutant runoff into storm drains. Where necessary, require individual local agencies to file a Report of Waste Discharge or NPDES permit application for the implementation of baseline control programs.

Cities and counties should review and revise their planning procedures and develop or revise comprehensive master plans to assure that increases in pollutant loading associated with newly developed and significantly redeveloped areas are, to the maximum extent practicable, limited.

Areas that are in the process of development, or redevelopment offer the greatest potential for utilizing the full range of structural and non-structural control measures to limit increases in pollutant loads. Comprehensive planning must be used to incorporate these measures in the process of developing. Cities and counties should fully utilize their authority under CEQA to assure implementation of control measures at all proposed development and significant redevelopment projects.

4.14.1.2 COMPREHENSIVE CONTROL PROGRAM

The goal of the Water Board's comprehensive control program is to remediate existing water quality problems and prevent new problems associated with urban runoff. To achieve this, the program focuses on reducing current levels of pollutant loading to storm drains to the maximum extent practicable. The Water Board's comprehensive program is designed to be consistent with federal regulations (40 CFR 122-124) and is implemented by issuing NPDES permits to owners and operators of large storm drain systems and systems discharging significant amounts of pollutants. The conditions of each NPDES stormwater permit require that entities responsible for the systems develop and implement comprehensive control programs.

The regulations authorize the issuance of system-wide or jurisdiction-wide permits and they effectively prohibit non-stormwater discharges to storm drains. They also require listed municipalities to implement control measures to reduce pollutants in urban stormwater runoff discharges to the maximum extent practicable. The Water Board will, where necessary, require stormwater discharge permits for discharges not cited in the regulations which are a significant contributor of pollutants to waters of the region.

The comprehensive urban runoff control program includes all elements of the baseline control program designed to prevent increases in pollutant loading. To reduce current pollutant loading to the maximum extent practicable, the program also includes:

- Characterization of urban runoff discharges to the extent necessary to support program development;
- Elimination of illicit connections and illegal dumping into storm drains;
- Development and implementation of measures to reduce pollutant runoff associated with the application of pesticides, herbicides, and fertilizer;
- Development and implementation of measures to operate and maintain public highways in a manner that reduces pollutants in runoff; and
- Effective pollution reduction measures may include educational activities such as painting signs on storm drain inlets and regulation of activities such as application of pesticides in public right-of-ways.

Each NPDES stormwater permit issued by the Water Board will require an annual report evaluating the effectiveness of its comprehensive urban runoff control program. At a minimum, quantitative monitoring, a detailed accounting of program accomplishments (including funds expended and staff hours utilized), an overall evaluation of the program, and plans and schedules for the upcoming year shall be used to assess effectiveness.

The Water Board's urban runoff control program is still relatively new. Table 4-11 lists the entities in each area that have implemented comprehensive control programs. In addition, there is a need to develop and implement similar programs in the urban and rapidly developing areas of Solano County and the cities of San Rafael, Novato, Petaluma, Napa, and Benicia, and the Ports of Oakland, Richmond, and San Francisco. Urban runoff discharges from these areas are considered significant sources of pollutants to waters of the region and may be causing or threatening to cause violation of water quality objectives. The Water Board intends to consider similar action for these at a later time. The City and County of San Francisco is not permitted under the storm water program because it has a combined (sanitary and storm) sewer system operating in accordance with existing NPDES permits.

The Water Board will conduct surveillance activities and provide overall direction to verify and oversee implementation of urban runoff control programs. Technical guidance for prevention activities, the identification, assignment, and implementation of control measures, and monitoring will be developed.

4.14.2 HIGHWAY RUNOFF CONTROL PROGRAM

An essential component of reducing pollutant loading to storm drain systems involves managing runoff from public roads. While many roads fall under the jurisdiction of entities responsible for storm drain systems, public highways are controlled by the California Department of Transportation (Caltrans). In order to ensure that all public highways are maintained to reduce pollutant runoff, the Water Board issued a stormwater NPDES permit to Caltrans in August, 1994. The permit requires implementation of a highway Stormwater Management Plan which addresses the design, construction, and maintenance of highway facilities relative to reducing pollutant runoff discharges to the maximum extent practicable.

The highway runoff management plan shall include litter control, management of pesticide/herbicide use, reducing direct discharges, reducing runoff velocity, grassed channels, curb elimination, catch basin maintenance, appropriate street cleaning, establishing and maintaining vegetation, infiltration practices, and detention/retention practices. In addition, the plan must include monitoring the effectiveness of control measures, runoff water quality, and pollutant loads. When possible, Caltrans is expected to coordinate with existing agencies and programs related to the reduction of pollutants in highway runoff.

4.14.3 INDUSTRIAL ACTIVITY CONTROL PROGRAM

Industrial stormwater sources are subject to best available technology (BAT) economically-based standards. Federal regulations require stormwater permits for any site where industrial activity takes place (or has in the past), and materials are exposed to stormwater. The definitions of industrial activities subject to these permits (provisions of Title 40 Code of Federal Regulation, Part 122.26, revised December 18, 1992) are incorporated by reference into this plan. This incorporation by reference is prospective including future changes as they take effect. The Water Board will require an NPDES permit for the discharge of stormwater from all industrial facilities where such activities occur. These permits apply to the discharge from any system used to collect and convey stormwater at industrial sites. These sites include, but are not limited to, industrial plant yards, access roads and rail lines, material and refuse handling areas, storage areas (including tank farms) and areas where significant amounts of materials remain from past

activity. Permits are issued both to privately and publicly (federal, state, and municipal) owned facilities.

The Water Board's permitting strategy for industrial facilities is based on a four-tier set of priorities for issuing permits. At a minimum, all permits will require compliance with all local agency requirements. General permits for industrial facilities will not be less stringent than individual permits.

4.14.3.1 TIER I: GENERAL PERMITTING

The majority of stormwater discharges associated with industrial activity in the region will be covered under a general permit issued by the State Water Board in November, 1991.

4.14.3.2 TIER II: SPECIFIC WATERSHED PERMITTING

In some watersheds, water quality has been impacted by stormwater discharges from facilities associated with industrial activity. Facilities within these watersheds will be targeted for individual stormwater permits or regulation under watershed-specific general permits. The Water Board issued a general permit for industrial activity in the portion of Santa Clara County that drains to South San Francisco Bay to support the county's comprehensive control program and will consider a similar general permit for Alameda County at a later time.

4.14.3.3 TIER III: INDUSTRY-SPECIFIC PERMITTING

Specific industrial categories will be targeted for individual or industry-specific general permits. For example, the Water Board issued a general permit for storm water discharges from boatyards in August 1992. The use of general permits is intended to alleviate the administrative burden of issuing storm water permit for individual industrial facilities. In some cases, such as large U.S. Department of Defense facilities, individual sites or classes of sites may be significant sources of pollutants, and individual permit(s) specific to these classes of sites are warranted.

The Water Board considers stormwater discharges from automotive operations, including gas stations, auto repair shops, auto body shops, dealerships, and mobile fleet-washing businesses to be significant sources of pollutants to waters in the region. Local agencies implementing comprehensive control programs are addressing these discharges through ordinances as part of their comprehensive control programs. The effectiveness of local measures will be assessed before the Water Board considers permitting these under a separate industrial permit.

4.14.3.4 TIER IV: FACILITY-SPECIFIC PERMITTING

A variety of factors will be used to target specific facilities for individual permits, such as amount and characteristics of runoff, size of facility, and contribution to existing water quality problems. Permitted individual facilities will be required to identify "hot areas" where runoff may contact pollutants; activities that may release pollutants to runoff; segregate stormwater discharges from the "hot areas;" and identify and implement control measures for "hot areas." In addition, permittees will be required to eliminate all non-stormwater discharges to storm drain systems unless authorized by an NPDES permit or determined not to be a source of pollutants requiring an NPDES permit.

4.14.4 CONSTRUCTION ACTIVITY CONTROL PROGRAM

The Water Board will require an NPDES permit for the discharge of stormwater from construction activities involving disturbance of five acres or greater total land area or are part of a larger common plan of development that disturbs greater than five acres of total land area. The majority of construction activity discharges in the region will be permitted under a general permit issued by the State Water Board in 1992. Permit conditions address pollutant and waste discharges occurring during construction activities and the discharge of pollutants in runoff after construction is completed. Permit conditions are consistent with the Water Board's erosion and sediment control policy (Resolution No. 80-5) and consistent with local agency ordinance and regulatory programs. The intent of the permit is not to supersede local programs, but rather to complement local requirements. This will require local agencies to effectively address construction activities through their early planning, CEQA processes, and implementation of development control measures as part of their baseline or comprehensive control programs.

4.15 AGRICULTURAL WASTEWATER MANAGEMENT

Agricultural wastewaters and the effect of agricultural operations must be considered in terms of land use practices and controls developed in the agricultural element of land use plans. The activities of primary importance to water quality in this basin are animal confinement and irrigation practices. Agricultural pesticide use and limits on fertilizer application are not specifically considered because of the limited applicability in this region.

4.15.1 ANIMAL CONFINEMENT OPERATIONS

Animal confinement operations such as kennels, horse stables, poultry ranches, and dairies, raise or shelter animals in high densities. Wastes from such facilities can contain significant amounts of pathogens, oxygen-depleting organic matter, nitrogen compounds, and other suspended and dissolved solids. In addition, erosion is also a common problem associated with these facilities. Runoff of storm or wash water can carry waste and sediment and degrade receiving surface waters. Groundwaters can also be degraded when water containing these wastes percolates into aquifers. The risk of water quality degradation increases during the rainy season when animal waste containment and treatment ponds are often overloaded.

Minimum design and management standards for the protection of water quality from confined animal operations are promulgated in Title 23, California Code of Regulations, Chapter 15, Article 6. These regulations prohibit the discharge of facility wash water, animal wastes, and stormwater runoff from animal confinement areas into waters of the state. They also specify minimum design and waste management standards including:

- Collection of all wastewaters;
- Retention of water within manured areas during a 25-year, 24 hour storm;
- Use of paving or impermeable soils in manure storage areas; and
- Application of manures and wastewaters on land at reasonable rates.

The Water Board has the authority to enforce these regulations through Waste Discharge Requirements.

Facilities such as the dairies located in Marin and Sonoma counties and horse boarding stables are typical of animal confinement operations within the region.

4.15.1.1 DAIRY WASTE MANAGEMENT

Much of the land within the Tomales Bay, Petaluma River, Napa, and Sonoma Valley watersheds is used for agricultural purposes. Within these watersheds, a significant number of livestock are housed and grazed.

Animal waste can cause water quality problems through runoff into surface and groundwaters of the state. Stockpiled manure, washwater, and stormwater runoff from corrals, pens, and other animal confinement areas are potential sources of water pollution due to their high bacteria levels (the coliform group used as indicators), ammonia, nitrate and suspended solids. Detergents, disinfectants, and other biocides commonly used may also contribute to the toxicity of animal wastes. These constituents can be extremely deleterious to fish and other forms of aquatic life. High bacterial levels have had an adverse impact on shellfish resources in the region (i.e., commercial shellfish harvesting in Tomales Bay).

Problems facing the dairy industry include manure containment during the rainy season, appropriate manure dispersal on pasture land, and implementation of range management practices aimed at water quality protection. The availability of ample farm and pastureland is therefore extremely important in managing animal waste.

Since the 1970s, the cooperative relationship between the Water Board and the dairy industry has been an important aspect of dairy waste control. That relationship has been instrumental in the construction of dairy waste handling, treatment, and disposal facilities in the late 1970s. However, proper waste control management is just as important as the physical facility. Management techniques include routing wash water and drainage to impervious holding and storage areas, constructing manure storage areas controlling both subsurface infiltration and runoff, stormwater overflow protection for retention basins, and applying manures and wastewater on land at reasonable rates for maximum plant uptake of nitrogen.

Poor practices that have led to water quality problems in the past include: inadequate maintenance and operation of facilities; overloading treatment and storage facilities; increase of herd size without commensurate additions to waste handling facilities; poor range management practices; and simple neglect of seasonal waste management responsibilities.

4.15.1.2 DAIRY WASTE REGULATION

Both the regulation and the support services for the dairy industry involve several federal, state, and local agencies. Each has its particular role and mission, but all share the goal of protecting the beneficial uses of state waters while assisting dairies in complying with regulations while conducting their day-to-day business. The following agencies play a direct role in dairy waste management and regulation:

REGULATORY

- California Regional Water Quality Control Board
- California Department of Fish and Game

SUPPORT SERVICES

- Agricultural Stabilization and Conservation Services
- U.S. Department of Agriculture — Soil Conservation Service
- University of California Cooperative Extension Farm Advisor
- County Farm Bureaus
- Resource Conservation Districts

To address dairy waste management concerns, dairy operators in Marin and Sonoma Counties have formed a Dairy Waste Committee. The Dairy Waste Committee supports dairy operators in their efforts to solve waste control problems and locate technical and financial assistance. The Committee serves as a vehicle through which the Water Boards and California Department of Fish and Game can disseminate information on water quality regulations and requirements. This committee does and will continue to play an important role in any successful waste control program.

Additionally, the Southern Sonoma and Marin County Resource Conservation Districts (RCDs) have a cooperative, voluntary program in which a farmer agrees to use the land within its capabilities, develop a conservation plan, and apply conservation practices to meet objectives and technical standards of the RCDs. In turn, the RCD agrees to furnish the farmer with information and technical assistance in order to carry out the conservation plan.

WATER BOARD PROGRAM

PERMITTING/WAIVER OF PERMITS

Generally, discharges are subject to Waste Discharge Requirements (WDRs) issued by the Water Board. However, the Water Board may waive WDRs where such a waiver is not against the public interest and still assures the protection of beneficial uses of state waters. For the present, the Water Board has been waiving WDRs for dairies where proper waste control facilities are in place and management practices are in conformance with the California Code of Regulations - Title 23, Article 3, Chapter 15 (Discharge of Waste to Land).

CONTINUING WASTE CONTROL PLANNING

In 1990, the State Water Board established a Dairy Waste Task Force to look at the dairy industry statewide and develop standards for dairy regulation. The main emphasis has been on developing better communication and guidance materials for the industry; developing a dairy survey form to help the Water Boards determine if a dairy qualifies for a waiver from WDRs; determining the number and location of dairies; develop more uniform WDRs; and preparing an outreach program aimed at the dairy industry, local government, and the public.

The Water Board directs the Executive Officer to continue the following staff activities:

- Work with the dairy industry through the local dairy waste committees, County Farm Bureaus, RCDs, and other local/state agencies in obtaining cooperative correction of dairy waste problems.
- Recommend adoption of WDRs in those cases where water quality objectives for waters within an agricultural watershed are consistently exceeded, or where corrective action is unsuccessful in eliminating either the short- or long-term water quality problems or threats. The Water Board may choose to take enforcement action through the issuance of a Clean-up and Abatement Order or assess monetary penalties in those cases where dairy practices have resulted in or threaten to cause a condition of pollution or nuisance in surface waters through the issuance of Administrative Civil Liability or referral to the California Attorney General's Office.
- Monitor the compliance of dairy waste management programs with regional goals and implement the recommendations of the State Dairy Waste Task Force.

4.15.2 IRRIGATION OPERATIONS

An increase in the concentration of soluble salts contained in percolating irrigation water is an unavoidable result of consumptive use of water. Salt management within soils and groundwater is considered separate from water management, but is closely related to drainage control and wastewater operations. For irrigated agriculture to continue in the future, acceptable levels of salts in soils and groundwaters must be controlled.

Maintenance of a favorable salt balance, that being a reasonable balance between the import and export of salts from individual basins, must be considered to control increases in mineral content. This is especially applicable for the Livermore and Santa Clara Valley groundwater basins.

The ultimate consequences of regulatory action for irrigation operations must be carefully assessed. The "no-degradation" concept in connection with salt levels is not appropriate in all circumstances.

A concept of minimal degradation might be considered in some areas. It would need to be coupled with management of the surface and underground water supplies in order to assure acceptable degradation effects. If minimal degradation is considered, it can be offset by either recharge and replenishment of groundwater basins with higher quality water that will furnish dilution to the added salts, or by drainage of degraded waters at a sufficient rate to maintain low salts and salts leaving the basin. To aid recharge and dilution operations, additional winter runoff can be stored in surface reservoirs for subsequent use with either surface stream or groundwater basin quantity/quality management.

4.16 WATER RECYCLING

Per Water Code Section 13050, recycled water means water which, as a result of treatment of waste, is suitable for a direct beneficial use or a controlled use that would not otherwise occur and is therefore considered a valuable resource. To date in this Region, disposal of most municipal and industrial wastewater has primarily involved discharges into the Region's watersheds and the Estuary. With growing awareness of the impacts of toxic discharges, drought, future urbanization, and growth on the local aquatic habitat, there is an increasing need to look

for other sources of water. Increasingly, conservation and water recycling (formerly referred to as reclamation) will be needed to deal with these long-term water issues. The Water Board recognizes that people of the Region are interested in developing the capacity to conserve and recycle water to supplement existing water supplies, meet future water requirements, and restore the Region's watersheds and Estuary. Disposal of wastewater to inland, estuarine or coastal waters is not considered a permanent solution where the potential exists for conservation, water recycling, and reuse.

The Constitution of California, Article X, declares that, "...because of the conditions prevailing in the state, the general welfare requires that the water resources of the state be put to beneficial use to the fullest extent to which they are capable, and that the waste or unreasonable use or unreasonable method of use of water be prevented, and that the conservation of such waters is to be exercised with a view to the reasonable and beneficial use thereof in the interest of the people and for the public welfare." In other words, when suitable recycled water is available, it should be used to supplement existing water supplies used for agricultural, industrial, municipal, and environmental purposes.

The Water Board also recognizes and supports the concept that water reuse is an essential component for planning future water supply, especially in areas dependent on imported water. This includes projects that use recycled water to increase the local water supply, to improve the salt balance in the groundwater basin, or to reduce the need for wastewater export through recycled water irrigation and groundwater recharge with imported water or with high-quality recycled water. The year-round, dependable recycled water resource may also be appropriate for stream flow augmentation to enhance beneficial uses of streams.

State Water Board Resolution 77-1, adopted in 1977, requires the State and Regional Water Boards to encourage water recycling projects for beneficial use using wastewaters that would otherwise be discharged to marine or brackish receiving waters or evaporation ponds. The resolution also specifies using recycled water to replace or supplement the use of fresh water or better quality water, and to preserve, restore, or enhance in-stream beneficial uses, including fish, wildlife, recreation and aesthetics associated with any surface water or wetlands.

4.16.1 WATER RECYCLING AND REUSE PROGRAM

Before a wastewater producer can obtain an increase in connections and discharge flows under the Water Board's NPDES program, it must demonstrate that a maximum effort has been made to develop and implement a credible and effective water recycling program. This program must be integrated with a source control program (Pretreatment and Pollution Prevention Program (Section 4.13 Pretreatment and Pollution Prevention)) and a water conservation program.

All water recycling projects involve three components: 1) treatment of wastewater to produce water of quality suitable for the intended reuse; 2) distribution, which may also include storage, to convey the treated water to the place(s) of use; and 3) the end use, reuse. The most common types of reuse involve discharges to land for irrigation of landscape plants or crops, but reuse may also include non-discharge uses such as for cooling water or toilet flushing. Each of these components is subject to various design and operational requirements specified in the Water

Recycling Criteria (WRC) codified at Title 22, CCR, Division 4, Chapter 3, which were extensively revised and updated by Department of Health Services (DHS) from 1993 to 2001.

The Water Board in conjunction with DHS implements the WRC. DHS and the State Water Board have entered into a Memorandum of Agreement (MOA) on Use of Reclaimed Water. The intent of the MOA is to insure that there is coordination among DHS, the State Water Board and the Regional Water Boards to implement the recycled water program.

The Water Board is the permitting agency for water recycling projects through issuance of water recycling requirements, also called Water Reuse Requirements (WRRs). The WRRs require a discharger proposing a new water-recycling project to prepare an engineering report describing the project, for review and approval by DHS. The Water Board may then prescribe WRRs for the project based on recommendations from DHS. WRRs include relevant specifications from the WRC and other applicable requirements based on Water Board plans and policies, such as effluent limits and operation, and monitoring and reporting requirements. WRRs may be issued for discrete single-facility reuse projects or for large-scale projects such as municipality-based reuse programs involving multiple types and places of reuse.

In 1996, in order to facilitate water recycling and reuse in the Region, the Water Board adopted the General Water Reuse Requirements for Municipal Wastewater and Water Agencies, Water Board Order No. 96-011 (General Water Reuse Permit). This permit is applicable to producers, distributors, and users of non-potable recycled municipal wastewater throughout the Region. The intent of the General Water Reuse Permit is to streamline the permitting process and delegate, to the fullest extent possible, the responsibility of administrating water reuse programs to local agencies. Regulation under the General Water Reuse Permit requires submittal of a Notice of Intent (NOI) to the Water Board and written authorization from the Water Board's Executive Officer.

Under the General Water Reuse Permit, water recycling and reuse have expanded rapidly throughout the Region. It is estimated that twenty wastewater or water distribution agencies in the Region will be operating under the General Water Reuse Permit by 2007.

In 2001, the State Legislature established the California Recycled Water Task Force (Task Force). The mission of the Task Force was to evaluate the current framework of state and local rules, regulations, ordinances, and permits to identify opportunities for and obstacles to the safe use of recycled water in California. The Task Force consisted of representatives from federal, state, and local agencies, private entities, environmental organizations, universities, and public-interest groups. The Task Force identified and adopted recommendations to address obstacles, impediments, and opportunities for California to increase its recycled water usage as described in the report "Water Recycling 2030, Recommendations of California's Recycled Water Task Force."

4.16.2 INTERAGENCY WATER RECYCLING PROGRAM AND COORDINATION

Implementation of water recycling projects requires the involvement, approval, and support of a number of agencies, including state and local health departments, the Water Board, local POTWs and water districts, and land use planning agencies. Interagency coordination must be a priority of all parties involved in water recycling. Failure to coordinate activities can result in the inability

to carry out water recycling projects in a timely, consistent, and cost-effective manner. The Water Board seeks cooperation and participation of professionals from the water recycling industry and the water, health, and regulatory agencies to assure the development of criteria that are both attainable and appropriate. To facilitate inter-/intra-regional recycling projects, interagency coordination is necessary when the wastewater agency produces recycled water outside of an interested water purveyor's service area. Effective communication and cooperation between agencies regarding distribution and service is vital and should begin early in the planning process. This will assure the water purveyor that there will be no duplication of service, enable interagency agreement on project development and implementation, and help avoid any unnecessary delays that could jeopardize a project.

Several regional water-recycling programs have been initiated in the Region to facilitate water reuse in contiguous areas. This has heralded a new way to implement water-recycling projects by focusing agencies toward regional collaboration, irrespective of jurisdictional boundaries. This has the effect of integrating water and wastewater planning to concurrently solve water supply and wastewater discharge problems, and will lead to more efficient water recycling projects by taking advantage of economics of scale. One such program is the South Bay Recycling Program in Santa Clara County. In addition, the North Bay Watershed Association was created, “to help regulated local and regional public agencies work cooperatively on water resource issues that impact areas beyond traditional boundaries in order to promote stewardship of the North Bay Watershed (Marin, Sonoma and Napa Counties).” The coordination and integration of water reuse activities in the North Bay is an important component of the Association’s functions.

4.17 MUNICIPAL WASTEWATER SLUDGE MANAGEMENT

One particular type of solid waste is wastewater sludge, a by-product of wastewater treatment. Raw sludge usually contains 93 to 99.5 percent water, with the balance being solids that were present in the wastewater and that were added to or cultured by wastewater treatment processes. Most POTWs treat the sludge prior to ultimate use or disposal. Normally this treatment consists of dewatering and/or digestion. In some cases, such as at the Palo Alto treatment plant, the sludge is incinerated.

Treated and untreated sludges often contain high concentrations of toxic metals and often contain significant amounts of toxic organic pollutants and pathogens. The storage and disposal of municipal sludges on land can result in degradation of ground and surface water if not properly performed. Therefore, sludge handling and disposal must be regulated.

On February 19, 1993, the U.S. EPA promulgated national standards regulating the use or disposal of non-hazardous sewage sludge (40 CFR Part 503, et.seq.). Part 503 regulations primarily affect sewage sludge (also known as "biosolids") use and disposal by incineration, surface disposal, and land application (including distribution and marketing). Part 503 regulations also establish pollutant limits, operational and maintenance practices, monitoring frequency, recordkeeping, and reporting requirements. The federal definition of sewage sludge includes domestic septage (from septic tanks, cesspool, portable toilet, etc.). Disposal in a municipal solid waste landfill (MSWLF) is not considered surface disposal. Thus, the MSWLF is not regulated by the national sewage sludge program.

The State of California has neither requested nor been granted the delegation of the federal sewage sludge management program at this time. Therefore, U.S. EPA will be responsible for implementation and enforcement of the national rule. Under the rule, facilities that must apply for a permit include the generators, treaters and disposers of sewage sludge. Nevertheless, 40 CFR Part 503 has, for the most part, been written to be self-implementing. This means that anyone who uses or disposes of sewage sludge regulated by 40 CFR Part 503 must comply with all the provisions of the rule, whether or not a permit has been issued.

State regulations of the handling and disposal of sludge are contained in Chapter 15 and DTSC standards for hazardous waste management. Prior to promulgation of the national rule, sewage sludge facilities were regulated by the Water Board through the issuance of site-specific waste discharge requirements. The Water Board may continue to regulate certain sewage sludge facilities when believed to be necessary for the protection of water quality.

4.18 ON-SITE WASTEWATER TREATMENT AND DISPERSAL SYSTEMS

As the population of the Region increases, demand for new development increases. In many cases, new development is within areas served by municipal sewer systems. However development is also occurring in outlying areas not served by existing sewerage agencies. In those instances, new discrete sewerage systems are being proposed. These are primarily onsite wastewater treatment and dispersal systems (onsite systems or septic systems) serving individual homes, but include community systems serving multiple residences. Today there are more than 110,000 onsite systems throughout the Region, and approximately 1,000 new systems are approved each year.

In response to these development pressures, the Water Board adopted a Policy on Discrete Sewerage Facilities in 1978. The policy set forth the actions the Water Board will take with respect to proposals for individual or community sewerage systems serving new development. An important provision of the policy required the development of guidelines for acceptable onsite system practices. The Water Board's policy and guidelines are presented below.

4.18.1 POLICY ON DISCRETE SEWERAGE FACILITIES

This policy enumerates the following principles, which apply to all wastewater discharges:

- The system must be designed and constructed so as to be capable of preventing pollution or contamination of the waters of the state or creating nuisance for the life of the development;
- The system must be operated, maintained, and monitored so as to continually prevent pollution or contamination of the waters of the state and the creation of a nuisance;
- The responsibility for both of the above must be clearly and legally assumed by a public entity with the financial and legal capability to assure that the system provides protection to the quality of the waters of the state for the life of the development.

The policy also makes the following requests of city and county governments:

- That the use of new discrete sewerage systems be prohibited where existing community sewerage systems are reasonably available;
- That the use of individual onsite systems for any subdivision of land be prohibited unless the governing body having jurisdiction determines that the use of the systems is in the best public interest and that the existing quality of the waters of the state is maintained consistent with the State Water Board's Resolution 68-16; and
- That the cumulative impacts of individual system discharges be considered as part of the approval process for development.

Finally, the policy also requires that a public entity assume legal authority and responsibility for new community wastewater treatment and dispersal systems. Community systems are defined as collection sewers plus treatment facilities serving multiple discharges under separate ownership. The policy requires local governments, during the development approval process, to consider either the formation of a new government entity or an existing public entity to assume this responsibility.

4.18.2 ONSITE SYSTEM GUIDELINES

Since the early 1960s, the Water Board, pursuant to Section 13296 of the Water Code, adopted waivers for reporting certain septic system discharges in all the Region's counties except San Francisco. In its policy, the Water Board required the development of individual system guidelines concentrating mainly on septic systems. These guidelines provided information on system design and construction, operation and maintenance, and the conduct of cumulative impact studies.

In 1979, the Water Board adopted Resolution No. 79-5: Minimum Guidelines for the Control of Individual Wastewater Treatment and Disposal Systems (Minimum Guidelines). These guidelines include recommended practices for onsite system design, construction, operation and maintenance, and cumulative impact assessments, along with supporting rationale. The guidelines focus on the most common and conventional type of onsite systems, a septic tank followed by gravity-flow discharges into a subsurface soil absorption system, but underlying principles remain applicable to all types of onsite systems.

4.18.3 ALTERNATIVE ON-SITE SYSTEMS

The conventional onsite system, when properly constructed and operated, has long been a reliable and acceptable method of providing onsite sewage management. However, there are widespread conditions throughout the Region that preclude the use of conventional systems, including high groundwater, shallow or poor quality soil, or steep slopes. In recent years, there has been active interest and research in the development of alternative methods of onsite wastewater management to accommodate these limiting conditions. Alternative methods currently in use include additional treatment prior to soil discharge such as by a sand filter, or improved methods of dispersal into native soil such as by pressurized distribution throughout the soil absorption system, or via an engineered above-grade mound unit.

While alternative methods can afford improved practices, the use of alternative systems is not without limitations. The site and soil conditions that preclude conventional practices remain and must be appropriately addressed, since all onsite systems ultimately rely on soil absorption of all

or most of the wastewater generated. Most alternative systems require a high degree of design expertise, which increases the danger of faulty design or installation and complicates the review of various proposals. Furthermore, given that alternative systems are primarily used in areas of existing site or soil limitations, in the event of failure, options for replacement will be few, and corrections difficult to achieve. Finally, most alternative systems require a far more intensive and sophisticated level of management than conventional systems, including inspection, monitoring and maintenance by qualified service providers, and increased regulatory oversight, as well as careful use and operation by the homeowner.

Recognizing the need for a position on alternative systems, the Water Board adopted the following statement in the 1979 Minimum Guidelines:

"The Water Board Executive Officer may authorize the Health Officer to approve alternative systems when all of the following conditions are met:

a. Where the Health Officer has approved the system pursuant to criteria approved by the Water Board Executive Officer;
b. Where the Health Officer has informed the Water Board Executive Officer of the proposal to use the alternative system and the finding made in (a) above; and
c. Where a public entity assumes responsibility of the inspection, monitoring and enforcing the maintenance of the system through:

(i) Provision of the commitment and the necessary legal powers to inspect, monitor, and when necessary to abate/repair the system; and

(ii) Provision of a program for funding to accomplish (i) above."

The fundamental point is that the Water Board will allow the use of alternative systems only if adequate design review, system management, and means for failure correction are assured, and a county or some other public agency assumes ultimate responsibility for these actions.

The Water Board may authorize local agencies to approve and permit alternative on-site systems, provided the local regulatory program is found to be acceptable and in accordance with the Water Board's position on alternative systems discussed above. An acceptable program should include a) siting and design criteria for the types of alternative systems being approved, b) procedures for on-going inspection, monitoring, and evaluation of these systems, and c) appropriate local regulations for implementation and enforcement of the program. Authorization may be granted through a conditional waiver adopted by the Water Board and will typically include a Memorandum of Understanding (MOU) between the Water Board and the local agency. Typically, that agency will be the county environmental health department. The MOU provides a means for identifying the responsibilities of both the Water Board and the local agency, applicable criteria for siting, design, construction, operation, maintenance and monitoring, and procedures for implementing the program.

Alternative onsite system designs proposed for approval in a local agency program should be substantiated by suitable reference materials demonstrating successful performance under site and soil conditions similar to the local conditions, including previous field or research facility

testing and documentation of applicable design, installation and use criteria. System designs that have not been fully proven under proposed conditions will be considered experimental and treated with caution. In general, experimental systems will require more careful siting and design review and, if approved, intensive monitoring and inspection to ensure adequate system operation and performance. Experimental systems are generally approved only for limited use, until successful performance has been demonstrated and documented, and acceptable design, installation and use criteria determined.

4.18.4 GRAYWATER SYSTEMS

Graywater systems are a special group of onsite systems that are used to manage only isolated domestic wastewaters that have not come in contact with toilet wastes. In 1997, the California Building Standards Commission approved revised California Graywater Standards. These standards were developed by the California Department of Water Resources (DWR), are codified at Title 24, CCR, Part 5, Appendix G, and apply to all graywater systems statewide.

The standards specify the means by which certain non-toilet wastewaters may be collected, filtered, and discharged into onsite subsurface irrigation systems. Allowable sources of graywater include showers, tubs, bathroom sinks and laundry water. Discharged graywater may only be used for subsurface landscape irrigation. The standards apply to both residential and commercial buildings.

Cities and counties have authority to develop policies and procedures for the implementation of graywater programs. In developing these, consultation with the Water Board and local water districts can ensure that potential impacts on local water quality are taken into consideration.

4.19 EROSION AND SEDIMENT CONTROL

Current estimates of annual sediment inflow to San Francisco Bay are 5.9 million cubic yards with 3.9 million cubic yards contributed through the Delta and 2.0 million cubic yards from Bay Area tributary streams. By the year 2000, ABAG has estimated that approximately 322,500 acres of land area will be converted to urban use. This is a 73 percent increase above the 1975 urbanized land area. This increase in urbanized land use can be expected to be the future source of much of the sediment that will reach the rivers, streams and channels and ultimately the Bay system each year.

Soil erosion and related water quality impacts may result from a wide variety of causes including construction, hillside cultivation, non-maintained roads, timber harvesting, improper hiking/ biking trail use, and off-road vehicles.

Natural erosion processes are accelerated when existing protective cover is removed before, during, and following construction and agricultural activities. Studies relate that erosion on land where construction activities are taking place is about 10 times greater than on land in cultivated row crops, 200 times greater than on pasture land, and 2,000 time greater than on timber land that has not been logged.

The exposure of the soil mantle to falling rain, overland and channelized flow, and the impact of equipment moving over the site results in the increased movement and loss of soil.

Damage from erosion and sedimentation can be categorized in the following ways:

- Damage to construction sites;
- Damage to stream channels;
- Damage to water quality/beneficial uses;
- Damage to public and private property; and
- Damage to agricultural lands.

In most cases, the adverse results of human activities can be reduced and in some instances eliminated through the use of both structural and non-structural measures of various types that are properly employed at the appropriate time. The high cost of lost resources, resource replenishment and after-the-fact repair and maintenance make both pre-project erosion control planning and preventive maintenance necessary. The goals of and the program for erosion and sediment control are summarized below.

GOAL

The goal of the Water Board's Erosion and Sediment Control Program is to reduce and prevent accelerated (human-caused) erosion to the level necessary to restore and protect beneficial uses of receiving waters now significantly impaired, or threatened with impairment, by sediment.

This goal is to be attained through implementation of proper soil management practices. Voluntary implementation is encouraged, but enforcement authority will be exercised where beneficial uses of water are clearly threatened by poor soil management practices.

PROGRAM

In May of 1980, the Water Board adopted two separate items to alert local governments to the Water Board's concern on erosion control problems related to construction activities. The first item was a statement of intent (Resolution No. 80-5) regarding erosion control which stated that the Water Board:

- Recognizes that water quality problems are associated with construction related activities;
- Recognizes ABAG's progress in developing erosion and sediment control regulatory programs and assistance to local governments to implement these programs;
- Recognizes local governments power to adopt and implement these programs;
- Intends to strengthen its position with regard to regulation of sediment and erosion control problems especially with regard to construction activities; and
- Intends to take appropriate enforcement action pursuant to the California Water Code in cases where land development or other construction activity causes or threatens to cause adverse water quality impacts associated with erosion problems and intends to consider, during enforcement actions, whether local government negligently contributed to the problem due to failure to adopt and/or effectively enforce erosion control programs.

The second item was a memorandum of understanding negotiated with the Council of Bay Area Resource Conservation Districts that is intended to provide the following:

- Assessment, control and monitoring of potential and existing soil erosion related water quality problems;
- Improvement of coordination between the Resource Conservation Districts and the Water Board; and
- Monitoring of local government progress on the adoption and implementation of erosion and sediment control ordinances.

The Water Board has recognized and encouraged the efforts that ABAG has made since mid-1980 in working with local Bay Area governments to improve their ordinance and regulatory programs on erosion and sediment control. ABAG's 1995 Manual of Standards for Erosion and Sediment Control Measures, which provides specific guidance to local governments, is an important tool for improving erosion and sediment control.

The Water Board intends to follow the guidelines listed below in regulating erosion and sedimentation for the protection of beneficial uses of water.

1. Local units of government with land use planning authority should have the lead role in controlling land use activities that cause erosion and may, as necessary, impose further conditions, restrictions, or limitations on waste disposal or other activities that might degrade the quality of waters of the state.

2. Best Management Practices (BMPs) should be implemented to reduce erosion and sedimentation and minimize adverse effects on water quality. A BMP is a practice or combination of practices determined to be the most effective and practicable means to prevent or reduce erosion and sediment related water quality degradation. Examples of control measures are contained in the Manual of Standards for Erosion and Sediment Control Measures. Further technical guidance can be obtained from the Resource Conservation Districts.

3. Local governments should develop an effective erosion and sediment control ordinance and regulatory program. An effective ordinance and regulatory program must:

- Be at least comparable to the model ordinances in ABAG's Manual of Standards for Erosion and Sediment Control Measures;
- State that water quality protection is an explicit goal of the ordinance;
- Require preparation of erosion and sediment control plans consistent with the Manual of Standards with specific attention to both off-site and on-site impacts;
- Provide for installation of approved control measures no later than October 15 of each year; and
- Have provisions for site inspections with follow up at appropriate times, posting of financial assurances for implementation of control measures, and an enforcement program to assure compliance with the ordinance.

4. All persons proposing alterations to land (over five acres) are required to file a Report of Waste Discharge and/or and Erosion Control Plan with the Water Board. A statewide general NPDES permit aimed at minimizing erosion from the proposed activities has been issued.

In addition, the Water Board may find that any water quality problems caused by erosion and sedimentation for such a project were due to the negligent lack of an adequate erosion control ordinance and enforcement program by the local permitting agency. Such a finding of negligence could subject a permitting agency to liability for indemnification to a developer if civil monetary remedies are recovered by the state.

5. The Water Board may take enforcement action pursuant to the California Water Code to require the responsible persons (including local permitting agencies) to clean up and abate water quality problems caused by erosion and sedimentation in the event that the local permitting agency fails to take the necessary corrective action.

4.20 DREDGING AND DISPOSAL OF DREDGED SEDIMENT

Dredging and dredged sediment disposal in the San Francisco Bay Area is an ongoing activity because of continual shoaling which impedes navigation and other water dependent activities. Large volumes of sediment are transported in the waters of the Sacramento and San Joaquin Rivers which drain the Central Valley. The average annual sediment load to the San Francisco Bay system from these two rivers is estimated to be eight million cubic yards. Of this amount, some four million cubic yards is transported out of the Bay through the Golden Gate. The remaining four million cubic yards is circulated and/or deposited in the Bay. In addition, some two and one-half million cubic yards are deposited into the Bay from local watersheds.

Annual maintenance dredging of shipping channels, harbors and marinas in the San Francisco Bay results in disposal of between two and eight million cubic yards of dredged material at in-bay disposal sites. There are currently three designated disposal sites for use by the Corps, the Navy and other dredgers. Additionally, the Corps disposes of material from several projects at designated sites in Suisun Bay and on the San Francisco Bar (west of the Golden Gate). All aquatic dredged material disposal sites are operated as "dispersive" sites, that is material disposed at the sites is intended to disperse and be carried by currents out to sea.

4.20.1 REGULATORY FRAMEWORK

The Corps of Engineers issues federal permits for dredging projects pursuant to Section 404 of the Clean Water Act. As a part of this permitting process, the dredging permit applicant must seek water quality certification from the State of California, in accordance with Section 401 of the Clean Water Act. Currently the applicant must contact the Water Board for 401 certification. The Water Board may waive certification, or it may recommend to the Executive Director of the State Water Resources Control Board that Certification be granted or denied. Water quality certifications often contain conditions that the permittee must meet during the term of the permit. For example, Certifications often contain conditions requiring periodic testing of the dredged material, or avoidance of sensitive ecological areas and spawning grounds. The San Francisco Bay Conservation and Development Commission (BCDC) also regulates dredging and disposal under the provisions of the McAteer-Petris Act.

4.20.2 ENVIRONMENTAL IMPACTS OF DREDGING AND DISPOSAL IN THE AQUATIC ENVIRONMENT

During the late 1980s and continuing to the present, concern over the potential impacts of dredged sediment disposal in San Francisco Bay has increased substantially, forcing regulatory agencies to reexamine their dredging policies. The Water Board, during their triennial review of the Basin Plan in 1986, stated their intention to update and revise the Water Board's dredged sediment disposal policy for San Francisco Bay. During the triennial review, the Water Board recognized that periodic dredging is necessary to maintain the beneficial use presented by navigation and other water dependent activities. The Water Board also stated their intention to institute a more rigorous testing program to determine the suitability of dredged sediment for unconfined aquatic disposal in San Francisco Bay.

Most dredging and dredge material disposal operations cause localized and ephemeral impacts with related biological consequences (Table 4-12). In August, 1980, the Water Board adopted a general policy for the regulation of dredge sediment disposal. Many concerns have been raised about the adequacy of the Corps' regional procedures to identify potential pollution conditions. One area of concern is implicit in the guidelines and protocol, for testing of sediment for ocean disposal. The current ocean disposal criteria (pursuant to the Marine, Protection, Research and Sanctuaries Act) are more stringent than the inland criteria (governed under the Clean Water Act). In the 1980s it was determined that the Alcatraz disposal site was accumulating significant amounts of material, with the depth of the site going from the original 110 feet to 30 feet. The mounding at the disposal site ultimately became a threat to navigation. The Corps eventually dredged the Alcatraz site to increase the depth, redistributing the material within the disposal area several times between 1984 and 1986.

In September of 1988, Water Board staff circulated and presented an issue paper entitled "A Review of Issues and Policies Related to Dredge Spoil Disposal in San Francisco Bay." The issue paper discussed the major environmental concerns posed by dredged sediment disposal in San Francisco Bay, namely: (1) mounding at the Alcatraz disposal site which posed a navigational hazard and has the potential to alter circulation patterns in the Bay; (2) the disposal of increasingly large amounts of material has the potential to alter benthic and shoreline habitats and to increase water column turbidity; and (3) the resuspension of dredged sediments may increase contaminant bioavailability. The issue paper presented a range of alternative strategies for the Water Board to consider. Public and agency testimony was received by the Water Board during hearings on September 15, 1988 and October 19, 1988. Agencies testifying included the Corps, U.S. Environmental Protection Agency (USEPA), and California Department of Fish and Game (CDFG). In the issue paper, Water Board staff recommended that the Water Board consider adopting quantity and quality limits for the disposal of dredged sediment at unconfined aquatic disposal sites within San Francisco Bay.

Additionally, the Water Board and the Corps took steps to prevent further "mounding" at the region's single largest disposal site, the Alcatraz site. In 1989, the Water Board adopted volume targets which served to prevent over-filling of the region's three aquatic disposal sites. BCDC also revised its policies to restrict in-bay disposal. Land disposal avoids many of the potential adverse impacts in aquatic systems. A different set of potential environmental impacts is associated with land disposal but also the opportunity for creating environmental benefits.

4.20.3 DREDGING STUDY PROGRAMS

4.20.3.1 DREDGE MANAGEMENT PROGRAM

In the late 1980s, the Corps of Engineers undertook a series of local dredging studies as a part of the Dredged Management Program (DMP). Additionally, the Corps nationally undertook a Demonstration Program, to examine the environmental impacts from various dredged material disposal practices. The goal of these programs was to examine: 1) factors associated with aquatic disposal practices, 2) the characteristics of dredged material, 3) alternative methods of disposal and 4) dredging technology. However, because the DMP was conducted internally; was not consensus-based; and did not fully involve other state and federal agencies, environmental groups and the dredging community; concern and conflict continued to surround dredging in San Francisco Bay. One particularly notable instance of continued conflict was a 1989 protest and blockade of the aquatic disposal sites by environmental and fishing interests. In the fall of 1989 and early 1990, the Corps undertook a new approach to studying environmental issues surrounding dredging and disposal site management.

4.20.3.2 LONG-TERM MANAGEMENT STRATEGY (LTMS)

The new approach, called the Long Term Management Strategy (LTMS) for dredged material, was designed as a cooperative process based on active participation by state and federal permitting agencies. The lead LTMS agencies share four basic goals related to the fact that dredging is important both economically and environmentally (Table 4-13). The LTMS structure is a pyramid form with technical committees at the base, and appointed state and federal agency administrators at the top (Table 4-14). Three staff-level committees, or "workgroups" were charged with addressing technical issues and managing environmental studies. The Corps of Engineers, San Francisco District, was charged with general coordination, contracting and administrative functions. Later in the process, a fourth committee was formed to carry out various LTMS implementation tasks. The implementation committee has been primarily concerned with permit coordination and streamlining, but has also attempted to address inequities in upland disposal site financing, upland/non-tidal site acquisition and changes to Federal dredging policy. Above the technical and implementation committees is the Management Committee, represented by management executives from five key LTMS agencies. The Management Committee, in turn, takes direction from the Executive Committee. The Executive Committee consists of the chairpersons of the Water Board and BCDC, the USEPA Regional Administrator, the State Dredging Coordinator (Governor Appointed), and the commander of the South Pacific Division, Corps of Engineers. Broad public input is gained via the Policy Review Committee, which meets quarterly to review the work and progress of LTMS.

4.20.3.3 THE LTMS PROCESS

The LTMS process allows participation by resource agencies, environmental groups and the maritime industry. In 1990, the LTMS Study Plan was approved by the participating agencies. The Study Plan outlined in general, the LTMS process and which scientific fields were pertinent and in which areas there existed "gaps" in knowledge. Technical work groups were established order to take responsibility for examining issues in the arenas of: 1) deep ocean disposal, 2) in-bay aquatic disposal, and 3) upland/non-aquatic disposal and re-use. Staff at the Water Board, BCDC and USEPA were appointed to chair the three work groups (Table 4-14). Each committee

was budgeted funds by the Corps in order to carry out approved studies. Throughout the LTMS process, the Corps has retained responsibility for contract management, budgets, and other administrative duties. For the first several years of the program, the In-bay studies work-group also served as a part of the San Francisco Estuary Project, as it was also designated as the subcommittee on "Dredging and Waterway Modification."

The LTMS process has resulted in new findings regarding sediment toxicity testing and transport; the development of new testing procedures; and new approaches to disposal of dredged material. Additionally, the LTMS participants continue to work toward better disposal site management, and, perhaps more importantly, an increased level of coordination and cooperation between those involved with dredging. Participating federal and state permitting and resources agencies receive technical and policy input from dredging, environmental and fishing communities through the LTMS structure.

4.20.3.4 OCEAN STUDIES

The Ocean Studies Work Group, funded through LTMS, provided input on U.S. EPA' s study and designation of a deep ocean disposal site for dredged material. The group oversaw studies in the areas of sediment transport modeling, benthic ecology and environmental risk. The results of various technical studies were compiled in an Environmental Impact Statement (EIS) in which five disposal sites were considered.

U.S. EPA completed an EIS on ocean disposal in August of 1993. Concurrent and following work on the EIS, U.S. EPA, with input from LTMS, moved closer to disposal site use by completing a Site Management and Monitoring Plan. The designated deep ocean disposal site is located about 58 miles offshore, beyond the boundaries of the California National Marine Sanctuaries, in waters which are 6,000 to 9,000 feet deep. The site was formally designated by U.S. EPA on August 11, 1994 (59 Federal Register Section 41243 et seq.) It is expected that the ocean site will be used for disposal of dredged material from large new work and maintenance dredging projects.

4.20.3.5 IN-BAY STUDIES

In-bay disposal studies were undertaken to address several key areas of concern. Following the general terms of the LTMS Study Plan, the In-bay work group examined key environmental concerns in the following areas:

- Physical effects of disposal, including turbidity;
- Physical processes including fate and transport of material from the disposal sites using numerical modeling;
- Toxicological issues, including release of contaminants during disposal, and ecological fate of contaminants;
- Non-treatment effects in sediment toxicity tests;
- Bioaccumulation;
- Methods to reduce the need for dredging; and
- Sampling and analysis methods for sediment testing.

Most of the LTMS in-bay studies were completed by the end of 1994; however, several documents remain in draft form.

4.20.3.6 UPLAND AND NON-TIDAL/REUSE STUDIES

The Upland Studies Program focused on the evaluation of the potential for upland disposal and the use of dredged material as a resource. The group conducted planning-level feasibility studies of potential sites in the San Francisco Bay and Delta. Studies examined the engineering, biological and hydrological aspects of wetland restoration using dredged material; as well as, various regulatory and planning issues surrounding upland reuse. Other issues studied by the group included: remedial technologies for treating contaminated sediments, an analysis of seasonal and tidal wetlands in the North Bay and a feasibility study of potential sediment rehandling sites.

The LTMS technical studies have added to our information base and have filled some of the "data gaps" that were originally identified in the LTMS Study Plan. In many cases, LTMS studies have confirmed our conceptual views and hypotheses about how the Estuary and the ecosystem functions.

4.20.4 WETLAND RESTORATION USING DREDGED MATERIAL

While the Water Board remains concerned about the impacts of both polluted and clean sediments on the San Francisco Estuary, much of the sediment disposed of in the Region is not polluted and could be used in beneficial ways (termed "reuse"). One of these uses involves the restoration of tidal marshes in areas which were once part of the Bay. These areas, known as diked historic baylands, were once open to the tides and were thriving salt marsh and mudflat ecosystems (further discussion under "Wetlands Protection and Management" section). Decades of land "reclamation," first initiated in the 1800s resulted in diked agricultural lands, the land surface of which have subsided for a variety of reasons.
